Legros, Alphonse (1837-1911), Fr. painter, b. May 8 at Dijon. In 1857 he exhibited a profile portrait of his father in the Salon, afterwards presented to the museum at Tours. In 1859 his 'Angelus' was exhibited and was highly praised. In 1863 L. came to England, married, and became teacher of etching at the St. Kensington School of Art, and in 1876 Slade prof. at Univ. College, London, in succession to L. J. Poynter. His pictures are chiefly fr. rural scenes and portraits and etchings. See monographs by L. Bénédite, 1904 and A. J. Halton.

Leguminosæ, very large family of plants, including peas, beans, vetches, clover, acacia, mimosa, gorse, broom, laburnum, etc. They usually have compound pinnate leaves and some of the leaflets are frequently modified to form tendrils. The roots of many members bear nodules containing bacteria that are able to convert atmospheric nitrogen into proteids, etc.; hence the practice of ploughing in crops of clover, etc., to enrich the ground. The flowers of L. are frequently butterfly-shaped; these constitute the sub-family *Papilionaceæ*, which includes all Brit. L. The fruit is a pod (legume). Pollination is by means of insects.

Legya, or *Lahka*, vil. in the S. Shan States, Burma, 120 m. S.E. by E. of Mandalay, produces rice, cotton, and sugar-cane. It manufs. iron and lacquer ware. Pop. (state) 33,000.

Leh, tn. of Kashmir, cap. of Ladakh,

180 m. E. of Srinagar. It is enclosed by a wall and towers, and has sev. Buddhist temples, a rajah's palace, bazaar, observatory, and mint. It is the great rendezvous for intercourse between the Punjab and Tibet, and Chinese Turkestan. It has an active trade in shawl wool. L. lies between the Indus, about 5 m. distant, and a chain of mts. Pop. 24,000.

Lehár, Ferencz (Franz) (1870-1948), Hungarian composer, b. at Komárom or Komarno (now in Czechoslovakia), son of a military bandmaster. For a time he followed his father's calling, though his training at the Prague conservatory was as a violinist. His music shows the influence of the S. Slavonic folk tunes and he first tried to win fame as a composer of serious opera as, for example, in *Kukuska* (later renamed *Tatiana*), produced in 1896; but it was subsequently, in the field of operetta or the 'musical play', that he achieved real distinction and the widest popularity. His best productions in this kind are *The Merry Widow* (1905); *The Count of Luxembourg* (1909); *Gipsy Love* (1910); *Frasquita* (1925); *Frédérica* (1928); and *The Land of Smiles* (1931), all distinguished for light music of a high order deftly orchestrated. In his later work he showed a tendency to forsake the musical play tradition and again sought to achieve the true operatic style, as, for example, in the tragedy, *Giuditha*, produced in Vienna in 1934. He also wrote marches, piano music, a violin concerto, sonatas, and dance compositions. If his most popular productions somewhat outlasted their great initial popularity, he is remembered for his charming melodies and waltzes. See A. Rivroir, *Une Heure de musique avec Lehár*, 1930; also studies by G. Knosp, 1935, and S. Czech, 1940.

Lehigh, riv. in Pennsylvania, U.S.A., 120 m. long. Anthracite mines are worked near it, and it has slack-water navigation to Whitehaven.

Leighton, tn. of Carbon co., Pennsylvania, U.S.A., on the W. bank of the Lehigh R., 20 m. N.W. of Allentown. It has coal-mines and manufs. of silk, wagons, and lace. Pop. 6600.

Lehmann, Lilli (1848-1929), Ger. soprano singer, b. at Würzburg. Studied under her mother, the singer Marie L., appeared at Prague as the first girl in Mozart's *Magic Flute* at an early age, was engaged at Danzig in 1868, at Leipzig in 1870, and made her first appearance in Berlin in the latter year. In 1876 she first sang at the Wagner performances of Bayreuth and in 1880 first visited London.

Lehmann, 'Liza' (Elizabeth Nina Mary Frederika (1862-1918), Eng. singer and composer, b. in London. Studied first with her mother, Amelia Chambers, an accomplished amateur composer, and later at Rome, Wiesbaden, and at home with MacCunn, also singing with Randegger. In 1885 she made her first appearance as a singer at St. James's Hall, where she sang for the last time in 1894, when she married Herbert Bedford.

Lehmann, Rudolf Chambers (1856-1929), Brit. oarsman and journalist, educated at Highgate School and at Trinity

College, Cambridge. Became famous at Trinity College for his rowing. Founded the *Granta* there and coxed the Cambridge crew in 1899 and the Oxford crew many times between 1891 and 1903. Called to the Bar at the Inner Temple, 1880, and ed. the *Daily News* in 1901. On the staff of *Punch*, 1890-1919. Unsuccessfully contested sov. seats between 1886 to 1892 but was elected to the House of Commons as Liberal member for the Market Harborough div. of Leicestershire and sat in the house from 1906 to 1910. Between 1890 and 1913 he pub. various books, including his parodies to *Punch* and *The Complete Oarsman* (1908).

Lehmbruck, Wilhelm (1881-1919), Ger. sculptor and painter, b. at Duisburg. He came of a peasant family, but in early youth was apprenticed to a commercial firm of metalworkers. In 1901, however, he was able to leave on account of a grant which enabled him to study art at the Düsseldorf Academy under the direction of Peter Janssen. Finishing at the academy in 1906, he travelled in France and Italy during the next eight years. Thereafter he lived mainly in Berlin until his death which was by suicide, on March 25, 1919. In his work he strove to express the spiritual and psychological aspects of his subject through his medium and was not deflected from this end by the pursuit of realistic representation. He is remembered particularly for his sculpture of the female figure, in which his romantic, idealistic mood predominates. Works by him were shown posthumously in an exhibition of Ger. artists in Paris in 1927, and he is represented in the museums in Berlin, Munich, and other Ger. tns., and also in New York.

Leibnitz (more commonly known as Leibnitz), Gottfried Wilhelm, Freiherr von (1646-1716), Ger. philosopher and mathematician, b. at Leipzig. In 1661 he entered the univ. of Leipzig as a law student, and in 1686, being refused his doctor's degree on account of his youth, he applied to the univ. tn. of Nuremberg, Altdorf, which not only conferred upon him his degree but offered him a professorial chair. At Nuremberg he made the acquaintance of Baron von Boineburg, who advised him to dedicate his treatise, *Nova methodus docendi discendique juris*, a proposal for the reform of the *Corpus Juris*, to the elector of Mainz. In this way the young man attracted the attention of the elector and entered his service. At first L. assisted in the revision of the statute book. In 1669 he was required to promote by argument the Ger. claims to the vacant throne of Poland, but his *Specimen demonstrationum politicarum pro rege Polonorum eligendo* had not the desired effect, and a Polish prince was elected. At this time Germany was in danger of attacks by the aggressive Louis XIV., and, in order to divert his attention from any such projects, he was approached with a scheme of L. for the Fr. conquest of Egypt. In 1672 L. was summoned to Paris to propound more fully the scheme he had laid down in *De expeditione Egyptiaca et Consilium Aegyptiacum*. It

in the following year he was appointed governor. In this position he showed himself incapable, and was recalled in 1587, dying the following year. See E. Bekker, *Elizabeth and Leicester* 1890 and F. Chamberlain, *The Private Character of Queen Elizabeth*, 1930.

ROBERT DUDLEY EARL OF LEICESTER

Leicester, Thomas William Coke, first Earl of (1752-1812). He was member of Parliament for Norfolk from 1776 until 1806 and again from 1807 until 1812. He became a farmer on a large scale, gaining wide fame by his improvements in crops and in the breed of cattle and sheep. He became, in 1837, earl of Leicester. See A. M. W. Stirling, *Coke of Norfolk and his friends* 1907.

Leicester, county of Leicestershire, England, 47½ m. by rail from London, of the Midland and N. E. railways. It is an ancient county which has grown in a few generations into a large and prosperous industrial city. The borough has four members to Parliament. The development of suburbs and large housing estates has resulted in a considerable growth of the city which now covers 17,000 ac. Pop. 261,300.

History—In the Roman period L., under the title of Ritha Corinunorum, was evidently a large and wealthy town, a fact which may be deduced from the rich mosaic or tessellated pavement found under the city. Two of them may still be seen, in St. Nicholas Street and Black Friars Street respectively. After the lapse of the Roman occupation L. was called by the Saxons Legerceastre and became a see of a bishop, only to lose that distinction for more than a thousand years in 874. The bishopric was transferred to Dorchester in Oxfordshire, during the Dan. invasion, when the Danes held Lancaster, Derby, and other midland towns. By the time of the Domesday survey L. had 332 houses and six churches, and a pop. of about 2000. The hist. of twelfth-

century L. was closely identified with that of the Beaumont family, which, as indicated above, was responsible for the building of St. Mary de Castro Church and the great hall of the castle, where Parliament met in 1426 and again in 1450. After the earl of Leicester with his Flemish mercenaries had supported Richard and Geoffrey against their father, Henry II., the latter retaliated by besieging L., partially destroying the town and demolishing the walls. In 1201 a meeting of barons took place in L. which was to prove a forerunner to the meeting in 1215 at Runnymede. The corporate life of the town was then already taking shape, the ancient portmoot having developed into an oligarchy consisting of the mayor and a self-constituted corporation. The guild merchant, the ancient equivalent of the present day chamber of trade gradually merged with this corporation and this amalgamation of council and chamber of trade governed L. for centuries. In the Civil war L. was for Parliament and although taken by Prince Rupert, it was retaken by Cromwell after the battle of Naseby. It was during the early years of the ensuing Puritan rule in England that Wm. Lisle (q.v.) a country estate of Nottinghamshire was experimenting with a knitting frame with twelve needles.

Buildings and Churches. In spite of many changes enough has remained to illustrate the hist. of the city from Roman times until the present. The centre of the modern city is the Clock Tower, a Victorian mutation Gothic monument near the site of the old L. Gate. Almost all the action in lay W. of this site. At the present time most of the principal shops and public buildings lie in the quarter of the city which is bounded on the N. by the High Street and on the E. by the Gallowtree Gate, Granby Street, and London Road. The town hall is a handsome Renaissance brick building erected about 1875 from the designs of Francis Haines, who belonged to a well-known L. family. It contains the council chamber, lord mayor's parlour, law courts, and various corporation departments. In Bishop Street are the G.O. and the central city reference libraries, and near by the central lending library. Near Victoria Park is De Montfort Hall, the city's prin. hall for meetings and large concerts. In Victoria Park stands the war memorial designed by Sir Edwin Lutyens. Abbey Park and Abbey Grounds are the site of the ancient abbey of St. Mary in the Meadows (de Pratis), better known as L. Abbey, which was founded in 1143 by Robert le Bossu, the second Beaumont earl of L., for canons regular of the order of St. Augustine. It is famous as the place of the death and burial of Cardinal Wolsey. The ruins are those of Carver's House, which was built in the grounds of the destroyed abbey burnt down by Royalist soldiers after the capture of the town by Prince Rupert in 1646. The outline of the walls of some of the abbey buildings have been discovered and are indicated by low walls raised above the turf. Interesting, too, are the church and fine old houses near by

in Belgrave: one of them, Belgrave Hall (c. 1709-13), is now a period museum. Adjoining it is a botanical garden.

The cathedral church of St. Martin was, from the fourteenth century onwards, in a special sense the civic church of the old bor. of L. For that reason, and also because of its central situation, it was chosen to be the cathedral when the new diocese of L. was formed. Near it is the old guildhall and library, surrounded by buildings of various dates. The earliest portions of the old guildhall were erected towards the end of the fourteenth century by the Corpus Christi Gild, an important religious fraternity which had its chapel in St. Martin's Church. The building remained the official headquarters of L. until about 1875, when the present tn. hall was erected on part of the site of the old cattle market. Near St. Martin's is St. Nicholas Church, with a Saxon nave and Norman tower and partly built of Rom. materials. Immediately W. of this church is a fine stretch of Rom. work, known as the Jewry Wall. Excavations of 1936-38 have shown that this wall is the W. wall of the basilica of the Rom. tn., the rest of the building lying underneath the church. The area to the W. of the wall, where lay the forum, a market-place of *Hate Cortanorum* (Rom. L.), has been acquired by the city council for an open space. Other notable anct. L. churches are All Saints', St. Margaret's, and the church of St. Mary de Castro close to L. Castle. There was probably a church on the site of St. Mary de Castro before the Norman Conquest. When later the castle was founded, the church, while retaining its parochial character, became the castle chapel. Robert de Beaumont, count of Meulan and feudal lord of L., placed in it a collegiate body consisting of a dean and seven canons. Much of the present building, including the chancel, belongs to the twelfth century, but the building received considerable alterations and additions at later dates. The earliest stone castle at L. was erected by Robert, count of Meulan, the first of the four Beaumont overlords who ruled L. throughout the twelfth century. This castle was enlarged and improved from time to time so long as the earls of L. and the dukes of Lancaster used it as a residence, but after 1399, when Henry IV., who was duke of Lancaster and earl of L., ascended the throne, the building was allowed to fall into decay. The great hall, however, has survived from the Norman period and is incorporated in the present structure, which was erected in the eighteenth century. Courts of justice are still held in this anct. hall, which has been adapted to modern requirements. L. has suffered severely in the past from the destruction of its historic buildings, and nowhere more so than in the Newark, where the buildings of the Middle Ages and the pleasant houses of the eighteenth century have largely disappeared. Among these was the Newark Chantry House erected by Wm. Wyggeston, a L. wool merchant and four times mayor of the staple of Calais, and the collegiate church of the Annunciation

of Our Lady, founded in 1355-58 by Henry, first duke of Lancaster and fourth Lancastrian earl of L. On this site to-day are the L. colleges of art and technology. The almshouse, Trinity Hospital, was originally founded in 1331 by Henry, third earl of L. of the house of Lancaster, under the title of the Hospital of the Annunciation of the Blessed Virgin Mary in the New Work (i.e. Newark). The main part of the hospital chapel is the original building of 1331 and portions of the old arcades remain embedded in the present modern structure. The Newark Gateway (fourteenth century) was the main entrance to an eccles. enclosure, which contained the church of the Annunciation and its collegiate buildings, together with the associated almshouses and infirmary known as Newark Hospital.

Industries.—The staple trades of L. are engineering, hosiery, and boot and shoe manufs.; and there are many other well estab. industries, including tobacco, spinning, tanning, and the manuf. of agric. machines for the surrounding agric. dist. L. is the greatest hosiery-producing centre in Britain and the greatest centre in the world of the knitwear industry. Many local industries are ancillary to the staple trades, e.g. the tanning and dressing of upper and lining leathers. The needs of the Second World War accelerated the development of engineering in the city, a development which was taking place before the war, so that engineering has become, and is likely to remain, L.'s major industry. Some of the biggest engineering firms in the city are concerned with the manuf. of boot and shoe and hosiery machinery; but there are numerous other engineering activities: typewriters, wood-working machinery, machine tools, lenses and optical instruments, scientific and surgical instruments, electric vehicles, electric clocks, heating and ventilating equipment, cranes, lifts, cinema equipment, electric transformers, gas-meters, turbo-generators, concrete and road-making machinery, aluminium hollow-ware, laundry and dyeing plant, lawn mowers, bakery equipment, watches, fountain-pens, etc. Allied trades include sheet metal works, iron and brass foundries, and the largest pattern-making shop in the country. Near the city are factories concerned with research and manuf. of jet engines. See P. W. Bryan, *A Scientific Study of the Leicester District*, 1933.

Leicester Breed, see under SHEEP.

Leicestershire, midland co. of England. The surface is chiefly low and flat with a few hills, the highest elevation being that of Bardon Hill (912 ft.) in Charnwood Forest (q.v.). The prin. rivs. are the Trent, the Avon, and the Welland. Nearly the whole co. is under cultivation, the pastures being good; cattle are reared extensively, and there is a special breed of sheep known as the New Leicester. Dairy farming is also carried on, and the famous Stilton cheese is made near Molton Mowbray, which is also famous for a certain kind of pork pie. It is a great hunting co., and in consequence horse-breeding flourishes. There are consider-

able mining industries, coal, limestone, freestone, and granite all being found. The co. was famous for its wool as early as 1313, and has large hosiery manufs at Leicester, Loughborough, Hinckley, etc. Boots and shoes are manufactured at Market Harborough, and there are also brick-fields and iron foundries. It contains six hundreds, and returns four members to Parliament. The area is 832½ sq. m. Pop. 580,000. See *Victoria County History*, 'Leicestershire,' 1907.

Leicestershire Regiment. This regiment, the old 17th Foot, was raised in 1688, and fought under William III. in Ireland and Flanders (Namur, 1695). During the Seven Years war it took part in the siege of Louisburg, Cape Breton, and later of Havana. It served in the Amer. War of Independence. In 1804 it went to India and distinguished itself in the first Afghan war (1839). In the Crimea it fought at Sevastopol, then went back to India for the second Afghan war (1878-1879). It formed part of the garrison defending Ladysmith during the S. African war (1899-1902). During the First World War it raised nineteen battalions, which served in France, the Balkans, and Mesopotamia. It was granted the badge of the Royal Tiger, superscribed 'Hindustan,' for distinguished service in India. In the Second World War the regiment formed part of the Brit. forces which fought in Malaya in 1941-42 against the Jap invaders. Other battalions formed part of the Brit. Eighth Army on the It. front.

Leiden, see LEYDEN.

Leis, see LEY.

Leif Eriksson, see ERIKSSON.

Leigh, tn. in Lancashire, England, 7 m. S.W. of Bolton, has extensive textile manufs and glass works, and coal is found in abundance. Parsonage colliery, the deepest in Britain, has been used for research on the relation between depth and the magnetism of the earth. The tn. stands on a branch of the Leeds and Liverpool and Bridgewater Canals. Pop. (1931) 4,000.

Leigh-Mallory, George (1887-1934), Eng. mountaineer, son of Rev. Herbert L.-M., rector of Moberley, Cheshire brother of Air-Marshall L.-M. Scholar of Winchester, 1900; exhibitor of Magdalen College, Cambridge, 1905, master at Charterhouse, 1910; served with Heavy Artillery, 1915-18; secretary and lecturer to the board of extra-mural studies, Cambridge, 1923. A great mountaineer, who began Alpine climbing in 1904, his notable climbs were on Mont Blanc (1911) and Aiguille des Charmoz (1919) (Papers in Alpine Jour., vols. xxxii., xxxiii.). He took a leading part in reconnaissance of Everest (q.v.), 1921, reached nearly 27,000 ft. without oxygen in 1922. In 1924 he and his companion Irvine were almost certainly seen about midday through a gap in the clouds, climbing the N.E. ridge of Everest at over 28,000 ft.; they were not seen again. Mallory has been called 'this Galahad of mountaineering, pure of heart, high of purpose.' His writings show a high appreciation of mountaineering as a

conquest of mind over matter, the physical achievement only a means to enlargement of the mind. He wrote parts of *Mount Everest, The Reconnaissance* (1921) and *The Assault on Mount Everest* (1922). See life by D. Pye, 1927.

Leigh-on-Sea, seaside tn. of Essex, England, 2 m. W. of Southend, of which it is a ward. Pop. 12,000.

Leighton, Frederick Leighton, Baron (1830-96), Eng. painter and sculptor, b. at Scarborough. At Florence he studied

W. F. Munsell

FREDERICK LEIGHTON

(Self portrait)

under Bozzuotti, Segnolini, and Zanetti. After four years there he went to Frankfurt, visited Brussels and Paris, then settled down to study under Ed. and Steiner. His first picture to attract attention in England was 'Cimabue's Madonna,' carried in Procession through the Streets of Florence,' which was exhibited in the Royal Academy in 1857, and which was bought by Queen Victoria. The following year he sent another picture, 'The Triumph of Music,' but it was not so successful, and he did not exhibit again until 1858. In 1860 he moved into his now famous house at Holland Park Road, containing a beautiful Arab hall with Damascus tiles, which has since been purchased by the nation. Among his earlier pictures was the popular 'Wedded,' but it was in his treatment of classical subjects that L. especially excelled. L. was elected an Academician in 1868, and exhibited his diploma picture, 'St. Jerome,' in 1869. He became president in 1878, when he was knighted, being raised to the peerage a few days before his death. His work is characterised by beauty of composition both in form and colour, while his almost perfect draughtsmanship made him unrivalled in his decorative work. L. also excelled as a sculptor; his

'Athlete struggling with a Python' (1877) was purchased by the Olanby Bequest, 'The Sluggard' and 'Needless Alarms' being exhibited in 1886. As an illustrator he also did good work, especially for the outs to Dalziel's Bible, and a series of illustrations for George Elliot's *Romola*, which reveal an unsuspected sense of humour. His decorative work may be seen at the Victoria and Albert Museum in the fresco 'The Industrial Arts of War and Peace,' also his 'Cimabue' in mosaic. Lyndhurst Church also possesses mural decorations illustrating 'The Parable of the Wise and Foolish Virgins,' to the memory of Poppy Cockrell. L. possessed many foreign orders and distinctions, and belonged to all the prin. foreign academies. See Mrs. A. Lang, *Art Annual*, 1884; C. Monkhouse, *British Contemporary Artists*, 1899; and R. Barrington, *The Life, Letters, and Work of Frederick Leighton*, 1906; also lives by E. Rhys, 1900, and G. C. Williamson, 1902.

Leighton, Robert (1811-84), archbishop of Glasgow. From 1841 to 1852 he had the care of a Presbyterian church in Newbattle, Midlothian, and from 1853 to 1860 (?) was principal of his old univ. He wrote *Zion's Plea against the Prelate* and was a victim of Laud's persecutions. For nine years from 1861 he held the bishopric of Dunblane, and in 1870 accepted from Charles II. the archbishopric of Glasgow, his mission from the king being to induce the Presbyterian clergy to become reconciled with their episcopal brethren. Four years later he retired. His writings reveal a true literary sense and an intellectual outlook in advance of that of other divines of his day. His works, with a life, were pub. by J. N. Pearson in 1830. See G. Burnet, *History of his Own Times*, 1723-34; also life by E. A. Knox, 1930.

Leighton Buzzard, mkrt. tn. of Bedfordshire, England. 36 m. N.N.W. of London. Straw-plaiting is the prin. industry, and there is trade in timber, corn, iron, clothing, concrete, and tiles. It has a fine cruciform church and a market cross, restored in 1852. Pop. 8000. See J. Stevenson, *Old Times in Leighton Buzzard*, 1891.

Leinthal, see COLDESTREAN.

Leiningen, former principality of Germany, dating back to the eleventh century, now shared mainly between Baden, Hesse, and Bavaria since the peace of Lunéville in 1801.

Leinster, S.E. prov. of Eire, comprising the cos. of Dublin, Kildare, Carlow, Kilkenny, Leix, Offaly, Longford, Louth, Meath, Westmeath, Wicklow, and Wexford. The MacMurroughs were kings of L. down to the early years of the twelfth century. Their descendants ruled independently in Wexford and Carlow till the sixteenth century. Richard Strongbow accepted L. from Henry II. as a fief of the Crown. Area 7580 sq. m. Pop. 1,240,200.

Leinster Regiment. Formerly 100th and 109th Regiments, which were linked in 1881. The 100th was raised in 1857 from Canadian volunteers at the time of the Indian mutiny, hence its title 100th or Prince of Wales's Royal Canadians. Its Canadian origin was represented by a

maple leaf in each of the four corners of the regimental colour. The 109th was raised as the 3rd Bombay European Infantry, and served under Sir Hugh Rose in central India during the Indian mutiny. The linked regiment served during the S. African war, 1899-1902. During the First World War it raised seven battalions, which served in France, Flanders, Macedonia, Gallipoli, and Palestine. After the inauguration of the Irish Free State the regiment was disbanded, on July 31, 1922.

Leipa, see BOHMISCH-LEIPA.

Leipzig, tn. 350 ft. above sea level and 70 m. N.W. of Dresden in Saxony, Germany. It is situated in a flat and fertile tract of country, close to the confluence of the Elster, Pleisse, and Parthe, and it has a connection to the Mittelland Canal. There are two great fairs, held at Easter and Michaelmas. L. has gained world recognition as the centre of the well-organised Ger. book trade and the headquarters of the trade organisation, which includes publishers and booksellers. Cigars, lace, ethereal oils, etc. were manufactured. Before the Second World War there were flourishing iron, machinery, and cotton industries, served by the brown coal deposits near by. Until this time L. was, with London and New York, one of the most important fur-trading centres of the world. The Gothic Rathaus, built in 1556, flanks one side of the spacious market square, near by is Auerbach's 'Hof' (1530), associated with Goethe's *Faust*. In air raids in the Second World War the Opera House, the Dresdner bank, the univ., the main post office, and the exhibition hall, besides all the main hotels, suffered damage. L. is pre-eminent in art and culture. After Berlin and Munich it has the largest number of undergraduates, and traces the hist. of its univ. back to 1409. Mendelssohn founded the conservatoire in 1843, and the Gewandhaus concerts, the operas, and the numerous choral and orchestral societies bore witness to the fullness of its musical life. In the neighbourhood is the famous battlefield where in 1813 Napoleon was defeated by the allies.

L., like Dresden and Chemnitz, suffered severely in the Second World War from Brit. and Amer. heavy bombers and was on sev. occasions raided at the same time as the other two cities particularly in Feb. 1945, when devastating blows were delivered in order to help Marshal Konev's First Ukrainian Front armies in their invasion of Silesia. L. was eventually taken by Gen. Hodge's First Amer. Army on April 17, 1945. The city fell to the Amer. at midnight after armour of Hodge's forces had reduced the last Ger. strongpoints manned by S.S. troops. Pop. 700,600.

Leiria: 1. Dist. of Estremadura prov., Portugal, with the Atlantic to the W. The dist. slopes to the sea from a range of hills which runs from N. to S. in the centre of the dist. Cap. L. Area 1317 sq. m. Pop. 353,600. 2. Cap. of the above dist. on the R. Liz, 76 m. N. of Lisbon. There is a twelfth-century ruined castle with an early Gothic church; the sixteenth-

century cathedral was modernised in the eighteenth century. There are manufs. of iron and glass. Pop. 5900.

Leisnig, tn. and summer resort in Saxony, Germany, 28 m. E.S.E. of Leipzig. Its manufs. include textiles, shoes, and machinery. Pop. 8100.

Leiston, or **Leiston cum Sizewell**, par. and vil. in Suffolk, England, 21 m. S.S.W. of Lowestoft. There are iron and agric. implement works. It contains ruins of a twelfth-century abbey. Pop. 4100.

Leitch, Archibald (1878-1931), Eng. physician and bacteriologist, educated at Rothesay Academy and Glasgow Univ. His earliest work in London was in the cancer research laboratories of the Middlesex Hospital, and it is for his work in cancer research that he will be remembered. In the First World War he was in charge of a mobile bacteriological laboratory; in 1920 he was made director of the research dept. at the Cancer Hospital, and in 1927 he was appointed to the chair of experimental pathology in London Univ. tenable at the hospital. Perhaps his best work was in the study of mule splinters, cancer and the cancers induced by tar. He evolved a new code of knowledge on cancer-producing substances which led him to take the view that cancer is not caused by any one agent, but by many.

Leith, port of Edinburgh, Scotland. It is situated on the S. shore of the firth of Forth in the co. of Midlothian, and its S. extremity adjoins the N. border of the metropolis, with which it has been incorporated since 1920. It has much traffic with the ports of Antwerp, Copenhagen, and Christiansand, etc. The harbour, dock, and warehouse accommodation is excellent. Shipbuilding, distilling, engineering, soap-boiling, and sugar-refining are the chief industries. Pop. 82,000.

Leith Hill, highest point in S.E. England, 1 m. from Goldharbour, near Dorking, Surrey. Height 965 ft. From the top of the tower on the summit thirteen cos. can be seen.

Leit-motif (Ger., leading motive) musical term used to describe a distinctive passage or phrase forming the prin. theme of a composition, or symbolising persons or ideas. It was first popularised by Wagner for the basic material of his musical dramas.

Leitrim, maritime co. of Eire, in the prov. of Connaught, bounded N.W. by Donegal Bay. The surface of the co. varies, the N. being mountainous, the S. more or less level; the scenery is extremely beautiful. In the N. are the Drinkmore Hills, and E. of Lough Allen is Slieve Aurlin (1922 ft.), the highest point of the co. The chief rivs. are the Shannon, the Bonnet, the Drones, and the Duff. There are numerous loughs, of which Lough Allen (8900 ac.) is the largest, the trout fishing being very good. A small quantity of coal is found, and iron and lead are abundant in the mountainous parts, but the co. is not very productive; the soil is moist and heavy, and the grain crops are poor. Potatoes are grown and some cattle and sheep are reared. Linen and woollens of a rough kind are manufactured,

and there are some potteries. L. is divided into five baronies, but the only tns. of importance are Carrick-on-Shannon and Manor Hamilton. The tn. of L. is a few m. N. of Carrick-on-Shannon. Four members are elected to the Dail. Area 619 sq. m. Pop. 44,500.

Leix, or **Laoighis** (Queen's County), co. in the prov. of Leinster, Eire, formerly called Queen's Co. and lying N. of Offaly (once King's Co.). Except in the N.W., where the Slieve Bloom Mts. lie, the surface is flat; in the centre there is some bog. The Barrow and the Nore are the chief rivs. L. includes a part of the Leinster coalfield, and limestone and clay ironstone are worked. Agriculture and dairy farming are carried on, and there are some small factories for cotton and woollen piece goods. L. was made a shire in 1556 and named after Queen Mary I. The co. tn. is Maryborough (Laoighise). Other tns. are Portllington and Abbeyfeix. Area 661 sq. m. Pop. 49,600.

Lekeu, Guillaume (1870-94), Belgian musical composer, b. at Heusy, Verriers. He completed his musical education under G. Vallin, and became a pupil of César Franck. On the latter's death L. studied under d'Indy and gained second prize in the Prix de Rome competition. L. was regarded as the leading representative of the Belgian branch of the Fr. school, and, had he lived, would probably have become a greater master than Franck, and one of the greatest masters of the transition from the nineteenth to the twentieth century. His composition is said to resemble Beethoven's in feeling and spontaneity, and his themes are so striking that once heard they are not easily forgotten. Works: *Orchestral*, *Fantaisie sur deux airs populaires angevins*; *Symphonic studies on Hamlet*; *Chant de triomphale delirance*; *lyrical comedy*, *Barberine* (incomplete).

Leki, see **LESQHIANS**.

Leland, Charles Godfrey (1824-1903), Amer. author, b. at Philadelphia. He was admitted to the Bar in Philadelphia (1851), but soon devoted all his time to literary work of an editorial and journalistic nature. Gypsy language and hist. was one of his special studies, and he also obtained a reputation as a Ger. scholar. In 1861 he estab. the *Continental Magazine* in Boston. L.'s best known work is *Hans Breitmann's Ballads* (1914), recounting the numerous diverting adventures of their hero, told in the patois termed Pennsylvania Dutch. He is also the author of *Sunshine in Thought*; *English Gypsies and their Language*; *English Gypsy Songs*; *Autobiographical Memoirs*, etc. See life by E. K. Lennell, 1905.

Leland, John (c. 1506-52), Eng. antiquary, b. in London, was educated at St. Paul's School, Christ's College, Cambridge, and All Souls' College, Oxford. Taking holy orders, he became chaplain and librarian to Henry VIII. in 1533, and also received the commission of king's antiquary, with power to search for records, MSS., and documents of antiquity in all the religious houses of England. In 1536 he was made canon and a rebend of King's

College, Oxford, and a prebend of Salla-bury. Most of L.'s work was in MS. at the time of his death, the bulk being deposited by Burton in the Bodleian at Oxford. His most important works are the *Itinerary*, a record of antiquarian travels in England and Wales (1710-12); the *Commentarii de Scriptoribus Britannicis* (1709); and *De Rebus Britannicis Collectanea* (1774). See lives by E. Burton, 1549, and W. Huddesford, 1772; also J. Bale, *Catalogues*, 1557, and L. Smith, *The Itinerary*, 1907.

Leleges, anot. race, often mentioned, with the Pelasgians, as the most ant. inhab. of Greece. Piracy is said to have been their chief occupation. They are represented as the ancestors of the Teleboans and the Taphians, who were notorious for their piracies. The L. are described in the *Iliad* as a tribe in S.W. Troas, and as allies of the Trojans.

Lelewel, Joachim (1786-1861), Polish historian, b. at Warsaw. He became lecturer in hist. at Vilna (1814). He retained the chair till 1824, when he was dismissed on suspicion of having taken part in secret revolutionary proceedings. In 1829 he became a prominent leader of the Polish revolution and on the failure of the uprising fled to France. His writings are by no means confined to Polish hist., though his chief work is the series of books on that subject collected under the title of *Poland, her History and Affairs Surveyed*, pub. in 20 vols. (1853-76). Another important pub. was *La Géographie du moyen âge* (1850-52). See monographs by S. P. Koczowski, 1927, and A. Śliwiński, 1932.

Lely, Sir Peter, (1618-80), Dutch painter, b. probably in Holland of Dutch parentage, studied in Haarlem under F. P. de Grobber. When William of Orange came to England in 1641 L. was in his train. L. painted many portraits of William and his bride Mary, which were much admired in England, and he was soon appointed one of the court painters. Perhaps the temporary absence of Van Dyck tempted L. to try his fortune in this country, and, with the favour bestowed upon him by the court, and his general popularity, he soon estab. a large practice.

When L. arrived in England he immediately dropped the Dutch style of painting for that of Van Dyck. When the monarchy was overthrown, and during the period of Puritanism that followed, L. altered his style to one of 'dour severity'; but it was during the Restoration that L.'s full powers were revealed. After the period of restriction a burst of exuberance followed, in which L. excelled, and he dominated the seventeenth-century group of Stuart portrait painters. The symphonic rhythm and subtle colour which prevailed throughout all his paintings set him apart from his many imitators. During the Restoration period L. painted his best works, namely, the two great series, the 'Flagmen' and the 'Windor Beauties'. In the latter L. was successful in bringing out the sensual attraction of his sitters. He was buried in the Covent Garden church of St. Paul

and was succeeded at court by Sir Godfrey Kneller. See C. Baher, *Lely and the Stuart Portrait Painters*.

Lemaître, François Elle Jules (1853-1914), Fr. poet and dramatist, b. at Veneecy, Loiret. From 1875 to 1879 he was prof. of rhetoric at the lycée of Havre, and from 1879 to 1881 prof. at the Ecole des Lettres, Algiers. He first came to the notice of the public in 1880 with a small vol. of verse, entitled *Les Médailles*, followed, in 1882, by *La Comédie après Molière*, and in 1883 by *Petites orientales*. In 1884 he held a professorship at Grenoble, which, however, he soon abandoned, and devoted himself exclusively to literary work. In 1895 he was elected a member of the Fr. Academy. Besides the works already mentioned he pub. *Les Rois Sévères* (1886); *Les Contemporains* (1887); *Impressions de théâtre*, chiefly literary essays (1888-1920); *Myrrha* (1894); *Contes en marge des vieux livres*, fiction (1905, 1907); and the plays *Les Rois* (1893); *Revolte* (1895); *Le Pardon* (1895); *L'Amie* (1898); *La Massière* (1905); *Bertrade* (1906); and *La Vieillesse d'Hélène* (1914). See lives by H. Baidcaux, 1920, and H. Moïce, 1924; also L. Grimm, *Lemaître als Kritiker des französischen Theater*, 1927.

GENERAL LEMAN

Leman, Gerart Mathieu Joseph Georges (1851-1920), Belgian general; was, before the First World War, director of studies at the military school at Brussels, with considerable repute as a mathematician. He became general in 1912, and attained celebrity by his defence of Liège against the Ger. invader, Aug. 1914. On the 14th he was overcome by fumes of exploding shells at Fort Lonclun, and taken prisoner. He was created a count.

Le Mans, see MANS, LE.

Lemberg, see LVOV.

Lemercier, Jacques (c. 1585-1660), Fr. architect and sculptor, b. at Pontoise. He went to Rome in 1607, remaining there

till 1620, when he returned to France and was patronised by Richelieu, becoming architect to Louis XIII., and being put in charge of the Louvre and the Tuileries. In 1629 he built the church of the Sorbonne and part of the Palais Richelieu, and then succeeded Mansard as director of the works of the Val-de-Grâce. In 1653 he built the church of Saint-Roch in Paris, and later the church of Reuil and Bagnollet. See L. Batiffol, *Le Louvre*, 1930.

Lemery, Nicolas (1615-1715), Fr. chemist, b. at Rouen, was contemporary with Boyle. He is remembered as a skillful experimenter who, breaking with traditional alchemy, adhered closely to observed experimental fact. He became physician to Louis XIV. His *Cours de chimie*, a standard work for many years, was pub. in 1667.

Lemming, small rodent, belonging, like the short-tailed kang, field mouse and the water-rat, to the sub-family voles (*Arvicolinae*), which is part of the family Muridae, in the order Rodentia. Its zoological name is *Myodes lemmus* (in the continental form, *Citellulus lemmings*). It has brownish-yellow fur, a short tail, about partially concealed ears, and a very short tail. In length it is about 5 in., and it has a blunted muzzle, black beady eyes, and dark brown or black spots on its back. It is abundant in the plateaus above the pine belt in the mts. of Norway and Sweden. They feed on grasses, lichens, and shoots of dwarf birch, and are never carnivorous. Their nests, which are built of straw and lined with hair, are hidden in the grass or under stones, and are inhabited by five young at a time; they breed at least twice in a year. About every three years, after they have multiplied their numbers to a great extent, armies of these restless little animals march seawards, causing great destruction in their path, and drawing after them a host of eagles, wolves, foxes, and other predatory beasts. During these extraordinary migrations, which last from one to three years according to the distance to be traversed, they only travel by night. Thousands die by the way, and certain death awaits those which on reaching the sea, plunge in and swimming onwards in the same direction, perish beneath the waves.

Lemniscate (Lat. *lemniscatus*, ribboned), curve invented by Jakob Bernoulli, occurring in many mathematical problems. It may be defined as the locus moving so that the product of its distances from two fixed points is constant, and equal to the square of half the distance between those fixed points. See H. Brocard, *Notes de bibliographie des courbes géométriques*, 1897-99.

Lemnos, or **Limnos** (modern, Limni), is. of the Grecian archipelago, midway between Mt. Athos and the coast of Asia Minor. It is of irregular form and hilly, and presents volcanic formations. It produces grain, oil, wine, fruits, and tobacco, and in former times the celebrated Lemnian earth was exported. It was at one time a possession of Athens. The chief port and town is Kastro on the W.

coast. Rich in classical associations, L. was celebrated as the habitat of the Thracian Sinties. Gk. mythology has it that when the Argonauts landed at L., they found it inhabited only by women, who had murdered their husbands. By the Lemnian women the Argonauts became the fathers of the Minyae, who were ultimately expelled by the Pelasgians. Darius conquered the is., but Miltiades delivered it from the Persians and made it subject to Athens. In 1657 it was taken by the Turks. The armistice with the allies after the First World War was signed by the Turks at Andros on Oct. 30, 1919. Area 180 sq. m. Pop. 21,000.

Le Moine, Sir James Macpherson (1825-1902), Canadian author, b. at Quebec, was knighted in 1897 for his literary work. Among his chief pub. are *Picturesque Quebec* (1828); *L'Ornithologie du Canada* (1862); *Les Pêcheries du Canada* (1862); *Quebec Past and Present* (1876); *Canadian Heronies* (1887); *Legends of St. Lawrence* (1898); and *The Annals of the Port of Quebec* (1901).

Lemon, Mark (1809-70), Brit. author, wrote novels, fables, and melodramas, and was a prolific contributor to many periodicals. He ed. the *Family Herald* and *Once a Week*, but is best known as one of the founders of *Punch*, over the destinies of which he presided from its birth in 1841 until his death. As editor of *Punch* he was the right man in the right place, and he surrounded himself with such valuable supporters as Thackeray, Jerrold, Leech, Keene, and Tenniel. He was an intimate friend of Dickens for many years.

Lemon, valuable fruit produced by *Citrus limonum*, a sub-tropical tree or shrub, and its many varieties. L. culture is the main industry in Sicily, but in many other dists. with suitable climates, including California and Rhodesia, the fruit is grown on a large scale. Like other citrus plants the L. grows well on greenhouse walls, and the fruit which is allowed to ripen on the tree is greatly superior to imported fruit gathered before the flavour could mature. The L. is distinguished from the citron by its thin rind, and is longer and less knobbed at the tip. The lime (*q. v.*) is more globular.

Lemonade, beverage obtained by extracting the juice of fresh lemons, mixing with water, and sweetening. It quickly allays thirst, and is useful in febrile and inflammatory complaints, especially when acid. Aerated water flavoured with lime juice, tartaric acid, or essence of lemons is also called L.

Lemonnier, Camille (1845-1913), Belgian art critic and novelist, b. in Brussels. His first book, *Salon de Bruxelles* (1863), was a vol. of art criticism. The 'realistic' tendency of his studies of peasant life more than once involved him in trouble with the authorities. He was three times prosecuted on the same grounds, being once fined and twice acquitted. His other works include *Nos Flamands* (1869); *Salon de Paris* (1870); *Un Coin du village* (1879); *Un Mâle* (1881); *La Belgique* (1888); *Théâtre* (1899); *L'Amant*

Passionnée (1905), *La Maison qui dort* (1909), and *I déte* (1912).

Lemon Sole, or **Smeat Dab**, is the popular name of *Pleuronectes microcephalus*, a species of flat fish belonging to the teleostean family Pleuronectidae. It is found from the bay of Biscay to the N. coasts of Europe and is widely consumed its flesh however, being inferior in flavour and firmness to that of *Solea vulgaris*, the common sole, a member of the same family. The L. S. has its head twisted at a right angle, so that both eyes lie on the right side, the dorsal fin commencing above the eye. Its skin is smooth and of a brownish-yellow colour, with light and dark spots.

Le Moyné, Charles, Sieur de Longueuil (1626-83) Canadian explorer b in Normandy, first served in the Fr. Army, and then emigrated to Canada where he became interested in colonisation. He lived for a time among the Hurons and obtained from them a concession to rebuild the fort at Niagara, which work he was engaged on when he d. Of his sons few were well known pioneers. His son Charles (1656-1729) was at the defence of Quebec in 1690. He was made a baron and governor of Montreal, 1700, and commandant general of Canada 1711.

Lemoyné, François (1658-1737) Fr. painter b at Paris, studied under Galloche and in 1711 won the Prix de Rome with his picture, 'Ruth and Boaz'. In 1718 he became an academicien. His title to fame rests chiefly on the decoration of the vault of the Salon d'Hercule at Versailles 64 ft in length and containing 142 pictures of great merit.

Lemprière, John (c. 1765-1824) Eng. classical scholar b in Jersey (Channel Is.). He took orders and became headmaster of schools in Abingdon and Exeter and later held two livings in Devonshire. He is best known as the author of the classical dictionary, *Bibliotheca Classica* (first pub. in 1755) founded on Sabinus's *Dictionnaire des auteurs classiques* and he also wrote a *Dictionary of Universal Biography* (1808).

Lemur, name applied to members of the order Primates, and so called originally because of their nocturnal habits and rather ghostly appearance at night. They are divided into four sub-families and of these we have representatives in the black L. the dwarf L. grey slow loris, and the slender loris. The distinguishing characteristics of the typical L. are the thick woolly fur, dog-like snout and nostrils and the structure and number of the teeth. The true Ls (i.e. black L.) are not nocturnal. Ls are found in Madagascar and W. Africa, India, Malay, and Indo-China. They all inhabit trees, and their diet consists of fruit, birds and their eggs, small reptiles and insects.

Lemur, or Ghost, figures in Rom. superstition. The 'lemures' were evil spirits who wandered about in search of mischief; they were thus distinguished from the 'manes,' or 'spirits of the dead' by their wicked intent. The Romans sought to appease them during the festival of the Lemuria, which was held annually on

May 9, 11, and 13. The name so they said, was a corruption of Lemuria which referred to Remus, Romulus's brother, being so called because the purpose of its celebration was the satisfaction of his shade. During the festival no man might marry, and all shrines and temples were closed. Ovid describes in his *Fasts* the curious rite which the patrifamilias performed. Rising at midnight he traversed his house with bare feet and washed hands and nine times spat a black bean from his mouth and with backward glance cried 'Thus I redeem me and mine.' The belief was that the evil 'lemures' either picked up the beans or else entered into them. Then the father washed again, beat kettles and clanged his brazen vessels and nine times repeated the courteous request 'Manes exite patrum' (Shades of our fathers depart). It was necessary to exorcise these ghosts as they alarmed good men, and haunted those of evil conscience. Some have held that there were elements of ancestor worship in this rite.

Lena, formerly **Pola de Lena**, in and com. in the prov. of Oviedo, Spain, 15 m S. of Oviedo. Pop. 40,000.

Lena, largest riv. in Siberia and one of the prim. rivs. of Asia. It rises in the Bural Mts. near the W. shore of Lake Baikal and enters the Arctic Ocean by many mouths. Its total course is over 2700 m. the whole being in Russian dominions. Its chief tribs. are the Vitim, Olekhma, Aldan and Vilyu. Between the upper L. and the source of the Aldan R. is mt. and plateau country rising from 1200 to 4000 ft. and the highland is on each side of the upper L. at its 1000 to 3000 ft. The L. basin is divided from the Amur basin by the Stanovoi geologic system or ranges of high mts. (9000 ft.) originally formed in the Caledonian period. The L. like the Yana and Kama flows through a region of perpetually frozen sub-soil and long hard winters—the temp. in Jan. averages -20 in the L. region. Hence navigation is very short and at times the riv. is impeded by ice floes throughout the summer though normally it is ice free for four months at the mouth and delta and for over five months in the S.

Although the L. is over 2700 m. in length and navigable as far as Khatanga it is improbable that it can ever rival the importance of the Yenisei as a commercial waterway. Its total length of navigable waterways is however 7110 m. of which nearly 5000 m. are utilized by steamers. The L. basin is the most important centre of production of gold and platinum in Russia. The Vitim, Olekhma, and Aldan flow into the L. from the great arc of mts., the Stanovoi and Dzhug Dzhug ranges, which rise to over 9000 ft. and form the lofty physical barrier between the plateau of Yakutia and the Pacific coast to the E. and the Amur basin to the S. Only the lower parts of these tribs. are navigable. The Vitim, for example, is impeded by falls some 340 m. above its confluence with the L. In its lower course the L. receives practically no tribs. The valley of the lower L. is broad and of low elevation. Near the mouth the L. flows through a

region which in winter presents the aspect of a grim frozen waste, and in summer a labyrinth of rock and flood-lakes. There is a very large delta, the numerous streams of which are impeded by great numbers of shoals and mud-banks. The upper valley of the L. is so narrow that agriculture is restricted to relatively small areas and trapping and lumbering are the chief occupations. The valley is, however, of considerable importance as a highway between Irkutsk on the Trans-Siberian Railway and Yakutsk. Verkholeusk, the administrative centre for the upper L., is a settlement of some importance. Other centres or trading stations include Kachug, 150 m. N. of Irkutsk, with a raft-borne cattle trade; Zhigalovo, with a shipbuilding and repairing yard; Kirensk, a comparatively large settlement also engaged in wood-working and ship-repairing; and Vitim, at the confluence of the L. and the Vitim. The plateaus and valleys of the Vitim-Olekma-Aldan region, together with the L. valley to the N. of the plateaus, comprise the most valuable gold-producing region of Russia. The chief mining vils. or settlements are Nizhnyy Ulen, and Nodzhinsk, and these are also engaged in the fur trade. Tornot and Aldan are important settlements in the Aldan gold-producing region. Some of these vils. or settlements are relatively large towns, containing new two-storied brick-built houses, office buildings, stores, warehouses, and workshops.

Le Nain, Antoine, Louis, and Matthieu, see **NAIN, L.**

Lenard, Philipp (1862-1947). Ger. physicist, *b.* at Pozsony in Hungary, educated at Budapest, Vienna, Berlin, and Heidelberg; and prof. at Heidelberg 1896-98, Kiel, 1898-1907, and Heidelberg again, 1907-31. His investigation of the cathode rays showed that the electrons of which they were composed could pass right through atoms, and hence that much of the space within atoms was empty. For this work he received a Nobel prize in 1905. He demonstrated that in the photo-electric effect electrons are released by the action of light, carried out fundamental work on the phosphorescence, and made the first measurements of ionization potentials. Of a jealous and unfriendly disposition, he became a staunch supporter of the Nazi regime, an anti-Semite, and a bitter critic of Einstein.

Lenau, Nikolaus (1802-50), pen-name of Nikolaus Niemsch von Strehlenau, Austrian poet, *b.* at Csatad, Hungary. His first pub. poems appeared in 1827, and in 1832 he pub. a vol. of poems dedicated to the Swabian poet, Gustav Schwab. Besides his *Schieflied*, and short lyric effusions, L. wrote *Faust* (1836); *Saronarola* (1837); and *Die Albigenser* (1842). His collected works were pub. by A. Grim in 1866. See lives by A. X. Schurz, 1863, 1913 (enlarged by E. Castle); L. Heynaud, 1904; V. Terrante, 1934 (with bibliography); and M. Schaefferberg, 1935.

Lenbach, Franz (1836-1904), chief Ger. portrait painter of the nineteenth century, *b.* at Schorbenhausen, Upper Bavaria.

He became a pupil of Piloty, whom he accompanied to Italy, where he studied the old masters. On his return to Munich he soon recognised that his chief strength lay in portraiture, and at Rome, where he spent many of his winters, he soon became the centre of a brilliant artistic circle. His best known portraits are those of Bismarck, Moltke, Gladstone, Wagner, Strauss, and Liszt. See monograph by A. Rosenberg (5th ed.), 1911.

Lencas, see **CHONTALS.**

Lenclos, Anne, or Ninon de (1616-1706), Parisian courtesan, *b.* in Paris, famed equally for her beauty and intellect. She had a succession of lovers, including Saint-Evremond, Gaspard de Coligny, Rochefoucauld, and Condé, but in spite of these liaisons was greatly admired for her wit and intellectual culture, and soon became the leader of society in Paris and the friend of Mme de Maintenon, Mme de la Fayette, and Voltaire. See Helen K. Hayes, *The Real Ninon de Lenclos*, 1905; Mary C. Rowell, *Ninon de Lenclos and her Century*, 1910; and C. Austin, *The Immortal Ninon*, 1929.

Lenczyca, or Lechysa, tn. in the prov. of Kalisz, Poland, situated 80 m. W.S.W. of Warsaw. Pop. 10,000.

Lendinara, tn. of the prov. of Rovigo, Venetia, Italy. Pop. 16,600.

Lend-Lease. The Lend-Lease Act, 1941, which constituted an innovation of supreme importance in the hist. of economic policy, was passed by the U.S. Congress in March 1941 and provided that the President might authorise the manuf. or procurement of 'any defence article' for the government of any country whose defence the President deemed vital to the defence of the United States; and that he might permit competent authorities to 'sell, transfer title to, exchange, lease, lend, or otherwise dispose of to any such government any defence article,' etc. 'Defence article' is defined as including not only weapons, munitions, and ships, but 'any agricultural, industrial, or other commodity or article for defence.' Under this Act not only the Brit. Commonwealth, but all the allied nations, and also fighting France, the S. Amer. neutrals, Turkey, Egypt, Iraq, and Persia were declared eligible for L.-L. This was, however, a perfectly constitutional development, for the Act depended on the constitutional authority of Congress 'to provide for the common defence and welfare of the United States,' as devised in the historic constituent assembly by Alexander Hamilton. Master L.-L. agreements were negotiated with numerous countries. Reciprocal L.-L. agreements were also signed with a number of countries, including Great Britain, providing that each country receiving L.-L. aid from the U.S.A. should furnish in return such goods and services as it could supply and as the U.S. Gov. required for its own war effort, without any consideration being given to the maintenance of a balance between the values of goods and services received and given. The office of L.-L. Administration was estab. in Oct. 1941, to list and arrange the procurement of

supplies under the Act. The functions of this office were to ascertain the eligibility of applications according to the Act and in the light of current policy to ascertain whether the applications were compatible with the war production programme of the allied nations, and to forward approved applications to the appropriate agency. L. L. supplies were not subject to export licence and were available only to governments and not to private individuals. The office was therefore in constant contact with foreign governments and had its own missions or representatives in several of the countries concerned. Thus the Harriman mission in London represented the office and the War Shipping Administration. The Maxwell mission in Egypt and the Wheeler mission in the Persian Gulf in addition to their purely military functions, expedited and supervised L. L. supplies. Other missions were sent to Australia, India and S. Africa while special representatives were sent to the Middle East supply centre and to Persia.

United Kingdom Lend Lease.—The United Kingdom also made L. L. payments to the other countries of the allied nations. Up to the middle of 1943 the United Kingdom had made such payments to a total of £2,500,000,000 in excess of the sums received from the allied nations. In this reverse operation the following were among the outstanding contributions which the Brit. Commonwealth had made during this critical period of the Second World War.

U. S. receipts, bindings, erected in the United Kingdom for Amer. forces: \$2,000,000; goods and services transferred in United Kingdom: \$2,000,000; shipping service: £12,000,000; total from the United Kingdom: \$216,000,000. From Australia: \$19,000,000; from New Zealand: £12,750,000; from India: £11,220,000; grand total received by the U. S. A.: \$291,975,000. Russ. receipts from United Kingdom: vehicles and trucks: \$93,000,000; guns and ammunition: £16,000,000; aircraft and equipment: £6,000,000; industrial materials and naval supplies: £3,000,000; total: £179,000,000. These estimates cover only a part of the field in which aid was given by the United Kingdom, nor is account taken of manifold services which are not so easily estimated in terms of pounds and dollars and there are other instances of which designedly no definite record was kept.

Figures issued by the Ministry of Production in Sept. 1944 of the Brit. aid for the invasion of France reflect the extent of reverse L. L. to U. S. forces: thus 5000 special trucks were lent to the Amer. forces for the invasion; the military equipment provided for the Amer. forces included 11,000,000 rounds of small arms ammunition in France, where damaged ports had to be repaired; the Amers. were given 2110 pontoon units. Before the invasion started the United Kingdom had become an armed camp for the Amers., and by June 30, 1944, some \$49,181,000 had been spent by the War Office on new buildings for the Amer. forces. This sum

covered the cost of storage and workshops: 174 m. of railway track, 200 m. of roads in camps and depots, accommodation for 750,000 men and hospital space for 100,000 beds. About 40,000 men worked for 25 months to achieve this result and 150,000 tons of stores were used.

L. L. officially terminated on Aug. 21, 1945, by presidential order and negotiations were instituted for the disposal of the \$2,000,000,000 worth of goods in transit and some \$1,500,000,000 worth in stock piles throughout the world. The countries affected by the order included Great Britain, France, Belgium, the Netherlands, Austria, New Zealand, China and India. As at July 1945, the money value of L. L. material totalled nearly \$12,000,000,000 while the money value placed on reverse L. L. (i.e. goods and services supplied to U. S. forces abroad) was estimated at \$5,500,000,000. According to Congress on Aug. 30, President Truman said that to attempt the collection of the \$12,000,000,000 worth sent to the United Nations would threaten their political stability and help sow the seeds of a new world conflagration. Moreover, he recognised the disastrous effects on U. S. trade and hence upon production and employment which would result from adding back the \$12,000,000,000 to the other enormous obligations of the foreign countries concerned.

In the twenty-third report to Congress on L. L. President Truman disclosed that the Brit. Government received 60 per cent. of all L. L. aid to allied countries. The figure for the Brit. Commonwealth was over \$787,000,000. Russia received 25 per cent., i.e. £590,000,000. L. L. aid by the U. S. A. from May 1, 1941, to Sept. 30, 1945, amounted to £126,150,000,000.

Lentant Jacques (1661-1728), English novelist and writer. He was ordained to the Protestant Church in England, but about the year 1684, among his writings, principally on theology, may be mentioned his *Life of the N. P. in France*, which he annotated and published in collaboration with Benbow.

Lenpen, Suzanne (1891-1948). English tennis player. As at Compiegne, instructed by her father, she became champion of England at the age of fourteen. In 1914 won the hard court singles and doubles. On her debut at Wimbledon in 1919 she won the English ladies' doubles championship and also the ladies' doubles with Miss F. G. G. retaining the title until 1925 and retaining it in 1925 for a period of illness. In 1927 she became a professional but retired the following year. She was Olympic champion in 1921.

Length, Measure of see under **WEIGHTS AND MEASURES**.

Lenin (1870-1924), pseudonym adopted by Vladimir Ilyich Ulianov, first president of the Union of Socialist and Soviet States of Russia. He was born at Simbirsk, now Penza, S. of Kazan, on April 10. His father was a native of Astrakhan and an inspector of schools and Ulianov attended the public school at Simbirsk. The circle of his father's home was that of the

middle class urban intelligentsia which ardently cultivated book learning was keenly interested in abstract ideas, but had little time for the arts and was at most indifferent to the Russian national tradition. The early years were spent in an atmosphere of revolutionary protest against social conditions and he was scarcely seventeen years of age when his brother Alexander was executed for complicity in an attempt to assassinate the tsar in 1887. This intensified his revolutionary sentiments though emotion never played a great part in his personal life. He proceeded to Kazan University to study law but was expelled thirty days afterwards for the extreme violence of his utterances on political matters. It must be remembered that as the brother of an executed rebel he was under prejudiced observation. During his term of banishment he studied the agrarian question and came under the influence of Karl Marx's *Das Kapital*. The horrors of the famine of 1891 served to inflame his passion against existing inequalities of property and he became convinced that Marxism was the only way of salvation for the Russian people. He wrote *The New Economic Movement Among the Peasantry* in 1892 while at St. Petersburg University. It was not published though it achieved the significance of a place in the Russian secret Police archives. His law studies and a natural bent for analysis led him to avoid the idealism often associated with visionaries; he was in all things a realist.

At St. Petersburg he formed the Militant Union for the liberation of the Working Classes and organised strikes among factory work which were successful except in proving the existence of the will to strike. In 1897 he was sentenced to hard-labour to Siberia and in 1900 established quarters at Munich, whence he issued numerous pamphlets. In 1901 he was in Switzerland with other political refugees and there joined the staff of the review *Iskra* (Spark) becoming one of the leaders in the revolutionary activities of the refugees who were banded together under the name of the Russian Social Democratic party. This party until the revolution of 1917 was styled the Old (or United) Russian Social Democratic party, but Lenin soon split it into conflicting sections. At the second congress of the party held in London in 1903 a bitter discussion arose over the question of tactics, and ended in a vote which gave a majority (*bolshevists*) for the view advocated by Lenin and the supporters of this view came to be known as 'Bolsheviks' (see BOL-SHEVISM) and those of the minority (*menchevists*) view as 'Mencheviki'.

He returned to St. Petersburg after the failure of the 1905 revolution and formed the Workers' Soviet, his chief lieutenant being Leo Trotsky (q.v.). An abortive attempt at revolution in Moscow caused him to flee to Geneva where he produced the *Proletarian* and came into association with Maxim Gorki. By 1913 he had by pamphlet and news sheet instilled his own views into a growing mass

of workers, and the death of Stolypin gave him an opportunity to issue his paper *Pravda* in St. Petersburg despite repeated suppressions. Disruption within his party at this time caused a division into a Bolshevik (extreme) section and Menshevik (moderate) party. With Bolsheviks he went ruthlessly forward. While in exile in Switzerland he fore-saw the coming collapse in Russia and with a nucleus of workers pursued his plans to meet it. He recognised the First World War only as an opportunity to his schemes and wrote *Imperialism as the Last Stage of Capitalism* (1917).

LENIN IN 1915

When the Russian monarchs fell workers' Soviets and peasants came flocking into the Duma the Russian Government and the magnitude of the problem facing the new government pointed to Lenin as the only leader great enough for such formidable tasks. He was not allowed to return through Germany, however, until April 16 1917. A struggle began with the moderate socialists known as the 'Left' followed the Bolshevik capture of the Moscow and Petrograd Soviets and the routs in July and August. Lenin then reappeared from Finland and became head of a 'council of peoples' commissars. He took up his residence in the palace of the tsar's favourite ballerina but continued without change his ascetic mode of living utilising the building more for his staff than for any indulgence of the amenities. His first decree abolished all private ownership of land and property. Crown and Church property was transferred to the control of the Workers' Soviets. Lenin concluded peace with Germany believing that revolution would quickly follow in that country. Indeed he firmly believed that world revolution was imminent. He was not popular, however, even with his own followers, subordinating everything ruthlessly to state needs in the conviction that the desperate situation could be saved only by discipline and force. During a meeting at

the Kremlin to which he had moved he was seriously wounded by a would-be assassin but recovered to be faced by civil war within the country and a blockade by Britain without as well as threats of invasion by counter-revolutionaries under Kolchak in Siberia and Denikin and Wrangel in the N and S. The tide however turned at last with the enormous help he received from Trotsky his army chief. The counter-revolution was crushed by 1921 and pure Communism was modified by the new economic policy (N.E.P.). For the sake of production private enterprise and profit were allowed on a small scale. Trade treaties were signed with Britain and other capitalist countries.

After four years of struggling against difficulties which would have overwhelmed most men, the terrific strain he had imposed upon his physical resources had its inevitable result and he was attacked by a form of brain disease. He was able however to hand to his successor before he died a unity of purpose on all its frontiers and showing undeniable signs of considerable economic development. Shortly after issuing his famous economic theory he died on Jan 21. It was a striking instance of a man with a fixed goal—the goal of the universal social revolution and towards that chosen goal he marched unflinchingly undisturbed by weariness or intellectual doubt never halting at crime and never moved by the slightest compunction. In all things he was guided by Marxist theory adapted to the needs of modern Russia. Marxist-Leninism as interpreted by Stalin remains the doctrinal foundation for Communism. L's works comprise 10 vols. of which extracts may be found in *Is this Lenin* (2 vols. 1941). A collection of his writings *Избранные произведения* was published in 1930. *Stalin on Lenin's Life and Work* 1924, I. Trotsky *Lenin 1920-1924*, I. Trotsky *Lenin 1925-1929*, I. Trotsky *Lenin 1930-1933*, I. Trotsky *Lenin 1933-1934*, I. Trotsky *Lenin 1934-1935*, I. Trotsky *Lenin 1935-1936*, I. Trotsky *Lenin 1936-1937*, I. Trotsky *Lenin 1937-1938*, I. activities of the Swedes made it necessary that some strong centre should be created in the extreme W., and this Peter the Great decided to do. Unfavourable as was the site that he chose, it was the only one possible. There had already been a small fort there, some 5 m. from the mouth of the Neva, built by the Swedes, which had become an important commercial place during the connection of Novgorod with the Hanseatic League. This fort and tn. had been almost entirely destroyed by fire under Alexis Michailovich, and it was but an insignificant vil. when Peter took possession of it. It provided him, however, not only with a strong point of vantage against the Swedes, but also with a place through which intercourse could be established with civilised Europe, an object which he had much at heart. The difficulties he had to overcome were immense, but by indomitable perseverance and a reckless disregard of human life they were all overcome. Out of dismal swamps and bleak morasses arose a city of which it was said a century ago, 'The united magnificence of all the cities of Europe could but equal St. Petersburg.' L. is rich in fine buildings and palaces, many of which, however, have fallen into disrepair. The Imperial Winter Palace was rebuilt in 1839 after having been destroyed by fire two years previously, and was damaged slightly during the 1917 revolution. Considerable damage was done by Ger. bomber planes, especially in 1941 (see Leningrad, Siege). There are a number of museums and art galleries, which have many comparatively recent additions, and numerous splendid churches which are permitted to remain open, although the Orthodox Church has been disestablished by the Bolsheviks. Many of these buildings, however, were either destroyed or severely damaged in the siege of 1941-43.

The public structures, quays, piers, ramparts, etc., are all composed of masses of solid granite. The Neva, as it passes through the city, has a breadth of from 500 to 700 yds. It forms one of the prin. beauties of the city, for its waters are clear as crystal and very deep, so that large ships can moor at the quays which line its banks. L. port, at the mouth of the Neva, is now one of the great world ports. Its total length of quays is 21,000 ft., and the port has been re-equipped with ice-breakers that keep it open from April to Nov. A plan for constructing a 7.5-m.-long underground railway was approved before the outbreak of war in 1939.

Unfortunately the low position of the city renders it liable to inundations whenever a strong wind from the sea causes the riv. to rise much above the average height. L. is not only watered by the Neva, but also by a number of its branches which virtually make the city a collection of small is. The Neva runs first towards the N. and then, turning to the W., sends out towards the N. an arm called the Nevka, which again divides into two branches called the Great and Little Nevka. The main riv. also divides into two branches, the Great Neva, which runs S.W., and the

Little Neva, which runs N.W. Thus the gulf of Kronstadt receives the Neva by four great arms. In addition to these streams the city is intersected by a number of canals, so that a large number of bridges are required. The longest of these, the Irvitsky bridge, is some 2000 ft. in length. The prin. part of L. is built on the l. b. of the Neva. In the centre stood, prior to the Bolshevik rule, the Admiralty, the finest and most imposing of what then constituted the crown buildings, surrounded by the beautiful Alexander Garden. From this central point radiated three long boulevards, rendered imposing by their width. Eastwards runs the Nevsky Prospekt, the city's central thoroughfare, while S. and S.E. respectively stretch the Voznesensky Prospekt and the Gorokhovaya Ulitsa. Other famous palaces of old St. Petersburg were the Marble Palace, the Taurida, presented to Prince Potemkin by Catherine II.; the Antichkov Palace, which was the residence of Emperor Nicholas while Grand Duke; the Old Michailov Palace, later used as a school of engineers; and the New Michailov Palace, one of the finest palaces in Europe, built between 1819 and 1825. Close to the Winter Palace is the Hermitage, built by Catherine II., which contained a costly library and one of the most magnificent collections of paintings in the world, besides other treasures. The two most famous public monuments of old St. Petersburg were the Alexander Column, erected in honour of the Emperor Alexander, and the great equestrian statue of Peter the Great, which stands in the Peter Square. The city also had numerous splendid churches, among which were the magnificent church of St. Isaac of Dalmatia, built 1819-53; the Theolokos of Kazan, St. Nicholas, St. Alexander Nevsky, and St. Peter and Paul. The univ. of L. before the Second World War had eleven faculties, including a workers' faculty, and its students numbered nearly 1000, 68 per cent of whom were workers.

Until 1939 L. was one of the main industrial centres of Russia, but the construction of new plant was discouraged under the second five-year plan and L. has declined in importance. The chief industries were those of cotton, woollen, and clothing manufs., iron founding, machinery, paper making, and printing, tobacco, leather, glass, soap, and chemicals. L. was also a great publishing centre. The pop. of L. by the census of 1939 was 3,191,000.

Considering the severity of the siege of 1941-43 L. is still remarkably like the city that began the Oct. revolution of 1917. Within the twelve months after the end of 1941 its centre had been so restored that it was difficult to believe that it had been in the line of battle, though in the suburbs big scars were still to be seen. Among many old landmarks of bygone days which still remained were the fortress of Peter and Paul, the famous Smolny of Lenin's days, the Krasny Zamok on the Fontanka, former palace of Tsar Paul, and other buildings. A city planning committee had by then made plans for the industrial

future of L. Industry is to be located so as to serve the needs of the people. Some 600,000 inhab. d. of starvation in the siege, many were killed in action, and many left the city. It is proposed to allow the pop. to rise very gradually to its old figure, to site enough industries there to provide them with employment, mostly the old engineering industries, and to spread the pop. over double the area of the old city. The new city centre is an imposing building out in the open fields, bearing scars of the struggle with the Gers. New workers' flats are being built round it and here will be the industrial part of the city. The old part of L. radiates from the beautiful Admiralty building. This is to be the administrative centre for N. Russia.

Leningrad, Siege of (1941-43). From Aug. 21, 1941, in the Second World War, L. was closely besieged by the Gers., and for sixteen months overland communications with the rest of Russia were cut. The siege was begun by Gen. von Leeb with an army of 300,000 riflemen, a div. of motorised infantry, 1000 tanks, and 1000 first-line aircraft. For months L. lay under direct threat of capture. Probably 250,000 Gers., Finns, and soldiers of other satellite nations d. in the approaches to the city; while in L. itself the Russian death-roll from gunfire, hunger, and exposure was very high. The problem of the welfare of 4,000,000 inhab. was complicated by the swelling of the pop. with refugees from overrun regions outside, by the loss of main power supplies through the cutting of the connections with the Svir generating plants, and by the coldest winter (1941-42) known for centuries. The active defence policy of its garrison saved L. Its aircraft bombed the Ger. positions and went far out to attack the Luftwaffe's bases in Finland and Estonia. Its ground forces were always attacking the Ger. defence system; snipers stealing through the broken on outlying hills or on skis over the snow and ice took heavy toll. When navigation was free the Baltic fleet harassed the supply routes from the Hanseatic ports to the Ger. force in Finland; and when the fleet was icebound its guns were lent for the suppression of the Ger. siege artillery batteries. Even in the depth of winter, when medical restoratives were needed to enable workers to get to the factories, the output of arms and ammunition from the great armament works never ceased. In Dec. 1941 transport difficulties and Ger. air raids brought L. to the verge of famine; but this was remedied when the great ice highway across Lake Ladoga was built and Douglas planes flew provisions into the city. At the lowest point of its fortunes L. sent thousands of workers to the front, women taking their places at furnaces and lathe under shellfire in the industrial suburbs. A pioneer movement organised an auxiliary army of children who played a notable part in making life possible in the city. Once the

Lake Ladoga road was open and the Russians had advanced in the Lake Ilmen, Volkhov, and Kalinin sectors, the situation at L. improved and when, at the end of April 1942, the winter had passed, 150,000 volunteers set about an immense spring-cleaning of the city until it earned the reputation of being the cleanest place in all Russia. Trams began to run again. Even social life was not forgotten, many instrumentalists being released from the front to enable them to play in the city's orchestra. The city's defences now became formidable and the Ger. Air Force suffered heavily over the approaches, though the suburbs sustained widespread damage from siege guns in the W. and S.W., some of these being suppressed by the Russian advance towards Peterhof. Famous buildings did not suffer very greatly. Pushkin's house on the Moika was wrecked only in the war. The portals of the Hermitage were damaged, as also was Anichkov bridge, whose bronze horses, however, had been removed for safety. La Fontaine's statue of Peter the Great was slightly damaged. When in the autumn of 1942 the city was completing its preparations for launching an attack a large proportion of the pop. was evacuated by the Lake Ladoga route. The piercing of the blockade was at length effected by a combined operation under Col.-Gen. Goryov, the victor of Moshak-k (q.v.) and commander of the L. garrison from early in 1942, and Gen. Meretzkow, aided by men of the fleet fighting on the ice of Lake Ladoga and the guns of warships and coastal batteries. While the issue was still in some doubt the pressure of heavy Russian tanks which had been brought across the Neva by pontoons, and deadly low-flying Stomox's planes, flung the enemy back to the edge of the forest; while on the Volkhov Gen. Meretzkow forced a passage to Lake Ladoga and split the Ger. belt asunder. From the E. yet another Russian force delivered a powerful series of frontal attacks. The junction of the two armies of Goryov and Meretzkow on Jan. 18, 1943, after a seven-day battle, in which the enemy lost 11,000 men in killed and prisoners, established a corridor 10 m. broad and so relieved the city. See L. Ehrenburg, *Russia at War*, 1943; W. I. D. Allen and P. Muratoff, *The Campaigns of 1911-13*, 1944.

Leninsk-Kuznetsky, tn. of the Novosibirsk Region of the R.S.F.S.R., N.W. of Stalinsk, to which there is a branch of the Trans-Siberian railway. Iron ore, coal, gold and precious stones are found in the neighbourhood. Pop. 81,900.

Lennel, see GOLDSTRAEM.

Lennep, Jacob van (1802-68), Dutch poet and novelist, b. at Amsterdam. He took his doctorate in law at the univ. of Leyden in 1824 and started legal practice in Amsterdam in 1829, becoming procurator-general. He was a member of the Dutch Parliament, 1853-56. His first essay in literature was to pub. a trans. of Byron's *Bride of Abydos* in 1826 and of the *Siege of Corinth* in 1831. A greater influence was, however, that of Sir Walter

Scott, and he is now remembered chiefly for his series of historical novels which displayed excellent narrative power. They include *De Plegzoon, een verhaal* (1835, Eng. trans. *The Adopted Son*, New York, 1847); *De Rook van Dekana* (1836, Eng. trans. *The Rose of Dekana, or the Friesian Heiress*, 1817); *Jacobus's Verklacht op het huis te Teylingen* (1839, Eng. trans. *Jacobus's Lament at the House of Teylingen*, 1810); and *Bernardus Huyck* (1810, Eng. trans. *The Count of Talavera*, 1880). Van L.'s dramatic works were pub. in 3 vols. (Amsterdam, 1852, and his poetical works in 11 vols. (Rotterdam, 1859-62. See life by N. Beets, 1906, and M. F. Lemmen, 1909; also J. ten Brink, *Geschiedenis der Noord-Nederlandsche Letteren in de XIXe Eeuw* (No. iii).

Lennox, Charles Henry Gordon-, see RICHMOND AND GORDON, DUKE OF.

Lennox, Charlotte (nee Ramsay) (1720-1804), Brit. writer, b. in New York. She came to London in 1735, and after a brief period on the stage earned her living by writing. Her chief books are *Life of Harriet Stuart* (1751); *The Female Quixote* (1752); and *Shakspeare Illustrated; or The Novels and Histories on which Plays are founded* (1753-54).

Lennox, anc. Scottish ter. comprising the anc. sheriffdom of Dumbarton, and large portions of the shires of Stirling, Perth, and Renfrew. The earldom of L. was first conferred on Alwin, probably a Celt by descent, about 1175. The title passed in 1173 to his descendant, Sir John Stewart, Lord Darnley. Matthew, second earl of this Stewart line, fell on Flodden Field, and Matthew, fourth earl, married Margaret Douglas, daughter and heir of the earl of Angus and Margaret Tudor, sister of Henry VIII.; Matthew's eldest son, Henry, married Mary Queen of Scots. After the murder of Darnley (1571), Matthew worked for the abdication of Mary, and in 1570, his grandson being recognised as James VI. of Scotland, he was appointed regent. On his death (1571) the title passed to James, who conferred it on his uncle, Charles, the younger brother of Darnley, who left an only daughter, Lady Arabella Stewart. In 1580 James conferred the title on his cousin, Esme Stewart, grandson of the third earl, and in the following year Esme was created duke of L. He was succeeded by his son Ludovic, who was created earl of Richmond (1613), and earl of Newcastle, duke of Richmond (1623) in the Eng. peerage. On his dying without male issue (1624) his titles passed to his brother Esme. On the death of the sixth duke, Charles, the L. dukedom devolved upon Charles II., who bestowed it on his illegitimate son, Charles Lennox (by the duchess of Portsmouth), who sold the lands to the marquess of Montrose in 1702. See *Scots Peerage*, vol. x., and W. Fraser, *The Lennox*, 1874.

Lennox Hills, range in Scotland, include the Campsie Fells, Strathblane Hills, and Kilpatrick Hills, and are situated between Dumbarton and Stirling. They rise to 1894 ft. in the peak of Earl's Seat.

Lennoxtown, vil. of Stirlingshire, Scot-

land, 11 m. N.E. of Glasgow by rail. Halls are made and there are calico-printing, alum and bleach works, and coal-mines. Pop. 2000.

Leno, Dan (1861-1904), stage name of George Galvin, Eng. comedian, b. at Somers Town, London. His parents were travelling entertainers, known as Mr. and Mrs. Wilde, and as a child he was trained as an acrobat and dancer. With his brother he won the world championship in clog-dancing at Leeds in 1880, and after appearing in pantomime at the Oxford and Surrey Theatres, he was engaged for Drury Lane by Sir Augustus Harris. In 1900 he was transferred to the Pavilion Music Hall, and in 1901 performed before the king at Sandringham. See J. H. Wood, *Dan Leno*, 1905.

Lenormand, Henri René (b. 1882), Fr. dramatist, b. May 3 in Paris, son of the composer, René L. He was educated at the Lycée Janson-de-Sailly. His first work was *Les Possédés* (1909), performed at the Théâtre des Arts, and the next *Pauvre* (1911), followed by *Les Rates* (Eng. trans. *Failures*, 1923) and *Le Temps est un songe* (Eng. trans. *Time is a Dream*, 1923), both performed at the Théâtre des Arts. His later plays are *La Simonne* (1920); *La Manquer de rêves* (1922, a modern reproduction of *Oedipus Rex*); *L'Homme et ses fantômes* (1924); *Les Trois Chambres* (1931); and *Crepuscule du théâtre* (1935). See H. Daniel-Rops, *Sur le Théâtre de H.-R. Lenormand*, 1926.

Lenormant, François (1837-83), fr. archaeologist, b. in Paris. He won the prize in numismatics at the Académie des Inscriptions with his *Classification des monnaies des Lagides* (1856), and was appointed sub-librarian (1862). After travelling in Greece he accepted the professorship of archaeology at the Bibliothèque Nationale (1874-83). His chief works are *Les Antiquités de la Troade* (1876) and *Les Origines de l'histoire d'après la Bible* (1880-84). From cuneiform inscriptions he deduced the existence of a non-Semitic tongue which was later known as Accadian. Other works: *Manuel d'histoire ancienne des Peuples* (1868-69, 1881); *Lettres assyriologiques* (1871-79); *Les Premières Civilisations* (1871); *Les Sciences occultes en Asie* (1874-75); *La Monnaie dans l'antiquité* (1878-79); and *Monnaies et médailles* (1883).

Le Nôtre, Andre (1613-1700), Fr. landscape gardener. Louis XIV., who heard of his skill, gave him a commission to lay out the gardens of Versailles, the Trianon, the terrace of St. Germain, and the gardens of Fontainebleau, St. Cloud, and Chantilly. He was also the designer of St. James's Park and Kensington Gardens in England, and also of Greenwich Park. In addition to these he visited Rome and laid out the gardens of the Quirinal and Vatican.

Lens, tn. in the dept. of Pas-de-Calais, Franco, 9 m. N.N.E. of Arras. It possesses a rich coal-field, and is also engaged in sugar-refining and other industries. Occupied by the Gers. early in the First World War. its recapture was an aim of

the Allies in the operations known as the battle of Loos (q.v.), Sept. 1914, but it was not taken. Its importance as a railway junction and as a coal-mining centre enhanced its strategic value, and it was the prin. Brit. objective in the battle of Arras (q.v.) in April 1917, but again it did not fall. L. was evacuated by the Gers. Sept. 4, 1918. The tn. suffered considerable damage in the Second World War. Pop. 40,300.

Lens, in optics, a portion of a refracting medium bounded by two curved surfaces, or by one plane surface and one curved surface. Ls. are usually made of glass, their surfaces being usually portions of spheres, and for most practical purposes having a small thickness in proportion to the radius of curvature. They may be divided into two classes, convex or converging L., and concave or diverging L. The former are thicker in the centre than at the edges, and the latter thinnest at the centre. Light is refracted (i.e. changes its direction) when it passes from air to glass, or from glass to air, and Ls. are important because the refraction at their two surfaces can be made to alter the directions of the incident light rays in such a way that whole groups of rays pass onwards towards a single point, or in directions away from a single point. If, for example, rays from a point on a distant object fall on the convex L. of a camera, they are so refracted that all reach one point on the photographic plate or film placed behind the L. and at a suitable distance from it, and they are said to form an *image* of the object point. From each point on the object a group of rays is in this way focused on the plate at an appropriate point, so that the totality of rays passing through the L. produces a picture or image of the object upon the plate. In this case the rays travel to the image, and the image is said to be a *real* one. Similarly the rays from a point on an object fall on the L. of a pair of spectacles, and are refracted in such a way that they pass to the eye as though they had come from a point other than that where they originated; that is, they merely appear to come from an image point, and the image is said to be *virtual*. Whether the image produced by a convex L. is real or virtual depends upon the distance of the object and such characteristics of the L. as the curvature of its faces and the nature of the glass of which it is made; concave Ls. however, produce only virtual images of real objects. The sizes and positions of the images formed by Ls. depend upon the sizes and positions of the objects, and upon various characteristics of the Ls. See A. Cox, *Photographic Optics*, 1943, and B. K. Johnson, *Practical Optics*, 1945.

Lent (O.E. *lencetan*, spring; M.E. *lenten*, *lente*). In the Christian Church, the period of fasting before Easter. In the time of Irenaeus a rigid fast was observed by some Christians for forty hours before Easter morning. In Alexandria, during the third century, Christians fasted throughout Holy Week, and by the fourth century the period had extended to about forty days. In the eighth or ninth century it was determined that the fast should begin on

Ash Wednesday, between which and Easter Sunday are forty days, excluding Sundays, on which fast is not observed. Hence in Rome the Sundays in L. were, and are, called in *Quadragesima*, i.e. within the Forty Days, whence Fr. *Carême*, etc. The fourth Sunday in L. used to be known as 'Mothering Sunday,' for on that day young servant maids were allowed a holiday to visit their mothers, and usually took with them a rich *simnel* cake. The fifth week is called *Passion Week*; the sixth, beginning with Palm Sunday, is *Holy Week*.

Lenthall, William (1591-1662), Eng. politician, b. at Henley-on-Thames, son of an Oxfordshire landowner. Called to the Bar in 1616, he entered the Short Parliament as member for Woodstock in 1640, and in the following year the king made him Speaker, a position he retained until 1653. His behaviour when Charles I. ordered him to disclose the whereabouts of the five members he wanted to arrest is historic. He became master of the Rolls in 1643, and was Speaker again in 1659 when the Rump was recalled. Though favouring the Restoration he was exempted from pardon in 1660 but was unmolested and d. at his residence at Burford.

Lentils, seeds of a small branching plant with pale blue flowers (*Erum lens*). Their shape has given the name to the glass lens. There are numerous varieties and all are of high food value. The plant is hardy in Great Britain, but is rarely cultivated. In all S. parts of Europe, and in Egypt and India, the crop is an important one.

Lentini, tn. in the prov. of Syracuse, Sicily, 1½ m. S.E. of Lake L. Its inhab. are chiefly engaged in the manu. of earthenware. Pop. 17,000.

Lentulus, patrician family of the Cornelia gens, of which the most prominent persons were: (1) P. Cornelius L. Sura, the man of chief note in Catiline's conspiracy. He was successively quaestor, praetor, and consul int. in 70 B.C., was expelled from the senate, with sixty others, for infamous life and manners. It was this, probably, that led him to join Catiline. From his distinguished birth and rank, he calculated on becoming chief of the conspiracy, and in order to gain power and recover his place in the senate he became praetor again in 63 B.C. When Catiline left for Etruria L. was left as leader of the home conspirators, and his irresolution probably saved the city from being burned. L. was deposed from the praetorship, and was strangled in the Capitoline prison. (2) P. Cornelius L. Spinther was successively curule, aedile, praetor, and consul over the period 63-57 B.C. In his consulship he moved for the immediate recall of Cicero, and afterwards received Cilicia as his prov. On the outbreak of the civil war in 49 B.C. he joined the Pompeian party.

Lenz, Jakob Michael Reinhold (1751-1792), Ger. poet, b. at Sesswegen, Livonia, is a typical representative of the *Sturm und Drang* period. His earliest efforts at composition were sacred songs in the

style of Klopstock. After studying theology at Königsberg—his father was a vil. pastor—he migrated to Strasburg, joined the literary coterie of Salzmann (1749-1821), and gained the friendship of Goethe. His passionate lyrics, *Die Liebe auf dem Lande*, were inspired by Friederike Brion, whom Goethe also loved. Insanely overtook him in 1777. His romantic comedies *Der Hofmeister* (1774) and *Die Soldaten* (1776), etc., show a marked deficiency in restraint. See H. Kindermann, *Lenz und die deutsche Romantik*, 1925.

Leo, or **The Lion**, one of the twelve zodiacal constellations or 'signs,' of which it is the fifth, the sun entering it about July 22. It is surrounded by Ursa Major, Leo Minor, Cancer, Hydra, Sextans, Virgo, and Coma Berenices. The constellation can be easily found by drawing a line through the Pole Star, and the third star of the Plough (γ Ursa Majoris). This line intersects ι , at the bright star Deneb (α Leonis). The two brightest objects in the constellation are Regulus (α Leonis) (first magnitude) at the bottom of the well-known 'sickle,' and the blue star Deneb (magnitude 2.2).

Leo, name of thirteen popes.

Leo I. (440-61), styled the *Great*, probably a Rom. by birth, first definitely heard of as a deacon possessing great influence in 429, and while in Gaul on a diplomatic mission he was chosen to succeed Sixtus III. He was foremost in checking the heresies of Manichæism, Priscillianism, and Nestorianism, and in establishing the prime authority of the bishop of Rome and the authority of the law of its apostolic see. He formulated against the Monophysite, Eutyches, the doctrine of the union of the human and divine persons in one Jesus Christ, in a letter, known as the *Tome of St. Leo*, intended for the 'robber' synod of Ephesus but adopted at the council of Chalcedon (451). L. turned back the Huns under Attila (452) and saved the plundering of the auct. basilicas of Rome from the Vandals under Genseric in 455. He was succeeded by Hilarius.

Leo II. (882-83), a Sicilian, succeeded Agatho I. He upheld the rights of the see of Rome against the encroachments of Ravenna. He was succeeded by Benedict II.

Leo III. (795-816), a Rom. by birth, succeeded Adrian I., and sent the keys of St. Peter's tomb to Charlemagne. After a murderous attack in 799 he sought protection from the king of the Franks, who came to Rome in 800. In public synod before Charlemagne L. repudiated on oath the charges against him. On Christmas Day 800 he crowned Charlemagne emperor of the W.

Leo IV. (817-55), a Rom. priest, succeeded Sergius II. He fortified Rome, defeated the Saracens at the mouth of the Tiber, built the Leonine city, which included the Vatican, and crowned Alfred the Great when his father Ethelwulf took him in 853 to Rome as a pilgrim.

Leo V. (903), a Benedictine monk, succeeded Benedict IV., but was deposed by his chaplain, Christopher. The records of

the tenth century are incomplete, and make no mention of his subsequent hist.

Leo VI. became pope in 928 in succession to John X., and is stated by some to have been murdered by the notorious Rom. lady, Marozia, who is also said to have murdered John X. (q.v.).

Leo VII. (937-39), negotiated peace terms between Hugo, king of Italy, and Alberto II., duke of Rome, and son of Marozia. He had the reputation of a zealous ecclesiastic.

Leo VIII., the name of an anti-pope (c. 964).

Leo IX. (1049-51), Alsatian; his name was Count Bruno von Egisheim, and he belonged to a noble family related to the Emperor Conrad. In 1026 he was bishop of Toul and was elected to succeed Damasus II. at Worms, a choice confirmed in Rome, whither he journeyed as a pilgrim with Hildebrand, afterwards Gregory VII. In the synod of 1049 he renewed the rule of celibacy of the clergy which, with his suppression of simony, marked his reforming zeal. He held many synods and travelled much. He was crushingly defeated by the Normans near Civitella in 1053, and was a captive at Benevento. He was succeeded by Victor II.

Leo X. (1513-21) was Giovanni, son of Lorenzo de' Medici, the Magnificent, b. at Florence in 1475. Educated by the first scholars of the new learning, he was made a cardinal when only fourteen, though only fully admitted to the sacred college in 1492. He retired to Florence at the election of Alexander VI. till the expulsion of the Medici from Florence. On the restoration he, as head of the family, governed the state till his election to the papacy on the death of Julius II. The first part of his pontificate was taken up by negotiations with the Emperor Maximilian, Ferdinand of Spain, and Henry VIII. of England, for an alliance against France and Venice, and for restoring peace to Europe for the sake of a crusade against the threatening advance of the Turks. His grants of indulgences helped to arouse the spirit of revolt against the abuses of the Church which culminated in the Reformation; L.'s failure in face of the revolt in Germany and the N. was mainly due to his absorption in pressing forward the temporal claims of the papacy in Italy, and in diplomatic intrigues for these ends, which were subservient to his lifelong policy of increasing the power of his family, the Medici. He d. suddenly after the news of the success of his plans.

Leo XI. (1605), Alessandro de' Medici, only reigned a month, and was succeeded by Paul V.

Leo XII. (1823-29), b. near Spoleto in 1760, was secretary to Pius VI., and was engaged in diplomatic missions in Europe and with Napoleon. Cardinal-priest in 1816, and cardinal-bishop 1820, he was elected pope on the death of Pius VII., being expected to live only a short time. He was a distinct reactionary, suppressing all forms of political movement and societies, and establishing an elaborate

system of spies. He was succeeded by Pius VIII.

Leo XIII. (1878-1903). Gioacchino Pecci, b. at Carpineto in 1810, of a Sienese family, his father having served in the Napoleonic armies. He was educated by the priests at Viterbo and at Rome, entered the Accademia dei Nobili Ecclesiastici in 1832, and was ordained priest in 1837. He was made bishop in 1843, and was engaged in diplomacy in Brussels till 1846, when he was appointed archbishop of Perugia. Here he remained, working assiduously for social and educational reform and the restoration of churches. In 1853 he was made a cardinal by Pius IX. He strenuously opposed the loss of the temporal power and the other effects upon the papacy of the unification of Italy. In 1877 he became Cardinal Cicerone, and was elected pope in 1878 by a large majority of votes, possibly in the expectation of a short papacy in view of his age. He reorganised the curia on strictly economic lines, enforced a stricter theological training in accordance with the doctrines of St. Thomas Aquinas, especially in his encyclical *Aeterni Patris*, threw open the Vatican library and archives to scholars, and encouraged the study of church hist. His encyclical *Rerum Novarum* (1891), dealing with the condition of the industrial classes, was considered to be socialistic in tendency. His commission to inquire into the validity of Anglican orders led to their definite and final condemnation from the Rom. Catholic point of view in 1896. Faced at his entry to the papacy with complete isolation from the European powers, L. worked to establish friendly relations with all except the Crown of Italy, which made him, like Pius IX., a 'prisoner of the Vatican.' His plan to bring the Fr. Catholics to support the republic can hardly be said to have succeeded. He d. a few months after the celebration of his jubilee.

See F. Hayward, *History of the Popes*, 1931.

Leo I., Flavius (c. 400-474), Emperor of Constantinople, b. in Thrace, was crowned by Anatolius on the death of Emperor Marcianus in 457. He adopted stern measures against the Eutychians, and defeated the Huns in Daemia. While on an expedition to recover part of Africa, his fleet was destroyed by the Vandals. Towards the end of his reign he suppressed a rising of Goths, and, on his deathbed, left his crown to his four-year-old grandson, Leo II., who d. after a nominal reign of ten months.

Leo III., the Isaurian (c. 650-710), emperor of the E., b. in the Syrian prov. of Comagene. In 717, refusing to acknowledge the usurper Theodosius III., he was elected emperor by the army, and during the first year of his reign defeated the Saracens, who had laid siege to Constantinople. He passed legislative reforms on religious matters, and by issuing edicts against the image-worshippers gave rise to the great iconoclast controversy. As the papal power persistently opposed him, he seized all the revenue of the Rom.

see he could lay hands on and attempted to transfer S. Italy, Greece, and Macedonia from the lat. patriarchate to that of Constantinople, with the result that the prov. of Ravenna separated from the empire. See E. Gibbon, *Decline and Fall* (ed. by Barry), 1896.

Leo V., Flavius, surnamed the *Armenian*, served as a commander under Nicephorus, but was exiled for treachery in 811. Recalled and made commander of the E. army by Michael I., Byzantine emperor, he went with the latter on an expedition against the Bulgarians. During a battle near Adrianople the army became disaffected, leaving Michael to defeat. L. was then crowned at Constantinople and in the succeeding two years subjected the Bulgarians to two decisive defeats. His persecution of image worshippers, however, alienated his nearest friends, and he was assassinated by the friends of Michael the Stammerer, who was raised to the throne as Michael II.

Leo VI., surnamed Sapiens and Philosopher, succeeded his father Basil I. in 886 as Byzantine emperor. His earliest act was to depose Photius (q.v.), patriarch of Constantinople. Most of his reign was occupied in minor wars against barbarians and conflict with churchmen. The origin of his surname is unknown, and Gibbon suggests that it was given only because he was less ignorant than most of his contemporaries in matters of Church and State and also because his education had been directed by the learned Photius. He wrote a work on military tactics entitled *De Ispandis Ballico* (trans. by Sir John Cooke in 1554 and sev. times since); also a number of *Oracula* in iambics and *On theos* on theological topics.

Leo Africanus (Alhassan Ibn Mohammed Alwarzani), Berber traveller of the fifteenth century. He travelled extensively in N. and Central Africa and Asia Minor, and while returning from Egypt was captured, set free by pirates and taken to Rome, where he was converted to Christianity. His account of his journeys, written in It., was pub. in 1550 by Ramusio. Other works include poems, lives of Arab philosophers and physicians, and a Sp.-Arab. dictionary.

Leo Allatius, see ALLATIUS, LEO.

Leoben, tn. in the prov. of Styria, Austria 26 m. N.W. of Graz, with iron-mine close by. Here in 1797 was signed a peace between France and Austria. Pop. 11,100.

Leobschütz, see GILBEY, LEON.

Leochares (fl. 350 B.C.), eminent Gk. sculptor, was a pupil of Scopas, with whom he worked on the Mausoleum. With Lysippus he executed a group in bronze representing Alexander at a lion hunt. He also made busts of Alexander, statues of Zeus, Ares, and of the family of Philip of Macedonia. All his works are lost, but the statuette in the Vatican of 'Gaiymede carried away by an Eagle' is probably a copy of his work.

Leo, Leonardo (1694-1744), It. musical composer, b. near Brindisi. While studying at Naples in 1712 his sacred drama,

L'Infedella abbattuta, was performed by his fellow students. Among his works are *Pisistrato* (an opera) (1712), *La Alpeca scoperta* (1723), and *Amor vuol sofferenza* (1729) (comic operas), *Karnace* (1737) and *L'Olimpiade* (1737). Some of his music is still played and sung.

Leominster: 1 Bor and mkt tn of Herefordshire, England, situated at the confluence of the Lugg and two other small rivers. It is 12 m from Hereford and 157 m from London. It has regular and wide streets and has some fine old timbered houses. The magnificent church has a Norman nave and fine examples of window tracery. It was restored in 1866.

vines, corn and fruit grow in plenty. There is some mining of coal and iron but agriculture and sheep raising are the chief sources of wealth. With Salamanca, Valladolid, Palencia, and Zamora, it constituted a medieval kingdom from 913. Area 5936 sq m. Pop. 29,800. 2 Cap of the prov. of L., Spain. It is perched on a hill (2631 ft) and is made up of two distinct quarters, the old or eccles. and the modern or industrial. Its fine Gothic cathedral dates back to 1199. There are iron foundries and manufs. of machinery, etc. Pop. 20,000. 3 Locality the cap. of Nicaragua. Central America. 50 m N.W. of Managua the

LEON CATHEDRAL

and enlarged by the addition of the S. nave in 1879. The tn. hall was built in 1855. Formerly a centre of the wool trade, with certain mercantile guilds, L. now trades chiefly in cider and hops and other agrie. produce. The tn. originated in a monastery founded by the Mercian king Morwald, who had a castle near by, where a fortress stood till 1055 when it was destroyed by the Welsh. The tn. charter of incorporation was granted by Queen Mary Tudor. L. was represented by members of Parliament as early as 1295, but in 1865 its representation was reduced to one member. Pop. 6000. 2 Tn. in W. Worcester co., Massachusetts, U.S.A., 40 m W.N.W. of Boston. Pop. 22,000.

Leon: 1. Prov. of N.W. Spain. The Cantabrian Mts. bound it to N and W, and in this direction the prov. itself is highland, whilst the plains of the S. and E. are part of the Castilian plateau. The Montañas de L. separate the basins of the Miño and the Douro, and the upper Sil waters the valley, El Bierzo, in which

presently sheep-raising and the manuf. of textile goods and boots and shoes are the staple industries. The ornate Romanesque cathedral (completed in 1774) and the many handsome public buildings lend dignity to the tn. Pop. 45,900. 4. Tn. in Guinajuato prov., Mexico. 30 m. W. by N. of Guanajuato. Wheat and other cereals are grown in the area and the tn. has manufs. of cotton and woollen goods, pottery, and leather goods. Pop. 74,300.

Leon, Fray Louis de, see PONCE DE LEON.

Leonard, Thomas Arthur (1864-1948). Long pioneer of open air holidays, b. at Stoke Newington. Studied in Germany and at the theological college in Nottingham, afterwards becoming a minister of the Congregational Church in Lancashire. His observation of the futile use which the industrial workers of the N. made of their leisure revealed to him what might come from an enlightened democracy with cultural and ethical, if not indeed spiritual promptings, overriding barriers of class,

creed, and colour, became with him, some felt, almost an obsession. He was, however, encouraged in his ideas by his friends, and it was not long before he found opportunity of putting his theories into practice through the medium of holidays. So in the early nineties the Co-operative Holidays Association, and in 1913 the Holiday Fellowship (q.v.), were founded. He was the first general secretary of each of these bodies, a period of office which covered over thirty years of his life. There came later the Youth Hostels Association, the Greyhound Fellowship, and International Tramping Tours, in the starting of which he played a prominent part. He was awarded the O.B.E. in 1935.

Leonardo da Vinci (1452-1519). It. painter, sculptor, engineer, and architect, b. at Vinci, near Empoli. His father was Ser Piero da Vinci, a Florentine lawyer, and his mother (Catarina) was of humble birth and unmarried. The child was brought up in his father's household, and from his earliest years showed the greatest promise for the future. Among his early pursuits were music, modelling, and drawing. His father placed him under the tuition of Andrea del Verrocchio, and in his studio L. worked with Sandro Botticelli and Pietro Perugino and other less famous men, such as Lorenzo di Credi. If tradition is to be believed, he was soon able to teach his master. Verrocchio allowed his pupil, then about eighteen, to paint a kneeling angel in the picture of 'Christ's Baptism,' and the result was such that Verrocchio knew that he could teach L. nothing more. The picture is now in the Academy at Florence. In 1472 he was enrolled in the painter's guild at Florence. Somewhere about 1477 Lorenzo the Magnificent appears to have taken him into special favour, and under his protection L. worked independently until 1483. During this time he was filled with projects of all kinds of architecture, hydraulics, mechanics, and engineering, also studying and observing every branch of science.

His art was not the reviving of lost glories, but the finding of fresh revelations in living and often obscure things. Thus his picture on a wooden shield, when he was quite young, cost him the minute study of insects and reptiles from which he created a dragon which terrified and delighted all who beheld it. So later his picture of the 'Medusa' was exceedingly terrible, yet very beautiful, depicting loathsome things blended with a great and tragic loveliness. From Florence he went to Milan, about 1483, and here, under the protection of Ludovico Sforza, he commenced various works, among them the great monument to Francesco Sforza and the world-famous picture of the 'Last Supper,' in the refectory of the convent church of S. Maria delle Grazie. This masterpiece has been the victim of many experiments; the original work suffered from the damp wall on which it was painted, the picture became blistered and mildewed, and after many years Cavaliere Cavenaghi restored as far as it possible the wonderful gift to posterity left

by L. From Milan he went to Venice, and while commencing various pictures spent half his time in gigantic plans of engineering work. In 1502 he travelled as chief engineer to Cesar Borgia, mapping out the country and planning and arranging canals, harbours, and various restorations, but in 1503 he was back again in Florence. His next work was the decoration of the council hall of the Signory; Michelangelo was also commissioned to produce a battle scene on another wall of the same apartment. L.'s cartoon was finished in two years and was exhibited with that of Michelangelo. The violent action and extraordinary vitality of both these great works moved the whole of Florence to passionate admiration. Unfortunately L.'s work was destroyed by an experiment of his own. Raphael, then only nineteen, came to watch these two at work. The portrait of Mona Lisa (or 'La Gioconda'), the wife of Francesco Zanobi di Giocondo, was finished in 1504; that mysterious, smiling picture was perhaps his masterpiece—a work of rare suggestion and subtle elusiveness, such as L. loved. Francis I. bought it later for 4000 golden florins, and it was placed in the Louvre, from which it was mysteriously stolen in 1912, but was later recovered and returned.

In 1506 L. returned to Milan and later accompanied Francis I. back to France. The last two and a half years of his life were spent at the castle of Cloux, near Amboise, which had been presented to him. Only a few of his works have survived; many were begun and never finished. Among his surviving works are the two pictures of 'Our Lady of the Rocks' in the Louvre and the National Gallery, the latter probably helped out by his pupil Ambrogio; 'St. Anne' and 'John the Baptist,' now in the Louvre, a 'Virgin and Child' recently stolen from the Schoeffmann collection in Munich, and sev. studies and drawings at Christ Church, Oxford, Windsor, and elsewhere. A wax bust of 'Flora' was discovered and attributed to L. in 1909 and bought as such by the Kaiser Friedrich Museum in Berlin. It is, however, generally assumed that it is by H. Cockle Lucas, and dates from 1846. See E. Macurdy, *Leonardo da Vinci*, 1907; W. von Seidlitz, *Leonardo da Vinci*, 1909; J. Thilly, *Leonardo da Vinci: the Florentine Years of Leonardo and Verrocchio*, 1913; D. Merejkowski, *Romance of Leonardo da Vinci*, 1913; A. J. Anderson, *Leonardo da Vinci: the Admirable Painter*, 1915; and R. A. Taylor, *Leonardo the Florentine: a Study in Personality*, 1927; also life by Antonina Vallentin, 1939.

Leonardo of Pisa (Leonardus Fibonacci, or Pisanus), It. mathematician who flourished in the thirteenth century. His *Liber abaci* attracted the attention of the Emperor Frederick II., to whose court he was admitted. His other works are *De practica geometriae* (1220) and *Liber quadratorum* (1225).

Leoncavallo, Ruggero (1858-1919), It. musical composer, b. at Naples. His best known work is his opera *I Pagliacci* (1892), other of his works being *Chatterton* (1896)

and *La Bohème*, which last-named, performed in Venice in 1897, suffered by comparison with Puccini's more famous opera of the same title, though some prefer it to the latter (Scholtes).

Leonforte, tn. in the prov. of Catania, Sicily, 45 m. N.W. of the tn. of Catania. It trades in cereals, oil, and wine. Its churches suffered in the invasion of Sicily in 1943, but architecturally they are not of great importance. Pop. 24,400.

Leonidas (c. 489-480 B.C.), king of Sparta, in succession to his half-brother Cleomenes. In 480 he marched with his troops against the invading army of Xerxes, king of Persia, and posted his men, numbering 5300, by the narrow pass of Thermopylae. The Persians vainly attempted to force a way through the pass; they were driven back by L. and his gallant band with great slaughter. At length the Mallian, Ephialtes, turned traitor and showed the Persians a track to the rear of the Spartan army. When L. learned that the Persians were crossing the mt. he dismissed all the other Greeks except the Thespians and Thebans, declaring that he and the Spartans must needs remain in the post if they had been sent to guard. Without waiting for the Persians to attack in the rear he advanced from the pass and charged the enemy masses with his handful of troops. In the hopeless battle which resulted L. was overcome and fell in the fight, his head being afterwards cut off and his body crucified.

Leonid Meteors, see METEORS.

Leonine Verses, irregular forms of verse in which the two syllables of the foot immediately preceding the caesura are made to rhyme with the two final syllables of the line. Examples may be found in Ovid and other Rom. poets, e.g. 'Diluitur posito senior hora meo' (*Heroides*, xix., line 14); but they became popular in the Middle Ages through the influence of the minstrels, who in the Lat. verses sacrificed quantity to accentuation. This form has been used in sev. Eng. poems, and with notable success in Shelley's 'Cloud'—'I am the daughter of the earth and water.'

Leonnatus, Macedonian, served in the bodyguard of King Philip, and afterwards became a distinguished general in the army of Alexander the Great, Philip's son and successor. Alexander, remembering how two years previously Leonnatus and Peucestes had saved his life in battle, gave the former a golden crown at Susa in 325 B.C. On his master's death (323) Leonnatus became satrap of Lower Phrygia. He d. fighting whilst on his way to Antipater, his friend, who was shut up in Lamlia, Thessaly.

Leontini, see LENTINI.

Leontius (fl. sixth century), theological writer who was b. at Byzantium, and became a monk of the monastery of St. Saba, Jerusalem. He wrote *Contra Nestorianos*, *Contra Severum*, and other polemical treatises. See life by J. P. Junglas (1908).

Leopard (*Felis pardus*), fierce blood-thirsty carnivore found throughout the

African continent and S. Asia, though its numbers are rapidly diminishing. Its colour is pale fawn to rufous buff, and the coat is covered with large rosette-shaped spots. It varies in length from 3½ to 4½ ft., and is smaller than the lion or tiger, to which it is closely allied, though it differs from them in climbing trees. The black L. of Java was formerly regarded as a separate species, but is now agreed to be a case of melanism. The L. seems to kill for the love of slaughter; though rarely attacking man unless provoked, it may attack children. For the snow L. see Ounce. The clouded L. is found in the E. Indies, Malaya, and India; it is about 6 ft. long, feeds on small birds and mammals, and lives in trees.

LEOPARD

Leopard, Hunting, see CHEETAH.

Leopardi, Giacomo, Count (1798-1837). It. poet, b. at Recanati, of a poor but noble family. He devoted his early years to an unaided study of the classics, with remarkable success. Dissatisfied with his home life, he went to Rome in 1822, hoping to find a more congenial environment, but he suffered an intense disappointment; and in spite of the friendship formed there with Bunsen and Niebuhr, he returned in the following year to Recanati. Here he remained for ten years, except for short holidays at Florence, Pisa, Milan, and Bologna; at the last-named tn. his brilliant classical scholarship earned for him a commission to edit Cicero and Petronius (1825). The last four years of his life (1833-37) were passed at Naples. L. presents a most fascinating study in psychology and temperament; he is akin in various ways to Heine and d'Annunzio. A sensitive soul, capable of idealism, but embittered by disillusionment and a martyr to ill health, loneliness, and privation, he stands out as the poet of despair; the growing pessimism of his mind is to be clearly traced in his works. His despondency finds its most poetic expression in his *Bruto Minore* (1824); in 1827 appeared his *Operette Morali*, for the most part a series of

imaginary dialogues, which have brought him the same high degree of recognition as a master of prose that his *Idilli* and *Canzoni* have brought him as a poet; whilst his *Epistolario* in particular is one of the most pathetically beautiful works ever penned. As a masterly genius of literary expression he stands in the front rank. It. eds. of his works are by Ranieri (6 vols.) (1845) and De Robertis (1937-38). The chief Eng. trans. are: (prose dialogues) C. Edwardes (1882), P. Maxwell (1905), and J. Thomson (1905); and (poems) - Townsend (1888), F. H. Cliffe (1903), and Sir T. Martin (1904). See studies by F. De Sanctis, 1888, 1920; P. Hazard, 1913; G. A. Levi, 1931; and A. Tigher, 1940.

Leopard's Bane, see DORONICH.

Leopold I. (1640-1705), Holy Rom. emperor, son of Ferdinand III, became king of Hungary (1655), king of Bohemia (1656), and emperor (1658). During his long reign he was engaged in many wars - with Sweden (1660); with the Turks, who, being defeated by Montecuccoli at St. Gothard (1664), agreed to the treaty of Vasvár (1664); with the Protestants of Hungary, whom he suppressed with the aid of John Sobieski, king of Poland, and defeated at Mohacz (1687) and Zenta (1697). He was engaged in three wars with Louis XIV. of France, and towards the close of his reign, L., on the death of King Charles II. (1700), claimed the Spanish throne for his second son, the Archduke Charles, thus beginning the War of the Sp. Succession. See life by R. Baumstark, 1873.

Leopold II. (1747-92), Holy Rom. emperor, son of Francis I. and Maria Theresa, b. at Vienna, became grand-duke of Tuscany in 1765. He was chosen emperor in 1790, on succeeding to the Austrian hereditary dominions at the death of his brother, Joseph II. He managed to re-establish order in Belgium and to make an alliance with England, but was chiefly preoccupied with the affairs of France, where the life of his sister, Marie Antoinette, was in danger. In 1792 he concluded the treaty of Pillnitz with Prussia for the restoration of Louis XVI. of France.

Leopold I., George Christian Frederick (1790-1865), king of the Belgians, was the son of Francis, duke of Saxe-Coburg-Saalfeld, and uncle to Queen Victoria. In 1813 he became cavalry general under the Russian emperor, Alexander, fought bravely in the battles of Leipzig and Lützen (1813-14), and afterwards accompanied the allied sovereigns to Paris. The death of his first wife, Charlotte Augusta, daughter of George IV., and her-presumptive to the Eng. crown, after one year of married life (1817), was a great blow to him. In 1831 he became king of the Belgians, which people had just achieved their independence of Holland, having already declined the sovereign power of Greece, and proved a wise and capable ruler. Queen Victoria received much advice from him, and his experience gave him much influence in Europe. See J. J. Thonissen, *La Belgique sous le règne*

de Léopold I^{er}, 1862; T. Juste, *Léopold I^{er}*, 1868; and L. de Lichtervelde, *Léopold I^{er} et la formation de la Belgique contemporaine*, 1929.

Leopold II., Louis Philippe Marie Victor (1835-1909), king of the Belgians, was the son of Leopold I. From 1816 to 1865, the year of his accession, he served in the army. In 1853 he married Marie Henriette (d. 1902), daughter of the Archduke Joseph of Austria. Before his father's death he travelled a great deal in the E. and in N. Africa. As a king he will be remembered for the major part he played in the events which led finally to the annexation of the Congo Free State in 1908. Feeling the need of an overseas expansion for his little country, he formed the Association Internationale Africaine (1876), and proceeded to exploit the almost unexplored regions of the Congo. In view of the serious strictures which had been passed in various quarters, L. himself in 1904 appointed a commission of inquiry into the administration of the Congo Free State. The pub. of the commission's report (Oct. 30, 1905) aroused deep and painful interest, more especially as the composition of the commission had seemed to guarantee that its members would look upon the administration of the Congo with friendly eyes and that her interests would not suffer from prejudice (introduction to Eng. trans. of the report). Much resentment was aroused too in Catholic missions on account of the trenchant criticism of their work in the Congo. The hist. of the foundation of the Congo Free State through the activities of L. II. when still duke of Brabant, from 1878-84, is given in Sir H. M. Stanley's *The Congo and the Founding of its Free State* (1885), which contains a full account of Stanley's explorations, made under a commission from L. II., who contributed £50,000 towards the expenses. In Belgium to-day interest in the Congo no doubt arises from a twofold source: the public is widely concerned as shareholder in Congolese enterprises; but 'there exists perhaps a sentiment of even greater force in the general determination that the present-day rule of the colony should be such as to present the strongest possible contrast to the history of the Free State under Leopold II.' (Lord Hailey, *An African Surrender* 1938).

Leopold III. (b. 1901), king of the Belgians, son of Albert, king of the Belgians (q.v.), whom he succeeded Feb. 17, 1934. Was educated at Eton College and Ghent Univ. and entered the Belgian Army. He married (Nov. 10, 1926) Princess Astrid of Sweden, who was killed (Aug. 29, 1935) when a motor-car, driven by L. himself, crashed in Switzerland, and has issue two sons, the heir apparent Prince Baudouin, duke of Brabant (b. Sept. 7, 1930), and Prince Albert (b. June 6, 1934), and a daughter, Princess Josephine Charlotte (b. Oct. 11, 1927). On Sept. 11, 1941, L. married Mile Mary Lillian Baels, daughter of an ex-minister of agriculture. L. stated that his wife renounced the title of queen and was to be known as Princess de Réthy. Children

of this marriage have no claim to the throne (his son Alexander Emmanuel Marie Leopold was born on July 18 1942). On Sept. 1940 Belgium reaffirmed its strict neutrality following the German invasion of Poland and two months later L. in the hope of resisting the tide of events consistently with the queen of Holland made an offer of mediation but the hope expressed of an equitable peace was vain. On May 10 1940 the Germans launched an attack on Belgian fields

LEOPOLD III (1937)

and communications and L. took command of the Belgian Army having appealed to the Allies for military aid. On May 8 however despite the previous assurance by M. Flandre that Belgium would continue her resistance the Belgian Army on the order of L. capitulated. M. Flandre declared in a broadcast from Paris that L.'s capitulation had no legal validity and that his decision had been taken against the wishes of his Cabinet. That Belgium would continue to resist, and also that the Belgian ministers were then forthwith absolved from their allegiance to L. Thereafter L. was held by the Germans at Lükken Castle near Brussels. His conduct excited hostile comment in Britain at the time. In 1946 L. set up a committee to investigate the charges against his conduct and policy. In its report issued on June 10 1947 the committee rejected as 'entirely false' the allegation that L. had surrendered to the Germans without warning his British and French allies. The report added that following

his surrender L. refused to endorse the attitude of the Belgian Government in France which sought to negotiate an armistice with the Germans. Dealing with L.'s visit to Hitler in Nov. 1940 the report said that he had undertaken the visit to avoid reprisals which the Germans would have taken against the Belgian people if L. had persisted in refusing. Previously he had twice refused to see Hitler. The report emphasises that the Belgian pre-war policy of neutrality was fully approved by M. Paul Henri Spaak, Socialist foreign minister, and was ratified by the Belgian Parliament only three weeks before the German invasion. It stated also that the king was right when in May 1940 he decided against his government's will to remain with his troops when they were forced to surrender and that he never acted against the constitution. This was challenged by M. L.riot, the war-time Christian Socialist Prime Minister who argued that L. and his government practised two irreconcilable policies, one was again evident when the government after the liberation and received a written statement written by L. before his flight to Germany in June 1944. In his statement L. argued that any commitment undertaken by the government in exile would be null and void without his signature. Although Art. 35 of the constitution provides that if the king is unable to reign his powers are exercised by the council of ministers. By order of L. and without knowledge of the government a copy of that statement was handed to L. M. Lord Montagu to be forwarded to the British Government. M. Flandre concluded that L.'s interpretation of his constitutional rights was not in accordance with traditional Belgian conventions.

After L.'s negotiations following the king's liberation by the American armies in Austria broke down L. resided near Geneva with his wife and children. His brother Prince Charles was elected regent by parliament in Sept. 1944 when Bismarck was liberated and the king was still in captivity. In July 1945 a bill prolonging the regency until parliament authority for its termination was given by a two-thirds majority was passed by the votes of all parties excepting the Christian Socialist Party. There is no majority in Parliament in favour of the king's return. So far L. has refused to abdicate in favour of his eldest son Prince Baudouin, who was born in 1930 and according to the constitution attained his majority in 1948. See also Cammermeyer *The Prisoner of Laeken*, 1941.

Leopold Karl Gustaf (1756-1829) Swedish poet born at Stockholm. In 1786 he was made secretary to Gustavus III and collaborated with him in his works. He afterwards became a member of the Swedish Academy. His tragic death among which may be mentioned *Odin* (1822) and *Virginia* (1822) were valued highly by his contemporaries and his poems are still admired. His collected works were published in 6 vols. (1811-33).

Leopoldina Railway, one of the two former British owned railway systems in Brazil, the other being the Great W.

system. The L. R. system serves a large area to the N. and N.E. of Rio de Janeiro, with its main terminal at Rio itself, the total length being 1651 m. It was constructed and developed by Brit. capital and management at a net cost of over £15,000,000 and by 1919 had been in operation for nearly eighty years, though the later company, formed to amalgamate sev. smaller lines, dated only from 1897. In 1919 agreements were concluded for the acquisition by the Brazilian Gov. of this system and also for the Great W. system. The combined purchase prices of the two companies' systems is to be in the region of £14,000,000 and will be found by Brazil out of her accumulated sterling balances. The agreements are subject to ratification by the Brazilian Congress and to the approval of the companies' stockholders. The Great W. system lies in the N.E. states and serves primarily the rural areas, having its terminal point some hundreds of miles from Rio. The company operated the system under a lease agreement made in 1872. Both companies enjoyed a relatively prosperous and settled career for many decades, but began to encounter increasing difficulties from the early 1930s. Brazil had some £39,000,000 of 'blocked' sterling balances at the beginning of 1939, and under the Anglo-Brazilian payments agreements she will be able to pay the purchase price for the railway out of these balances.

Leopold, Lake, see RIKWA, LAKE.

Leopoldshall, vil. in Saxony-Anhalt, Germany. It has salt works, and manufs. chemicals. Pop. 6700.

Leopoldville, trading station in Belgian Congo, W. Africa. It stands on the l. b. of the Congo, near Stanley Pool, and is the cap. of L. prov. and Stanley Pool dist. This tn., which was founded by Stanley in 1882, is the chief means of communication with Upper Congo, and is connected by rail with Matadi. It is also the end of a pipeline from Matadi, crude oil being transported for use in riv. steamers. There is a regular air-service between L. and Brussels. Pop. 32,000 (3100 whites).

Leosthenes, Athenian general, was commander of the Gks. in the Lamiian war, 323 and 322 B.C. He was killed in a siege before Lamia, after having conquered Antipater.

Leotychides (491-469 B.C.), king of Sparta. In 479 B.C. he was commander of the Gk. fleet and distinguished himself as victor at the battle of Mycale.

Leovigild, or **Löwenhild** (d. 566), king of the Visigoths in Spain. He was successful in defeating the Byzantines who dwelt in Andalusia, and by 585 had united all Spain except the S. imperial dists. He was a staunch supporter of Arianism, and was ardent in his persecution of Rom. Catholics.

Lepage, Jules, see BASTIEN-LEPAGE.

Lepanto, see CORINTH, GULF OF.

Lepanto, name of a famous naval battle fought on Oct. 7, 1571, off the tn. of L. (Naupaktos) in the gulf of Corinth between a Turkish fleet of 273 galleys under Ali Pasha, with the boy of Alex-

andria and the dey of Algiers, and an allied fleet of 200 galleys, and some heavy galleasses. The allies were commanded by Don John of Austria, representing Spain, but the prin. force was contributed by Venice under Barberigo, Genoa under Andrea Doria, and the papal contingent under Marc Antonio Colonna; Sicily and Naples also sent a force commanded by the Spaniard, Santa Cruz. Pope Pius V. had instigated the league in fear of the growing and aggressive power of Turkey in the Mediterranean. The result was a crushing and final blow to the Muslim sea power; the Turkish centre was routed, their right wing annihilated, and only part of the left escaped; the Turks are said to have lost 20,000 men, including their prin. leaders. The allies lost 8000, with Barberigo. Cervantes lost an arm in this battle. See J. de la Greviere, *La Guerre de Chypre et la bataille de Lepanto*, 1888 and J. R. Hale, *Famous Sea Fights*, 1919.

Lepchas, original inhab. of Sikkim. They now number about 25,000, but are steadily decreasing, largely owing to the infiltration of large numbers of Ghurks, by whom the L. are either absorbed or driven into the mts. Their language is Mong. There is little of tribal organisation, the only grouping being into clans, which are in effect family groupings. Nowadays the sole function of these clans is to regulate marriage, since a man must not marry a girl of his own clan. There is, however, considerable sexual freedom within a family, probably because in the crowded conditions of life sexual jealousy would prove a considerable strain upon social harmony. L. believe in a spirit world, but the ordinary man must deal with the spirits by the mediation of a lama. The pop. is practically self-supporting, though some commodities, such as salt, cotton, and oil, are obtained via a prin. Tibetan trade route which passes through the country.

Lepers, see DAMIEN, FATHER; LEPROSY.

Lepidolite, mica of a lilac colour, sometimes violet, found in masses made up of scales containing lithia.

Lepidoptera, scale-winged order of insects, comprising butterflies and moths. It is the scales which give the usually gay colours to the four wings of the perfect insect. L. have a well-marked metamorphosis through the egg, larval, and chrysalis stages. Most are easily distinguished from other insects, though the clear-wing moths and some of the wingless females may be confused. The perfect insect has usually a long spiral proboscis or tongue by which nectar may be extracted from flowers. The larva or caterpillar has biting jaws which the perfect insect lacks, and usually casts its skin sev. times before pupation. The chrysalis stage is almost or quite inert, and in many cases is passed in a cocoon. See also articles under individual species. See F. W. Frohawk, *Complete Book of British Butterflies*, 1934; E. B. Ford, *Butterflies*, 1915; and vols. on butterflies, moths, and caterpillars in the Wayside and Woodland Series (Warne).

Lepidosiren, genus of dipnoid or 'lung' fishes. It is confined to certain rivers in S. America. See DIPNOI.

Lepidus, name of the famous Roman patrician clan of the *Æmili*.

Marcus Æmilius Lepidus, sent as ambassador to Ptolemy, king of Egypt, in 201 B.C. Consul in 187 B.C., he was pontifex maximus and six times princeps senatus.

Marcus Æmilius Lepidus, consul in 137 B.C., was praised by Cicero for his oratory. His conduct of the Numantine war in Spain was a fiasco.

Marcus Æmilius Lepidus, father of the triumvir, proved a grasping praetor of Sicily in 81 B.C. At first he sided with Sulla, but, having veered over to the popular party, tried to rescind the Sullan constitution in his consulate of 78 B.C. He opposed the burial of Sulla in the Campus Martius, and the bitter quarrel with Catullus, his colleague, to which his opposition gave rise, eventually led to civil war. In 77 B.C. suffered defeat in the Campus Martius at the hands of Pompey and Catullus, the senatorial leaders.

Marcus Æmilius Lepidus, useful tool to Caesar, because of his 'cold riches'. It was he who proposed Caesar's dictatorship, and in 46 B.C. was rewarded for his services by being made colleague to the dictator in his consulate, and also his *magister equitum*. In the civil war which followed Caesar's murder (44 B.C.), he joined forces with Antony, and was allowed to join him and Octavian in the triumvirate (43 B.C.). But whilst the other triumvirs fought their enemies abroad, L. was left idle in Rome, and after Philippi was stripped of Gallia Narbonensis and Spain, his provs. The young Octavian finally reduced him to impotence in Sicily (36 B.C.). Here his undignified public life ends, but he lived on till 13 B.C.

Lepine, Louis (1816-1933), Fr. police officer, b. at Lyons and educated at Heidelberg and Berlin Univs. In the Franco-Ger. war of 1871 he was a sergeant-major in Rochereau's Scouts. In 1877 he entered the civil service, and in 1892 became prefect of police for the first time and then for some years governor of Algeria. In 1899 he was again prefect of police and, during the next two decades, reorganised the service. He formed the *brigades criminelles*, founded a research dept., and estab. a body of riv. police. His fearlessness during riots was proverbial, and he narrowly escaped death on sev. occasions.

Le Play, Pierre Guillaume Frédéric (1806-82), Fr. engineer and economist, was a native of La Rivière Saint-Sauveur (Calvados). After other appointments he became prof. to the School of Mines in Paris, and in 1855 received a commission from Napoleon III. to organise the exhibition of that year and afterwards the one of 1867. He pub. *La Réforme sociale en France* (1864); *L'Organisation du travail* (1870); *La Réforme sociale* (1881); *La Constitution essentielle de l'humanité* (1884); and *Les Ouvriers européens* (6 vols., 1885). In 1886 he founded the Société internationale des études pratiques d'éco-

nomie sociale, stressing the value of private property, religion, and family organisation. See F. Auburtin, *Frédéric Le Play d'après lui-même. Vie-méthode-doctrine*, 1906.

Lepontine Alps, part of the Alpine range of mts., situated between the Simplon and Splügen passes. They include also the Adula group close to the sources of the Upper Rhine. See ALPS, Western.

Leporidae, hare family, belong to the *Duplicidentata*, a sub-order of *Rodentia*, distinguished by the presence of two pairs of incisors in the upper jaw, whereas all other rodents have one pair only. The genus *Lepus* contains the hares and rabbits (*q.v.*).

Leprechaun, in Irish-Celtic folk-lore a dwarf or gnome in the form of an old man with wrinkled face, generally a rich curmudgeon who can only be induced by threats of violence to disclose the place where his treasure lies; but when caught by human beings he purchases his liberty by revealing the location of a 'crock of gold' which disappears when its hiding-place is found. The L., though peculiar to Ireland, seems indebted to England; at least, for his name. In Irish he is called 'Lobaircin,' akin to Eng. 'Lubberkin,' and L. is no doubt a corruption of that word. In the time of Elizabeth the word 'Lubrican' was used in England to indicate some kind of spirit. The Ulster 'Lucharmán' or 'Lougheryman' is also probably of Eng. origin.

Leprosy, an endemic, chronic, and mildly infectious disease caused by the *Mycobacterium lepre*, which was first identified as its cause by Dr. Hansen of Norway in 1871. L. has, however, been known from time immemorial, and owing to ignorance and bad diagnosis the term, in general and even technical usage, included until the nineteenth century the pathological condition of almost any one suffering from a scrofulous or skin disease. In biblical times it was regarded as a visitation from God for certain heinous sins. In this wider sense it was common in Great Britain and Europe throughout the Middle Ages, and many hostels for the shelter of sufferers were estab. in this country, being usually known as leazar houses from St. Lazarus, the patron saint of the disease. Rigid segregation, mainly under the influence of the Church, effected the disappearance from this country—as endemic—of the disease by the beginning of the sixteenth century; the number of cases now in Great Britain is estimated at between 200 and 300, compared with estimated figures for the world of 7,000,000 and for the empire 3,000,000.

Prior to the First World War leprosy was mildly endemic in most S. European countries, and the movements caused by war may have increased the incidence. In N. Europe it is not endemic. The central African belt is probably the most highly infected part of the world per head of the pop., though India and China, for which accurate figures are lacking, are heavily infected. Africa, it is estimated, has 1,000,000 to 1,250,000 cases.

The disease is not hereditary, nor a dirt

or sex disease. The method of transmission is not certain but seems to be by continuous close association in the family, school and similar relations. Although like every other disease it is encouraged by bad health conditions and is most prevalent where crowded housing makes close contact inevitable, it is not restricted to class, race, or colour. Liability to infection, however, seems to be confined to young and adolescent children and to a small proportion of adults who are particularly susceptible to it. No specific cure or protection from the disease has been found comparable with penicillin or quinine but the first and most important treatment by injections with chaulmoogra oil and its derivatives is usually beneficial in early cases. During the last seven years good results have been obtained from the sulphone family of drugs, particularly in severe cases and research with them and other synthetic drugs is active. The disease is found in two main types with intermediate variations. The tuberculous type is not infectious and can well be treated in out-patient clinics, it is however liable unless treated to turn into the other type and since it affects the nervous system, frequently results in disfigurement and maiming through trophic changes of the nerves and body extremities. The lepromatous type affects the skin and constitutes perhaps one quarter of all cases. This type is probably the source of infection and spread of the disease by contact but although it produces nodules and superficial disfigurement does not normally render the sufferer unfit for work. Such cases should be segregated or at least isolated from the chance of contact with children. In fact the protection of children is the most important side of Leprosy control work.

The difficulties in control of the disease arise from the tradition-mindedness of most of the peoples afflicted with the disease, their lack of health education and the financial stringency of most of the colonies affected. Although most of the colonies have under the Colonial Development and Welfare Acts of 1940 and 1945, framed their plans, these have been slow to develop though British Guinea, Fiji, Nigeria, and others have been a little further.

Finally the psychological side must be stressed. A leper is everywhere a taboo because he has the disease. It is not his fault, and he may well be uninfected. But the taboo reacts on his chances of recovery, and a more humane view of the disease would give him much better hopes not only of being cured, but of complete rehabilitation. See A. Weymouth *Through the Leper Squint* 1938, L. Rogers and E. Muir, *Leprosy*, 1940, P. Burgess *Who Walks*, 1941, R. G. Collingwood *Practical Textbook of Leprosy*, 1947, and E. Muir, *Manual of Leprosy* 1948.

Lepsius, Karl Richard (1810-84) Ger Egyptologist, b. at Naumburg am Saale. In 1834 he wrote his first book, *Die Paläographie als Mittel der Sprachforschung*. Between 1834 and 1842 he travelled in England, Italy, Holland, and Germany,

collecting materials for his dissertations on Egyptian art, and studying the ancient Egyptian and Osirian languages. During the 1840s he wrote *Lehrbuch der Ägyptischen Paläographie und Hieroglyphik* and *Inschriften der Ägypter*. He conducted a scientific expedition (1842-43) to Egypt and published the results of his researches in *Denkmäler aus Ägypten und Aethiopien* (12 vols. 1919-29). His other works include *Chronologie der Ägypter* (1841), *Über den ersten ägyptischen Hieroglyphen* (1841), *Ägyptische Buchführung* (1848), and *Standard Alphabet* (2nd ed. 1863). See life by G. Ebers 1887.

LEPIS MINA COURTS OF JUSTICE

Lepus 1 *Lepus Magna* (modern Lebda) a port in the N coast of Africa 60 m S of Tripoli once a Phoenician colony. 2 *Lepus Minor* a port in the N coast of Tunis now ruined on the E coast of Tunis, Africa.

Lepus (the Hare) a constellation supposed to represent a hare in the act of running from Orion's dog. It is situated directly under Orion.

Le Puy, or **Le Puy en Velay**, see **Puy**.
Le Quenoy, see **QUENNOY**.
Le Queux, William (1863-1927) Eng novelist. b. in London. He travelled much and made a fine collection of medieval MSS. He wrote over 130 sensational stories, his most famous being *The Invasion of 1110* (1906). See N. S. Bladen, *The Real Le Queux* 1938.

Lercara Friddi, tn with important sulphur deposits in the prov. of and 28 m SSE of the city of, Palermo, Sicily. Pop. (com.) 14,000.

Lerici, small seaport 12 m. E S E of Spezia, on the gulf of Spezia in Liguria, Italy. Close by are smelting works for lead ore. Pop. (com.) 10,000.

Lerida, 1 Prov. of N. E. Spain watered by the Ebro and its tributaries. Canals have rendered the S. E. mts. of Lerida comparatively fertile, but agriculture is not very profitable. There are linen and cotton factories, distilleries, etc. Wine, wool and cattle are exported. Area 46,689 m. Pop. 286,900. 2 Cap. of the above prov. on the S. E. 3 m. N. of Tortosa. There are two cathedrals and it has old fortifications. It manufactures silk and leather. Pop. 46,000.

Lérins, *Iles de*, group of 11 is. 2 m. S. of Cannes in the Mediterranean Sea. Marguite and St. Honorat are the largest and in the latter are ruins of a 4th century monastery.

Lérins, *Claro Josephe*, see CLARO.

Lerma, 1 Riv. of Mexico state, Mexico, a few miles E of Toluca. Top about 7,000. 2 Riv. of S. Mexico, in N. E. S. W. of Mexico city and flowing into the Gulf of California, 200 m. E. of the Gulf of California and flowing into the Gulf.

Lermolov, Ivan, see MOROZOV, GIOVANNI.

Lermontov, *Mikhail Yurjevich* (1811-1841) Russ. in poet and novelist. He wrote his best work at Moscow, but in an office in the Caucasus. Ivan Nicholas transferred him to the Caucasian army as he was indignant with the tone of his work on the death of Pushkin. But the wild life of the mountainous Caucasus proved no exile to the freedom loving poet. Here he wrote his novel *Prinets Genz* (1840) and here he died. The English and French literature of the time were still Byronic. More like a true romantic than any other Russian poet he had an imagination of a loving, supernatural nature in his poem of romantic love *Tamara* (1839).

Leroi, *Julien David* (1841-1903) Fr. writer on architecture. He went to Rome to study the art and in 1871 he visited Greece for a similar purpose and on his return published *Rome et ses plus beaux monuments* (1874) and *Grèce* (2nd ed. 1877) which was the earliest systematic account of the archaeological remains of that country.

Leros, one of the S. Sporades near Rhodes in the Aegean forming part of Greece. There are marble quarries. In 1938 the Grk Gov. instituted a law here for reclaiming and reducing bandits who had been victims of rebellion and general unrest in the civil war (see GREECE II, 1938). Pop. 1,000.

Le Roy, *Edouard* (b. 1870) Fr. philosopher, member of the Academy of Moral and Political Sciences since 1919, deputy for Belgium at the College de France 1921, and was titular prof. there from 1921. He is a chevalier of the Legion of Honour. His chief works are *Les Origines humaines et l'évolution de l'intelligence* (1928) and *Le Problème de Dieu* (1929). Other works: *Logique et critique* (1907), *Une Philosophie nouvelle*, *Henri Bergson* (1912), *L'Existence idéelle et le fait de l'évolution* (1927),

and *Introduction à l'étude du problème religieux* (1944).

Leroy-Beaulieu, *Henri Jean Baptiste Anatole* (1842-1912) Fr. publicist. He wrote a series of articles for the *Revue des deux mondes* (1882-89). In book form these articles became subsequently known as *L'Empire des Tsars et des Russes*. In another of his Russian studies *L'Homme d'Etat russe*, he told the story of the emancipation of the serfs under Alexander II. He also wrote several books on Judaism and the Jews, and on Roman Catholicism and the papacy.

Leroy-Beaulieu, *Pierre Paul* (1843-1916) Fr. economist, brother of the preceding, became prof. of political economy at the Collège de France. In his popular *Le Collectivisme* (1883), he purposed to expose the errors of collectivist doctrines. Other of his works are *La Colonisation chez les peuples modernes* (1874) and *Le traité de la science des finances* (1877).

Lerroux, *Alejandro* (1861-1919) Sp. statesman, b. at La Rambla Cordova. He studied law in Barcelona, then entered politics and became leader of the advanced republicans. Elected to the Cortes in 1901 but his republican opinions led to his exile and he went to S. America (1907).

He returned to Spain after the First World War in which he had enthusiastically supported the allied cause and took a prominent part in the formation of the Sp. Republic in 1931 being the first foreign minister in the provisional Gov. of Radical Socialist, Socialist and Republican Alliance parties. During the five years from 1931 to 1936 he was constantly in and out of office as Prime Minister, a result due not to his individual policies, such as the chaotic nature of the country in the formative days of the new constitution. At the time of the election to the first president of the new republic, his experience and record of leadership marked him out as a likely candidate, especially as the prestige he had acquired as a representative of Spain in the League of Nations would have made his appointment welcome abroad. But he was excessively unpopular in Catalonia, whose autonomy he opposed, and in the end the gov. favoured Zamora. The Anarchists under L. then separated themselves from the coalition and went into opposition. He became Prime Minister in Nov. 1931 after a political landslide at the election due to reaction from the reforms of the left which were often marked by tyranny. His Radical party or Centre party being returned as the largest single party in the Cortes. During his term of office his gov. subdued dangerous Anarchist Syndicalist revolts in Seville and elsewhere but he resigned when the president rebuffed him over the Amnesty Bill for political crimes committed before Dec. 18 1931. In office again soon afterwards, he pursued an energetic but unpopular policy of public economy and constitutional revision and again resigned; but once again entered the Foreign Office from which a petty gambling transaction involved his resignation. He took no active part in politics after the outbreak

of the civil war. Pubs.: *Al Servicio de la Republica* (Madrid, 1930) and *Trayectoria politica de Alejandro Lerroux* (selections from speeches and writings, 1934).

Lerwick, seaport and cap. of the Shetland Is., Scotland, and the most northerly tn. of the United Kingdom. It is on Bressay Sound, a natural harbour on the E. coast of Mainland, and lies 115 m. to the N.E. of Kirkwall in Orkney. L. is an important fishing station, and also a centre for the R.N. Reserve, who use the old Cromwellian fort as their depot. Pop. 5100.

Lesage, Alain René (1668-1717), Fr. author and dramatist, b. at Sarzeau, Morbihan. An assiduous writer, he pub. over a hundred dramas, the best of which are *Crispin rival de son maître* (1707), an extravagant farce of a knavish valet, and *Turcaret* (1709), a brilliant and essentially Molière-que comedy and satire on the contemporary dealers in finance. But his fame now rests on his romances, *Le Diable boiteux* (1707) and *Gil Blas de Santillane* (completed in 1735). Though the scene of the latter, his masterpiece, is laid in Spain, it is the life of Paris which is painted. The characters of Gil Blas and the preposterous quack, Dr. Sangrado, as also of the sprightly demon Amodeus in *Le Diable boiteux*, are drawn with the detachment of a great artist, whilst as a stylist L. ranks with the best authors of his day. See study by E. Lintilhac, 1893, and G. Lanson, 'Études sur Gil Blas' in *Hommes et livres*, 1895.

Les Andelys, see **ANDILYS**.

Lesbonax, Gk. rhetorician, who lived in the days of Augustus. According to Suidas he wrote at least sixteen political orations, but two only have survived to our times. In one of these he urges the Athenians to persist in their struggle with Sparta.

Lesbos (historian), see **HILLANICUS**.

Lesbos, see **MYTILINI**.

Les Cayes, see **CAYES, LES**.

Lesse-majesté, see **LEZZI-MAJ-STY**.

Lesghians (also called **Lesghis**, **Lezgins**, and **Leki**) are a people, composed of about twenty-seven tribes, who dwell with the Tchetchens in the Daghestan in the Caucasus, and also in Kuba, She-makha, and Sakataly, and other regions of Transcaucasia. There are some 600,000 of them in all, and among them are included Avars, Kurinians, Lakians, Andians, and Kasimukhians. In 1839 when Shamyl, their leader, was taken prisoner, they lost their independence and came under the Russian yoke.

Lesina, see **ILVAR**.

Leskov, Nikolai (1831-95), Russian novelist, b. at Orel. He worked as a clerk and as an estate manager's assistant, in which latter capacity he gained an insight into peasant life which he subsequently put to good use in his novels. Some journalistic success led to his settling in St. Petersburg as a young man, and it was not long before his efforts in fiction attracted notice. A strong enemy of the revolutionary movement of the sixties, his early work was largely an attack on

the movement, and his attitude towards certain contemporary conditions aroused considerable opposition, but his influential friends procured him official positions that eased his circumstances. Late in his career, however, he eschewed the bitterness of politics and devoted himself to pure literature. His numerous stories are remarkable for originality of style and conception. His subjects were largely the church and clergy, the beliefs of the people and their superstitions. He also showed himself an ardent adherent of the social doctrines of Tolstoy. His prin. works are *The Bull Sheep* (pseud. 'M. Stebnitsky') (1863); *The Blind Pilcy* (1864); *Old Days in Plodomasora* (1869); *Cathedral Folk* (trans. into Eng., 1872); *The Enchanted Wanderer* (trans., 1873); *The Scolded Angel* (1873); *A Decayed Family* (1874); *On the Edge of the World* (1875); *The Just Men* (1877); *The Left-handed Smith and the Steel Flea* (1881).

Leskovac, or **Leskovatz**, tn. of Serbia, Yugoslavia, 26 m. N. of Vranja. Hemp, flax, and tobacco grow in plenty. Pop. 11,000.

Leslie, Lesly, or Lesley, The family of, descended from Malcolm, son of Batholi, who lived during the latter part of the twelfth century in Lesslyn or Leslie, in Aberdeenshire. In 1157 the family received a title by the conferment of the earldom of Rothes on George L., a native of Rothes. The seventh earl was created duke of Rothes, marquess of Ballinbreich, but d. without issue, the title continuing through the family of his eldest daughter. Connected with the earls of Rothes are the earls of Leven, descended from Alexander L. (q.v.); the Lords Lindores, whose title was created in 1600 and became extinct in 1775; and the Lords Newark, the first of whom was David L. (q.v.). See Col. C. Leslie, *Historical Records of the Family of Leslie*, 1869.

Leslie, Alexander, Lord Balgonie, first Earl of Leven (c. 1580-1661), Scottish general, a native of Aberdeenshire. He enlisted as a common soldier in the army of Gustavus Adolphus, king of Sweden, but by 1616 he had been promoted to the rank of field marshal of Sweden, and his gallantry was rewarded by a knighthood. He fought with great distinction in the Thirty Years war, holding the chief command under Gustavus. In 1629 he successfully defended Stralsund against the insurgent imperialists, led by Wallenstein. Nine years later he was recalled to Scotland to resist the eccles. policy of King Charles I. and set himself to organise the Covenanting army. With his army he marched s. to Dunn Law in 1639, and in 1640 reached Newcastle, which he held till the treaty of Ripon in 1641. In August of that year he was received by the king and created earl of Leven and Lord Balgonie. He fought in Ireland in 1612, and later commanded the Scots Covenanters against the Royalists in the Civil war. Charles surrendered to him at Newark in 1647. After the execution of the king he worked for the restoration of Charles II., and fought against Cromwell at Dunbar in 1650. In 1651 he was

imprisoned in the Tower, and on his release retired to Scotland, and *d.* at Balgonie in Fifeshire. See C. S. Terry, *The Life and Campaign of Alexander Leslie, First Earl of Leven*, 1899.

Leslie, Charles Robert (1791-1859), Eng. painter and writer, *b.* in London of Amer. parents. His first successful picture was 'Anne Page and Slender' (1817), which was followed by 'Sir Roger de Coverley going to Church' (1819). He chose his subjects chiefly from the works of Shakespeare, Addison, Fielding, and Cervantes. In 1824 he was elected an R.A. after the exhibition of his 'Sancho Panza and the Duchess' (1826). He was appointed prof. of drawing at the Military Academy at West Point (1833-34) and prof. of painting at the Royal Academy (1848-51). He also gained some popularity as a writer, his chief books being *Handbook for Young Painters* (1845), a life of Constable (1815) and of Sir Joshua Reynolds, which was completed by Tom Taylor (1865), who also ed. his *Autobiographical Recollections* (1860).

Leslie, David, Lord Newark (1601-1682), Scottish general, fifth son of the first Lord Lindores. He took part in the Thirty Years war, serving under Gustavus Adolphus, but returned to Scotland about 1640 at the time of the rise of the Covenanters against King Charles I. Joining the troops under his kinsman, Alexander L., earl of Leven, as lieutenant-general, he was present at the battle of Marston Moor (1644), routed Montrose at Philiphaugh (1645), and fought in the siege of Newark, when Charles took refuge in the Scottish camp. With the earl of Leven and the rest of the Covenanters, he went over to the Royalist side, and after some strategic success was taken prisoner by Cromwell at Worcester in 1651 and was confined in the Tower till the Restoration. In 1661 he was created Lord Newark. See S. R. Gardiner, *History of the Great Civil War*, 1886-91.

Leslie, Frank, see CARTER, HENRY.

Leslie, or Lesley, John (1527-96), Scottish bishop and historian, *b.* at Kingussie, Inverness-shire, where his father, Gavin L., was rector. He studied theology at Poitiers, Toulouse, and Paris, and took holy orders in 1558. He was strongly opposed to the Reformation, and in 1561 had a disputation with Knox and others. In the same year he went to France to accompany home the young Queen Mary, whose friend and spiritual adviser he continued to be to the end of her life. His promotion was now rapid. He was appointed prof. of canon law, Aberdeen (1562), privy councillor (1565), abbot of Lindores (1565), and bishop of Ross (1565). He also sat on the commission to revise the laws of Scotland, and was largely responsible for the 'Black Act' or *Actis and Constitutions of the Realm of Scotland* (1566). On the imprisonment of Mary in England, he appeared as her ambas. before Elizabeth, plotted for her escape, and made plans for her marriage with the duke of Norfolk. In consequence he was imprisoned in the Tower (1571-73) and was

afterwards banished from England. While on the Continent pleading Mary's cause he pub. *De Origine, Moribus, et Rebus Gestis Scotorum* (Rome, 1578). In 1579 he was made suffragan and vicar-general of the diocese of Rouen, and was twice imprisoned on account of his political opinions. He was appointed bishop of Coutances in Normandy (1593), and *d.* in an Augustinian monastery near Brussels. His writings include *A Treatise concerning the Defence of the Honour of Marie, Queene of Scotland* (1569), under the pseudonym Eusebius Dilectophilus; and *De illustrium foeminarum in republica administranda auctoritate libellus* (1580). See E. C. Cody's ed. of the Lat. hist. (Scottish Text Society, 2 vols., 1888-95).

Leslie, Thomas Edward Cliffe (1827-82), Brit. political economist, *b.* in co. Wexford, Ireland. In 1853 he was appointed to the chair of jurisprudence and political economy at Queen's College, Belfast. His papers on industrial economy were collected in *The Land Systems* (1870); *Essays on Political and Moral Philosophy* (1879); and *Essays in Political Philosophy* (1888).

Leslie, mrlt. tn. of W. Fifeshire, Scotland, on the Leven, 3½ m. S. of Falkland, with bleach-works, and flax-spinning and paper-mills. Pop. about 2000.

Lesmahagow, coal-mining vill., 5 m. S.W. by W. of Lanark, in Lanarkshire, Scotland. Pop. 13,000.

Lespinasse, Jeanne Julie Eleonore de (1732-76), Fr. authoress, *b.* at Lyons, the illegitimate daughter of the Comtesse d'Albon. For ten years (1751-61) she acted as companion to Mme du Deffand, and in her *salon* made the acquaintance of d'Alembert and other members of her brilliant coterie. But the attractions of her companion roused the jealousy of Mme du Deffand, and a violent quarrel ensued, the result of which was that Mlle de L. set up a rival *salon*, and d'Alembert shared her roof. She did not, however, accept him as her lover, but, as her *Lettres* (pub. in 1809) reveal, was the victim of a devouring passion for the Comte de Guldert, and in a less degree for the Sp. Marquis de Morn. See A. Beaumier, *La Vie amoureuse de Jeanne de Lespinasse*, 1928; also life by P. de Séguin (King. trans.), 1907.

Lesse, riv. of Belgium and one of the main tribs. of the Meuse, rising in the prov. of Luxembourg and flowing N.W. through the prov. of Namur. It joins the Meuse at Anseremme, 2 m. S. of Dinant. At Belvaux the waters of the L. disappear to continue for 24 hrs. their mysterious underground course, which has formed the famous caves of Han.

Lessen, see LESS NER.

Lesseps, Ferdinand, Vicomte de (1805-1894), Fr. diplomatist and engineer, *b.* at Versailles. In 1828 he was sent as assistant vice-consul to Tunis, and in 1832 he was appointed vice-consul at Alexandria. He received the Cross of the Legion of Honour for his heroic conduct during an epidemic of the plague (1834). He became consul at Cairo, and while here began his plans for the construction of the Suez Canal. In 1837 he married Mlle

Agathe Delamalle. His second wife was Mlle Autard de Bragard. By his first marriage he had five sons, by the second twelve children. He served as consul at Rotterdam, Malaga, Barcelona, and Madrid. In 1854 he received the concession authorising him to pierce the isthmus of Suez. He obtained, by subscription, more than half the capital he needed, and the canal was finished in 1869 (see SUEZ CANAL); for this he received the Grand Cross of the Legion of Honour and an Eng. knighthood. In 1881 he commenced the Panama Canal. The funds were insufficient and political trouble followed; the company was wound up in 1888, and the directors were charged with fraud (see PANAMA CANAL). De L. came to England enfeebled in health and broken with trouble. He was later exonerated of complicity in the fraud and returned to France, where he d. at La Chénale in Berry. He was a man of great courage, with a reverence for duty and honour, possessing simple tastes and an affectionate nature. He was a member of the Fr. Academy and of the Academy of Sciences. See G. Smith, *The Life and Enterprises of Ferdinand de Lesseps*, 1893, and J. d'Elbée, *Un Conquistador de génie*, 1938; also life by H. J. Schoenfeld, 1937. Lesser Antilles, see ANTILLES; WEST INDIES.

Lesser Brethren, see FRANCISCANS.
 Lesser Pettyshops, see CHIFFCHAFF.
 Lessines (Flemish Lessen), Belgian city, situated in Hainaut on the R. Dender, 19 m. N.N.W. of Mons. It has important porphyry quarries and manufs. of safety matches and electric lamp bulbs. Tobacco and medicinal plants are largely cultivated in the surrounding dist. Pop. 9900.
 Lessing, Gotthold Ephraim (1729-81), Ger. essayist, critic, and dramatist, b. in Kamenitz in Upper Lusatia (Saxony). After five years at Meissen he passed in 1746 to Leipzig Univ. to study theology, but found more attraction in philosophy and literature. After a few years' literary hackwork in Berlin he went to Wittenberg (1751-52) where, in the course of extensive reading, he took his M.A. The next two years were spent in Britain studying Lat. and Eng. literature; in 1754 appeared his first work of importance, *Vademecum für den Herrn G. N. Lange*. About this time he became intimate with Nicolai, and collaborated with Moses Mendelssohn in the brilliant essay *Pope, ein Metaphysiker* (1755); the same year saw the pub. of his first drama of any worth, *Miss Sara Sampson*, the outcome of his studies in Eng. literature. The Seven Years' war (1756-63) cut short a three years' tour L. had projected, and he returned to Leipzig, where he remained for a time with the poet von Kleist; but 1758 found him again in Berlin with Nicolai and Mendelssohn, with whom he issued a jour. *Literaturbriefe*, consisting of letters in criticism; the fifty-four letters which L. himself contributed are the direct antecedents of his later writings, and possess much of the same elegance, force, insight, and originality. From 1760 to 1765 he was secretary to the governor

of Breslau, but returning to his literary career he produced in quick succession two of his finest masterpieces, *Laocoon* (1766), one of the greatest constructive critical works on aesthetics ever written, and *Minna von Barnhelm* (1767), the first great comedy in the Ger. language in point of both chronology and merit. His essays on the Fable (1759) and the Epigram (1771) must also be mentioned. His ideas found a maturer expression in his *Hamburgische Dramaturgie* (1769), the outcome of his short-lived connection with the National Theatre of that tn. A series of brilliant pamphlets followed, notably the essay *Wie die Allen den Tod gebildet* (1769), written in controversy against Klotz and the whole school of eclectics, who had attacked his *Laocoon*. The following year he became librarian at Wolfenbüttel, under the patronage of the duke of Brunswick, with whom he subsequently travelled in Italy; and here *Emilia Galotti* (1772), his greatest tragedy, was pub. In 1776 he married Eva König, but she d. in childbirth after little more than a year's conjugal happiness. Meanwhile L. had become entangled in theological controversy against orthodox Lutheranism under George of Hanburg, his chief attack being the *Reinhardt's Freymüthig*; but for fear of incurring the displeasure of his patron he returned to 'his old pulpit, the stage,' and summed up his ideas on fiction in the splendid dramatic poem, *Nathan der Weise* (1779). The following year saw the completion of the masonic dialogues, *Ernst und Falk*, and also *Die Erziehung des Menschenge schlechts*, the corner-stone of his theological writings and his last work of importance. His works rank as monuments of constructive criticism; they bear witness to his profound learning, and are written in an exceptionally concise and vivid style. There are eds. of his works by K. Lachmann, 12 vols. (1838-40); 24 vols. re-ed. by L. Mueker, 1886-1924, 3rd ed.; E. Bell (dramatic works), 2 vols. (1879); R. Boxberger and H. Blümner, 14 vols. (1883-90); and J. Petersen and M. von Olshausen, 25 vols. (1925-29). See H. B. Garland, *Lessing, the Founder of Modern German Literature*, 1937, and A. von Arn, *Lessing und die geschichtliche Welt*, 1944; also lives by J. Sima, 1877; H. Zimmermann, 1878; T. W. H. Rolleston, 1889; and E. Schmidt (11th ed.), 1923.

L'Estrange, Sir Roger (1616-1701), Eng. pamphleteer, b. at Hunstanton, Norfolk. He accompanied Charles I. on his expedition against the Scots and during the Civil war was captured by the Parliamentarians in an attack on Lynn and condemned to death as a spy. He was reprieved and imprisoned in Newgate, but escaped in 1648 and fled to the Continent, returning to England in 1653, and making terms with Cromwell. He was made licensor of the press at the Restoration. In 1663 he estab. the newspaper the *Public Intelligencer*, and also the *News*, which in 1665 became the *London Gazette*. From 1675 to 1680 he issued the *City Mercury*, or *Advertisements concerning Trade*, and in 1679 he founded the *Observer*. He lost his office as licensor at the revolution of

1689. He was a man of letters of considerable ability, and made some good translations of Josephus, Cicero, Esop, Erasmus and Quevedo.

Le Sueur, Eustache (1617-55) An sacred and historical painter, b in Paris. His best work is a series of pictures on the life of St Bruno. Many of his pictures, including 'Angel and Hagar', 'St Paul preaching at Ephesus', and numerous fine black and white drawings are in the Louvre Paris. See life by G. Rouches, 1923.

Lesueur, Jean Francois (1760 or 1763-1837) French musical composer, b at Dieuze near Abbeville. He was musical director at the cathedral of Notre Dame Paris, 1786-97. From 1791 to 1802 he was inspector of studies at the Paris Conservatoire, and in 1801 he was appointed Maestro di Cappella to Napoleon for whose coronation he composed the musical service. Louis XVIII returned him at his court, and in 1818 appointed him prof. at the Paris Conservatoire. His operas include *Le Calice Du Roi* and *Paul et Virginie*.

Le Sueur, William Dawson (1810-1917) Canadian author and lecturer, b at Quebec. Educated at Victoria High School and Toronto Univ. From 1858 to 1910 he was secretary of the postal office, and later became vice president of the Canadian Postal Authorities. He was joint editor of *The Makers of Canada* series, which he contributed a list of Count Brudenell (1906). Other works of his are *A Defence of Modern Thought*, *Evolution and the Ecclesiastical*, *Evolution of Modern Thought*, *The Theory of Matter*, *God and the Development of Man*, *Philosophy and the Development of Man*, *Philosophy and the Development of Man*.

Letchworth, tn in Hertfordshire, England, 4 1/2 m N of London. It was founded in 1903 as a garden city on the line suggested by Sir Lancelot Howard (*1903 in the Garden City Path to Letchworth* (1898)) and has been developed as an industrial and residential tn by First Garden City Ltd on an estate of 598 acres, much of which is a permanent rural belt. There are over a hundred factories and workshops in the industrial area, the leading industries being heavy and light engineering, tabulating machinery, printing, bookbinding, electrical, parachutes, perambulators, photographic papers, the manufacture of refuse collection vehicles, furniture, corsets, and scientific instruments. Careful balance is maintained between industries, recreational and female skilled and unskilled labour with the result that in times of depression the whole tn is not affected. Letchworth has been selected as the site for one of the new colleges to meet the needs of N. Herts. The tn is within the outer county ring suggested in the Greater London Plan, 1944, and the proposed optimum pop is 32,000. It is one of the healthiest tns in England and an outstanding example of modern tn planning. Pop, 21,500. See also GARDEN CITIES. See the books issued by First

Garden City Ltd and C. B. Pardoll, *The Garden City*, 1913, and *The Building of Saltaire*, 1923, 1949.

Le Tellier, Francois Michel, see LOUVORS, MARQUIS DE.

Lethaby, William Richard (1857-1931), Eng. architect and student of antiquity, b at Barnstaple. He won the Soane medalion in 1879 and the Pugin student ship in 1881. From 1896 to 1912 he was principal of the L.C.C. School of Arts and Crafts, and from 1900 to 1918 prof. of design at the Royal College of Art. He was also a member of the committee of the Society for the Protection of Ancient Buildings. Among his writings may be mentioned *Architecture, Mysticism and Myth* (1892), *Leadwold* (1893), *The Church of Santa Sophia Constantinople* (a study of Byzantine building in collaboration with H. Swanson, 1894), *London before the Conquest* (1902), *Medieval Art* (1904), *Westminster Abbey and the King's Craftsman* (1901), *Crack Buildings* (1903), *Westminster Abbey and the Antiquities of the Coronation* (1911), *Architecture* (1912), *Form in Construction* (1922), *Life and Growth* (1913), an outline of the life of Philip Webb (1913), and *Hammer Abbey* (1914). In 1906 he became surveyor of the fabric of Westminster Abbey and held that post for twenty-one years, and from 1902 to 1912 was architect to the cathedral.

Lethargic Encephalitis, see ENCEPHALITIS.

Lethargy state of morbidly sound or prolonged sleep from which the sufferer can be aroused only with great difficulty. It is intermediate between heavy sleep and complete coma, and may be the result of excessive excitation either of mind or body, but is more often occasioned by a congestion in the vessels of the brain when it is attended by great danger.

Lethbridge (formerly **Coalbanks**, later **Coalhurst**) tn of Alberta, Canada, 145 m S.W. of Calgary. It owes its existence to coalmining. In 1882 mines were opened at what was then known as Coalbanks. The following year a railway line was surveyed from Dunsmuir to Coalbank, and with the completion of the line mining operations began in earnest. Shaft were sunk and operated on the same underground level, the output then being about 900 tons and the pop. 350. In 1885 the Canadian Pacific Railway agreed to take 9000 tons to encourage the enterprise, as well as to ensure cheap fuel for the settlers. The N.W. Coal and Navigation Company was then formed in England with a capital of £50,000, with Wm. Lethbridge of Courtlands, Devon, England as president. Coalhurst was the first official name assigned to the post office here as there was already in Ontario a small place known as L. This situation naturally caused confusion, as the station bore the name L., and all official correspondence was addressed to Coalhurst. Hence the name was eventually changed to L. In 1899 work commenced on the Alberta Railway and Irrigation Company's canal which extended from St. Mary's R. to Chin Coulee.

From that time L. in addition to coal developed as a large farming dist. There is a dehydration plant and other industries and a airport. It was incorporated as a tn. in 1891 and as a city in 1906 Pop. 19,900.

Lethe (Oblivion), in ant. Gk. mythology, one of the rivers of the lower world whose waters when drunk by the dead caused them to forget all evils past. The belief first appears in literature in the fifth century B.C. when Aristophanes mentions it in his *Frogs*. Pluto embodies the myth in his *Leopold* (τ) and Pausanias includes the drinking of the waters of L. as part of the Orphic initiatory rites (ix. 33-5), with which compare Dante's *Purgatorio* (xxviii and xxxiii). See J. L. Harrison *Introduction to the Study of Greek Religion* 1908.

Lethington, Lord, see MATTLAND, SIR PETER.

Leti Group, see under MOLLUSCS.

Leto (called Latona by the Romans) in ant. Gk. mythology, the daughter of Coeus the Titan and Phoebe was believed by Zeus and by him became the mother of Apollo and Artemis. The later poets dwell upon Heracles' persecution of her both before and after her connection with the is. of Delos, but Homer and Hesiod do not mention it. Her worship was generally connected with that of her children particularly at Argos and Delos.

Le Touquet, see TOULITT II.

Lettering The hist. of European L. is broadly a hist. of modifications due to the various means of reproducing it in different ages. The classic Rom. alphabet whose form was standardised by about the first century A.D. was the archetype of all later styles and owed its main characteristics to the fact that it was incised in stone. Later the scribe who wrote with a pen on vellum was not consciously devising new forms, but doing his best to imitate earlier models. He worked on a smooth, easy surface and the capitals tended to become rounded and at the same time he narrowed the proportions to save space. Since the sixteenth century the exigencies of type design have influenced L. so that for example, swash characteristics tend to be eliminated.

The following is a brief hist. of the development of L. *Roman capitals* of which the best known example is the inscription on Trajan's column were the models for what are called *square capitals*. These were formal pen made letters and were in use until the beginning of the sixth century at the same time as the freer form of *rustic capitals*. By the fourth century *uncials* were developed a rounder hand more characteristic of the pen and quicker to write. Their evolution to *half uncials* at about the beginning of the sixth century marked the first appearance of minuscules proper with 'ascenders' and 'descenders'. This hand branched out into different families the Irish half-uncial becoming one of the most perfect forms. The revision of liturgical books instituted by Charlemagne in the eighth century brought about a revival of good penmanship which had declined outside

England and Ireland. The creation of the hand now known as the Caroline Minuscule by Alcuin at the monastery at Tours had a widespread influence throughout all Europe, except Germany and was to become the prototype of our present-day Rom. alphabet. However by the twelfth century the impulse towards speed of writing and the necessity to save space resulted in a gradual compression and increasing angularity to form the characteristic Gothic style. Fortunately the Renaissance saw the revival of the Carolingian Minuscule in Italy and it was this hand which the first printers followed when cutting their types. The rapid spread of the invention of printing saw the gradual decline of the art of L. and the monastic scriptorium was no longer the home of bookmaking. Therefore the letter forms found in fifteenth and sixteenth century MSS. have acquired a permanence due to the conservative character of type design.

At the turn of the present century, which saw a reversion to earlier forms of craftsmanship in various fields, there was a revival of good penmanship associated with the names of Wm. Morris, Edward Johnston, Eric Gill and others. In the present day the wood engraved L. by Reynolds Stone should be mentioned. Side by side with this revival has come the enormous domain of commercial advertising for a bewildering variety of styles which while of a high technical competence are of very varied artistic merit. See also ILLUSTRATION OF MANUSCRIPTS, TYPE AND TYPESETTING. See II Johnston *Writing and Illuminating and Lettering* 1906. I Munde Thompson *Introduction to Greek and Latin Palaeography* 1912 and Sir A. H. Hall, *English Writing Masters, 1700-1800* 1931.

Letterkenny, town in co. Donegal, Ireland, 2 mi. W. by S. of Londonderry. Hist. industries of shirt making and rope making. Pop. 2000.

Letter of Credit, see CREDIT LETTER.

Letter of Marque, licence or commission granted by the gov. to a private person to fit out an armed ship or privateer to capture the enemy's ships and merchandise in time of war or in reprisal for damage done. Privateering was abolished by the declaration of Paris in 1856 so that the granting of Ls of M. has fallen into disuse. See also PRIVATEERS. See II Wharton *International Law* (10th ed.) 1901 and W. E. Hall *International Law* (8th ed.) 1921.

Letterpress Printing, see PRINTING.

Letters, or Epistolary Writing, branch of literature which is but little studied although one of the most delightful forms. A good letter requires to be natural, easy, and well expressed, suited to the nature and requirements of the person addressed. Among the L. of literature those of Mme. de Sévigné occupy one of the foremost places. Among the most famous L. in Eng. literature the first in date are the *Paston Letters* written between various members of the Paston family (afterwards earls of Yorkmouth) between the years 1422 and 1509, and first pub. in 1923. These, not being meant for publication, are frank and natural, and provide an

excellent picture of the times in which they were written. The epistolary form has often been used for didactic purposes, as the epistles of St. Paul and the early Christian teachers, and for political purposes, as in the *Letters of Junius* (1769-72). Other famous collections are *Lord Chesterfield's Letters to his Son* (1774-1787), Sir Walter Scott's *Paul's Letters to his Kinsfolk* (1815), and *Tales of Malachi Malaguerther* (1826), and in more recent times the *Vallima Letters* (1895) of Robert Louis Stevenson. Swift's *Journal to Stella* (1768) is more in the nature of a diary, but his *Drapier's Letters* (1724) are a masterpiece of literary invective. Other famous letter-writers are Cicero, Seneca, Erasmus, Horace Walpole, Pope, Charles Lamb, Mme de Maintenon, Cowper, Jane Welsh Carlyle, and Byron. See G. E. Vulliamy, *English Letter Writers*, 1945.

Letters, or Signs, see ALPHABET; NUMERALS; PHONETICS.

Letters Missive are letters from the sovereign conveying permission or command to some particular person, thus differing from 'letters patent', which are addressed to the public. They are used generally for the nomination of a bishop, and are sent to the dean and chapter with the *comp. d'lire* (q.v.).

Letters of Attorney, see POWER OF ATTORNEY.

Letters Patent, see PATENTS.

Letter-wood, name given to the heartwood of *Brosimum Aubletii*, a species of Moraceæ found in Trinidad. It is chiefly used as a veneer.

Lettow-Vorbeck, Paul Emil von (b. 1870), Ger. general, b. at Saurlohn, in the Saar, eldest child of Gen. Paul Karl von L.-V. (Graduating at Berlin Univ. he was sent out as colonel to Ger. E. Africa in Jan. 1914 to command the colonial troops. During the war (see AFRICA, GERMAN EAST, FIRST WORLD WAR, CAMPAIGN IN) he showed the highest ability, and only surrendered on being informed of the armistice, at Chamberzi, Nov. 14, 1918. His *Reminiscences of East Africa* appeared in Eng. in 1920.

Lettres de Cachet (*lettres closes*) were blank 'letters' signed and sealed by the king of France and issued to governors of prisons. The insertion of a person's name therein was all that was necessary to secure committal to the Bastille or another prison. (Meetings of estates and other bodies were called by L. de C. also.) They were abolished in 1789, though Napoleon used them for a short time.

Lettres Portugaises, see ALCORAZO. MARIANNA.

Letts, see LATVIA.

Lettuce, valuable salad plant which can be produced for use on any day in the year. It originated from *Lactuca scariola*, a native of S. Europe. The cabbage L. is low and cabbage-like, the cos L. comes later in the season and is more crisp, erect, and compact, but these types are widely varied. L. is rich in vitamins (q.v.) and is also an important source of the iodine necessary in human diet for the formation of thyroxin in the thyroid gland.

Letzeburg, see LUXEMBOURG.

Leucadia, or Leukas, anoth. name of one of the Ionian Is., now called Santa Maura, lying off the coast of Acarnania, 50 m. S.W. of Corfu. It is about 20 m. long, with a greatest breadth of 8 m., and has an area of 110 sq. m. The surface rises in rugged limestone heights, from the chalky appearance of which the Is. takes its name of 'Whiteland.' The bold promontory (Cape Duralo) at the S. end of the Is. rises to 2000 ft., and is the legendary scene of 'Sappho's Leap' and the death of Artemisia, queen of Halicarnassus. The chief products are olive oil, currants, and wine. The cap., Amaxikhi, or Santa Maura, lies at the N.E. end. The land was colonised in the seventh century B.C. by the Corinthians, who made it an Is. by cutting a canal through the isthmus which joined it to the mainland. Prof. Dorpfeld identifies it with the Ithaca of the *Odyssey*. See P. Goessler, *Leukas-Ithaka*, 1904, and W. Dorpfeld, *All-Ithaka*, 1927.

Leucemia, see LEUCOCYTHÆMIA.

Leuchars, vil. and par. of Fife-shire, Scotland, 6 m. N.W. of St. Andrews, noted for its R.A.F. airfield. It has a church dating from the twelfth century with a Norman apse and chancel. Pop. 3000.

Leucine, or Aminoisocaproic Acid, (CH₃)₂CH·CH₂·CH(NH₂)COOH, substance found widely distributed in the animal juices, particularly in the pancreas. It is produced by the putrefaction of proteins, and may be prepared from proteins such as casein by hydrolysis.

Leucippus (fl. sixth century B.C.), Gk. philosopher, the contemporary of Zeno and Anaxagoras, and the founder of the Atomistic theory afterwards developed by Democritus.

Leucite, rock-forming mineral, consisting of potassium and aluminium metasilicate, KAl(SiO₃)₂. The crystals often contain such minerals as olivine and augite, as well as other impurities. L. rocks are found widely distributed throughout the globe, especially in the form of lavas in the neighbourhood of Vesuvius and Rome. They are usually rocks which contain felspar but no quartz.

Leucocytes, see under LEUCOCYTOSIS.

Leucocythæmia, or Leucemia, disease characterised by an excessive number of leucocytes, or white corpuscles, in the blood. The enormous increase in the number of these cells resembles that found in cancerous growths. The acute form of lymphatic L. is generally fatal, and is characterised by anæmia, enlargement of the spleen and lymphatics, and softening of the bone-marrow. The chronic form, which is characterised by similar changes in the lymphatics but by a lesser degree of hypertrophy in the spleen, may last for two or three years. Myelogenous L., caused by disease in the bone-marrow, is nearly always chronic. There is no entirely satisfactory treatment for the disease, though good results sometimes follow the application of X-rays or radium to the long bones which contain the marrow and to the spleen. Splenectomy is sometimes tried, though with varying success. (See illustration, p. 404.)

Leucocytosis, increase in the number of white corpuscles above the average number contained in the blood. The white corpuscles or leucocytes act as destroyers of microbes that may have attacked the tissues. They are attracted to any portion of the body where such microbes are numerous, and the need for performance of their functions stimulates the production of leucocytes. It is therefore a symptom of some morbid condition where the production of leucocytes has been unduly stimulated. In normal health the number of leucocytes is from 5000 to 10,000 per cubic millimetre. There are five varieties: the polymorphonuclear cell derived from the bone marrow and constituting 70 per cent of the total number of colourless corpuscles; the

BLOOD FROM A CASE OF LEUCOCYTHAEMIA SHOWING INCREASE IN WHITE CORPUSCLES
Magnified 300 times

eosinophilic cell derived from bone marrow and forming 2 per cent of the whole; the lymphocyte derived from the lymphoid tissue and forming above 20 per cent of the whole; the monocyte, probably a later development of the lymphocyte, and forming 4 per cent of the whole; and the basophile, a cell rarely found in the blood of adults. The functions of the different varieties vary to a certain extent; they probably have varying capacities for attacking the different pathogenic organisms. *L.* is usually associated with an increase in the number of polymorphonuclear cells, although there are allied conditions in which the lymphocytes or the eosinophilic cells may be increased above the average. During the process of digestion and in the course of pregnancy the leucocytes are increased in number normally. After hæmorrhage, during inflammation, infectious diseases, and many toxic conditions varying degrees of *L.* occur. As it does not occur in such infectious diseases as influenza, measles, malaria, typhoid fever, it is possible to have a differential diagnosis on the extent of *L.* In typhus fever, for instance, it is very pronounced and it is an

important symptom in trichinosis, the disease caused by the parasite, *Trichina spiralis*, of the pig. The number of leucocytes in many cases bears a relation to the defensive power of the blood against bacillary invasion, and a steady fall in the quantity of leucocytes is a sign of danger in many diseases. When the number becomes excessive the condition is called leucocythæmia (*q.v.*) or leucæmia. An increase in the number of lymphocytes known as lymphocytosis is a similar condition of the cosmophilic cells is called cosmophilus. The latter condition is characteristic of some forms of insanity. The opposite condition to *L.*, that is, where there is marked absence of leucocytes is called leucopenia.

Leucol, name formerly applied to quinine or its isomer, isooquinoline ($C_{17}H_{19}N$). Both are obtained in the distillation of coal tar and occur in the fraction which lies over between 216° C. and 243° C. Isoquinoline is separated by converting the mixed base into the acid sulphates and subsequently decomposing the sulphate of isooquinoline with caustic solution.

Leucoma, opacity of the cornea or anterior transparent portion of the eye. Its outward appearance is a white patch presented by a firm, cartilaginous thickness to ground glass. According to the position and extent. Its origin may be a certain amount of distortion of vision is occasioned. The opacity is caused by inflammation resulting from injury or infection of the conjunctiva. If the inflammation is below the epithelial layer of the cornea a loss of tissue takes place and the place of the destroyed tissue is taken by a more connective tissue. After the inflammation has ceased the opacity may gradually decrease, but in many cases it persists and then tends to become permanent. Gentle massage of the eyeball may and the disappearance of the opacity may, but in general it is not advised to interfere much with the eye while any trace of inflammation remains. If the lens and retina are undamaged it is sometimes possible to remove the *L.* and to replace it with a graft of transparent cornea obtained from another person. *L.* is to be distinguished from hazy degeneration of the margin of the cornea which occurs in old people as a white opacity in that region.

Leutera, vil in I. coli, ancient Greece, 6 m. from Lichia, famous for the victory gained in its neighbourhood by the Theban under Epaminondas over the Spartans (371 B.C.).

Leuk (fr. Leuch-*la-Ville*), summer resort of Switzerland in the canton of the Valais on the r. b. of the Rhodé, 10 m. N. of Sion. At Leukerbad (Leuch-*les-Bains*) about 10 m. N. of the town, at an altitude of 4629 ft. are hot, saline chalybeate, and sulphurous springs, twenty-two in number. *L.* has now times been destroyed by avalanches, from which it is now protected by a strong embankment. Pop. 2200.

Leukas, see LEECADIA.

Leuthen, vil of Polish Silesia, 10 m. W. of Wrocław, famous for Frederick the

Great's brilliant victory over the Austrians in 1757. Pop 700. See J. Kautzen *Die Schlacht bei Leuthen*, 1901.

Leutholf, Hlob., see LEUTHOLF, JOI.

Leutschau., see LOOS.

Leutze, Emanuel (1816-68), German painter noted for his historical pictures. b. in Gmünd, Württemberg. From 1841 to 1859 he studied art at Düsseldorf (under Lessing), Munich, Venice, Rome and other places. He settled in America and painted some notable historical pictures and some portraits.

Leuven., see LOTUVEN.

Leuwenhoek., see LEUWENHOEK.

Leuzinite, mineral, classed by some geologists as a variety of halloysite. It is a hydrous silicate of alumina and is opaline and translucent.

Levallois-Perret, fin. of the Seine dept., Paris, a suburb of Paris. It has many of motor cars, chemical products and mechanical and electrical engineering. Pop. 11,600.

Levant (from the It. *di Levante* it rises) originally a hebr. as well as a name for the E. meeting the coastland of the Mediterranean from Egypt but now chiefly restricted to the Mediterranean coastland of Asia Minor and Syria. See 1. *Hebr. Levant*. Pop. 1,100,000. and 2. *Levant*. *See II. Levant*.

Levant Company, Eng. company which traded with the Levant from about 1599 to 1840. It was a company under a charter of 1591 which gave it monopoly of the trade with Constantinople and the Levant. It flourished for many years, but its trade was interfered with by the Turks.

Levanter, strong easterly wind prevalent in the W. end of the Mediterranean and in the S. Afr. an coast during the whole of the summer months.

Levant, ex. Couchant, hebr. term used when a wind blows from the E. or E. by N. which have been the prevailing winds for a not less than twenty-four hours. It is long enough to be down and return to bed (*couchant et levé*). The term is used for the right of a field owner to pasture (*Levant et couchant*) by day and by night has little or common practice.

Levee (fr. *lever*, to rise). 1. Morning ceremonial visit to the Emperor of such gentlemen as have the right of entry. The name arises from the fact that the visits were first inaugurated by the King of France who held these receptions in the dressing room. A *Levee* is distinguished from a "drawing room" or court in the land, inasmuch as only gentlemen attend the former. 2. Embankment built to prevent overflowing during floods. The most noteworthy system of Ls. is that of the Mississippi, which covers about 1500 m. The Ls. are controlled by the various bordering states and by a Federal Mississippi B. Commission.

Levee en Masse, see under LEVEE.

Level, word with sev. meanings— one of which may indicate a small instrument or workman's tool for testing the horizontality of a surface, or a more complicated

instrument for obtaining the direction of a line parallel to the horizon, or a still more complicated instrument, used by surveyors and engineers, with many refinements, for determining with great accuracy the relative 'heights' or distances of different parts of the earth's surface from the earth's centre, using, as a matter of practical convenience, an agreed conventional datum, usually that of 'mean sea level' (*q.v.*). The simplest form of L. is the water L., which consists of a length of metal glass, or rubber tubing with each of its two ends bent up at right angles and fitted with a piece of glass tubing—the whole being filled with water, preferably coloured blue or red, and supported as required. The surface of the water will always be at the same level, i.e. in a horizontal line at each end, irrespective of the intermediate divergencies (if any) of the main tube.

The spirit L. is much more commonly used, and is more convenient and accurate. This consists of a glass tube slightly convex on the upper side nearly filled with alcohol and closed at both ends in cases of brass or wood, so that it has a plano and a curve on which it may rest. If the underside of the casing is parallel to a tangent to the centre of the bubble tube the casing will be horizontal. The bubble or air left represents the true surface of the liquid and is at the highest position possible which it can assume in the tube when the surface on which it rests is horizontal. The quantity of spirit L. is directly proportional to the radius of curvature of the bubble tube. A bubble is sensitive in proportion to its length, i.e. the bubble being more than 1 in. in a 10 in. small inches may be varied by 1/1000 of an inch. The bubble is held in position by a piece of rubber tubing, and is held in position by a piece of rubber tubing, and is held in position by a piece of rubber tubing. For surveying purposes the L. is much used in combination with a spirit level. A surveying instrument in which the L. is used in combination with a spirit level is a surveying level. The L. is a telescope in which the L. is mounted horizontally on a tripod. The instrument is somewhat in construction to the alidade; the bubble by which the instrument is brought into position at right angles to the axis of the earth is usually placed at the top of the telescope. But sometimes at the side and viewed through a narrow, hinged mirror. In all telescopic levels, it is necessary to have a reference mark to which all observations can be referred. This consists of a glass diaphragm in the true plane of the instrument, having vertical and cross lines engraved thereon. To obtain the difference of L. between two points A and B the levelling instrument is placed at a suitable place between the points, the heights at which the horizontal line of sight is cut off by a graduated levelling staff held at A and B are read off, and the difference gives the difference of L. between A and B.

The many types of surveyors and engineers' Ls. may be divided into three categories, namely, (1) dumpy Ls. (2)

'Y'-Ls., and (3) other reversible Ls., the last class including precision Ls. The dumpy L. has been deservedly popular since Gravatt introduced this form in 1848, for its traditional simplicity and stability. Amer. and continental surveyors have long favoured the Y-L., in which the telescope is removable and reversible end for end, and can be rotated also about its optical axis. The various loose parts were a serious drawback, but the Kern L. is still used considerably in America. Among reversible Ls. may be cited those of Cushing & Cooke, and the Swiss, Heinrich Wild, who developed the well-known Zeiss L. Each of the well-known Eng. makers has made advances in details of construction in surveying instru-

W. F. Stanley & Co. Ltd

12-IN. ENGINEER'S PRECISION LEVEL

ments, so that it is impossible to describe any one instrument as the 'best' for all purposes, nor is it possible to illustrate them all. The illustration above is a dumpy L., the optical axis of which is permanently fixed at right angles to the vertical axis. When the axis of the instrument is correctly verticalised by means of the levelling screws, if it is revolved its optical axis or line of collimation will describe a L. plane. The telescope body and centre are of hard gun-metal, of great strength and rigidity, in a single casting. The telescope is internal focusing. The long spirit-L. is of a sensitivity of 20 sec. per one-tenth inch and fitted in a special manner to avoid strain and distortion from changes of temp. The levelling arrangement is three-screw, each screw fitted with dust-covers, etc. The quick-setting arrangement is fitted with patent ball joint and setting index, and saves much time in setting up and wear on the screws. The glass diaphragms are engraved, of various patterns, with stadia for measuring distances. The tripod stand usually supplied is the solid round-form mahogany, with specially constructed head for hard wear. In the precision or tilting-L., the line of collimation is adjustable with respect to the vertical axis and the instrument has to be levelled by a special individual screw at every sight. For convenience the bubble tube is fixed at the side of the telescope and can be read either with a hinged

mirror or with a special prism reading device in which views of the opposite ends of the bubble are brought together in coincidence. These views of the bubble only exactly coincide when the instrument is correctly levelled. This device eliminates all parallax and makes a more accurate reading possible. The levelling screw of this instrument is so graduated as a gradient screw for setting out gradients. One complete turn of the gradienter screw tilts the telescope through the stadia intercept, i.e. 100. The drum is divided into 100 parts, giving a reading of 100 direct, and by estimation 0.1. The gradienter screw can also be used for the measurement of distances which are too great to be measured with the diaphragm stadia.

Where S = length of staff traversed by the centre line of the diaphragm,
Distance $= 100 \times S$

Drum revolutions

See also SURVEYING AND LEVELLING

Levellers, ultra-republican political party in England during the Civil war. Powerful in the Parliament during the early years of the Commonwealth, they advanced their views on religious toleration and democratic government in numerous pamphlets, the most noteworthy being by their leader John Lilburne (*q.v.*). The *Agreement of the People* is a noteworthy essay in democracy, and foreshadows many later developments in Eng. government. They were dissatisfied with the autocratic form of government estab. by Cromwell after the death of Charles I., and in 1649 broke out into a mutiny, suppressed by Fairfax. See T. C. Pease, *The Leveller Movement*, 1916; G. P. Gooch, *English Democratic Ideas in the Seventeenth Century*, 2nd ed., 1927; A. S. P. Woodhouse (ed.), *Puritanism and Liberty*, 1938; W. Haller and G. Davies (eds.), *The Leveller Tracts, 1641-1651*, 1944; W. Schenk, *The Concern for Social Justice in the Puritan Revolution*, 1948.

Levelling, see SURVEYING AND LEVELLING.

Leven, Earl of, see LESLIE, ALEXANDER.

Leven, tn. at the mouth of the L. of Forth, Fife-shire, Scotland, 9 m. N.E. of Kinkaidy. It is a health resort and has fine golf links. The chief industries are rope-making, flax-spinning, and linen-weaving, and there are breweries, foundries, and collieries. The earl of L. takes his title from this tn. Pop. 7000.

Leven, Loch: 1. Lake in the co. of Kinross, Scotland, has an area of 6½ sq. m., and is 11 m. in circuit. The surplus waters are discharged by the R. L. It contains seven is., on one of which, Castle Is., are the ruins of L. L. Castle in which Mary Queen of Scots was imprisoned (1567-68). A causeway just under water connects the is. with the W. bank. St. Serf's, the largest is., contains the ruins of an old priory. It has famous trout fisheries. 2. Sea-loch forming the boundary between Argyll-shire (S.) and Inverness-shire (N.), Scotland, between Bullachullish (*q.v.*) and Kinlochleven.

Levenshulme, tn. in S.E. of Lancashire,

England, 3 m. from Manchester. The chief manufs. are cotton and woollen goods and machinery, and there are calico-printing factories and bleaching works. Pop. 22,000.

Lever, Charles James (1806-72), Eng. novelist, b. in Dublin of Eng. parents, his father being an architect. He was educated privately and at Trinity College, Dublin, where he took a degree in medicine. He forsook medicine for literature when, in 1837, his first novel *Harry Lorrequer* appeared serially in the *Dublin University Magazine* and was immediately successful. He later became editor of the magazine, and gathered round him the Irish wits and writers of the time. He is chiefly remembered for his rollicking tales of Irish life, such as *Jack Hinton* (1834), *Charles O'Malley* (which is also concerned with the Peninsular war, 1840), and *Arthur O'Leary* (1844). In later life he lived on the Continent, was Brit. consul at Spezia, and died while at Trieste.

Lever, Sir William Hesketh, see LEVERHULME, VISCOUNT.

Lever: 1. Great, tn. in Lancashire, 14 m. S.E. of Bolton, has coal- and iron-mines, and manufs. chemicals. Pop. 5000. 2. Little, tn. 3 m. S.W. of Bolton, Lancashire, has cotton mills, bleaching yards, and collieries. Pop. 5000.

Lever, rigid bar which turns about a point called the fulcrum. The parts of the bar on each side of the fulcrum are called the arms. The principle of the lever was estab. by Archimedes. By applying force at one point on the L., a weight is raised or resistance overcome at another point. There are three classes of Ls., according to the position of the fulcrum in regard to the power and weight: (1) Where the fulcrum is between the power and weight; to this class belong the crow-bar, a poker in the bars of a grate, the handle of a pump, etc. The bascules of the Tower Bridge are of this class, the visible portion representing an arm of the L. (2) Where the weight is in the middle; to this class belong a wheelbarrow, nutcrackers (a double L.), etc. (3) Where the power is in the middle; to this class belong the treadle of a loom, a pair of tongs, etc. In a L. the power multiplied by its arm, or distance from fulcrum, is equal to the weight multiplied by the arm. If the force applied to the L. is less than the resistance of the weight, the L. is said to work at a mechanical advantage, if vice versa, at a mechanical disadvantage. Ls. of the first class may work either at an advantage or disadvantage, or the force may be exactly equal to the weight. Ls. of the second class always work at an advantage, and those of the third class always at a disadvantage, though there is the advantage in the last class that the object moved is moved through a greater space than the power. In bent Ls. the perpendicular distance from the fulcrum to the meeting-place of the lines of direction of the forces is taken for calculation. Compound Ls. are those in which the short arm of one acts on the longer arm of another, as in drawbridges, testing-machines, etc. The three types of Ls. above de-

scribed abound in all mechanism, though very often in a disguised form.

Leverhulme, Sir William Hesketh Lever, first Viscount (1851-1925), founder of Port Sunlight, b. Sept. 19 at Bolton, Lancashire, a son of a grocer. L. extended his father's business to Wigan in 1877. When soapmakers tried to raise the wholesale price he was paying them for the soap he was wrapping and selling as 'Sunlight Soap,' he bought soap works at Warrington, engaged an experienced soapmaker (called Winsor) as his servant there, and devoted himself to making, advertising, and marketing his own soap. He prospered so fast that his enlarged sphere, named Port Sunlight, on the Wirral peninsula, was inaugurated in 1889. There he began what he called prosperity sharing, in lieu of profit sharing, that is to say, the employee was housed on the estate at an uneconomically low rent and had other like payments in kind, and was thus bound to the interests of the firm of Lever Brothers (James Darcy L. was the brother in partnership). After many attempts L. entered Parliament in 1906 as Liberal member for Wirral. But he did not stand again, and ceased to be M.P. in 1910. He bought the lease of Stalford (now Lancaster) House in 1913 and presented it to the nation for the London Museum. Ennobled in 1917, he took the title of Leverhulme. In 1918-20 he acquired the rs. of Lewis-with-Harris and tried developments in Lewis that did not succeed; he yielded much of his property there to the inhab. See life by his son, the second Lord L., 1927.

Leverkusen, tn. of the Rhineland, Germany, N. of Cologne, noted for chemical industries, iron works, and the manuf. of machinery and textiles. Pop. 50,000.

Leverrier, Urbain Jean Joseph (1811-77), Fr. astronomer, b. at St. L6, Normandy. In 1846 he was admitted to the Academy. His most notable work was the inference of the existence of the planet Neptune, and his calculation of the point at which it would become visible. It was discovered in the position by the Ger. astronomer Galle. In 1849 he was elected to the Legislative Assembly and was made a senator by Louis Napoleon in 1852. In 1854 he became director of the observatory of Paris.

Leveson-Gower, Francis, see ELLESMERE, EARL OF.

Leveson-Gower, George, see GRANVILLE, EARL OF.

Leviathan, name of a reptile that occurs five times in the O.T., viz. Ps. civ. 25-6, Ps. lxxiv. 11, Isa. xlvii. 1, Isa. li. 9, Job xli. In the last place a description is given. In all cases but that in Ps. civ. the term is usually explained as referring to the crocodile, and, this animal being known to the Israelites chiefly from the crocodiles of the Nile, it was often used as the symbol of Egypt (Is. xl.). Some have seen in L. and Behemoth legendary creatures combined from various Egyptian and Babylonian myths. (See illustration, p. 108.)

'Leviathan,' name of, at one time, one of the world's largest ships formerly

called the *Laterland* and built in Germany in 1914. It was bought by U.S. Lines in 1922 and operated as *President Harding* but proved uneconomical. In 1939 a Belgian company purchased her. As the *Ville de Bruges* she was sunk by a Ger submarine in Feb 1940. Her tonnage was 29 957 dimensions 907 x 100 x 53 ft (5 ft shorter than the Brit *Majestic*, and if measured according to Brit mercantile rules the tonnage would be 51,252 while that of the *Majestic* if measured by Amer rules would be 61.06 instead of 56 621). Also the name of a Brit light fleet carrier, launched in 1941, of 15 000 tons displacement and carrying forty four aircraft.

Levico, tn in the Tyrol Austria 10 m S.E. of Frient. It is much frequented for its mineral springs. Pop 7000.

BIHEMOTH AND LEVIATHAN

William Blake's concept of the illustration of the Book of Job

Levin, prin tn of lower Manawatu dist., N Is New Zealand situated on the W coast 59 m N of Wellington by rail. It is the centre of a flourishing dairy industry. The neighbouring Tararua mts & numerous trout streams and rivers and bathing beaches make it a well known sports centre. The Hotoewenua College is the prin educational institution. Pop 4000.

Levis, or Point Levi, tn cap of L co., Quebec Canada, on the S shore of the St Lawrence. It has a ferry and a rail road bridge to Quebec. It is fortified has fine docks great shipping trade and considerable manufs., including iron ship-building and saw mills. Pop 11 900.

Levison, Wilhelm (1876-1947), Ger historian & authority on the hist of N.W. Europe, particularly of N England during the seventh and eighth centuries. Formerly prof of medieval hist at Bonn Univ, he was dismissed under the National Socialist regime and came to England in 1933 to continue his studies at Durham Univ., of which he was elected honorary fellow in 1939. The Ford lectures delivered by him at Oxford Univ in 1913 were pub in 1946 with the title *England*

and the Continent of Europe in the Eighth Century. A comprehensive selection from his works in Ger, Fr, and Eng was pub in Düsseldorf in 1947 entitled *499 Rheinischer und Frankischer Frühzeit*. L was also a Lat scholar, a language in which he composed many of his writings.

Levita, Elias (1485-1549) celebrated rabbi, philologist, critic and poet. He spent most of his life in Rome and Venice, and had a wide circle of friends there. His works are on the Psalms, Job, Proverbs, Amos & Lamentations and Lamentation dictionary and a Heb grammar. See also by J Levy.

Levites, Israelitish tribe whose origin is traced from Levi the son of Jacob and Leah. Levi is considered by some critics as merely the ponum of the priestly caste and some have entirely denied the existence of the tribe as a tribe. On account of the attack made on Simeon by Simeon and Levi these two tribes were not given a portion of the territory in Canaan, but were scattered throughout the country. The hist of the tribe is complicated by the gradual development that took place among the Levites in the function of an exclusive priesthood and a single sanctuary. Deuteronomy (X, 8 and XXI, 17) speaks of the separation of the tribe from the rest of the tribes for the work of bearing the ark for the ministry of Yahweh and for the dealing of controversies. But the lateness of this view is shown by the contemporary injunction that the Israelites should erect a single sanctuary on taking possession of Canaan. The Priestly Code in Leviticus and Numbers distinguishes the tribe from the family of Aaron in particular. These last constituted the priesthood while the Levites did to them and had charge of the sacred ornaments. They were not allowed to offer sacrifice.

Leviticus, the third book of the Pentateuch, belongs almost entirely to the stratum known as P (see HEBREW). It is concerned chiefly with legislation regarding the priestly functions. Chapters I-VII deal with the Laws of Sacrifice and with certain priestly regulations. Chapters VIII-XI deal with the consecration of priests and Chapters XII-XVI with the Laws of Purification and Atonement. The section consisting of Chapters XVII-XXVI is known as the Law of Holiness and stands apart from the preceding chapter and is derived from a different source probably another body of priestly legislation. It is marked off not only by its differences in style but also by its rigid and frequent insistence on the necessity of holiness.

Levkas, see LEUCADIA

Levkosia, or **Leikosia**, see NIOBSIA

Levuka, tn on Ovalau Is., was until 1882 the cap of the Fiji Is (qv).

Levy, Hermann Joachim (1881-1949), Ger economist and sociologist, b in Berlin, became a naturalised Brit subject, 1946. Son of a retired textile manufacturer, he was educated at Munich Univ where he took up the study of economics. After lecturing at Halle for some years he became a prof at Heidel-

berg Univ. During the First World War he worked in the Ger. Admiralty, but after the war returned to economics, paying special attention to industrial cartellisation. In 1918 he became prof. at the Technische Hochschule, Berlin. Essentially a lover of peace L.'s life in Germany became ever more difficult, and in 1935 he came to England, where he soon estab. himself as a leading economist in industrial assurance. His first pub. was *Large and Small Firms* (1911); his next *Economic Liberalism* (1913). His *Industrial Germany* (1935) was an acute analysis of collectivism and monopoly as opposed to free competition, and in *The New Industrial System* (1936) he gave a survey of the tendency in Britain towards large industrial units. *Industrial Insurance*, pub. in collaboration with Sir Arnold Wilson in 1937, attacked the companies and societies engaged in industrial insurance, advocating strongly the extension of National Health Insurance arrangements to cover death benefits, while in *National Health Insurance* (1945) he proposed alternatives to the proposals of the Beveridge Report. In his *Retail Trade Associations* (1942) and *The Shops of Britain* (1948) he argued for state control of both industrial combinations, and retail trade associations.

Levy (fr. *leve*, from *lever*; Lat. *levare*, to raise), collection of a body of men for compulsory military or other service in times of national emergency. The L. is usually restricted to class, e.g. to men between certain ages, but in times of great danger a *levée en masse* may be enforced, when all able-bodied men are required to serve in person, either for purposes of defence or offence. The word L. is also used as a synonym for *raising taxes*.

Lévy-Bruhl, Lucien (1857-1939), Fr. philosopher, b. in Paris. Educated at the Lycée Charlemagne and at the École normale supérieure, he became a lecturer at the latter institution and then at the Sorbonne (1899). He was later a prof. at the Univ. of Paris. His works include *L'idée de responsabilité* (1884); *L'Allemagne depuis Leibnitz* (1890); *History of Modern Philosophy in France* (Eng. trans., 1899); *La Philosophie d'Auguste Comte* (1900); *Les Fonctions mentales dans les sociétés inférieures* (1910); *La Mentalité primitive* (1921); *L'Âme primitive* (1927), and *Le Surnaturel et la nature dans la mentalité primitive* (1931).

Levy-Lawson, Sir Edward, and Sir Harry Lawson Webster, see BURNHAM.

Lewanika (c. 1840-1916), paramount chief of the Barotse of N. Rhodesia from 1875 to 1916. His real name was Robosi, the 'escaped one,' because he was b. when his mother was fleeing from the Makololo; 'Lewanika' was merely an adopted name. He was of distinguished descent, being a grandson of Marumbwa, a famous Barotse chief. He succeeded to, or rather usurped, a kingdom comprising some twenty large African tribes, to which the Portuguese governors of Angola to the N. of Barotseland had given the name Marotse-Mambunda. L. was in exile when, heading

a revolution against his cousin King Sebeke, he obtained the throne and, finding that the cap. Sebeke was still a storm centre of rival factions, set up his seat of gov. at Lealui on the Zambezi in the N. Among the chief influences for good in his career as by far the most successful of Barotseland's rulers was the work of such Protestant missionaries as François Collard and Arnot. But L. was by nature a lover of the arts of peace and a social reformer even though he was also a doughty tribal fighter and a fine hunter. In 1885 he was ousted from the throne through the treachery of Mathaha, a counsellor who had poisoned L.'s mind against his supporters and so forfeited their confidence. Mathaha now put Tatira, a youth, on the throne as a puppet king and wielded the chief power himself. But L. returned at the head of an army and, in a battle in which Mathaha and most of the chiefs on both sides were killed, regained his throne. He seems to have pardoned some of the rebels, but Tatira and a great many others, of both sexes, were put to death. His reforming zeal was shown in the abolition, by 1893, of trial by ordeal and witchcraft at his cap. Slavery, however, was only stamped out after L. had sued for and obtained Brit. protection. Realising that he would be always beset by enemies both at home and abroad, L. made a treaty with the Brit. representatives, but the first Brit. resident commissioner (Major—afterwards Sir—Robert Coryndon, a member of Rhodes's staff) did not arrive until seven years later (1897). In 1902 L., accompanied by Col. Colin Harding, who had organised the Barotse police, visited England for the coronation of Edward VII. He was quick to appreciate the difference between those who only received him as a king and those who welcomed him as a friend. What unquestionably impressed him on this visit was to see 'what respect there was for God and His Law,' and though L. never actually declared himself a Christian he was by nature a devout man and allowed Lilia, his son and successor, to be baptised as a Christian. L. and his people were intensely loyal to the allied cause in the First World War, but the strain of the time adversely affected his declining health and he died on Feb. 4, 1916, his burial being conducted with immense pomp, according to all the Barotse traditions. See H. Marshall Hole, *The Passing of the Black Kings*, 1932; Lt.-Col. C. Harding, *Far Bugles*, 1932; and C. W. Mackintosh, *Lewanika*, 1942.

Lewes, George Henry (1817-78), Eng. author, b. in London, began to contribute to the *Edinburgh* and *Quarterly* reviews in 1840, and continued to do so for many years. He pub. a *Biographical History of Philosophy* in 1845-46, and in 1855 brought out his *Life of Goethe*, which became a standard authority on 'the subject both in England and in Germany. His *Physiology of Common Life* appeared in 1859-60 and *Problems of Life and Mind* in 1878. For a short time (1865-66) he was editor of the *Fortnightly Review*. In 1861 he met Mary Ann Evans, later famous under

the pseudonym of 'George Elliot,' with whom he lived until his death.

Lewes, municipal bor. and the cap. of the co. of Sussex, England, situated on the navigable Ouse, 41 m. S. of London. It is of great historical importance, Henry III. having been imprisoned by Simon de Montfort in the castle, the ruins of which still exist. There is a sixteenth-century grammar school. Pop. 11,900.

Lewes, Miss of. The proclamation by Henry III. after his defeat at Lewes (1264), that he would abide by the Provisions of Oxford and would place himself under the control of a privy council whom Parliament should elect.

Lewin, William Charles James, see TERRIS, WILLIAM.

Lewis, Alun (1915-44), Welsh poet, b. near Aberdare, and educated at Cowbridge Grammar School, the Univ. College of Wales, and Manchester Univ. He entered the army in 1940 and was commissioned in the S. Wales Borderers with which regiment he served in India and Burma. He was accidentally killed while in Burma in March 1944. His austere sense of vocation as a writer and his disciplined style of writing marked him out as a poet of great promise, as shown by his first pub. vol. of poems, *Raiders' Dawn* (1942). This was followed by *Ha! Ha! Among the Trumpets*, a vol. prepared by him and pub. posthumously in 1945 with an introduction by Robert Graves. L.'s poetry is most successful in its realistic and humane approach to life, tempered with a fine idealism, and formed with integrity and discipline. His sense of realism also found expression in a notable collection of short stories, *The Last Inspection* (1943). A number of his letters from India were pub. in 1919, together with six short stories under the title *In the Green Tree*.

Lewis, Cecil Day (b. 1904), Eng. poet, was educated at Sherborne and Wadham College, Oxford. He was for eight years a schoolmaster, and worked in the Ministry of Information during the Second World War. Before the war he concentrated upon a technique which was much influenced by Irish ballads and by Thomas Hardy, and in which he wrote some pastoral love poems of a high standard. Some of his best introspective poetry was contained in *O Dreams, O Destinations*, a sequence of sonnets on childhood. The war proved a period of reorientation in which he, with contemporaries like MacNeice and Spender, suffering from uncertainty as to the purity of the ideals for which it was fought, called upon, in his own words, to 'defend the bad against the worse.' A similar uncertainty about his own feelings, as in the series of poems inspired by his service in the Home Guard, inevitably meant a loss of power, though they include much fine writing. His works include *A Time to Dance* (1935); *Collected Poems, 1929-33* (1938); *A Hope for Poetry* (1938); *An Anatomy of Oxford* (with C. Kenby, editor, 1938); *Overture to Death* (1938); *Poems in Wartime* (1940); trans. of Virgil's *Georgics* (1940); *Word Over All* (1943);

Poetry for You (1945); *The Poetic Image* (1947); *Poems, 1913-47, 1948*; and *Collected Poems, 1929-38* (1949).

Lewis, Clive Staples (pseudonym of Clive Hamilton) (b. 1898), son of a Belfast solicitor, was educated at Malvern College, privately, and at Univ. College, Oxford, where he became a lecturer in 1924. In 1925 he was elected fellow and tutor of Magdalen College, Oxford. The awakened interest in religion and philosophy is reflected in his works: his *Pilgrim's Regress* (1935) is an allegorical apology for Christianity, reason, and romanticism, and his *Allegory of Love* (1936) a study in medieval tradition. *Out of the Silent Planet* and *A Preface to Paradise Lost* followed these in 1938 and 1942; but his outstanding book is *The Screwtape Letters* (1942), in which again, through the medium of allegory, he exposes the shams and follies of this age. 'Screwtop' is the devil's advocate who instructs his nephew, Wormwood, in the art of leading human beings into temptation and claiming them from Our Father Below. Wormwood, fixing on a convert to the Christian faith, tempts him at all points. The victim meets superficially intellectual people, witty sceptics who flatter his vanity; he falls in love only to find his attention wanders during prayer. At the close of this parable he displays unconscious heroism in an air raid and thus passes beyond the tempter to find himself in heaven. In the course of his parable L. restates the fundamental truths of religion by showing them in reverse and thus exposing false ideas, while at the same time he delivers attacks on current fashions in so-called Christian doctrine, such as 'the historical point of view.' The book is notable for its originality and wisdom. As an allegory it succeeds in conveying the basic truth about the nature of goodness, the meaning of worship, and the relationship between God and man. In an age of materialism and world wars L.'s works are a valuable contribution to religious thought besides making clear the essentials of Christian philosophy. Other later works by L. include *The Personal Heresy* (with E. M. W. Tillard, 1939); *The Problem of Pain* (1940); *Christian Behaviour* (1943); *The Great Divorce* (1945); and *Warbles* (1947).

Lewis, Dominic Bevan Wyndham (b. 1891), Welsh writer. As a young man he was intended for the law, but his career in this direction was interrupted by the First World War. He served with the Infantry in France and Macedonia, and was invalided out in 1918. He decided to enter journalism, and in 1919 joined the staff of the *Daily Express*, his contributions to which made his reputation as a satirically witty writer and deserving a place in the line of great Eng. humorists. He left the *Daily Express* in 1924 and has since written for the *Daily Mail*, the *Sunday Referee*, and other papers. In recent years he has also contributed to the *New Chronicle* under the pseudonym of 'Timothy Shy.' In addition to his humorous writings, L. is a Fr. scholar and historian, having pub. studies of François

Villon (1928) and Ronsard (1914), also biographies of Louis XI, of France (*King Spider*, 1930) and of Charles V. (*Emperor of the West*, 1932). His essays and occasional writings have been collected in a number of vols., including *A London Farrago* (1922); *At the Sign of the Blue Moon* (1921); *At the Blue Moon Again* (1925); and *On Strawn and Other Conceits* (1927). He trans. Burchey d'Aureville's *Anatomy of Dandyism* in 1928, and in collaboration with Charles Lee compiled an anthology of 'bad verse,' entitled *The Stuffed Owl* (1930).

Lewis, Sir George Cornwall, second Baronet (1806-63), Eng. statesman. From 1855 to 1858 he was chancellor of the exchequer, and in the following year became home secretary (1859-61), and then secretary of state for war (1861-63), which latter office he accepted against his will. He was editor of the *Edinburgh Review* from 1852 until 1855, and he was the author of many books, the most valuable of which is *Essays on the Administration of Great Britain from 1783 to 1839* (1861). His *Letters* were ed. in 1870 by his brother Gilbert, who succeeded him in the baronetcy.

Lewis, Sir George Henry (1.3. 1911), Eng. solicitor of Jewish extraction, b. at Holborn. He became a member of the firm of L. & L. He soon distinguished himself as an advocate in police court cases, and the reputation he obtained soon made the firm famous. In almost every important case he was consulted by one side or the other, and he soon became more distinguished for the cases he kept out of court than for those he fought. He was a personal friend of King Edward VII. and a popular figure in general society.

Lewis, John Llewellyn (b. 1880), Amer. labour leader, b. at Lucas, Iowa, and educated at public schools. Between 1909 and 1917 he was active in promoting the United Mine Workers of America and the Amer. Federation of Labour, and was elected president of the United Mine Workers' Union in 1920. Founder and leader of the Congress of Industrial Organizations, he organised mass unions in place of the more restricted 'craft unions' of the older system. In the presidential election of 1911 he urged Amer. labour to support Willkie, declaring his intention of resigning if Roosevelt were re-elected, his assumption being that Roosevelt was leading the country into war. The result was that he split the ranks of the C.I.O. and ensured Roosevelt's return in triumph. He accordingly resigned from the presidency of the C.I.O., but continued to exercise a strong influence on Amer. labour as president of the Mine Workers' Union.

Lewis, Matthew Gregory (1775-1818), Eng. author, b. in London, was attaché to the Brit. embassy at The Hague in 1791, and in the following year pub. *The Monk*, which attracted much attention and made its author famous. He wrote plays and poems, and his *Castle Spectre* ran at Drury Lane for sixty nights. His *Life and Correspondence* was pub. in 1839.

Lewis, Meriwether (1771-1809), Amer. explorer, b. in Virginia; was the first

(with Wm. Clark) to explore the Amer. continent from St. Louis to the mouth of the Columbia R. in the Pacific (1804-6). See O. L. Wheeler, *The Trail of Lewis and Clark*, 1901.

Lewis, Sinclair (b. 1885), Amer. author, b. at Sauk Centre, Minnesota. Graduating from Yale Univ. in 1907, he worked for a time as a newspaper reporter and then in various editorial capacities with some Amer. book-publishing firms. In 1914 appeared his first novel, *Our Mr. Wrenn*, followed by a number of others, none of which had any marked success. But in 1920 there appeared his *Main Street*, which rapidly became a 'best seller.' It was recognised that here was a new force in Amer. literature, a satirist of the first order, who saw his country men with clear eyes. The book brought in more money to the fortunate author than he ever dreamed possible, and from then on he felt free to do the work he was all along assured was in him. In 1922 appeared his *Babbalanza*, which gave Amer. a new term, one with which to describe the self-satisfied Rotarian type of Amer. business man. *Martin Arrowsmith*, a picture of the medical profession, appeared in 1921. In 1927 appeared his *Elmer Gantry*, a savage satirical picture of the professional religious revivalists. *Dodsworth* (1929) was the fruit of his numerous trips to Europe. L.'s position in literature was consolidated when, in 1931, he was awarded the Nobel prize. His other novels include *Ann Packers* (1933); *It Can't Happen Here* (1935); *The Prodigious Parrot* (1938); *Bethel Merridew* (1910); *Godson Plunish* (1913); *Cass Timberland* (1915); *Kingsblood Royal* (1918); and *The God-Sacker* (1919). See study by C. van Doren, 1933.

Lewis, Windham (b. 1884), Eng. painter and author, b. in America and educated at Rugby and in the Slade School. As an artist he achieved fame as the leader of a school of abstract painting, known as Vorticism, and founded and ed. a periodical in support of the movement entitled *Blast*. His work is represented in the Victoria and Albert Museum. His chief novels include *Tarr* (1918) and *The Apes of God* (1930). He rejects psychological analysis in favour of a series of satirical grotesques and a simplified exteriority, but he is inclined to inflate his language in an attempt to achieve massiveness, while his conception of satire, lacking the positive standards of a Swift or a Rabelais, tends to become the expression of personal exasperation. Other books are *The Art of Being Ruled* (1926); *Palface* (1929); *Hitler* (1931); *Snooby Baronet* (1932); *The Revenge for Love* (1937); *Blasting and Bombardiering* (1937); *Count Your Dead* (1937); *The Mysterious Mr. Kull* (1938); and *The Hitler Cult* (1939).

Lewis & Co., John see JOHN LEWIS PARTNERSHIP.

Lewis, or Lewis-with-Harris, northernmost and largest is. of the Outer Hebrides, off the W. coast of Scotland, from which it is separated by the Minch, 30 m. wide. Length, N. to S., 60 m.; greatest breadth,

30 m area 770 sq m. Lochs Reservoir and Scutworth divide it into 1 or the N and Harris on the S. The coast is much indented, having Loch Finisort and Broad Bay on the E and Loch Port on the W, while on the N the headland of the Butt of Lewis rises to 80 ft. Much of the surface is rugged and two peaks, Meallaval and Lu Mor, reach 1700 ft, but large tracts are swampy, and there is much peat and wet forest remains. There are many Druidic remains and ruined forts. Chief industries are cattle breeding, fishing and kelp making and the weaving of

as that of the Hotchkiss gun. The wear on the barrel through over heating and the rush of gas which forces the bullet up the barrel is great and a cooling system is provided by means of flanges radiating from the barrel and enclosed in a tubular cover.

Lewisham, suburb of London and a port and metropolitan borough since 1888, situated in Kent, 6 m S S E of Charing Cross. It returns three members to Parliament. Pop. 219,900.

LEWIS GUN, LIGHT PORT, 1.5 INCHES

Harris tweed. Only 5000000 lbs are grown. Snowy is the only 1.5 in. Lewis Gun, invented in 1841, in 1841-1842 when Lord Leverhulme built it with the idea of developing it as a weapon, but the scheme was abandoned.

Lewis Gun, light port 1.5 in. gun, introduced into the British Army in the First World War and used as an infantry weapon. Like the Hotchkiss gun it is an automatic firearm, and the intensity of fire is its primary function. Continuity of fire is controlled by attaching the striker to some member of the moving parts, the completion of whose forward movement is properly timed. The bullet is fired by the striker passing through a hole in the face of the bolt. The gun is fed by a circular magazine fixed horizontally over the mechanism and holding forty-seven rounds. The weight of the gun (without mounting) is 26 lb., about the same

as that of the Hotchkiss gun. The wear on the barrel through over heating and the rush of gas which forces the bullet up the barrel is great and a cooling system is provided by means of flanges radiating from the barrel and enclosed in a tubular cover.

Lex Loci, phrase used in private international law on the extraterritorial application of legal rights (*lex loci*) to denote the principle in which the law of one country is applied to decide cases tried by the tribunals of another country. *L. l. rei sita* denotes the principle on which questions relating to real property are decided by the real property law of the place where the property is situate; *L. l. actus* denotes the law of the place where a legal transaction took place. The principal species of the *L. l. actus* are the *L. l. contractus*, or the law of the place where a contract was made, or its terms finally agreed upon; *L. l. delicti commissi*, or law of the place where a civil injury was committed; *L. l. tut.* or law of the place where a contract was to be performed. The abbreviated term, *L. l.*, is generally appropriated to the *L. l. contractus*. The general presumption is that, in the absence of express terms to the contrary, a contract is to be performed at the place where it is made, and that its nature, the interpretation of its terms, and its validity generally are to be determined by the laws of that place, and where, therefore, a place of performance is specified the law of that place will govern the interpretation and validity of the contract and not the *L. l. contractus*; and where the law of the place of performance and that of the place where the contract was entered into differ, it is presumed that the parties intended the contract to be governed by the principles of the former. In the case of actions in Eng. courts on bills of exchange, the net results of the Bills of Exchange Act, 1882, is that the law of the place where an act is to be done is to govern the performance of that act, e.g. in the case of a bill drawn in France and accepted in England and payable in Germany, Fr. law governs the drawing, Eng. the acceptance, and Ger. the payment.

Lex Talionis, law of retaliation, which finds expression in the Moslem dispensation of an eye for an eye, etc. Something of the principle is to be found underlying Bentham's celebrated *Theory of Punishment*. Whether punishment in kind does most adequately fit the crime depends on whether one's individual theory of punishment is vindictive, retributive, deterrent, morbid, or otherwise. *L. T.* in modern international law includes (a) *amicable retaliation*, or retaliatory acts corresponding to legal but discourteous acts of another nation (called also *retorsion de droit*), and (b) *vindictive retaliation*, or *retorsio facti*, i.e. belligerent acts in kind.

Ley, Robert (1890-1915), Ger. Nazi

politician, b. at Niederbreidenbach in Hesse. He took a degree in chem. at the Univ. of Bonn and served in the First World War, being taken prisoner in France. He joined the National Socialist party in 1921 and represented it in the Reichstag in 1932. When Hitler came to power L. was given the task of abolishing the trade unions and setting up in their place a labour organisation with himself at the head. In this capacity he was responsible for directing the labour needs of the Ger. war machine both before and during the Second World War. On May 16, 1945, he was captured by Amer. troops and eventually stood his trial at Nuremberg as a war criminal. During the trial, however, he managed to commit suicide by hanging himself. He was notorious for his violent anti-semitism.

Leyburn, par. and mklt. tn. of the N. Riding of Yorkshire, England, 7½ m. S.W. of Richmond, near the L. b. of the Ure. Pop. 7,000.

Leycesteria formosa, Himalayan Honey-suckle, or Flowering Nutmeg, hardy deciduous shrub with handsome racemes of white or purple flowers, succeeded by purple berries which are eaten by game birds. A variety has pretty variegated leaves.

Levden, Lucas van (1491-1573), see LUCAS VAN LEYDEN

Leiden, or **Leyden**, city of Holland on the Old Rhine, 6 m. from the sea, 17 m. from Rotterdam and with canal communication to both Rotterdam and Amsterdam. It is an ant. tn. Its weaving establs. were very important at the end of the fifteenth century, and L. baize and L. cloth were familiar terms. These industries have declined, and linen and woollen manufs. are the most important; there is also a considerable transit trade in butter and cheese, and the tn. is a centre of the bulb-growing industry. But in spite of these industries L. is essentially an academic tn. and contains the most important univ. of Holland. It was founded in 1575 as a reward to the inhab. for their courageous defence against the Spaniards in 1574, and was for a long time one of the most famous schools of Europe, numbering among its profs. Schomius and Grotius. Connected with the univ. is a library containing over 190,000 vols., and some very important oriental and Gk. MSS.; the botanic garden, founded in 1587; the observatory (1566); the museum of natural hist.; and the Egyptian museum. Pop. 86,400.

Leydenburg (Transvaal, S. Africa), see LADENBURG.

Leyden Jar, see ELECTRICITY, *Electrostatics*.

Ley Farming, practice of growing grass as a crop and as pasture from selected seeds mixtures in a rotation, alternating with tillage crops. Earliest work on seeds mixtures was done in the 1870s. L. F. advanced in Great Britain under such pioneers as Prof. Gilchrist and Robert Elliot (Clifton Park). It received big impetus from advocacy and breeding of new and leafy strains of grasses and clovers bred at the Welsh Plant Breeding Station,

Aberystwyth, by Sir R. George Stapledon; it became a key factor in food production (milk and meat) during the Second World War, and is a permanent feature of modern post-war farming. The ley is valuable to redeem marginal or poor land, to refresh worn-out permanent pastures, to provide more nutritious and heavier crops for cutting or grazing, and to leave the soil in better fertility for the taking of a tillage crop. Leys may be laid down for one to six years. Thorough cultivation by plough, disks, roller, and harrows is essential to give a fine, firm, and shallow seed bed of good tilth. Estab. depends upon rectification of any lime deficiency, generous phosphatic manuring, and the application of a soluble nitrogenous fertiliser (nitro-chalk or sulphate of ammonia) at sowing time. Main sowing dates are mid March to early April, June, and late July-Aug., the earlier the more successful as a rule. Ley mixtures may be sown under corn but do better by direct sowing. Seeds mixture is determined more by usage; general purpose; mainly hay; or mainly grazing, and rainfall than by soil type; clovers, cock-foot, timothy, and perennial ryegrass being chiefly employed, though lucerne and sainfoin are sometimes used. See R. G. Stapledon, *The Plough-up Policy and Ley Farming*, 1939.

Leyland, urb. dist. and tn. of Lancashire, England, 11 m. S. of Preston. It has cotton-mills, bleaching yards, and manuf. of paint, rubber products, and motor vehicles. Pop. 13,300.

Leys School, The, public boarding-school for boys at Cambridge, England, founded in 1874 by leading Methodists who wished to provide a public school of an undenominational Christian character. The fine modern buildings have accommodation for 260 boys.

Leyte: 1. Prov. of the Philippines, including the is. of L. and over 7000 is. and islets with a total land area of 111,830 sq. m. The is. of L. (2785 sq. m.) is a detached peninsula of Samar, from which it is separated by the strait of San Juanico. The coasts are high and there are good natural harbours. Abaca, bananas, hemp, rice, and coco-nut oil are produced, and the mineral wealth includes gold, magnetite, and sulphur. Petroleum seepages have been reported. Cap. Tacloban. It is the eighth largest of the Philippine Is., and became of great strategic importance (possessing eight airfields) in the fighting in the S.W. Pacific during the Second World War. Occupied by the Jap. in 1941, it was recaptured in 1941, following large-scale landings by U.S. forces on Oct. 20. The Jap. were finally driven out by Dec. 23, 1944. Pop. 360,000. See PACIFIC CAMPAIGNS IN THE SECOND WORLD WAR. 2. Pueblo on N. coast of above is., near L. R., 36 m. N.W. of Tacloban. Pop. 7000.

Leyton, par. and tn. of Essex, forming one of the N.E. suburbs of London, situated on the l. b. of the Lea. The par. includes also the dist. of Leytonstone to the E. Saxon and Rom. remains have been found in the vicinity. L. has the Essex C.C. ground. Pop. 129,300.

Leze-majesty, or **Lése-majesté** (Norman-Fr., from Lat. *lasea majestas*, high treason), in jurisprudence refers to any crime committed against a sovereign power. Amongst the Romans, it denoted political misdemeanours, acts of rebellion, and similar offences against the majesty of the empire. It is now frequently used in a general sense as a term for an insult. See further under MAJESTY.

Lezghines, see LESGHIANES.

Lhasa, or **Lhasa** ('God's ground'), cap. of Tibet, 29° 39' N., 91° 5' E. It is situated on a fertile plain, 11,830 ft. above sea level, and is surrounded by barren hills. In the cup of which is a well-watered land of great fertility. A little to the S. flows the Kyichu, which empties into the great Tsungpo, some 40 m. to the S.W. Though it is only 360 m. by road from Darjeeling, until the Brit. armed mission of 1904 advanced into the interior of Tibet for the purpose of arranging a commercial treaty, only one European, Thomas Manning, an emissary of Warren Hastings, had penetrated to this 'forbidden city.' There is a permanent Chinese official representative in L., who comes under the Tibetan and Mongolian Affairs Commission of the Executive Yuan. This is a survival of Chinese suzerainty over Tibet; but the whole of central and E. Tibet is under independent Tibetan administration, with its own civil service and its own army. Tibetan officials bow to the authority of the Dalai Lama, who rules by virtue of his position as supreme head of the Lamaist Church. After the Brit. expedition this potentate fled to India, and in 1910 was again a fugitive. The Chinese deposed him but were roused by what they regarded as Brit. trespass on their domain into an effort to substantiate that Tibetan suzerainty which through lethargy and sloth had long since dwindled to a shadow. In 1912 the Dalai Lama returned, and the Chinese were worsted in the fighting that ensued. The pop. of L. is about 50,000. The fact that it is the Mecca of Lamaism, a debased form of Buddhism, draws students and devotees from all parts of Mongolia and Tibet, and from the broad Asiatic steppes, which reach from Lake Balkhash to Manchuria, and thus the traveller will find the public places thronged with Orientals of every feature, language, and dress, and will sometimes find whole families encamping in the streets, and the surrounding plateau strewn with the black tents of pilgrims from afar. A sacred road, the Ling-Kor, circles the city, a road the faithful pilgrim follows on his knees with frequent prostrations. The inhab. include Tibetans, Chinese, Mongolians, Nepalese, and Ladakhs. Most are engaged in weaving stuffs from native wools, but the potters also form a busy class, and the Nepalese are excellent gold and silver smiths. Commerce is largely concentrated in the hands of Muslims and foreigners.

Description.—From the W. L. is approached through a picturesque gateway, the Pargo Kallag, which lies in the narrow gap between two eminences, the Chagpori, crowned by a fort and the lamas'

medical college and that other on which is built the splendid palace of the Dalai Lama. It is called the Potala and is a majestic pile of red and white buildings covering a hillside from top to bottom with its terraces, its buttressed battlements and many windowed walls. It is approached on either side by a broad stone stairway which zigzags up to the outward sloping walls. The Jo Khang or great temple of the Jo or Buddha which is the principal religious edifice is situated in the middle place in the very heart of the city which lies a mile away from the Potala. Its exterior surroundings have a cluster of small buildings with

oldest convent of Tibet Dehung one of the largest monastic institutions in the world Sera and Galen.

History—The Dalai Lamas did not make L. their residence till the seventeenth century. Since the days of Ngawang Lopsang the fifth Dalai Lama (d. 1681) his successors have dwelt in his Potala and have continued to exerts their religious sway over an uneducated and credulous people who can have advanced little in many centuries. I have ever has been the political cap since the days of King Srongtsan Gampo who flourished in the seventh century and who first taught the Tibetans

THE POTALA, LHASA

E. N. A.

glittering gilded roofs, but within are found jewelled lamps, highly wrought gold and silver vessels and richly decorated chapels, images and shrines. The private houses are mostly of sun-dried brick and clay whitewash and bands of red and yellow entering largely into their color scheme. The general appearance in comparatively recent years was one of the utmost squalor: the avenues were full of filthy hungry dogs and pigs wandered up and down the dirty streets. There were no pavements, no drains and the common two-storied dwellings whose lower halves were windowless were begrimed with soot, and repulsive through their stench. How far this picture is true to day is not easily ascertainable but it is probable that no great change has taken place. L. is a refuge of monks and lamas. There are monasteries within the city, but the more famous lie some few miles distant. Of these latter the most revered are Samye (founded in 770), the

about Buddha. A monument recording a peace made on equal terms between the sovereign of Tibet and the Great Tang emperor of China in 822 refers to the heyday of L.'s independence and prosperity. From that date the monarchy declined and yielded to a state of chaos where central authority was no longer respected and every town was under the control of its own priests. See S. C. Das, *Journey to Lhasa and Central Tibet* 1902; P. Landon, *Lhasa the Central Tibet Expedition* 1904; E. Candier, *Travelling in Lhasa* 1910; A. David Noel, *My Journey to Lhasa* 1927; E. S. Chapin, *Lhasa the Holy City* 1938.

Lherzolite, in petrology a fine grained dark green or black rock, often granular and consisting of olivine, chrome diopside and enstatite, and accessory pyroxene or chromite, and belonging to the pyroxenites. First described from Lherz in the Pyrenees. L'Hôpital, Guillaume François Antoine (1661-1704) marquis de Sainte Mesme and

comte d'Autremont le mathématicien, b in Paris entered the army, but was obliged to leave it on account of defective sight. He had always studied mathematics with great zeal and in 1692 made the acquaintance of John Bernoulli from whom he learnt the principles of the infinitesimal calculus. His works include *Le Théorie des courbes mécaniques* (1693) *L'analyse des infiniment petits* (1696) the earliest systematical treatise on the differential calculus *Traité analytique des courbes coniques* (1720) *Les Deux géométries* and *La Construction des équations*.

MICHEL DE L'HÔPITAL

L'Hôpital, Michel de (c. 1601-73) Fr. statesman, b at Aigueperse, Auvergne, studied law at Toulouse and Padua and became an advocate in Paris in 1534. He rapidly rose to positions of honour becoming successively auditor of the Rolls at Rouen, councillor of the parliament of Paris (1604-11), Henry II at the Council of Trent (1547-48), steward in the household of the duchess of Lorraine, superintendent of finances (1603), member of the Council of State (1599) and chancellor of France (1606). He resigned in 1608 his moderation having brought him into disrepute with the Catholics. See *L'Hôpital* (1905).

Li, Chinese measure of length just over one third of an English mile. Also a small coin or weight of about 0.83 gram.

Lia Fail, see **LYSRAÏL**.

Liakhov Islands, see **NEW SIBERIA ISLANDS**.

Liamo, see **NING PO**.

Liana, or **Liane** (Fr. *lier*, to bind), name given generally to any climbing or twining plant which grows in tropical forests. A well known example may be found in the genus *Sauvire*.

Liaoning, prov. of Manchuria, China, one of the nine provs. formed in 1945 by the reorganisation of the three N.F. provs.,

Li, Kirin and Hollungkiang which comprised Manchuria. It lies in the S. with Anking on the E. and Hopen and Jehol on the W. Its important tns. are the cap. Moukden (Shenyang), Luoyang (Chink-sien) Fushun (a coal mining centre) and Penki (where there are iron deposits). Port Arthur leased to Russia lies at the S. extremity. The prov. produces coal and iron, wheat, millet and soya beans. Area 25,962 sq. m. Pop. 9,992,000.

Liaopoh, one of the nine provs. of Manchuria, China, formed in 1911 by the reorganisation of the three N.F. provs. The N.W. has grazing land and the S.E. is a fertile agric. area. Millet, wheat and soya beans are produced. The chief tns. are Liowin in the cap. and a railway junction Szapinghai, also a rail junction and Lungliao. Area 47,603 sq. m. Pop. 3,708,000.

Liaotung, peninsula of Manchuria in the extreme S., forming part of Antung prov. The gulf of Li. is on the W. and Korea Bay on the E. At the S. tip of Li. is Port Arthur. Fuchow is important in Li.

Liaoyang, city of Manchuria, lies in the prov. of Liaoning between Mukden and Port Arthur. It was the scene of a great Russian defeat in 1901 when it fell into the hands of the Japs. Pop. 100,000.

Liquat Ali Khan (d. 1896) Indian politician, b in Lucknow, second son of a wealthy landowning family which claims descent from the Persian king, Naushervan the Just and is said to have gone to India five centuries ago. From 1919 to 1922 he was in England and after taking a law degree from Victoria College, Oxford, he was called to the Bar by the Inner Temple. In 1926 he was elected to the United Provs. Legislative Council where he sat for fourteen years. Six of them as deputy president and leader of the Democratic party. In 1940 he was elected to what was then India's Central Legislative Assembly and became deputy leader of the Muslim League. Through his long and close association with Jinnah (q.v.) he was destined to play a leading part in the negotiations which culminated in the partition of India into two dominions. In 1946 he was appointed a member of the Viceroy's Executive Council and leader of the Muslim League in the interim gov. In the gov. he was the first Indian finance minister and presented the Indian budget of 1947-48. He has been Home Minister and minister of defence of Pakistan since the new dominion was established. He took part in the Brit. Commonwealth Conference of April 1949 when he discussed the commonwealth status of India.

Libanius (c. 314-c. 392), Grk. sophist, b at Antioch, lived and taught mainly in Constantinople, but also in Athens and Antioch. In religion he was a pagan, and supported the views and plans of the Emperor Julian with regard to the Christians, but in private life he was mild and tolerant and always maintained friendly relations towards St. Basil and St. John Chrysostom, two of his pupils. He wrote a life of Demosthenes and 'arguments' to that orator's speeches.

His *Orations, Declarations, etc.*, have been ed. by Reiske (4 vols., 1791-97), and his letters by J. C. Wolf (1738). See lives by L. Petit, 1866, and G. R. Sievers, 1868.

Libanon, or **Libanus**, see **LEBANON**, **MOUNT**.

Libation (Lat. *libatio*, a drink-offering), wine or other liquid poured out in honour of a deity. In classic times public sacrifices were often accompanied by *liba*; the custom was also carried out privately, and the Romans, at their meals made drink-offerings to the household gods. A similar practice prevailed among the Jews, who poured oil or wine upon their altars. With the Greeks, the *liba* sometimes consisted of milk, honey, etc.

Libau, or **Libava**, see **LIEPĀJA**.

Libavius, Andreas (1540-1616), (Ger. chemist, b. at Halle; became director of the gymnasium at Coburg. L. wrote an important treatise on chem. (*Alchymia recognita*, 1597) and designed the first chemical (as opposed to alchemical) laboratory; he discovered stannic chloride, SnCl₄, and developed a rudimentary system of chemical analysis.

Libel, see **DEFAMATION**.

Libellatici, name given to these Christians who, during the persecution of Decius (A.D. 249-52), evaded the edicts directed against their faith by obtaining *libelli*, which were either official statements that they had sacrificed to the imperial gods, or magistrates' certificates that the charge of Christianity was unfounded.

Libellula, typical genus of the family Libellulidae, or dragon-flies (q.v.). Named by Linnaeus from the supposed resemblance of the expanded wings to an open book.

Liber, term applied in botany to the inner bark of exogenous stems. It is synonymous with phloem and bast (q.v.).

Liber, in Roman mythology, the deity corresponding to the Greek Dionysus. Originally the H. god of the productivity of nature, and especially of the vine, so called from the unrestrained character of his worship, L. was identified with Dionysus when the Hellenic cult of Demeter spread to Italy. A temple was built to L., Libera, and Ceres near the Circus Maximus, and a festival, called the 'Liberalia,' was held in Rome on March 17. In the rural parts a feast to L. and Liber (Gk. Persephone) was held at the time of the grape harvest, the first fruits of which were offered up, together with cakes of meal, honey, and oil. At the *Liberalia* the youths used to lay aside the *toga praeterea* and assume the *toga libera*, or *virtus*. See Ovid, *Fasti*, iii.

Liberalism, in modern times stands for such government by the people as will maintain individual liberty to the maximum extent compatible with social order. Hence it is that L. and liberty are intimately bound up with one another, though the exact connotation of the latter term is notoriously difficult to determine. Liberty on its positive side was defined by H. H. Asquith (afterwards Lord Oxford and Asquith, q.v.) (speech at the conference of delegates of the Liberal Association of

E. Fife, 1907) to mean 'the power of initiative, the free play of intelligences and wills, the right, so long as a man did not become a danger or a nuisance to the community, to use as he thought best the faculties of his nature, or his brain, and the opportunities of his life.' According to Prof. Hobhouse it is antagonistic to all 'standardisation,' and such Liberal-Socialism as may be said to exist must be democratic and must 'emerge from the efforts of society as a whole to secure a fuller measure of justice and a better organisation of mutual aid . . . must give the average man free play in the personal life for which he really craves.' Asquith publicly stated the distinction between L. and Socialism in much the same terms, and based the power of L. to combat such Socialism as spelt the negation of liberty upon the fact that the Liberal party was free and unfettered by entangling alliances with those 'interests, monopolies, classes, and privileges which with a kind of network of interdependence covered the frame of society and made progress with social reforms seem sometimes desperate.' In his historical review of L. Prof. Hobhouse shows how the Liberal movement has often sought to dispense with general principles, a fact which explains its frequent inconsistencies, inconsistencies which, however, must inevitably exist in any upward or progressive movement acting partly through abolition and partly through compromise. Such theory as modern L. has is one inducted from the practical needs of the governed in preference to theory based on the empty forms of constitutional dogma. Many Liberals, notably M. Faguet, abrogate speculative foundations altogether, and look solely to social utility.

Perhaps the greatest names in the past hist. of L. are those of Cobden and Bright, Mill and Gladstone. Bentham's influence upon the Cobden school was essentially practical, and the great work of that school was the emancipation of foreign trade from tariffs. Modern L. probably owes as much to Mill as to any other thinker, especially as it can refer such of its principles as are almost purely socialist to Mill's ideas of a co-operative organisation of society to secure the amelioration of the position of the wage-earners, and the extension of the franchise to the whole of the people. Gladstone was a Cobdenite in economics, and it is in relation to international dealings that he struck his original note. Gladstone's foreign policy was radically opposed to that of 'annexation' and jingoism (q.v.), and with him that alone was internationally right which was according to the dictates of conscience, an ideal which contemplates every man as a citizen, not of a narrow circumscribed state, but rather as a citizen of a possible world state. The work of embodying the ideals of L. in Acts of Parliament was long postponed, and has been the work almost exclusively of more recent years, an effective check during the last twenty years of the nineteenth century to domestic legislation of all kinds being offered first

by the Homo Rulo question, and later by the trumpet-call of imperialism (q.v.). Liberals on the reaction of the electoral tide in their favour in 1906 at once set to work to carry out their ideals, and the seven ensuing years saw the triumphant passing, *inter alia*, of Acts to secure a minimum wage to various trades, the estab. of labour exchanges, a scheme of national insurance, the provision of old-age pensions, the grant of local government to S. Africa, the immunity of trade union funds from liability for the tortious acts of their agents, facilities for the provision of small holdings and allotments, the taxation of the increment value of land, the increase of liquor duties and the virtual explosion of the inflated value of 'tied houses,' the curtailment of the legislative power of the House of Lords, the

JOHN BRIGHT

consolidation of free trade principles, the practical abolition of religious teaching in state-aided schools, the better housing of the working classes, and a number of other avowedly democratic reforms. The promising outlook of L. in 1914 suffered severely during the First World War. A serious cleavage occurred in 1916 between Asquith and Lloyd George (q.v.), and by 1918 a small party of Independent Liberals found themselves in isolation. A partial recovery was made in 1922 under the banner of Free Trade, and 150 members of the party were returned at the election of that year. But the disaster of 1924, when Liberals secured only forty seats, caused internal dissension to reappear with increased bitterness, and over the question of the general strike (q.v.) Lloyd George was officially outlawed by the estab. Liberal party. Upon the death of Lord Oxford in 1928, however, Lloyd George assumed leadership of the Liberal party. In 1931 sev. Liberals were included in the National Gov. (q.v.); but, following the Ottawa

Imperial (Economic) Conference (q.v.), many prominent Liberals seceded, owing to their disagreement over the tariff agreements concluded with the dominion govts. There would seem to be practically no difference in political outlook between the National Liberals—which small party included Lord Simon (lord chancellor)—and the Conservatives. L. as a political force suffered a further eclipse in the general election of 1915, securing only twelve seats, while the Liberal National held only thirteen. *See* NATIONAL GOVERNMENT. *See* J. S. Mill, *Representative Government*, 1861; J. Bentham, *Principles of Morals and Legislation*, 1796; T. H. Green, *Principles of Political Obligation*, 1895, and *Liberal Legislation and Freedom of Contract*; E. Faguet, *Le Liberalisme*, 1902; J. MacCunn, *Six Radical Thinkers*, 1910; L. T. Liberalitas Juliae, *see* EVORA.

Liberal League, despairing offshoot of the leaderless Liberal party, formed in 1901, when as yet that party was still 'in the wilderness.' Judged by the tendencies of Liberalism before the First World War the L. L. was distinctly retrogressive, for its prin. founder, the earl of Rosebery, in more or less definitively breaking away, together with his associates, Sir Edward (later earl) Grev and Asquith (later Lord Oxford and Asquith), from the more numerous body of Liberals in the 'tabernacle' of Sir Henry Campbell-Bannerman, elected to expunge Home Rule from the party creed, and to side-track anything that militated against Liberal Imperialism. Late in 1905, however, when the want of solidarity in the Liberal opposition appeared to have given way to a general agreement, Lord Rosebery, on the question of the party attitude towards Home Rule again becoming acute, once more declined to have anything to do with it, and left Sir Henry Campbell-Bannerman in sole command of the party's future. When the flower of the L. L., in response to Lord Rosebery's exhortations of loyalty to the official leader, Campbell-Bannerman, had thrown in their lot with the latter, that future materialised in a period of almost unprecedented success. Shortly after this, when Lord Rosebery's Liberalism fell short of the progressive demands of the historic Budget of 1909, the L. L. was dissolved.

Liberal Unionists, *see* under POLITICAL PARTIES.

Liberator, Consolidated, Amor, bomber and transport aircraft. The original contract for the Liberator was placed by the

U.S. Army on March 30, 1939, and the prototype flew on Dec. 29, a production order being given in the autumn of 1940. Production was stopped on May 31, 1945, by which time over 19,000 had been built. Also known by its maker's number, the Model 32, the U.S. Army number B-24, and the U.S. Navy PB4Y. The first Ls. came to Britain under Lease-Lend, and were converted to transports for the Atlantic ferry because they were not suitable for operational duties. The next machines were modified and put into service with Coastal Command, where their long-range and heavy armament — the R.A.F. added four 20 mm. cannon beneath the fuselage — made them ideal for attacking submarines. When the U.S.A. entered the war they used the B-24 in large numbers in all theatres for high-altitude daylight formation bombing. Of the many variants the B-24 J was one of the most widely used; with four 1200 h.p. turbo-supercharged engines it flew at 297 m.p.h. at 25,000 ft., and had a range of 1540 m. at 237 m.p.h. with normal fuel

THE LIBERATOR

B-24 Liberator in U.S.A.A.F. markings. There were twin-gun turrets in the nose, on top of the fuselage, a retractable ball-shaped one below and another in the tail, and also single guns in each side of the fuselage.

and full bomb load of 8000 lb. Amer. machines had a crew of ten and an armament of ten 0.5 machine guns in four twin-gun powered turrets and two hand-operated beam guns. Two bomb bays in the fuselage under the wing had 'roll-top deck' doors, and held bombs one above the other. These bays were too small to take bombs larger than 2000 lb., but instead two 4000 lb. 'block busters' could be carried externally under the wing. The R.A.F. used Ls. as bombers in the Far E., but main use was with Coastal and Transport Commands. One machine was used, and very much liked, by Mr. Churchill for many of his overseas journeys, including his visit to Egypt before El Alamein. Ls. were also used for long-range espionage missions to Poland. Since the Second World War they have been used as transatlantic mail and freight aircraft by B.O.A.C.

Liberi, Pietro (1605-87), called 'Il Libertino,' It. painter, b. at Padua, studied under Padovanino. His paintings exhibit great variety of subjects and treatment, the most notable of them being 'The Battle of the Dardanelles,' 'Venus,' and 'The Judgment of Paris.'

Liberia, Negro republic in W. Africa, lying between the Brit. colony of Sierra Leone on the N.W., the Fr. colony of the

Ivory Coast on the E., and Fr. Guinea on the N., and extending some 350 m. along the N. coast of the gulf of Guinea, with the R. Mano on the W. and the Kwalli on the E. From time to time the boundaries of the Liberian frontier have been marked out by Franco-Liberian treaties, and the present demarcation was fixed in 1911. The chief headlands are Cape Mount, 1050 ft. above sea level, with the lagoon known as Fisherman Lake at its base, Cape Montsenado, 350 ft., and Cape Palmas, 200 ft. above the sea. The area is 43,000 sq. m. Monrovia is the cap., and the nine ports of entry include also Robertsport, Marshall, Grand Bassa, and Greenville. The coastal plain is narrow except in the W.; in the E. the land rises to Mt. Kibi Diandi (2296 ft.). The civilised region stretches, about 20 m. in width, along the coast; further inland is unexploited, little explored forest. The prin. rvs., besides the above mentioned, are the Cestos, of which the Nuon has been discovered to be the upper course (1908), the St. John, and the St. Paul. Most of these have rapids or falls which prevent navigation, the Kwalli being the only one servicable. The hinterland is composed of vast forests, the Nidi forest possessing *Euntunia* rubber trees. Many rare species of animals are found, and the vegetation is unusually rich and beautiful. So far little has been done with regard to the mineral wealth of the dist.: there are indications of gold in most of the rvs., also of bitumen; sapphires have been found, corundum being met with in many places; lead and iron are also found. Iron is being worked and gold mining is increasing. The vegetable wealth of the country is not yet fully developed. One Para rubber plantation has been started and over \$11,000,000 worth of rubber was exported in 1916; some palm-oil, palm kernels, coffee, cocoa, piasava, kola-nuts, and ivory are also produced and exported. L. has no railways; there are about 250 m. of state roads and 160 m. of private roads in the rubber plantations. With lend-lease (g.p.) aid the road system was extended into the interior. There is an airport at Robertsfield, and services are run by Air France and Pan-Am. Airways.

In 1821 the Amer. Colonisation Society selected Cape Montsenado as a refuge for the Amer. freed Negro slaves, and from that time onward they continued to be sent there. The Amer. colony was founded by Jehudi Ashmun between 1822 and 1828, the name L. being given it in 1824 by the Rev. R. R. Gurley. Until 1837 there were two republics, L. and Maryland. Troubles on the frontier led eventually to an Amer. commission being sent to L. by President Roosevelt in 1909, and this resulted in Amer. supervision of the finances, military organisation, and the boundary question. The republic is now governed by a president, elected for eight years, a House of Representatives, and a Senate, its constitution being modelled on that of the U.S.A. There are local magistrates, courts of common pleas, quarterly courts (five), and a supreme court. Brit. customs officers have been

lent to L. There is a gov. college at Monrovia, and about 200 schools, of which the greater part is maintained either by the gov. or by missions. The official gov. language is Eng. There is a large native pop. (2,000,000) which includes the Kru, Mandingo and Gola tribes. The Mandingos are Muslims, and the other tribes are mostly pagan. The American-Liberian pop. numbers about 12,000. About 50,000 of the Negroes on the coast have been converted to Christianity. Until L. declared war on Germany in 1917 about 70 per cent of her trade had been in Ger. hands. L. was one of the signatories of the treaty of Versailles, and an original member of the League of Nations. In 1927 the U.S.A. arranged a loan of \$5,000,000, with which the previous loan (1912), mainly Brit. in origin, was paid off. As a result of an International Commission of Inquiry on slavery and Forced Labour, the Liberian Gov. decided to adopt various suggestions and recommendations for social reform, and requested the co-operation of the League of Nations to that end. During the Second World War agreements between L. and the U.S.A. in 1942 and 1943 led to America undertaking considerable development in the country from the point of view of defence and communications. L. finally declared war on Germany and Japan on Jan. 26, 1941. In this year an Amer. mission was sent out to further the economic development of the country. See Sir H. Johnston, *Liberia* (2 vols.), 1906; H. V. Reeve, *The Black Republic: Liberia*, 1923; R. P. Strong, *The African Republic of Liberia and the Belgian Congo*, 1930; G. Greene, *Journey Without Maps*, 1936; G. W. Brown, *The Economic History of Liberia*, 1941; and Esther Warner, *New Song in a Strange Land*, 1948.

Liberius, St. (352-66), pope, who succeeded Julius I. He was banished to Thrace (355) by Emperor Constantius for refusing to excommunicate Athanasius. About 357 he was allowed to return to Rome, whereupon Felix II., who had been installed in his absence, retired. It has been asserted, and some historians still hold, that L. signed the Arian 'second formula of Sirinnum' as the price of his liberation. He later condemned even the mitigated 'Third Formula' (360). See L. Duchesne in *Mélanges de l'école française de Rome*, xxviii, 1. and ii, 1908, and J. Chapman, 'Contested Letters of Pope Liberius' in *Revue bénédictine*, 1910.

Liber Regis (*Valor Ecclesiasticus*), book compiled in 1535 on the eve of the Reformation, which contains an account of the valuation of all the eccles. property of England and Wales. The authorisation for the work was an Act providing for the payment to the king as the supreme head of the Church of England, not only of first-fruits and benefices, but of one-tenth of the entire property of the Church. An abridgment of this record entitled *Liber Valorum* was the foundation of the *L. R. vel Thesaurus Rerum Ecclesiasticarum* (1786), by one John Bacon, receiver of first-fruits. Queen Anne by giving up

first-fruits and tithes to trustees, who were empowered to administer them for the benefit of the poorer clergy, thereby made them part of the fund that has ever since been known as Queen Anne's Bounty.

Libertad, or **La Libertad**: 1. Dept. in the S.W. of San Salvador. The Pacific Ocean forms the S. boundary of the dept., which is very mountainous. There are crops of rice, coffee, sugar, etc., which constitute a considerable export trade, and silver- and gold-mines. Pop. 19,000. 2. La L., the port, is 16 m. S.S.W. of Nueva San Salvador. Pop. 2000. 3. Maritime dept. of N.W. Peru, with Ancash to the S. and Lambayeque to the N. The W. Cordilleras traverse the dept. from N.W. to S.E. Sugar, coffee, cocoa, rice, etc., are produced; mineral products include silver and gold, and there is much timber. Cap. Trujillo. Area 10,206 sq. m. Pop. 383,300.

Liberton, vil. 2½ m. S.S.E. of Edinburgh. It has an anct. par. church and convent. In the neighbourhood are quarries and coal mines. Pop. 5000.

Liberty Bell, bell cast in London in 1752, with the motto, 'Proclaim liberty throughout the land unto all the inhabitants thereof.' It was recast at Philadelphia and rung on the occasion of the adoption by Congress of the Declaration of Independence. It is in Independence Hall, Philadelphia.

Liberty, Equality, Fraternity (Fr. *liberté, égalité, fraternité*), motto of the Fr. republic, dating from the first revolution, when it was adopted as a political confession of faith, embodying the main teachings of the social philosophers of the eighteenth century. By 'equality' was meant merely equality for rich and poor in the eyes of the law and the absence of class privileges.

Liberty Loans, name given to the internal loans raised in the U.S.A. during the first World War. There were four separate issues of these loans during the war, and, after the armistice, a fifth, known as the Victory Liberty Loan. The Amer. people subscribed some \$24,000,000,000, and nearly one-quarter of the pop. of the country became owners of this scrip. All the bonds were issued at par, some of them being as low in value as \$50. The first one bore interest at 3½ per cent, the fifth at 4½ per cent. The fourth loan, which was the biggest raised by any country during the war, brought in \$7,000,000,000. Every loan was oversubscribed.

Liberty of the Press, see PRESS, FREEDOM OF THE.

Liberty Party, Amer. political anti-slavery party, founded 1839. It opposed the annexation of Texas. Its last convention was held in 1847.

Liberty Ships, name given to cargo vessels of 7100 gross tonnage built by assembly of prefabricated material under the auspices of the U.S. Maritime Commission. The original programme in 1941 consisted of 200 ships for Lend-Lease purposes. In 1942, after the Jap. attack on Pearl Harbour, the programme was

expanded, and in the peak year in 1943 over 1200 L. S. were completed in U.S. dockyards. The vessels were capable of a speed of 11 knots an hour, some being coal burning, some oil. Dimensions: length 441 ft. 6 in.; beam 56 ft. 10 in.

Librum Veto became an integral part of the Polish constitution at some time in the earlier half of the seventeenth century. It was adopted in the diet by the *szlachta*, or gentry. The political equality of all Polish gentlemen was taken for granted, and accordingly any one of them might say 'Nie pozwalam' (I disapprove) to any measure introduced into the diet, and thus compass the diet's dissolution, for having assumed the principle of absolute equality it followed that every Bill must receive unanimous support before passing into law. The L. V. was first used in 1652, and was finally abolished by the revolution of 1791.

Libonias, or **Jacobinia**, genus of shrubs and herbs, natives of tropical America.

Libitina, Rom. goddess who presided over funeral ceremonies; her temple at Rome contained all the symbols of mourning. The door through which wounded gladiators were carried from the arena was called the *Gateway of L.*

Libmanan, pueblo of the Philippine Is., situated in the Camarines prov., Luzon, on the Nicol. Pop. 15,000.

Libourne, tn. and riv. port of the Gironde dept., France, at the confluence of the Dordogne and the Isle, 17 m. E.N.E. of Bordeaux. One of the anct. free tns. founded by the Eng. (c. 1209), it became a thriving city. It produces woollens and military clothing; wine and brandy are exported. Pop. 110,600.

Libra (the *Balance*), seventh sign of the zodiac. In the older Gk. writers the Scorpion occupies two constellations of the zodiac, or rather the body of the animal occupies one and the claws, *chela* (χελαι), another. Though the *chela* were certainly a part of the Scorpion, yet they are often mentioned (as by Aratus, for instance) by themselves, as if they formed a distinct constellation. The word *chela* had sev. significations; so that it may have been by simple mistranslation that the Roms. (according to Hyginus, Virgil, etc.) gave the name of L. to the part of the heavens in question, and drew back the claws of the Scorpion to make room for the scales. L. is surrounded by Scorpius, Ophiuchus, Virgo, Centaurus, and Lupus, and contains the well-known globular cluster Messier 5 which has as many as eighty-five short-period variables. 2. Rom. unit of weight, and a unit of value, hence the Eng. & Lat.-Amer. countries, Spain, and Portugal still use the term for a unit of weight.

Libraries. The earliest collection of written works, apart from what we may call 'books,' appear to have been the official preservation of gov. and administrative records or archives, whose remains, found in anct. Babylonia, Egypt, and Crete, have proved of inestimable value to the archaeologist. Apart from their archives both Assyria, in the great library of Assurbanipal, and Egypt, in the

religious and scientific L. attached to the temples, afford examples of L. of books proper. The greatest L. of the anct. world were those of Alexandria, where there were two: the larger in the Bruchelou or Bruchium quarter, the smaller in the Serapeum. No precise enumeration of the books in them is possible, but Seneca gives the number as 400,000, in which connection it is to be borne in mind that any one well-known work, such as the *Odyssey* of Homer, probably comprised a large number of books—a vol. in the anct. world containing considerably less matter than a modern book or vol. The catalogue of the famous librarian, Callimachus, arranges all the prin. vols. in 120 classes. The library of the Bruchelou, which was connected with the museum or academy, was destroyed by fire accidentally when Julius Cæsar burnt the fleet; the other, in the Serapeum, thereafter became the chief library, though Antony tried to supply the loss by giving Cleopatra the library from Pergamum, so that the Bruchelou remained the literary quarter of Alexandria for at least two centuries. It seems doubtful, however, whether the L. of Alexandria continued, as is supposed, in a flourishing state until their destruction by the Saracens in A.D. 640; for it is probable that the library in the Bruchelou was finally lost when that quarter was destroyed by Aurelian in A.D. 273, while in A.D. 390, when Theodosius ordered the Serapeum to be destroyed, the Churtian pillaged the books in it. The most famous of private L. was that of Aristotle, said to have ultimately found its way to Rome in the time of Sulla. Æmilius Paulus brought back the library of the Macedonian Persus, and the wealthy Lucullus made book collecting fashionable. Augustus was the first of the emperors to establish public L., the Octavian and Palatine. One of those famous imperial L. was the Ulpian, founded by Trajan, which, housed in the baths of Diocletian, was destroyed by fire under Commodus. The great collection at Constantinople made by Constantine, Julian, and Theodosius formed a nucleus which was greatly enlarged, and from which much of anct. Gk. learning came to the W. after the capture of the city by the Turks.

During the early Middle Ages the collection and keeping of books and the maintenance of learning fell to the Church and to the monasteries, and the L. of the Benedictines, always renowned for their love of books, as at St. Gall, St. Henry, etc., were famous. The catalogues of many of these monastic L. have been preserved; thus we know that the monastery of Christ Church, Canterbury, had during the thirteenth and fourteenth centuries a library containing some 3000 works. (For the management and arrangement of the early L. see Cardinal F. Gasquet, *The Old English Bible*, 1897, and J. Willis Clark, *The Care of Books*, 1901.) An example of the old form of library may be seen still at Merton College, Oxford, at Cesena in N. Italy, and in the Laurentian library at Florence.

With the invention of printing the

modern library may be regarded as estab. All great L. preserve among their most precious treasures the MS. relics of the past, and the incunabula, or early printed books, not only command enormous prices when any come into the public market, but are the object of the scholar's research for cataloguing and historical purposes. L. are, however, now chiefly regarded from the angle of practical utility, and their system of arrangement, cataloguing, etc., is based on scientific principles by which their resources can be most readily available to the ever-growing

IV. In 1823, and the splendid Grenville collection by bequest in 1896. At the present day, mainly due to the great work of the most famous of its librarians, Sir Anthony Panizzi, the library possesses over 4,500,000 printed vols. and over 200,000 MSS. It takes rank as the greatest of all L., and perhaps chiefly for the reason that in every language its collection of books is the best outside their native country. The great circular reading room, designed by Panizzi, was opened in 1857. It is compulsory for all Eng. publishers to deposit one copy of

Herbert Felton

THE LIBRARY OF MERTON COLLEGE, OXFORD

needs of readers and students of every kind. Many of the great L. of the world receive separate articles in this encyclopedia; here is given a brief account under various countries of the most noteworthy, and, to conclude with, a reference to the public or free library movement which has placed the learning of the past and present at the disposal of all classes.

The United Kingdom.—The library of the Brit. Museum dates from the acquirement of Sir Hans Sloane's collection in 1753, to which was added the great Cotton collection, acquired by the nation in 1700, and the library of the kings of England, given in 1757 by George II., together with the invaluable right, shared by the Bodleian among other L., to a copy of every book entered at Stationers' Hall. In 1759 the museum library was opened. George III.'s collection was presented by George

every new book or periodical at the Brit. Museum, the Bodleian Library, Oxford, the Univ. Library, Cambridge, the National L. of Wales and Scotland (formerly the Advocates' Library), and Trinity College, Dublin. Other great London L. are the library of London Univ. (315,000 vols., including the Goldsmiths' library of economic literature) in the new building in Bloomsbury, the Patent Office Library (280,000 vols.), the National Art (200,000 vols. and 250,000 photos) and Science (250,000 vols.) L. at S. Kensington, and, perhaps most useful of all, the London Library (450,000 vols.), founded in 1841, open to subscribers, which, unlike the others, issues books to borrowers. Its splendid collection of books, its well-arranged catalogues, and small subscription make it useful to all students and readers generally. The L. of the

Inns of Court (three of which were badly damaged by Ger. air raids) each contain from 70,000 to 85,000 vols. The library of the Royal Society has 120,000 vols., and that of the Royal Institution 65,000. Many of the gov. depts. have good L. (besides the Patent Office), namely, the War Office (founded largely on the nucleus of the old Aldershot Library, 130,000 vols.); Admiralty (100,000 vols.); Board of Education (80,000 vols.); Foreign Office (76,000 vols.); Board of Trade (58,000 vols.); Colonial and Commonwealth Relations (formerly Dominions) Office (40,000 vols.). A relatively small library of books and a large collection of very valuable oriental MSS. is housed in the former India Office. A library unique of its kind is that of the College of Arms situated in Queen Victoria Street, London. It contains approximately 25,000 vols., including a very large genealogical and heraldic MS. collection, and the official records of armorial bearings and pedigrees. The library was, presumably, in existence as early as 1551, for its former building, destroyed in the Fire of London, was assigned to it in that year.

Outside London is the State Public Library of the Museum of Science and Art in Edinburgh and, next in rank and importance, the Bodleian (1,500,000 vols. and 40,000 MSS.) at Oxford, opened by Sir Thomas Bodley in 1602. It obtained the right to a copy of every book entered at Stationers' Hall in 1610. At Oxford, too, is the Taylorian Library with over 100,000 books. The Univ. Library at Cambridge (with 1,500,000 vols.) dates from the fifteenth century; its first great benefaction was in 1175, when the archbishop of York, Thomas Scott, erected a building which housed it until 1755. Trinity College Library is the largest individual college library (120,000 vols. and many MSS.). In Liverpool a building opened by Earl Baldwin in 1939 has given Liverpool Univ. a fine modern univ. library. The Mitchell Library of Glasgow is one of the largest Scottish L. There are many fine endowed L., the Chetham Library at Manchester taking priority as perhaps the earliest (1653) free library in England; the John Rylands Library, founded by Mrs. Rylands in memory of her husband, contains a wonderful collection of incunabula, the basis of which was the great Althorp Library collected by Earl Spencer. The L. of the various learned and other societies are in many cases of high value; some of the most notable are those of the Royal Society of Medicine, the Royal College of Surgeons, the Royal Empire Society (very seriously damaged by a Ger. bomb in 1911), the Zoological Society, the Geological Society, and many others.

In recent years L. of different countries have organised a system of co-operation in order to augment their resources. The movement is valuable, for in a recently compiled list of books in the Brit. Museum, Bibliothèque Nationale, and the Library of Congress a small section as to aba consists of 1357 titles, and the Brit. Museum and the Bodleian Library have only one-third

of the number. This, of course, does not apply to general reading, but to research, and illustrates the need for some system of international co-ordination in order to open avenues outside one particular country. These international resources are classified in the *Index generalis*, the *Minerva Index*, and the index issued by the U.S. Bureau of Education. According to the 1925 indexes, the world resources of printed books number 225,212,000 in 2300 L. This figure does not include over 1,000,000 bound MSS., or the contents of various archives; small libraries and works of fiction are not included.

THE PARLIAMENTARY LIBRARY, OTTAWA

Dominion Libraries.—An Australian parl. library was begun in 1902, and in 1917 was divided into a parl. section and an Australian section; the latter developed into a national library for Australia, holding the copyright privilege for the country. Other L. are maintained by the states independently. In New Zealand Auckland has the largest free public library and the chief academic library is at Otago Univ., Dunedin. In Canada Ontario has sev. fine L., including the Library of Parliament at Ottawa, the Legislative Library of Ontario at Toronto, and those of Queen's Univ. at Kingston and of Toronto Univ. Those in Quebec include those of McGill Univ., of St. Sulpice Seminary and of the Fraser Institute at Montreal, and of Laval Univ. at Quebec. The oldest S. African public library is at Cape Town, estab. in 1815 and holding copyright privilege for Cape Prov. Together with the Pretoria State Library it forms the National Library. Also there are L. in the legislatures, the parl. library at Cape Town being prominent. There are univ. L. at Pretoria and

Cape Town. The Royal Library at Cairo contains 500 papyri and 23,000 MSS., as well as books. In the K. and India there are L. in the Royal Asiatic Society's branches in many important towns, including Singapore and Rangoon. Tanjore Library possesses a remarkable collection of MSS. In 1923 was formed the All-India Public Library Association for the development of public L. The Imperial Library at Calcutta, with over 152,000 vols., is the chief library of the Indian continent.

United States of America.—According to the International Index the U.S.A. has 905 L. and a total number of vols. of over 81,000,000; 173 L. have over 100,000 vols., and six have more than 1,000,000 books. There are five working literary centres—Washington, New York, Boston, Chicago and San Francisco. The Library of Congress, which is the national library of the U.S.A., is the third largest in the world. It was founded in 1800, and shortly afterwards incorporated Jefferson's Library of some 7000 vols. It now contains nearly 6,000,000 vols., and about 2,000,000 pamphlets. Its collection of MSS. is also notable. It receives a copy of every book copyrighted in the U.S.A. Nearly 200,000 vols. are added to the library each year. Washington has eight other L., each with an average of 250,000 vols., as well as a large number of smaller and specialised L. In New York three L. have over 900,000 vols., and half the books in N. Amer. L. are in New York, which possesses also ten medical L., eighteen law L., among other first-class research L., chief being that of the Amer. Museum of Natural Hist., and the Morgan Library, with its valuable bibliographical section. In Boston Public Library there are 1,500,000 vols., while the library of the neighbouring Harvard Univ. houses 2,500,000. Harvard Univ. Library is the foremost univ. library in America, and in historical resources rivals the Congress Library and the New York Public Library. Beside six law L., six medical L., and eleven theological L. there are about 100 other special L. Chicago has a great public library, with nearly 1,500,000 vols., and its others include the John Crerar, the Newberry, and that of the univ. The L. of San Francisco suffered severely during the earthquake, April 18, 1906. The city has, however, two univ. L., those at Stanford and the Univ. Library. In Sacramento is a state library, while others include the Huntington Library and the Hoover War Library. Notable recent events in Amer. library hist. are the erection of the new central library building of Brooklyn, and the completion of the library of Congress annexo with an estimated book storage capacity of 10,000,000 vols., and the opening of the Rundel memorial building (Rochester Public Library).

Austria and Hungary.—The Imperial Public Library at Vienna is said to date from 1440, and to have been founded by the Emperor Frederick III. It contains a portion of a famous medieval collection, that of Matthias Corvinus of Hungary.

Its printed vols. number over 1,000,000, with nearly 30,000 MSS. It also lends vols.

France.—The Bibliothèque Nationale (q.v.) is one of the great L. of the world and has of all great L. the longest hist., though it may not be true that it dates from the collections of Charlemagne or of St. Louis. What is certain is that it contains a very large number of the collections of the Fr. kings, and that it represents the Bibliothèque du Roi of times anterior to the Fr. Revolution. It contains upwards of 4,000,000 vols., a magnificent collection of MSS., prints, medals, and maps. Other great L. are those of the Arsenal, confiscated at the revolution, the Mazarin Library, and that of the univ., originally that of the Sorbonne, founded in 1762. Others are the Sainte-Geneviève Library, the library of the French Senate; the library of the Museum of Natural Hist.; and the Hist. Library of the Ville de Paris. The International Index gives France 390 libraries with a total of over 26,000,000 vols.

Germany.—Berlin possesses in the Royal Library, founded by Frederick William, the Great Elector, in 1661, one of the largest L. of the world. It possesses nearly 1,500,000 printed vols. and over 30,000 MSS. The new building housing this was opened in 1909. It is remarkable for its ready access to the public and its lending powers to borrowers. Other great state Ls. are those at Munich, Dresden, Leipzig, Stuttgart, etc., while the univ. and municipal Ls. are exceedingly numerous, well managed, and equipped with ample funds. Modern improvements have, in recent years, before the outbreak of the Second World War, been effected in the Hamburg and Jena Popular Library, and in the Kiel Municipal Library. Altogether Germany has 273 L. mentioned in the Index, with nearly 11,000,000 vols.

Italy. Chief in antiquity, in wealth of MSS. and printed rarities, and of inexhaustible treasures of archives and historical and other works, is the library of the Vatican at Rome. Its early hist. is broken by the removal of the popes with the books to Avignon, and its modern hist. dates back to the Renaissance popes, of whom may be mentioned Nicholas V., Sixtus IV., and Sixtus V., the founder of the present building in 1584. Printed books are said to number 400,000, MSS. nearly 10,000, of which the famous *Codex Vaticanus* of the Bible stands first, together with the great MSS. of Virgil, Terence, etc. The library is open to the public, and since the papacy of Leo XIII. the archives also with certain reservations. Next in importance both historically and for its invaluable contents is the Biblioteca Mediceo Laurenziana at Florence, containing the collections of Cosimo, Pietro de' Medici, and Lorenzo the Magnificent. It was opened to the public in 1571, and contains some of the most precious classical MSS. in existence, including over 700 dating from before the eleventh century, and in addition a fourth-century Virgil and a tenth-century Homer. The largest modern library in Italy is the Nazionale Centrale Vittorio Emanuele at Rome,

founded 1875, with nearly 1,000,000 vols. Other important national or municipal L. are at Naples, Florence, Milan, etc., while all over Italy are numerous anct. L., containing great treasures, such as the specimens of early printing at Subiaco, the famous Biblioteca Ambrosiana at Milan, the great collection of archives, bulls, papal briefs, charters, etc., at Monte Cassino. Italy has 185 L. and 15,000,000 books in the International Index.

Spain.—The Biblioteca Nacional, Madrid, represents the former royal library, and contains some 600,000 vols., with 30,000 MSS. The Escorial Library, once one of the greatest in Europe, suffered from fire and robbery after the Fr. invasion of 1808.

Low Countries.—The Belgian chief state library is the Bibliothèque Royale, Brussels, of which the nucleus was the library of the dukes of Burgundy and the archives of the Sp. occupation. A new national library was planned for Brussels as a memorial to King Albert, but the Ger. occupation of the country in 1910 prevented the erection of the building. The chief library of the Netherlands is the royal library, Koninklijke Bibliotheek, at The Hague, founded in 1794. The library of the academy at Leyden, founded in 1575, is one of the most famous early L., and there are also the great L. of the univ. of Utrecht (1582) and Amsterdam (1578).

Russia.—Of the great L. of the world the public library at Leningrad is one. It contains nearly 2,000,000 vols. and 31,000 MSS.

The Public Library Movement.—The estab. of L. free and open to all ratepayers by municipalities out of funds provided by the rates was first authorised by the Public Libraries (England) Act, 1850, largely due to the efforts of Wm. Ewart, M.P. for Dumfriesshire, although a public library, claimed to be the first in England, was instituted for the citizens of Warrington, Lancashire, in 1845. The benefits of the Act were extended to Ireland in 1853. At first the rate was limited to 4d. in the £, but it was extended to 1d. in 1855. The right to establish was and is permissive and not compulsory, and until 1893 the power of adopting the Act was left to a vote of the ratepayers; now, except in rural par., the power rests with the local authority. Except in certain places, where exceptional powers have been granted, as in Birmingham, the 1d. rate was the limit of the funds to be disposed of, a fact which kept many municipal L. far below their proper and useful standard. Public L. generally contain a reference library, to which free access is given but no books are lent, a newspaper and magazine room, and a lending library, from which ratepayers may borrow books. Andrew Carnegie gave great encouragement to the public library movement by his presentation of the buildings to many municipalities adopting the Acts. The limitations imposed upon the public L. in 1910 involved many of them in imminent bankruptcy, and a sub-committee of the Reconstruction Committee of 1917, the war intervening, made strong

recommendations for relief. As a result the Libraries (Public) Act of 1919 removed two of the prin. hindrances to their development. One was the abolition of the limit of a library rate of one penny, and the other was the removal of the ban on the setting up of rural L. by co. councils. Co. councils were empowered to adopt the Library Acts for those dists. within their area which had not already done so, and the co. L., as they have come to be known, have made rapid progress. They establish branches in their own buildings in the larger vils. and small tns., and in school-rooms or other suitable places in other centres, and carry out the periodical exchange of book stocks. A further facility for the provision of the more expensive books to readers is made by the National Central Library, which has obtained undertakings from a large number of L. to lend their books through its agency, so that a borrower may apply through his local library, and the book he requires will be obtained regardless of distance. This system is being further extended by the compilation of joint catalogues of non-fiction books covering large areas, so that if possible a book may be supplied from the immediate neighbourhood before the request is transmitted to London. The National Book League renders most useful service to its subscribers by the pub. of bibliographies and 'readers' guides' on a wide variety of subjects, the books chosen being those of estab. authorities and the titles scientifically classified. All the metropolitan bors. have adopted the Libraries Acts, and there are over 100 public L. within the administrative co. To-day there is a very important and valuable movement for co-ordination between the public L. of London and the cos. Most L. specialise in some particular subject, usually of local association, and contiguous L. are now forming pools, so that each may have recourse to the resources of the others. Most public L. have returned to the 'open access' system. A recent development is the institution of children's L., and most L. have a special room where children may sit in comfort and read from an extensive range of children's books. The Amer. Library Association, the official organisation of librarians in the U.S.A. and Canada, was founded in 1876. It is assisted by over fifty voluntary committees and boards, and has a membership of 16,000. The analogous organisation in Great Britain is the Library Association (q.v.), founded in 1877 and incorporated in 1898. See also CATALOGUES AND CATALOGUING.

See E. Baker, *The Public Library*, 1924 and *The Uses of Libraries* (2nd ed.), 1930; Gwendolin Rees, *Libraries for Children*, 1924; Board of Education's Departmental Report on Public L., 1927; and the pub. of the Library Association (e.g. *The Year's Work in Librarianship*, 1929 ff.); Sir F. G. Kenyon, *Libraries and Museums*, 1930; A. Sadleir and M. Burton, *The World's Great Libraries*, 1934-37; L. R. McColvin, *Libraries and the Public*, 1937; *The Public Library System of Great Britain*, 1942, and, with J. Revis, *British Libraries*, 1946;

Libraries, Friends of the National. This society was founded in 1931 to assist national and other libraries by promoting the acquisition of books and MSS. of importance, by arranging photographic reproduction when originals are unavailable, and by co-operation with the National Art Collections Fund in cases of MSS. and books with an artistic as well as historical or literary value. Funds are acquired by gifts, bequests, and special appeals, and in 1947-48 £963 was spent on the purchase of books. Examples of its work are the contribution of £500 towards the purchase of the *Sherborne Cartulary* for the Brit. Museum, and £50 towards that of the *Shrewsbury Cartulary* for the National Library of Wales.

Library Association. The L. A. was founded in 1877 and incorporated by royal charter in 1898, its prin. purposes and powers being to unite all persons engaged or interested in library work; to promote the better administration of libraries, and the improvement of the position and qualifications of librarians; to hold examinations in librarianship and to issue certificates of efficiency; and to promote and encourage bibliographical study and research. The association has a total of 9000 personal and institutional members, including nearly 600 from countries outside the Brit. Isles. It maintains the Register of Chartered Librarians of whom there are 2800 fellows and associates. Ten branches and five sections serve the local and special interests of members respectively. Professional examinations are held twice yearly in June and December.

Library of Congress. see LIBRARIES, *United States of America*.

Libration. This term is applied to a small irregularity, compounded of the moon's rotation round her axis and her orbital motion, by means of which her visible hemisphere is not always quite the same. The mean revolution of the moon round her axis is the same period of time as her mean revolution in her orbit. If both motions were equable the moon would always present the same face to a spectator placed at the centre of the earth, on condition that the plane of her equator passed through the centre of the earth. None of these conditions being exactly fulfilled, and the variations being small and periodic, the consequence is that a small portion of the moon's surface in the E. and W. edges, and also in the N. and S., is alternately visible and invisible. The maximum L. longitudinally is a little short of 6° 50' and latitudinally is as much as 7° 53'.

Libretto (dimin. of It. *libro*, a book), text of a dramatic vocal work, especially an opera. The author of such a text is called the librettist. Some of the more famous Its. who composed operatic libretti were Rinuccini (who collaborated with Peri), Caccini, Monteverdi, and Gasilano; Apostolo Zeno, who lived in Vienna and

Venice as court poet; Metastasio, whose texts were set by many important composers including Gluck and Mozart; Lorenzo da Ponte, the author of Mozart's *Don Giovanni*, *Le Nozze di Figaro*, and *Così fan tutte*; Romani, associated with Bellini and Donizetti; Boito and Piave (with Verdi); Illica and Giacosa (with Puccini). Among the Fr., Quinault as Lully's librettist was famed for a century and a half; Scribo wrote texts for Moyerbeer, Halévy, Auber, Boieldieu, and Verdi. Wagner was his own librettist. Hugo von Hofmannsthal collaborated with Richard Strauss in most of that composer's more celebrated stage works, including *Rosenkavalier*, *Elektra*, *Ariadne auf Naxos*, *Die Frau ohne Schatten*, and *Arabella*.

Libreville, tn. of Gabun, Fr. W. Africa, is situated on the N. shore of the Gabun estuary. It is the cap. of the Fr. settlements in the gulf of Guinea and was founded in 1849. It has a shipping industry. Pop. 3000.

Libya and **Libyan Desert**, anct. Gk. name for the N. part of Africa, including Egypt; Homer mentions the land as very fertile. In Rom. hist. the name applied only to the region now known as the Libyan Desert, a huge plateau rising gradually to 1000 ft. above the Nile in stony terraces. The present L. lies along the N. coast from Tunis to Egypt and comprises Tripolitania and Cyrenalca. The coastline is 1100 m. and the area 680,000 sq. m. There are sev. famous oases, the largest being Kharga, easy of access from Ahvados and Thebes; others are Dakei, Farafra, Bahariyah, and Siwah; they are well supplied with springs and are exceedingly fertile; their occupation goes back to remote antiquity. Further to the W. the Libyan Desert merges with the trackless silence of the Sahara. L. was annexed by Italy, following war with Turkey, in 1911. In the course of operations (which relied mainly on the naval blockade of Tripoli) Benghazi was captured by Gen. Ameglio (Oct. 20). This was followed a few days later by the fall of Derna. By the end of the year Italy was in formal possession of all the coast lns. of Turkish N. Africa and then organised an expeditionary force for a movement into the desert interior. The 'pacification' of the Arab tribes was no easy matter, but it was eventually accomplished by Gen. Graziani, who employed methods of the utmost brutality (see also GRAZIANI). L. became a major theatre of operations in the Second World War (see AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IN). After the war a Brit. military administration was estab. until such times as the United Nations could decide on the future of L. In 1949 Cyrenalca achieved independence under the rule of the Emir Sayyid Idris al-Senussi. The Fezzan was administered by the Fr. as part of Algeria. In the Mediterranean zone of L. fruits, cereals, and dates are produced; tobacco, salt, leather goods, and carpets are other products. Pop. about 1,000,000. See R. A. Bagnold, *Libyan Sands*, 1935; D. Campbell, *Camels through Libya: a Desert*

the liquor traffic. Practically the whole law in England on the acquisition, retention, and forfeiture of the right to sell to the public intoxicating liquors, subject to a payment to the State in the form of excise licence duty, and the performances of various conditions is now contained in the Licensing (Consolidation) Act, 1910, and the Licensing Act of 1921. The Act of 1910 does not apply to Scotland, but the law applicable to that country is practically the same in principle.

The basis of Eng. licensing law is the control of the sale of liquor by granting licences (generally speaking) only to persons who have obtained a justices' licence authorising them to hold an excise licence. Justices' licences are available only for one year, and must be annually renewed at the licensing sessions. There is no right of appeal from a refusal, except in the case of old licences, when an appeal lies to quarter sessions. A licence may be forfeited by the holder if convicted of permitting premises to be used as a brothel, harbouring thieves, allowing seditious meetings to be held on the premises, selling or exposing liquor he is not authorised to sell, permitting gaming, or allowing bad characters to resort to the house, and other serious offences. It is a fundamental condition of the grant of a licence that liquor be sold only upon the premises and during certain hours. The Licensing Act of 1921 abolished the old-time 'closing hour,' but limits the sale of liquor to what are called 'permitted hours,' and thus leaves the publican free to keep his premises open for the sale of food and non-intoxicants at any hour of the day or night. By the present law justices at the general ann. licensing meeting have, within certain limits, the power of determining the hours during which the sale of intoxicating liquor on the licensed premises is permitted within their dist. on weekdays. The hours of sale, or 'permitted hours,' must be on weekdays, eight hours in ordinary dists., and nine hours in the metropolis, subject to the proviso that in any licensing dist., if they are satisfied that the special requirements of the dist. make it desirable, the justices may substitute eight and a half for eight hours. The justices in any dist. outside the metropolis may extend the permitted hours, in their discretion, to eight and a half hours a day, provided that no sale shall take place earlier than 9 o'clock in the morning or later than 10.30 at night, and that there shall be a break of at least two hours in the afternoon. In the metropolis the permitted hours may, in the justices' discretion, continue until 11 p.m. On Sundays, Christmas Day, and Good Friday the permitted hours are five only, of which not more than two shall be between 12 noon and 3 p.m., and not more than three between 6 p.m. and 10 p.m. In Wales and Monmouthshire there are no permitted hours on Sundays. These regulations apply both to on-licences and off-licences.

The Licensing (Consolidation) Act, 1910, contains important provisions regarding the sale or supply of intoxicating liquor

to children and young persons. Contraventions are punished by a fine of £1 for a first and £2 for a second or any subsequent offence. The Act of 1921 provides that no one may sell or supply liquor from a van, barrow, or basket, unless the liquor has been previously ordered and the quantity and price, together with the name and address of the person to whom it is to be supplied, has been entered in a delivery book carried by the deliverer, and in a day book kept on the premises. Under the same Act, too, no person may sell or supply to any person, as the measure of intoxicating liquor for which he asks, an amount exceeding that measure—commonly known as the 'long pull.' Conviction for either of these last two mentioned offences may entail a fine up to £30. Imprisonment may be given as an alternative, together with forfeiture of the licence, or cancellation of the liquor, or unlimited disqualification to hold a licence again. There are also a number of regulations as to the sale of liquor in clubs. Under the Licensing Act, 1921, a club in which the sale of intoxicants is made only as part of a meal may sell intoxicants for the space of one hour after the close of the permitted hours for the dist., and where liquor is supplied during permitted hours a further half-hour is allowed to the member for the consumption of that liquor, provided it is taken with a meal. Under the Licensing Act of 1919, bottle parties may not serve drinks after 2 a.m.

Generally speaking a retailer cannot obtain an excise licence until he has been granted a licence by the justices at brewster sessions, i.e. the special ann. meetings of the local justices held for the purpose of granting or renewing licences authorising the grant to him of an excise licence. The grant of a new justice's licence by the licensing justices must be confirmed by the 'confirming authority' (or sessions), who may refuse to confirm even if the grant is unopposed; but it is essential that those who occupy the position of a confirming authority should not only be unbiased, but so related to the matter as to be free from any reasonable suspicion of bias. (Lord Hewart, L.C.J. in *R. v. Sheffield Confirming Authority*, 1937.) The applicant for a manufacturer's or dealer's licence requires no authorisation from justices. Again retail liquor licences for the following places can be obtained from an officer of customs and excise without previous authority from the justices—Theatres, passenger vessels, railway restaurant cars, and naval and military canteens; while occasional licences are authorised by consent of a petty sessional court.

Manufacturers' licences relate to either spirits, beer, or sweets, and expire on Sept. 30 each year. The penalty for manufacturing spirits, beer, or sweets without a licence is £500. A distiller, rectifier, or compounder of spirits must take out a licence annually. Spirits means any fermented liquor containing a greater proportion than 40 per cent of proof spirit. Beer includes ale, porter,

spruce beer, black beer, and any liquor made or sold as a description of, or as a substitute for, beer, and which, on analysis, yields more than 2 per cent of proof spirit. Sweetened liquor made from fruit and sugar that has undergone a process of fermentation; it includes Brit. wines, 'made wines,' and methylin. Licences for wholesale dealers in spirits, beer, wine, or sweets must also be taken out annually. (Occasional licences are granted for cricket matches, flower shows, gals, and similar festivities.

The penalty for dealing without a licence is £100. Retailers' licences are either on-licences, i.e. for sale of liquor for consumption either on or off the premises, or off-licences, for consumption off the premises only. The term 'publican's licence' is exclusively appropriated to a retailer's on-licence for spirits, and the expression 'fully licensed premises' means premises to which a publican's licence is attached. A person who holds a publican's licence may sell by retail beer, cider, wine, and sweets, as well as spirits, without taking out any further retailer's licence. The penalty for selling by retail without a licence is either £50 or a sum equal to treble the full duty.

A reduction in duty is allowed in the case of (a) fully licensed premises and beerhouses of an ann. value exceeding £500; (b) hotels and restaurants; (c) premises used for any purpose to which the holding of a licence is merely ancillary, i.e. theatres, law courts, public gardens, picture galleries, and exhibitions; (d) refreshment rooms at a railway station. See also LIQUOR CONTROL.

Lichens, very large order of lowly plants resistant to extremes of heat and cold, and probably with a wider distribution than any other form of plant life. They are common objects on walls and rocks and on trees, to which some of them frequently do much injury. The majority, however, are not parasites, but, when present in abundance on the bark of trees, prevent it from performing its functions, and shelter numerous forms of injurious insect life. The most injurious lichen known is the red rust of the tea plant (*Cephalosporium myricoides*). Lichen is composed of a fungus and one or more single-celled or thread-like algae, which combine to form an excellent example of *symbiosis*, since neither is parasitic but both are equal partners in the life of the plant. The function of the fungal half of the partnership is to propagate itself by spores and to envelop and protect the algal cells and supply them with water. These can only grow by division, and in their turn manuf. the food for the whole lichen by absorbing carbon dioxide from the air, which is broken up under the influence of light into starch or lichenin. Some L. are of economic value. In the Arctic regions they frequently act as an important source of animal food, and have more than once saved the lives of explorers whose provisions were exhausted. The most important of these is the reindeer 'moss' (*Cetraria rangiferina*). *Rocella tinctoria*, which grows on rocks by the coast, is a

source of litmus, while other L. yield such dyes as orchil, cudbear, and orseille. There are some 2000 Brit. species of L. One of the most beautiful is *Cladonia cornucopioides*, which is common on heaths. See G. Masec, *British Fungi*, with a Chapter on Lichens, 1911.

LICHEN

Lichfield, municipal bor. and cathedral city of Staffordshire, England, lies in the valley of the Trent, 15 m. S.E. of Stafford. The cathedral, in the Decorated style, dates from the twelfth century and has a valuable library. It is the only Eng. cathedral with three spires. Together with many interesting monuments and memorials it contains a masterpiece by Chantrey, 'The Sleeping Children.' Addison, Garrick, and Dr. Johnson were educated at its grammar school. Valuable new coal seams were discovered in May 1949 at Whittington Heath, near L. by the Geological Survey of Great Britain. The seams lie at a depth of 3000 ft. and at the present rate of mining will add at least another eighty years of coal production in the dist. The total deposits may well be of the order of 4,000,000,000 tons, but the full extent of the new coalfield has not yet (1949) been ascertained. Pop. 9800.

Lichi, or **Leechee**, tree of the soapberry family, grown chiefly in China and S. Africa. Its aromatic fruit, which is enclosed in a thin, nut-like shell, is regarded as a delicacy whether eaten raw or preserved.

Lichnowsky, Karl Max, sixth Prince (1860-1928), Ger. diplomatist, b. at Kreuzenort, son of Karl, fifth Prince L. He entered the Ger. Foreign Office in 1884, and, after twenty years in various embassies and legations, retired in 1904. In 1912, however, he was appointed ambas. to Great Britain. The revelation of Ger. policy after the Sarajevo murders of 1914 came as a shock to him, and he privately printed a pamphlet called *Meine Londoner Mission, 1912-14*, which one of his friends pub. without his consent in 1918, with the result that L. was expelled from the Prussian Upper House and fled to Switzerland. Fuller revelations of his attitude may be found in his book trans. into Eng. as *Heading for the Abyss* (1928).

Lichtenberg, Georg Christoph (1742-1799), Ger. philosopher and satirist, b. near Darmstadt. He frequently visited England and gathered materials for his famous explanations of Hogarth's pictures, *Ausführliche Erklärung der Hogarth'schen Kupferstiche* (1794-99). His work includes philosophical essays, witty burlesques, satirical writings, and physical investigations, especially into electricity. His *Gesammelte Schriften* (14 vols.) appeared in 1844-53, his *Briefe* (1901-4), and his *Aphorismen* (1902-8). *Briefe aus Lichtenbergs englischen Freundeskreis* were ed. by H. Hecht in 1925. See R. M. Meyer, *Swift and Lichtenberg*, 1886, and M. Donke, *Goethe und Lichtenberg*, 1935; also studies by A. Leitzmann, 1899; E. Bertram, 1919; and O. Dencke (vol. i.), 1944.

Lichtenburg, tn in the Transvaal, S. Africa, 120 m. W. of Johannesburg. It was the centre of a remarkable diamond rush in 1926. Pop. 5860 (European 3280; native 2300; others 275).

Lichtenstein, tn. of Saxony, Germany, 45 m. S.E. of Leipzig, has a famous old castle. There are manufs. of linen and paper- and cotton-mills. Pop. 6000.

Licinius (Publius Flavius Galerius Valerius) (263-324), emperor of Rome, was a Dacian peasant and received his preferment at the hands of Galerius, on whose death in 307 he was made Augustus. L. shared his rule with Constantine, whose sister, Constantia, he married. The two emperors quarrelled and went to war; Constantine was victorious at Hadrianople and Chalkedon in 323, and caused L. to be put to death in the following year; the young L., son of the emperor, was murdered about the same time.

Licking, riv. in Kentucky, U.S.A., rises in the E. of the state, flows N.W. to the Ohio, which it joins opposite Cincinnati. It is 220 m. long and navigable for 70 m.

Lick Observatory, on Mt. Hamilton, California, U.S.A., was built at a cost of \$140,000 according to the bequest of James L. (1796-1876), an Amer. financier and philanthropist. It stands at an altitude of 4280 ft., and contains the vault of its founder. The observatory now belongs to the univ. of California. A 120-in. reflecting telescope has been installed which enables observation at 900,000,000 light years distance.

Lictors (Lat. *ligo*, to bind, probably with reference to the bound rods or fasces borne by them), civil officers amongst the anc. Romans, who were required to attend before the consuls or magistrates to clear the way. It was also their business to inflict corporal punishment and to perform executions.

Liddell, Henry George (1811-98), famous as the collaborator, with Dean Scott, in the compiling of the (ik. Lexicon. From 1816 to 1855 he was headmaster of Westminster School, dean of Christ Church from 1855 to 1891, and vice-chancellor of Oxford, 1870-74. Besides the valuable Lexicon he wrote a *History of Rome* (1855).

Liddesdale, or **Lidsdale**, beautiful dist. of the Eng.-Scottish border, is the valley traversed by Liddel Water, a union of small streams which flows through Rox-

burghshire from the S.W. of the Cheviot Hills and joins the Esk, 12 m. N. of Carlisle. In the valley is Hermitage Castle, a massive thirteenth-century stronghold.

Liddon, Henry Parry (1829-90), Eng. divine, b. at N. Stoneham, Hampshire. Appointed prebendary of Salisbury Cathedral in 1861, and in 1870 became canon-residentiary of St. Paul's Cathedral. His sermons, lectures, and writings, all of a High Church tendency, had a remarkable influence on the religious thought of the period. At the time of his death he was engaged on a life of Dr. Pusey, which was finished by other hands and pub. in 1893-1894. See J. O. Johnston, *Life and Letters of Henry Parry Liddon*, 1904; also life by G. W. E. Russell, 1905.

Lidford, see **LIDFORD**.

Lidford Law, an O.E. proverb ran:

'First hang and draw,

Then hear the cause by Lidford law.'

The term thus came into use to mean hang a man first and try him afterwards. The theory is that it arose from the very arbitrary procedure of the Stannary courts in the Devonshire tn. of Lidford.

Lidgett, John Scott (b. 1854), Brit. Methodist church leader and social reformer, b. at Lewisham. He entered the ministry by way of Univ. College, London, and for fourteen years was minister at Southport. One time vice-chancellor of London Univ.; associated with Hugh Price Hughes in the movement for the improvement of the industrial classes. He will, however, be best remembered as the man who, in 1891, in conjunction with Dr. Moulton, founded the Bermondsey Settlement, of which he held the wardenship from 1891 to 1919, and also as the guiding spirit in the movement which resulted in the union of the three Methodist denominations of which he became the first president.

Lidice, vil. of Bohemia, Czechoslovakia, in the Kladno coal-mining area, the scene of a Ger. crime against humanity during the Second World War. Heydrich (q.v.), the notorious 'protector' of Ger.-occupied Bohemia-Moravia, was killed by a bomb thrown at his car as he was leaving Prague (May 27, 1942). The Gestapo alleged that the vil. of L. was harbouring the men who had killed Heydrich. As a consequence all the male inhab. of L., numbering about five hundred, mostly coal-miners and steel workers, were shot, the women sent to concentration camps where many d., and the children put in 'educational centres.' The buildings of the vil. were destroyed, and the Gers. erased the name of L. from all official records. The total pop. of L. was nearly 2000. Later the smaller vil. of Ležaky in the Chrudim industrial dist. was subjected to the same fate as L. on the charge that the inhab. had sheltered parachutists alleged to have plotted the attack on Heydrich. The first house of a new vil., planned at Columbia Univ., was occupied in 1949. Many places abroad took the name of L., as did a co. of Quebec.

Lido sandy ls. in the N. of Italy,

between the R's Brenta and Piave separating the lagoons of Venice from the Adriatic Sea. It is a popular Venetian watering place. In the Second World War the convent of S. Nicolo was badly wrecked by Ger. troops. The name L. has been applied to bathing resorts in sev. countries.

Lie, Jonas Laurits Idemil (1833-1905) Norwegian novelist, *b.* at Ficker near Drammen. In 1866 he pub. a vol. of poems and in 1870 his first novel *Den fremmede* (Eng. trans. *The Visionary* 1891), a melancholy romance which made him famous. He spent his time there after between Italy, Germany, Paris and the Tyrol, not finally returning to Norway until 1891. During these years he pub. *Fremmede Fremtiden* (Eng. trans. *The Barque 'Future'* 1879), *Todsen og hans Husfru* (*The Pilot and His Wife* 1874), his first really great novel *Laustna Strømer* (a verse drama, 1876), *Rullant* (1881), *Gaapaa* (1882), *Fusslaen* (1883), *Familien paa Gyle* (1883), *Maister* (1885), *The Commodore's Daughters* (Eng. trans. 1892), *Noble* (1893), *Dyre Tot* (1896), *East Forland* (1899), *The Consul* (1901), and many others. See lives by A. Carborg 1893 and L. Lie 1909.

Lie, Marcus Sophus (1812-99) Norwegian mathematician *b.* at Nordfjordeid near Bergen. He was educated at the Univ. of Christiania where a special chair of mathematics was created for him in 1872. In 1856 he was appointed prof. of geometry at Leipzig. He pub. *Theorie der Transformationsgruppen* (1885-93) and *Vorlesungen über Differentialrechnung mit bekannten Infinitesimalen Transformationen* (1891).

Lie, Trygve (*b.* 1896) Norwegian lawyer and statesman *b.* at Grorud near Oslo and educated at Oslo Univ. studied as a barrister. He joined the Norwegian Labour party in 1919 and later became its legal adviser. From 1933 he served in the Norwegian Gov. being successively minister of justice, commerce, and supply and becoming minister of foreign affairs in 1941. This office he held until 1946 when he resigned on being appointed the first secretary-general of the United Nations Assembly.

Lieber, Thomas, see **LIEBIG**.

Liebermann, Max (1847-1913) (crit. painter and etcher native of Berlin). He was a pupil of Steiner and in 1869 studied at the School of Art at Weimar. His best subjects show the influence of J. Israels and of humble folk in the vils. and fields of Holland besides factory life in Germany. Some of his finest paintings are 'Flax Spinners' (Berlin National Gallery), 'The Woman with Goats' 'An Asylum for Old Men' and 'Labourers in a Turnip Field'. See lives by M. J. Friedländer, 1924 and H. Ostwald, 1930.

Liebhaf, Joachim, see **CAMPBELL**.

Liebig's Condenser, apparatus used to convert a vapour into the liquid state by cooling with the aid of water. There are sev. other kinds of condenser all founded on the same principle—vapour passing through a tube and being cooled by water, but L's C. is convenient when larger

quantities of a liquid are to be distilled. The apparatus consists of a glass tube enclosed in a jacket through which a constant stream of cold water is passed. The liquid to be distilled is contained in a distilling flask provided with a side tube which is passed through a cork in the condenser. In the neck of the flask a thermometer is supported by a cork, so as to enable the boiling point of the liquid to be determined.

Liebig, Justus, Freiherr von (1803-75) Ger. chemist *b.* at Darmstadt. At an early age he displayed a love of natural science, and in 1819 was sent to the Univ. of Bonn, going from there to Erlangen, where he took his doctor's degree in 1822, publishing a paper on 'vulminating mercury

JUSTUS LIEBIG

the same year. He then went to Paris where he made the acquaintance of Humboldt and Gay Lussac. At the recommendation of the former he was made prof. of chem. at the Univ. of Giessen, where he attracted students from all parts of Germany and other European countries. In 1852 he became a prof. of chem. at Munich. At the outset of L's career chem. was in its infancy but at the time of his death it had developed beyond all expectations. He estab. the first laboratory where students could receive thorough practical training and introduced the well known method of organic analysis. One of his favourite branches of research was the phenomena of animal and vegetable life and he was the first to prove that the activity of physical and chemical forces is the same in the organised as in the mineral world. He caused great developments in agriculture by the use of fertilisers and invented meat extract and baby food. His prin. work was *Chemistry in its Application to Agriculture and Physiology* (1840), and he also wrote *Animal Chemistry or Chemistry in its Application to Physiology and Pathology* (1842), a *Dictionary of Chemistry* (1857), *Familiar Letters on Chemistry* (1844), and

Researches on the Chemistry of Food (1847); most of which have been trans. into Eng. and Fr. See J. Vogel, *Liebig als Begründer der Agrikulturchemie*, 1874; A. W. Hofmann, *The Life-work of Liebig in Experimental and Philosophic Chemistry*, 1876; and W. Ostwald, *Grosse Männer*, 1909; and lives by R. Blunck, 1938, and R. Schenk, 1941.

Liebknecht, Karl (1871-1919). Ger. Socialist. b. Aug. 13, son of Wilhelm L. (q.v.). He practised at the Berlin Bar. In 1907 he pub. a pamphlet against militarism, for which he suffered two years' imprisonment. Member of the Prussian Diet in 1908 and of the Reichstag from 1912. He served on the W. front in the First World War. Expelled from the Reichstag, April 1916, for a speech on gov. finance, and in the autumn he received a sentence of four years' penal servitude for 'attempted high treason,' being released in Oct. 1918. Heading Spartacist rising, he was arrested Jan. 15, 1919, in Berlin, and on the way to Moabit Prison was shot dead probably by police, who said he tried to escape. His fellow prisoner, Rosa Luxemburg, was killed during the same journey. See M. Adler, *Karl Liebknecht und Rosa Luxemburg*, 1919, and life by W. Swienty, 1931.

Liebknecht, Wilhelm (1826-1900), Ger. social democrat, b. at Giessen. Imprisoned for his share in the Baden revolt of 1848, he escaped, going first to Switzerland, then to London, where he worked for Ger. newspapers and associated with Marx and Engels. In 1862, after the amnesty, he returned to Germany, but was banished from Berlin and Prussia for Socialist agitation. In 1864 he entered the N. Ger. Parliament, and in 1868 began to edit, with Hebel, the *Demokratisches Wochenblatt*, an attack on Bismarck in its pages led to their imprisonment for two years. On his release L. entered the Reichstag, remaining a member almost uninterruptedly for twenty-five years. He ed. the *Berlin Vorwärts*, and in 1895 was imprisoned for four years on a charge of *lese-majesté*. He pub. sev. works. See life by K. Eisner, 1900.

Lieber, Thomas, see ELIAS-Us.

Liechtenstein, small European principality, bounded on the N.E. and E. by the Austrian Tyrol and Vorarlberg, on the S. by the Swiss canton of Grisons, and on the W. by the Rhine, which separates it from the canton of St. Gall. It covers an area of 65 sq. mi., and has a very mountainous surface, the Alps here reaching an elevation of 8500 ft. Vaduz is the cap., and the constitutional monarch is a prince of the royal house of L., which dates back to the twelfth century. Until the dissolution of the Austrian empire L. was closely associated with the latter. Since Jan. 1, 1924, the state has belonged to the Swiss customs and administration dist. After the Ger. annexation of Austria Nazi influences were evident but the independence of the country was preserved. Rev. international financial bodies installed their headquarters in the principality so as to avail themselves of its low taxation and neutral status during the Second World

War. Pop. 12,200. See E. Hinderer, *Reiseführer für Liechtenstein*, 1935, and H. Hiltbrunner, *Fürstentum Liechtenstein*, 1946.

Liedekerke, small tn. of Brabant, Belgium, situated 12 m. W. of Brussels, and engaged in agriculture. Pop. 7700.

Liège (anc. *Leodium*, Flemish *Luik*, Ger. *Lüttich*): 1. Prov. of E. Belgium, almost bisected by the R. Meuse, and bounded on its E. side by Germany. This prov. offers very different aspects. Coal is found along the Meuse valley, where subsequently the iron and glass industries were centred. In its S. part are extensive quarries of freestone. The phosphate of lime abounds in the fertile Hesbaye plateau, where sugar beet is the most important crop and where the refineries are situated. In the N.E. is rich grass-land and the breeding of horses, cattle, and pigs is carried on. In the S.E. rises the high plateau of the Ardennes with the highest point of this prov. and of Belgium, the Botrange (2275 ft.). The wool industry is highly concentrated in the Vesdre valley round Verviers. Since the tenth century L. has been a mighty eccles. principality. In 1795 it came under France. In 1815 it was given to Holland and it became a prov. of Belgium in 1830. The inhab. are mainly Walloons. In 1920 the Ger. dists. of Eupen and Malmédy were ceded to Belgium and incorporated in the prov. of L. (see EUPEN). Area 1140 sq. mi. Pop. (1918) 963,850. In April 1919 minor border revisions, aiming to clear up confused enclave situations, added about 16 sq. mi. of Ger. ter. with 500 inhab. to the prov. of L. 2. Cap. of the above, on the Meuse, almost opposite the valleys of the Vesdre and Ourthe, 51 m. S.W. of Brussels. It is one of the most important cities of Belgium and has a pop. of about 156,200. Together with its suburbs, Angleur, Aus, Bressoux, Chénée, Crèvecoeur, Herstal, Jemeppe, Jupille, Montegnée, Ougree, St. Nicholas, Seraling, and Tilleur, there live 362,000 people on about 43 sq. mi. The city itself contains many interesting old churches dating from the tenth, eleventh, and twelfth centuries. The cathedral (formerly St. Paul's Church) was rebuilt in the thirteenth century. The chief secular building of L. is the magnificent old palace of the prince-bishops. It dates from the tenth century, was ravaged sev. times by fire, and rebuilt for the last time in the sixteenth century. The edifice covers an area of about 17,400 sq. yds. and accommodates at present the prov. gov., the law court, and the archives. L. has a univ. founded in 1817, sev. interesting museums, and a conservatoire. Two forts of its anc. fortifications remain, and it is a bishop's see. It is the bp. of Grétry, a famous Belgian composer. Among the products of its intensive hardware industry the chief is firearms. Other manufs. are zinc, machinery, textiles, caoutchouc, and sugar. Situated on a navigable riv. linked by the Albert Canal with Antwerp and junction of international railways, L. is an important trade and transportation centre.

Liège, Siege of (Aug. 1914).—The Ger.

war plan for an offensive against France envisaged the violation of Belgian ter. in order to give their right wing sufficient space in which to swing round and eventually envelop the Fr. left. L. was protected by a ring of outer forts all of pre-1911 design and armament. The Ger. force entrusted with the siege was under the command of Gen. von Emmich (q.v.) and one of his staff officers was Ludendorff (q.v.). The Gers. crossed the frontier on Aug. 4, 1914, and met with considerable opposition from the Belgians. Roads were strongly barricaded, and the intervening space between the forts was occupied. Eventually each fort fell, crumbled by the huge howitzers of the Gers., which, till then, had been a secret. Ludendorff, on his own initiative, had collected the scattered remnants of companies and regiments and organised them into a fighting force. He was then given command of a brigade, with which he broke through the interval between Forts de Fléron and d'Evegnée and reached La Chartreuse. In this position he was quite isolated from the rest of the Ger. force, but soon the grille of forts was pierced and L. was entered on Aug. 7, 1914. Some forts, although completely surrounded, continued to resist, under the heroic command of Gen. Leman, until Aug. 14, when his headquarters, the famous fort of Loncin, occupied by 300 men, was blown up. The delay, however, caused by the Belgian stand proved invaluable to the Allies (see FORTIFICATION: FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGN IN).

Second World War (May 1940). As L. was again a key position at the end of the strategic Albert Canal, its fortifications were completely rebuilt and modernised. A second time the defending troops had to withdraw, on May 13, threatened with encirclement by Ger. units, which had crossed the canal to the N. The forts, however, resisted again as long as possible and gave no rest to the advancing Gers. The fort of Pepinster continued firing until May 29, the day after the capitulation of the Belgian Army. After its liberation on Sept. 8, 1944, L. and its suburbs suffered much from flying bomb and rocket attacks. See also FORTIFICATION: FRANCE AND FLANDERS, SECOND WORLD WAR CAMPAIGN IN.

See G. Kurth, *La Cité de Liège au moyen âge*, 1910; T. Gobert, *Liège à travers les âges*, 1923-30; and P. Pourmarier and L. Denoel, *Géologie et industrie minière du pays de Liège*, 1930.

Liegnitz (Polish Legnica), tn. of Polish Silesia, formerly of Prussia. It was captured by the Russian forces under Gen. Roniev on Feb. 22, 1915. The tn. stands on the Kutzbach, 38 m. N.W. of Breslau. It is an important industrial centre, its products including textiles, leather, machinery, and cutlery. Pop. 77,000.

Lien, right to retain the goods of another pending payment of a debt due either in respect of the goods retained, or on a general account between the parties. *Is.* are either possessory, maritime, or equitable. Possessory *Is.* are divided

into (a) *Particular*, i.e. give a right to retain the particular goods in connection with which the debt arose. Such a *L.* may be provided for by express agreement, or it may be implied. The law implies a *L.* where skill has been exercised on the goods, or the creditor has been compelled to receive them. Examples of particular *Is.* are those of an innkeeper over his guest's luggage for payment of board and lodging, a shipowner over the cargo for his freight, a common carrier for goods carried, and wharfinger for goods warehoused, and the unpaid vendor's *L.* under the Sale of Goods Act. (b) *General*, i.e. give a right to retain not only for the debt arising in connection with the goods retained, but for a general balance of account. Such a *L.* arises either from trade custom (see CUSTOM), or express agreement. Bankers, solicitors, dyers, factors, and stockholders have the right to exercise a general *L.* A possessory *L.*, generally speaking, carries with it no right to sell the goods retained unless such right is conferred by statute. Innkeepers and wharfingers may sell, and so may the unpaid vendor.

Maritime Is. include those of seamen for their wages, a master for his wages, and disbursements in and about the cargo, a salvor, the owners of a ship which has been damaged in colliding with another ship by the default of the latter, and a bottomry bondholder (see BOTTOMRY). The right is exercisable over the ship and its cargo, and far from depending on the possession of the thing over which it exists, as in the case of a possessory *L.*, it is said to follow the thing wherever it goes. Among conflicting maritime *Is.* priority is given in the inverse order to that in which they arose. (See the principle under BOTTOMRY.)

Equitable L. exists independently of possession, and is in the nature of a right arising out of a trust created by agreement, express or implied. For example, the *L.* of a trustee on trust property for his costs and expenses, of a vendor of land for unpaid purchase money. *L.* may be lost by surrender of possession.

Liepaja, Libau, or Libava, seaport of Courland, in the Latvian S.S.R., on a bank separating Lake Libau from the Baltic Sea, 105 m. S.W. of Mitau. Improvement of the harbour commenced with the charter of municipal freedom, granted in 1625. In the nineteenth century L. rivalled Königsberg in importance, and with the construction of the L.-Vilna-Bakhmaz-Romny line, completed in 1904, L. became the direct exit for S. Russia. L. was also the terminus of Russian overseas lines. The Russians also built a large naval harbour, but it was not much utilised, owing to international complications. With the temporary achievement of Latvian independence L. passed out of Russian hand: but its importance as a port remained. L. suffered little during the First World War; during the Second World War it was captured by the Gers. at the end of June 1941 and liberated by the Russians in May 1945, and suffered heavily from bombing by both sides.

The whole harbour is open the year round, and the depth of the fairway is 26 ft. The chief industries of the tn. are wood, metal, paper and printing, and leather, 'Libava kid' being world famous; there are chemical works, breweries, and iron foundries. Pop. 57,000.

Lier (Fr. *Lierre*), city of Belgium, 10 m. S.E. of Antwerp is a charming place situated at the confluence of the Great and Little Nete, forming together the R. Nete (q.v.). Noticeable buildings are the tn. hall with belfry (1269-1411), the collegiate church (1377-1455), and the Zimmertoren, containing an interesting astronomical clock and a museum. The picturesque *Béguinage* (convent) dates from the thirteenth century. The chief manufs. are shoes, lace, embroideries, instruments of brass, and cutlery. Pop. 28,900. See S. Leurs and J. A. Goris, *Lier in Ars Belgica*, vol. iii. Antwerp, 1935.

Liestal, or Liesthal, cap. of Basle-land, Switzerland, 8 m. S. of Basle. It is a health resort, frequented for its medicinal springs. It manufs. textiles. Pop. 5000.

Lieutenancy, Commission of, name given to the body of commissioners who take the place of a lord-lieutenant in the city of London. They are sometimes called deputy lords-lieutenant, but this is an incorrect designation, as, although they perform the duties of a lord-lieutenant, they are commissioners appointed annually (as a rule) by the Crown; deputy lords-lieutenant, on the other hand, are appointed by the lord-lieutenant. The difference between the city of London and the rest of England is that in the former the L. is 'in commission.' It is noteworthy that under the commonwealth the Ls. of all the cos. were in commission, as Cromwell refused to recognise lords-lieutenant and appointed commissioners in their stead.

Lieutenant and Second Lieutenant (Army) (Fr. *lieutenant*, from Lat. *locum tenens*, holding the place of another), officers in the Brit. Army next in rank to a captain. The former are 'subaltern officers,' the latter 'subalterns.' The name L. is given to them because they 'understudy' the troop, squadron, or company commander, commanding themselves platoons or equivalent sub-units. Second Ls. were formerly called cornets or ensigns, except those of fusilier regiments, who were called second Ls., but when an alteration was made in 1871, those appointed before Aug. 26, 1871, or from the Sandhurst 'A' list, were made Ls. as from Nov. 1, 1871, those appointed after Aug. 26, 1871, were sub-Ls. The latter rank was altered in 1877 to second L., which, after being abolished from 1881 to Jan. 1887, is now in force. The duties of Ls. and second Ls. are identical. A L. of the army is of co-ordinate rank with a sub-L. of the navy and with a flying officer of the R.A.F.; a second L. ranks with a commissioned officer from warrant rank of the navy and with a pilot officer of the R.A.F.

Lieutenant (Navy). In the R.N. a L. holds intermediate rank between a sub-L. and a L.-commander. A young naval

officer first serves as a cadet or midshipman and then passes through the ranks of acting sub-L. and sub-L. He then qualifies in various courses of instruction, including such subjects as navigation, pilotage, and gunnery, and is then promoted to L., his seniority being according to the results of the examinations. Sub-Ls. and Ls. rank with Ls. and captains in the army, according to seniority in their respective ranks. There are also the ranks of instructor-L. and engineer-L.

Lieutenant-Colonel, see under COLONEL.

Lieutenant-General, see under GENERAL.

Lievín, tn. in the dept. of Pas-de-Calais, France, 11 m. S.W. of Bethune. It is the centre of a mining dist. Pop. 28,800.

Li-fan Sze-tu, see SZE-TU.

Life, see BIOLOGY.

Life Assurance, see INSURANCE.

Lifeboats, boats specially designed for saving life in cases of shipwreck, etc. The first in-sunderable boat was built in 1785 by K. Lukin, a London coachbuilder, encouraged by the Prince of Wales, but it was not until the wreck of the *Adventure* off S. Shields in 1789 stirred up public feeling that any great interest was manifested in the question. A prize was then offered for the best lifeboat, and Henry Greathead was commissioned to build a boat embodying the best points of his own prize-winning plans and those of Wm. Wouldhave. The principles of Wouldhave's lifeboat were not universally adopted until the *Providence* capsized at the mouth of the Tyne in 1849 and twenty of her crew lost their lives. It was then that the first self-righting lifeboat was built. The power to self-right is obtained by the two air chambers, or high 'end-boxes,' as they are called, which are the distinguishing feature of the self-righting lifeboat, and by a heavy keel, weighing from one-fifth to one-third of the boat's total weight. These high end-boxes, exposed as they are to the wind and the sea, make the self-righting lifeboat less easy to handle in heavy weather; and though she will come right way up as soon as she capsizes, she is, in fact, more liable to capsize than the lifeboat which cannot self-right. These, although once they go over they have no chance of self-righting, are much more stable.

In 1890 the first steam lifeboat was designed. She was propelled, not by screws, but by a powerful pump, which drew in water through an opening in the bottom of the boat and discharged it at the sides. It could take in a ton of water in a second and drive the boat at nine knots. Altogether six steam Ls. were built, some with pumps and some with screws. Motor Ls. are taking the place of all others. The first lifeboat to be converted into motor power was completed in 1904 and sent to Tynemouth. She had a 12-h.p. two-cycle motor. To-day the Royal National Lifeboat Institution maintains 154 motor L. and two pulling and sailing Ls. on the coasts of Great Britain and Ireland.

Through its ability to attain a speed and to cover distances impossible for boats which depend on sails and oars, and its

power against a heavy sea, the motor lifeboat with heavy oil or petrol engines, has been able to save lives that could never have been saved by the older boats. Fewer boats are required, as two boats can now safeguard a bay that once required five or six. The cost, however, is greater. The first lifeboat cost £150. One new type of lifeboat, introduced in 1917, is a cabin craft with two 40 h.p. Diesel engines. Oil-spray, radio set, loud-hailer, line-gun, and searchlight are carried. The modern motor lifeboat costs from £10,000 to £11,500, but a newly designed lifeboat, fitted with a deck cabin, built for St. Helier, cost £18,000. In addition the bouthouse and launching

The Royal Institution for the Preservation of Life from Shipwreck, now the Royal National Lifeboat Institution, was founded by the efforts of Sir W. Hillary, T. Wilson, and G. Hibbert in 1824. The institution has always been dependent on voluntary subscriptions. Since 1824 75,690 lives have been rescued from shipwreck; nearly £600,000 (the income of the institution in 1947 was £819,911; expenditure, £579,937) a year is required to maintain the lifeboat service. It gives rewards for rescues and attempted rescues. It compensates those injured in the service, and pensions the widows and orphans of those killed in its duties. The U.S. Life-saving Service was introduced in

THE LIFEBOAT OF ST. HELIER, JERSEY (1949)

The *Elizabeth Rippon* can take 95 on board, and is the first to be fitted with a deck cabin. The whole superstructure is built of aluminium alloy.

Topical Press

slipway, which are as essential as the L. herself, may cost as much as or more than the boat. Only the best materials are used in the construction of a lifeboat, and each boat has to be passed as efficient by an inspector before being used. The carriage of a lifeboat is a necessary adjunct where it is necessary to launch boats at a distance from the boat-house. Tilling's sand-plates are a great aid on soft and sandy beaches. They consist of an endless platelay or jointed wheel tyre fitted to the main wheels of the carriage.

LSs must be carried on board ships in sufficient number to accommodate crew and passengers. The *Queen Elizabeth* has twenty-eight steel Ls, powered by Diesel engines, fireproof and virtually unsinkable, carrying 145 passengers; equipment includes provisions, charts, radio, distillation plant, etc. Oil-tanker Ls are specially constructed to permit launching into an oil-covered sea. Launching is effected electrically, or by gravity as in the *Queen Elizabeth*.

1871, and both in equipment and efficiency has reached a very high standard; it is subsidised to a great extent by Congress. The life-saving societies of both France and Germany date from 1865, and are supported by voluntary contributions.

The Second World War saw the introduction of airborne Ls to rescue air crews, and the first was used operationally in May 1913. The most efficient type is constructed of two mahogany skins; buoyancy chambers to ensure self-righting are inflated automatically when the lifeboat is dropped on parachutes from the transporting aircraft. Sails and a 4-h.p. engine are provided, as well as radio, provisions, etc.

See J. C. Lamb, *Life-boat*, 1911; A. J. Dawson, *Britain's Life-boats*, 1923-1923; 1923; J. E. B. Seeley, *Launch*, 1932; C. Smedley, *Grace Darling and her Times*, 1932; C. E. T. Lewis, *Lifeboats and their Construction*, 1935; and J. G. Cumming, *Literature of Lifeboats*, 1936-37.

Life Guards, premier corps of the Brit. Army, taking precedence over all other regiments. Their duty is to attend the sovereign, as their title shows, 'life' being a corruption of the Ger. *Leib*, body, the L. G. thus being the bodyguards of the king. The origin of the L. G. dates back to 1660, when they were formed as a bodyguard to Charles II., being principally composed of the cavaliers who followed his fortunes in exile, and retaining for many years a certain superiority of personnel. Each regiment of the L. G. carries four standards; their motto is that of the sovereign, 'Dieu et mon Droit.' They fought at Dettingen, the Peninsular war, Waterloo, Tel-el-Kebir, and in S. Africa. On the outbreak of the First World War squadrons from the 1st and 2nd L. G. and the Royal Horse Guards were formed into a composite regiment for active service, and at once proceeded to France, and joined the 4th Cavalry Brigade, in Gen. Allenby's div. Its first action was in the retreat from Mons; then it took part in the battle of the Marne (q.v.) and the general advance. In Oct. 1914 it moved northwards and came under Sir Douglas Haig's command, and took part in the first battle of Ypres, immediately followed by the defence of Messines. While the composite regiment was in France a Household Cavalry Brigade had been forming in England, into which were drafted officers and men of Line Cavalry Regiments. This brigade went to the relief of Antwerp on Oct. 7, 1914, but arrived too late, and withdrew down the coast until it joined the allied forces about Ypres. On Nov. 7 the brigade won distinction by driving the Gers. out of a gap they had made between Cavan's right and Demoussy's left at Klein Zillebeke. In the course of the campaign the Household Brigade, in common with all cavalry, was converted to an infantry status, and, later, organised machine-gun squadrons. Further honours were gained in many battles, notably on the Somme, at Albert, Arras, the Scarpe, Passchendaele, Hindenburg line, and Cambrai.

In the general reduction of the army after the First World War the 1st and 2nd L. G. were amalgamated and designated 'the L. G.' and the Royal Horse Guards (the Blues) were reduced in strength. (For the services of the Household Cavalry in the First World War, see Sir G. Arthur, *The Story of the Household Cavalry*, vol. III., 1926.) In the Second World War the L. G. and Royal Horse Guards forming the 1st Household Cavalry Regiment, served in Palestine with the 1st Cavalry Div. The unit was soon mechanised, and saw service in Iraq, Syria, N. Africa, Italy, and Europe. A second regiment, formed in 1910, fought as an armoured car unit with the Guards Armoured Div. in the liberation of Europe. After the war the L. G. resumed their mounted ceremonial duties at Windsor and London.

Life insurance, see *UNDER INSURANCE*.
Liferent, in Scots law a right for personal servitude analogous to the Rom. *usufructus*, to use and enjoy a thing during

life without thereby destroying or wasting its substance. It mainly applies to heritable subjects, because a L. can hardly subsist in things which are consumed by use. But there is authority for saying that it may apply to household furniture or other things which wear out in process of time. A L. in a stock farm would be construed to mean that the liferenter must leave the stock at the close of his period of enjoyment substantially of the same descriptive value and extent as at entry, and a L. of money would give the interest to the liferenter. Ls. are divided into legal and conventional. Legal Ls. comprise (a) *terce (tertio)* or right of a widow, or wife who has divorced her husband, to one-third of the husband's heritable subjects, and (b) *courtesy* or right given to the surviving husband of all his wife's heritage, provided issue of the marriage was *b. alive* (i.e. has been heard to cry). Conventional Ls. are said to be either simple or by reservation. The former are constituted by grant by the proprietor completed by infeftment; in the latter the proprietor reserves to himself a L. in the same writing by which he conveys the fee of the land to another. See W. Gloag and R. G. Henderson, *Introduction to the Law of Scotland* (11th ed. 1916, by A. D. Gibb and N. M. Walker).

Life-saving and Rescue Apparatus. Maritime practice includes rocket apparatus, lifebelts, rafts, buoys, bells, etc. The prin. means of saving life near the coasts of Great Britain is the first-named. In 1807 Capt. G. W. Manby introduced the 'mortal' apparatus, which preceded the use of rockets. By this a line was fired over the wrecked vessel by means of a mortar; in 1814 there were forty-five mortar stations in England, and Capt. Manby was awarded a grant of £2000. John Dennet of Newport introduced the rocket system, and by 1853 there were 120 stations in the United Kingdom fitted with the apparatus. The rocket invented by Capt. Boxer was adopted in 1855; this is a combination of two rockets in one case, so that when the first rocket has carried the line as far as it can, the second adds an impetus to it, and a greater range is thereby attained. There are five parts to the rocket apparatus, the rocket, the rocket-line, the whip, the hawser, and the sling lifebuoy. The rocket to which the rocket-line is attached is fired over the wreck. The crew of the latter haul in the whip, which is an endless line rove through a block with a tail attached to it; the tail is detached and fastened to some portion of the ship high above the water, such as a mast. The hawser, to which is hung the travelling lifebuoy, is then hauled off to the wreck by the rescue party. The persons on the wreck then travel one at a time to shore in the lifebuoy. The rocket apparatus of Great Britain is the exclusive property of the Board of Trade, and is managed by the coast-guard service. Next in importance comes the lifebelt. Every man engaged in lifeboat work must wear a lifebelt or life-preserver, a canvas jacket, the lining of which is stuffed with cork or with rubber material that can be

'calls' in floor sequence independently of the order in which the car or landing buttons have been pressed. Landing doors provided with locking devices which prevent the L from being operated unless all doors are closed and prevents a door being opened unless the car is opposite that door. Modern Ls have power operated doors which may open and close automatically or under the control of the L attendant. The car is equipped with a safety device which clamps the car to the guides in the event of rope failure or of excessive speed when descending when overspeed on governor is provided. Ls may be provided with illuminated indicators to show the position of the car in L well and its direction of travel or the direction of a car that is about to stop at landing. Ls are now frequently provided with automatic leveling equipment which ensures that the car steps level with the floor independently of the load or direction of travel. On high speed Ls hydraulic buffers are installed to reduce impact should the car overrun its normal limits of travel.

Hand power Ls are mainly used for the conveyance of meals and light loads where the service is infrequent. They are manually operated by means of an endless rope running in a V-grooved pulley that is mounted on a shaft which carries another V-grooved pulley over which passes the rope that connects the car to the counterweight. For the larger sizes of handpower Ls it is common practice to incorporate speed gearing in the winding mechanism.

Hydraulic Ls may be direct acting in which the car is attached to the top of a ram which works in a hydraulic cylinder sunk beneath the L. Another form of hydraulic L is the suspended type in which the car is attached to a set of ropes that is led to a hydraulic cylinder and ram mounted on the wall of the L. Ls providing the cylinder and ram with an arrangement of multiplying pulleys or relatively short cylinders may be employed. These Ls can operate at speeds as high as 400 ft per min and the cars are provided with safety devices to prevent accident through rope failure. Hydraulic Ls however are now only installed to meet special circumstances. In electrically driven Ls were used but to day electrically driven Ls are usually arranged in pairs so that one acts counterbalancing the other.

Lifu, see under TOVATY ISLANDS.

Ligament band of fibrous connective tissue connecting the ends of bones and sometimes enveloping the joints. Most Ls are composed of white fibrous tissue which is made up of fibres running parallel to each other so as to form a compact structure. Such are the Ls around the joints. Other Ls are composed of yellow elastic tissue which is specially adapted to support a continuous but varying stress, as in the Ls connecting the various cartilages of the larynx. Ls are also classified as *funicular*, or cylindrical cords, *fascicular*, or flattened bands, and *capsular*, or enveloping Ls completely investing a joint.

Ligan, or **Lagan**, see FIORAM.

Ligno, pueblo of the Philippine Is. lies in Albay prov. Luzon, on the Quinali R. Rice, coconuts and abaca are grown. Pop. 18,000.

Ligature (Lat *ligatura* a band) cord band or thread used fortyingabout arteries or other vessels to occlude them temporarily or permanently. A L may be *provisional* if it is applied during an operation with the intention of removing it after the operation has been performed. If a L is tied so as to prevent discharge from a vessel until a wound has been healed it is usual to employ pure silk or catgut for the purpose so that it may become absorbed as the necessity for the L passes away. In other cases silver wire is used as it is not likely to lead to mucous irritation. For temporarily arresting the circulation of a limb as when an artery is severed a tourniquet, which can be tightened by turning a stick thrust between the band and the limb, is employed. Other Ls of rubber are used to compress a part so tightly that the tissues are destroyed, fistula is cured and growths are removed by this means.

Ligature, in music a slur or tie indicating that a group of notes is to be played collectively or in vocal music sung in one breath. In instrumental music the term marks the phrasing.

Light, agency that produces the sensation called sight. Certain bodies such as the sun, lamps, fires, etc. are said to emit light or to be self-luminous. Most objects, e.g. the walls of a room, grass, trees, human beings, books, etc. are rendered visible by light reflected by them from self-luminous bodies. In the absence of such reflection light from objects can not be seen. The branch of physics that deals with the theory of L is concerned with the propagation of the properties of L and with the physical nature of L. The emission of L from self-luminous bodies is an atomic phenomenon that received a satisfactory explanation at the hands of Einstein, Bohr, and others by means of the quantum theory. Similarly the absorption of L and in particular the emission of electrons from a metallic surface illuminated by L (photoelectric effect) was explained by the quantum theory. Certain properties of L have been explained only on the hypothesis that L is propagated as electromagnetic waves. Thus the quantum theory accounts for the emission and absorption of L while the electromagnetic theory accounts for the propagation of L. The two theories are irreconcilable however and the present theoretical research on wave mechanics is an attempt to find a formula for the solution of the difficulty. The reader is referred to the articles on RADIATION and QUANTUM THEORY for further discussion of this problem. L travels through empty space with a velocity of 186,000 m per second so that it travels from the sun to the earth in rather more than 8 min. Its speed in air and other gases is slightly less than this, but in transparent substances such as glass and water its speed is con-

siderably diminished. Thus in water its speed is less than 140 000 m. per second. This diminution in the speed of L as it passes from one transparent medium to another is responsible for the phenomenon of refraction that causes for example, a stick to appear bent when partially immersed in water and governs the behaviour of lenses. Reflection of L takes place at the surface of separation of two media. For the laws of refraction and reflection see the articles on these subjects.

Newton first analysed white light by means of a prism purchased at Stourbridge fair. The analysed light consists of an infinite number of colours, that lie between what we call red and violet

mission and reception are achieved. The L waves that affect our sense of vision on the other hand, are extremely short by comparison with ordinary objects and they do not bend round them appreciably. Hence light travels very approximately in straight lines. Diffraction of L waves takes place appreciably when the obstacle is very small and not very much larger than the wave length of these waves. The diffraction ($q.v.$) grating provides such obstacles and analyses white L by virtue of the fact that the diffraction effect is greater the longer the waves. The diffraction grating thus enables us to measure the wave lengths of L with precision.

The phenomenon of *interference* ($q.v.$) is produced when L waves from two suitable

MEASURING THE VELOCITY OF LIGHT

Astronomers have as it were measured the velocity of light by the method of the transit of Venus. When at its minimum distance from the Earth, Venus passes between the Earth and the Sun. The distance between the Earth and the Sun is about 149 597 870 km. The diameter of the orbit is 179 500 000 km. Light travels 180 000 km per second.

These are the 'colours of the rainbow' and are produced in the same way. The wavelength of red light is about 7×10^{-7} metres, while that of violet light is about 4×10^{-7} metres. These wave lengths have been determined with great precision by means of the interferometer ($q.v.$). Electromagnetic waves of wave lengths lying between the above limits cause the sensation of colour when they enter the eye and are said to lie in the visible spectrum. Waves of greater wave length than 7×10^{-7} metres may affect our sense of heat (infrared waves) and longer waves of the same type are used in communication with radar and broadcasting. Again electromagnetic waves of wave lengths lying between 10^{-10} and 10^{-12} metres are X rays, and still shorter waves are the rays from radioactive substances. Ultra violet waves, known to medicine, are about 3.5×10^{-7} metres long and the shortest known waves are about 4×10^{-12} metres long. They are the cosmic rays discovered by Millikan. Wireless waves are so long by comparison with terrestrial objects such as houses and buildings that they are diffracted, i.e. they can bend round them, in this way wireless trans-

mitters are superposed and it is possible to obtain darkness by such superposition. The colours of soap bubbles and other thin films such as oil and petrol on a road are due to interference of L waves and may be polarised. In electromagnetic waves the vibrations are at right angles to the direction of propagation of the waves. The vibrations may be in any one of the infinite number of directions at right angles to this direction of propagation. When L passes through a crystal, the vibrations are confined to one of two given directions and if L passes through two crystals suitably cut the emergent waves are polarised, i.e. there is only one direction of vibration. It is interesting to note the contrast between L waves and sound waves—the vibrations in the latter are longitudinal, i.e. they are in the direction of propagation. Sound waves therefore cannot be polarised.

Optics is a very ancient branch of physics. It is stated that a lens of rock crystal was found in the ruins of Nineveh while Aristophanes mentions the use of burning-glasses in *The Clouds* (Act II). Reflection and refraction were known to the Greeks of

300 B.C. and theories of vision were formulated by the Pythagoreans and the Platonists. Cleomedes, a Roman of the time of the Emperor Augustus, following Ptolemy, extended the knowledge of refraction and explained that atmospheric refraction enables us to see the sun after it has set. De Haen (about tenth century A.D.) wrote a book on optics, and, in addition to advancing the knowledge of reflection and refraction, made a close study of the optics of the human eye. Roger Bacon (thirteenth century A.D.) made notable contributions and prophecies in optics, some of which bore fruit when Galileo constructed one of the first telescopes in 1609. Snell of Leyden discovered the law of refraction about this time, and Newton explained it by the assumption of a corpuscular theory of L. According to this theory a luminous body emits swarms of corpuscles that travel in straight lines through the all-pervading ether. Huygens, a contemporary of Newton, formulated a wave-theory of L., but Newton's great contributions to the knowledge of L., combined with his great reputation, caused his theory to be favoured, and it was left to Fresnel (1788-1827) and Young (1773-1829) to establish Huygens's theory by the evidence of their experiments on diffraction and interference, and the explanation (by Fresnel) of the possibility of the propagation of L. in straight lines in normal circumstances (see above). The nineteenth century saw the development of the elastic solid theory of the ether, the medium through which L. was propagated, but this finally gave place to the electromagnetic theory following *Murphy's* theoretical researches supported by the accurate determinations of the velocity of L. The present difficulties attending the subject have been mentioned earlier in this article. The reader is also referred to the articles on AETHER, AETHER, ABSORPTION, DIFFRACTION, DISPERSION, FLUORESCENCE, POLARISATION, SPECTRUM, X-RAYS, etc.

Light Balls were formerly used in time of war to obtain information as to the enemy's position and occupation. They were of various kinds; thus one L. ball consisted of a canvas sack filled with an illuminating material and thrown among the enemy's working parties at night, or into their entrenchments, etc. L. B. containing illuminants were also fired from mortars, as were parachute L. B. These contained a lightly folded parachute, to which was attached a cup filled with some illuminating composition. On the bursting of the fuse the composition caught fire, and on the opening of the parachute afforded a view of the enemy for a

longer time than an ordinary 'ground' L. ball.

Lightcliffe, eccles. par. in the W. Riding of Yorkshire, 2½ m. E. of Halifax. Pop. 3000.

Lighter and Lightermen. Lighters are strong, heavy, flat-bottomed boats for transporting cargo to and from ships or docks. They are usually open, but some have a deck and large covered hatches. They are either furnished with mast and sail or else oars or sweeps are used; some are fitted for motor or steam propulsion, but many are towed. Lightermen are those employed in or about lighters. Thames Lightermen are licensed by the Watermen and Lightermen's Company, incorporated in 1827.

Lightfoot, John (1602-75), Eng. divine and rabbinical scholar, b. at Stoke-on-Trent. He took orders and became chaplain to Sir R. Cotton in London, who, in 1630, presented him to the rectory of Ashby in Staffordshire. His first pub. work, *Frühling, or Miscellaneous, Christian and Judaical, poems for recreation at various hours*, appeared in London in 1629. His next pub. was *A True and Accurate Observations upon the Book of Genesis* (1642). In 1643 he was made rector of St. Bartholomew's Church, near the Exchange. In the same year he sat in the Westminster Assembly. In 1650 he was appointed master of St. Catherine Hall, Cambridge, and four years later vice-chancellor of the Univ. The best ed. of his work is by J. R. Pitman (1822-25). See life by D. M. Welton, 1878.

Lightfoot, Joseph Barber (1828-89), Eng. prelate and theologian, b. in Liverpool. In 1861 he was made Litcham prof. at Cambridge, and shortly afterwards he became chaplain to the prince consort. In 1871 he was made a canon of St. Paul's Cathedral, and in 1879 accepted the bishopric of Durham. He left a number of important theological works, the chief of which was his *Apostolic Fathers* (2nd ed., 1890). He also wrote *Ignatius and Polycarp* (1885) and commentaries on the Epistles. See W. Sanday, *Lightfoot as a Historian*, 1890; also life by B. F. Westcott, 1890.

Lighthouse, building erected to carry a light for the purpose of warning and guiding mariners as to their position and course. From very ancient times towers were erected with beacon fires, those built by the Libyans and Cushites in Lower Egypt being perhaps the earliest. The first beacon which was regularly maintained for the benefit of mariners was probably that referred to by the Gk. poet Lesches at Sigoum in the Troad. The Pharos of Alexandria, built in the reign of Ptolemy II. (283-247 B.C.) by Straton of Cnidus, was one of the seven wonders of the world, and 'pharos' was for long used as a generic term for a L. The Emperor Claudius built a tower at Ostia in A.D. 50, and other noted Ls. of the Roma. were those at Ravenna, Pozzuoli, and Messina. The earliest Ls. in W. Europe were those at Boulogne (La Tour d'Ordre) and at Dover

(the Pharos), built by the Romans, who are also presumed to have erected *Is.* at Holywell and Flamborough Head. The earliest example of a tower exposed on all sides to the onslaught of the waves is the *L.* of Cordouan, built on a rock in the sea at the mouth of the Gironde; the first *L.* at this point (805) is attributed to Louis le Debonnaire. Many towers with braziers were built at various positions on the coasts of Europe during the seventeenth and eighteenth centuries, such as those at Tynemouth (c. 1608), *St. Bees* (1718), and the Lizard (1751) in the United Kingdom. The Boston Light on Little Brewster *Is.*, Massachusetts, is the oldest in the U.S.A., dating from 1716, and the present structure from 1859; other early *Is.* were erected at Beaver Tail, near Newport (1710), and at Brant in Nantucket Harbour (1754). *Is.* may be divided into two categories according to whether they are built on rocks, etc., exposed to the sea, or on the shore; the latter class are naturally more numerous. The former class vary in structure and design according to the special considerations of locality, foundations, etc.; they may be divided into four classes: those built of masonry or concrete, those built of openwork steel or iron on pile foundations, cast-iron plated towers, and structures on cylinder foundations. Masonry towers are built when the foundation is good; the chief points to be observed are as follow: the centre of gravity should be as low and the foundations as deep as possible, and the structure should be of a circular plan. The lower portion should present a vertical face to the waves, and the upper portion should be either straight with a uniform batter, or continually curved in the vertical plane. There should be no projections save a gallery under the lantern, and the height should be sufficient to prevent the spray reaching the latter. The stones, especially those on the outer face, should be dovetailed or joggled; recently concrete and reinforced concrete have been used in construction. The second class of *Is.* is suitable for shoals, coral reefs, etc., where the bottom is insecure or sandy, as iron or steel piles can be driven in and the structure built thereon. The third class is erected in situations where the cost of stone or the scarcity of labour renders masonry expensive. Cylinder or caisson foundations are used where it is desired to erect a substantial structure on sand-banks, shoals, etc., as in the case of the *Rothersand Tower* (see below). Some of the more important of exposed *Is.* are as follow: *Eddystone L.*, the present structure, built by Sir J. N. Douglass, dates from 1882; previous *Is.* were built by Winstanley (1698-1703). *Rudverdy* (1709-55), and *Smeaton* (1759-1877). *Hell Rock L.* (1811) off *Portsmouth* has a focal plane 93 ft. above high water. *Skerryvore L.* (1844) off *Argyllshire* has a height of 138 ft., a diameter at the base of 42 ft., and at the summit of 16 ft. *Héaux de Brehat L.* (1853), off the *Île de Ré*, has a height of 86 ft. *Bishop Rock L.* (1858, destroyed during building in 1850) in the *Solify Isles* was strengthened in 1874

and again between 1881 and 1897. *Minot's Ledge L.* (1869) in *Boston Harbour*, Massachusetts, U.S.A., has a height of 89 ft. *Beauly Head L.* (1902) has a height of 103 ft.; the old structure on the cliff had a height of 284 ft. *Rothersand L.* was commenced in May 1881, and was destroyed in Oct. of the same year. The present structure, which was completed in 1885, has a height of 78 ft. above high water, or from the foundation caisson to the top vane a height of 183 ft. Other noteworthy *Is.* are the *Horsburgh*, Singapore (1851); *Small's L.* (present structure 1861); *Dardanus Reef* in the *Red Sea* (1863), the *Wolf Rock L.* (1869); *Dhu Heartach* (1872); *Giant Basses*, Ceylon (1873); *Trong's*, Bombay (1874); *Spartan Reef*, Lake Huron (1871); *Chicken Rock*, off the *Coast of Man* (1871); *Armen*, near the *Île de Sein*, Finistère (1881); *Rattay Head* (1895); *Fastnet* (1904); and *Jumuit d'Ouessant*, France (1911). *Is.* built on land do not present any particular difficulties in construction; the highest is the *Veige Tower* (Finistère), built in 1902, with a height of 247 ft. from ground to focal plane, whilst the *Phare d'Eckmühl* (Penmarc'h, Finistère), 207 ft., built in 1897, is one of the most magnificent of such structures.

Optical Apparatus of Lighthouses.—There are three different systems of lighting, the catoptric, the dioptric, and the catadioptric. In the first the rays of light are reflected only from the faces of mercuries, such as silvered mirrors of plane, spherical, parabolic, or other profile. In the second the rays pass through optical glass and are refracted at the incident and emergent faces. In the third system, which is a combination of the other two, the light rays are refracted at the incident face, are totally reflected internally at the second face, and are again refracted on emergence at the third face. The catoptric system dates from about 1763, the dioptric from about 1786, and the catadioptric from 1823; the two latter were invented by Augustin Fresnel, whose calculations are still used as a basis on the subject. The catoptric system is not very efficient, since only a portion of the light emitted by the light source is reflected. Arrangements of this system are mainly used in light-vessels. When the rays from the source of light are distributed evenly into a belt of light around the horizon, being condensed only in the vertical plane, the light is a 'fixed' light. When the rays are concentrated into a pencil or cone of light directed towards the horizon and caused to revolve round the source of light, the light is a 'flashing light.' For sector lights and those throwing a beam over a wider azimuth than the flashing lights, the rays are condensed, both in vertical and horizontal plane, in such a manner as to concentrate the light over an azimuth of the required magnitude. Fixed lights are now very little used, being converted into occulting lights in many cases by the use of apparatus which enables the light to be cut off when required. Coloured lights are also not much used, as the power of a red light is

only 40 per cent of the same light through uncoloured glass, and that of green only 25 per cent, and a system of reinforcement has to be adopted to make the lights equal in intensity when two colours are used. Lights are divided by the Admiralty into fixed, flashing, and occulting. The distinction between the two latter is simply one of duration. All lights in which the period of darkness exceeds that of light are termed flashing, whilst all in which the light period is longer than the dark are termed occulting. These are further divided into group flashing, fixed and flashing, fixed and group flashing, and group occulting, according to the duration and combination of light and darkness. An 'alternating' light is one in which different colours are shown alternately without an interval; the term 'revolving' is still retained in this country for a light which gradually increases and decreases from eclipse to full, although really coming within the flashing class. A modern development has been the use of automatic control Ls. These are of sev. designs; there is usually a double or triple set of generators, run by petrol or Diesel engines and set to operate on alternate nights, and to take up the load on the failure of the running set. Time switches bring the light into action at set times, and flags and lights are arranged to warn an attendant of any faults. Remote control has also been developed, the controls being operated where necessary by submarine cable, as at the Platte Pongre L. off Guernsey.

Illuminating Agents.—As late as the nineteenth century wood or coal was used to give light in Ls.; smeltion introduced candles. Oil lamps with flat wicks were introduced about 1763, and the invention (c. 1780) of the Argand burner caused a great improvement. Sperma oil was used at first, and later colza oil. In 1868 a burner was invented which would consume hydrocarbon oils (petroleum, etc.). The use of coal gas dates from 1837. Incandescent burners to take coal and mineral oil gas are used. Acetylene is also extensively used, particularly in the case of unattended lights. For this purpose it is in a dissolved form and stored in convenient sized cylinders at a pressure of from 10 to 15 atmospheres. Its light is intensely bright whether plain burners or mantles are used. There are still instances of the use of carbide-to-water generators, but these require considerable attention and consequently are not so economical. The first installation of electric light for L. purposes was in 1858. In the early days the light was produced by arc lamps, but these have now been superseded by high-power, gas-filled, electric-filament lamps, rating from some 15 watts to 6 kilowatts. Besides producing an intensely brilliant light, electrically equipped Ls. are very economical to operate owing to the cleanliness of the plant and the many automatic electric devices which may be used. The current is obtained from a local supply whenever possible, but when this cannot be arranged a small generating set consisting of dynamos

driven by internal combustion engines is installed. In the event of failure of the main electrical supply, storage batteries or an emergency gas burner may be brought into use. Some lenses weigh many tons and are mounted upon a carriage which floats in mercury and is rotated by a simple weight-driven clockwork mechanism. The higher power of electric lamps enables lenses to be smaller and lighter, so that the mercury rotating arrangement can be replaced by a ball-bearing mounting, and the clock by electric motors.

Lightsips, Buoys, etc.—The use of vessels in places where Ls. cannot be erected dates from 1732 (see LIGHTSHIP). The use of unattended lights dates from 1881. Now electric, oil, and gas beacons, fitted with automatic apparatus for lighting, flashing, etc., have been placed at various points, and permanent wick lights, in which the wick is treated so that a deposit of carbonised tar is formed on its upper surface, are also used. The Morrey 'Bar' light-vessel has recently been electrified. Similar apparatus is also fitted to buoys, and electricity is stored in batteries aboard the buoy; other illuminants used include acetylene, kerosene, oil, gas, blue gas, and propane. A plant using dissolved acetylene can be installed in a buoy and may be left unattended for a year. For use in fog many forms of mobile signal have been developed, including explosives, sirens, bells, oscillators, whistles, and diaphones. Radio beacons are also used, and radar is being developed; the Decca system employs radio signals which actuate a special receiver having dials with coloured markings, the relation of these to a special chart giving an exact and instantaneous geographical position.

Lighting, see ELECTRIC LAMPS; ELECTRIC LIGHTING AND HEATING; LIGHTS, ARTIFICIAL.

Lightning, discharge of electricity between two clouds or between a cloud and the earth, the discharge being accompanied by a visible flash. The cause of the discharge is a difference in potential between cloud and cloud or between a cloud and the earth. In dry weather the electrical potential at the surface is positive from without inwards; that is, the atmosphere has a potential positive with

respect to the earth, and the difference of potential increase, with the distance from the surface. Under circumstances which have not yet been fully investigated, the normal exchange of electricity is not sufficient to maintain the usual balance; particles of water charged with electricity coalesce to form drops, so that the charge is spread over a smaller surface, producing in the aggregate a condition of stress which is eventually determined by a lightning flash. Prof. Loeb has suggested that when the cloud has acquired a certain potential a cosmic ray particle ionises the air and causes a 'streamer' of ions to join cloud and earth like a fine filament. Along this path passes the potential wave or 'return stroke' of the main flash from earth to cloud. L. is generally recognised as being of two kinds, *forked* and *sheet* L. The forked variety gets its name from the impression of sharp angles sometimes produced, but careful observation and photographic evidence show that the course is usually sinuous, with occasional branching. The thunder is the noise accompanying the discharge, augmented and prolonged by repeated echoes between cloud and earth. The L. is probably the impression of a flash so far away that the sound waves do not reach the observer; it usually consists of an indefinite illumination towards the horizon, usually reflected from or shielded by clouds. A third variety of L. is sometimes spoken of as *ball* L. This has been attributed to a slow progress of an ordinary flash under abnormal conditions, but the matter is still far from clear. The so-called thunderbolts are usually masses of metal or of earth that have been fused by the electric discharge. Thunder travels at the rate of 1100 ft. per second, so that an approximate estimate of the distance between the observer and the seat of discharge can be made. Thus if there are five seconds' interval between flash and thunder the storm may be said to be a mile away. By counting the intervals between the L. and thunder of successive flashes it can be determined whether a storm is approaching or receding. Isolated storms usually travel with the wind at 10,000 ft., which is often different from the surface wind; storms in belts (e.g. line squalls) are usually associated with transition zones between air masses and move with them. The former generally occur in summer and move slowly (often below 20 m.p.h.); the latter may move much faster.

Effects of Lightning.—When a discharge takes place it is most likely to do so through isolated buildings and trees, or those which project above others. If the material is not a good conductor of electricity injury is likely to be caused by the passage of the electricity. Of all trees the poplar, oak, ash, and elm appear most liable to be struck. Persons may be killed by L. instantaneously. If the shock be not immediately fatal burns, wounds, and loss of special senses ordinarily occur. As the danger to life is usually from shock the patient should be kept warm and stimulants administered. If respiratory action is impaired artificial respiration

should be resorted to and persisted in until the natural function is re-established. L. strokes are of two distinct characters. The A flash is of simple type; protection can be obtained by two or more properly constructed conductors. The B flash is a disruptive discharge which may strike the building in sev. places at once; to obtain security more points are required and horizontal conductors joining up all the metal work outside, also sev. down rods and earth connections. The conductors may be of copper tape or cable and should be run in a direct line to earth, and sharp bends and joints avoided; they should be kept 2 in. away from the walls by holdfasts. They must be connected either to a water main or to copper earth plates buried in damp soil, or the patent tubular earth (self-watering) is recommended by the L. Research Committee (see Report 1905). See also ELECTRICITY, ATMOSPHERIC. See Sir O. Lodge, *Modern Lightning Conductors*, 1902; W. J. Humphreys, *Physics of the Air*, 1929; papers, G. C. Simpson in the *Proceedings of the Royal Society*, 1926-27; B. F. J. Schonland, *Atmospheric Electricity*, 1932; and J. A. Fleming, *Terrestrial Magnetism and Electricity*, 1939.

Lightning-stick, see BULBOURNE.

Light Railways, see RAILWAYS, 'Light' Railways.

Lights, in public worship, were not used ceremonially by Christians during at least the first two centuries of our era. This is certain from the language with reference to them used by such early writers as Tertullian, Lactantius, and St. Gregory of Nazianzus. It is equally certain, however, that the exigencies of Christian worship during the days of persecution must have necessitated the use of L. for utilitarian purposes, and the L. thus introduced were later retained for the value of the symbolism which had become attached to them. During the Middle Ages the ceremonial connected with them became very elaborate, and their presence became associated with the Blessed Sacrament.

Lights, Aerial. Development of civil aviation and the consequent increase in night flying made it necessary before the Second World War to provide signal lights at various points and aerodrome facilities. There are still some light signals in use, but mostly these are dying out in favour of radar; while the old flashing beacons once seen in Surrey have been replaced by radio beacons. The A. L. still in use include obstruction lights, landing lights, and, of course, aerodrome boundary lights. Obstruction lights are those placed on wireless aerials or on any building situated near the approaches or runways to aerodromes. Buildings within 14 m. of any airport still need lighting because of the prescribed angle of approach laid down by formula for the pilot. See also AERODROME.

Lights, Ancient, popular name for the easement (q.v.) of right to light. The right to have free access of the sun's light to one's windows without obstruction by others originates either in a grant (q.v.) or

by prescriptive title of twenty years. The presumption in favour of the right after twenty years' uninterrupted enjoyment is that it has always existed. If, therefore, the person resisting the right proves that forty (say) years ago the access was blocked against the claimant or his predecessor in title, the inchoate right is defeated, and the same result follows if he can show that the claimant's enjoyment of light depended on a written leave or licence given by him, the person resisting, or his predecessor for a limited and now expired period. The owner of A. L. is entitled not only to sufficient light for the purpose of his then business, but to all the light which he has enjoyed prior to the interruption he seeks to restrain. A right to A. L. cannot be acquired in favour of open ground, but only in favour of buildings. If a person enlarges old windows, these enlargements can be obstructed with impunity, though the A. L. are still entitled to protection. The right to A. L. is lost only by intentional abandonment. See also EASEMENTS AND LIGHTS.

Lights, Artificial are produced by bringing some substance to a state of incandescence. In the older methods of artificial illumination this substance is usually some form of carbon. When a candle or oil lamp is burnt small particles of carbon are produced by the decomposition of the organic substances in the burnt material, and these particles, becoming heated to the point of incandescence, cause the flame to be luminous. Oils of vegetable and mineral origin have been used in lamps from time immemorial, but the introduction of mineral oil (kerosene) brought about a greater efficiency, and the fall in price consequent upon the discovery of vast natural stores of petroleum in America brought that illuminant within the reach of all. The efficiency of oil lamps owes a great deal to the burner introduced in 1784 by Argand, and the modifications and improvements which have been made since then. The central feature of the burner is that the wick takes the form of a hollow cylinder so that a current of air passes upwards and feeds the inner surface of the flame with oxygen. The introduction of a chimney enclosing the flame brought about a higher degree of steadiness and tended to increase the supply of air. Coal gas was first used as an illuminant by Wm. Murdoch of Edinburgh in 1779. The early burners were of the batswing type in which a flattened flame was produced by a slit in the end of the burner. Later the fistul flame was produced by causing two jets of gas from two small holes in the burner to impinge upon one another with the result that a flattening of the flame was produced. In undescend burners had been tried as early as 1826, but it was not until after Bunsen had introduced his heating burner that they became successful. The Bunsen flame is non luminous in itself, because the introduction of a certain amount of air into the gas current causes complete oxidation of the carbon with a resulting high temp. Attempts were made

to utilise this temp. in heating a mantle of infusible material to incandescence. In 1861 the Welsbach mantle was produced. In its later forms it consists of oxides of the rare earth metals thorium and cerium in the proportion of 99 to 1. A cylinder of interwoven cotton fibres is soaked in solutions of nitrates of the metals. The nitrates are converted into oxides by applying a Bunsen flame which also destroys the organic matter. In order to enable the mantle to be handled without

One of the early types of mantle lamp. The glass globe is filled with air and the mantle is a cylinder of interwoven cotton fibres soaked in solutions of nitrates of the metals.

break it is dipped in collodion formed by dissolving gun cotton in alcohol and ether. This leaves a film of gun cotton upon the mantle, which is thus rendered fairly secure until the film is burnt off by the consumer. Other improvements in coal gas illumination were provided by the introduction of the inverted burner and of the high pressure system, by which a small motor is used to increase the pressure above that of the gas in the mains.

Electric lighting may be divided into arc systems and incandescent systems. In the former two carbon rods are placed in contact end to end to enable an electric current to be passed, and are then drawn

apart so that a discharge takes place across the gap, which is therefore bridged by a curved stream of vapour at a temp. of about 3000° C. Arc-lamps are of many different types, and numerous mechanisms have been invented to maintain the necessary distance between the carbons, which are burnt away at a rate which varies with the current and the type of lamp. In recent times the efficiency of the arc as an illuminant has been increased considerably by using carbons impregnated with calcium salts. The first commercially successful incandescent lamp was that introduced by J. W. Swan and T. A. Edison. It consists of a filament of carbon enclosed in a small glass globe from which the air has been exhausted. In 1897 H. W. Nernst patented a lamp in which the incandescent substance was magnesia or a mixture of rare earths. The use of an exhausted glass vessel is rendered unnecessary, but the incandescent body requires to be heated by a small coil of platinum before its conductivity is sufficient to take the current. The lamp does not therefore become illumined as soon as the switch is operated, and is therefore less suitable for domestic purposes than for street lighting. In 1901 the tantalum lamp was introduced. The incandescent body is a zigzag wire made of tantalum, a metal melting at about 2600° C. A still higher efficiency has been afforded by the use of drawn tungsten wire. Electrical energy is transformed into light energy and heat energy in a lamp. The former is emitted as visible light, the latter is dissipated chiefly as infra-red or invisible light. In the vacuum lamp only about 6 per cent of the electrical energy is transformed into visible light energy, the remainder being dissipated as stated. A later invention is the gas-filled lamp, i.e. a tungsten filament enclosed in an atmosphere of argon (q.v.) mixed with a small percentage of nitrogen. The filament in this lamp is maintained at a temp. of 2500° C., which represents an increase of 500° C. over the highest possible temp. in the vacuum lamp if vaporisation of the filament is to be avoided. This has resulted in a higher efficiency, because the hotter the filament the higher the percentage of the visible light energy emitted. In point of fact this is about 8 per cent in the gas-filled lamp. Certain modifications in the construction of the lamp were involved. In order to minimise the loss of energy in the form of heat conducted and convected away from the filament by the gas the wire was coiled into a very small spiral. The immediate result was a brilliant but unevenly distributed illumination. Translucent milky-white bulbs overcame this difficulty, but, while they diffused the light, they also absorbed some of it. The latest process, that of internal frosting of the glass, secures uniform distribution with practically no absorption of the light, and this type of lamp seems likely to enjoy a long career.

Further developments in artificial lighting include the use of discharge tubes containing neon (q.v.) and other gases at very low pressures. The gas is rendered in-

candescent by the high voltage discharge of electricity through the tubes. This form of lighting is popular in advertisement signs, and in beacon lighting at aerodromes. Attempts have been made to utilise vapour lamps, particularly that in which a current travels through mercury vapour, but the colour of the light has so far prevented anything like a general use, although it is much used in therapeutics as a source of light abundant in ultra-violet light. Artificial lighting by luminescence has recently come to the fore, and seems likely to have great success. It depends on the fact that certain substances fluoresce very strongly under the influence of an electric discharge; typical of them are zinc sulphide, zinc orthosilicate, and magnesium tungstate. The powdered substances are coated inside a sealed tube and exposed to electrically derived ultra-violet light. Such lamps have an efficiency and life averaging about three times those of the ordinary filament lamp.

In some trades involving accurate matching of colours the uncertainty of daylight during the winter months is a great inconvenience, hence 'artificial daylight' units, based on the use of special filters with electric or gas lamps to imitate the colour of normal daylight, have been evolved, and are much used in the textile and dyeing industries. In other cases, for instance in the lighting of show windows and on the stage, high values of illumination may be adopted for the purpose of advertisement or display. In yet other cases the effect aimed at is of paramount importance, and economy in the use of light becomes an almost negligible consideration, this may be exemplified in places of entertainment, and it applies in great degree to 'architectural lighting,' in which the light is used as a decorative element and as an integral feature of the architectural design. The direction of light for these varied purposes involves considerable differences in the design of shades and reflectors, which may be so made as to spread light evenly in all directions, or to produce a highly concentrated beam. Thus in the different 'directional' devices for street lighting and in 'flood-lighting' units, the angle of dispersion may vary within wide limits, so that the light may be diffused over a relatively near and extensive surface, or focused on a distant point in the manner of a searchlight. In illuminating the objects to be photographed in cinematographic film production, 'sun-arcs' are adequate to produce the effect of sunshine for close shots and close-ups in the open air in the absence of sunlight, or where this happens to be in the wrong direction. In the studio several types of lighting are employed. 'Floods' are large banks of kilowatt incandescent lamps, contained in a large inverted reflector, hung directly over the set for general lighting. 'Spotlights' are small arc-lamps, usually clamped, amongst other lights, on the rail at the top of the walls of the set. Sun-arcs are also used in the studio for the simulation of sunshine. See also

ACETYLENE; ELECTRIC LAMPS; ELECTRIC LIGHTING; LAMPS; LIGHT-LIGHT.

Lightship, stoutly built vessel of steel, fitted with lights and fog-signals, and occasionally with radar and wireless direction-finding apparatus, and moored at sea near reefs or where it is not feasible to erect a lighthouse. They vary in length from 80 to 120 ft., and have displacements up to 500 tons. The first Eng. L. was that placed at the Nore in 1732, and had a lantern hung at the yard-arm. Later lanterns which surrounded the mast and could be lowered during the day were introduced by Robert Stevenson, this type being universally adopted, though the latest practice now is to have a fixed lantern mounted at the top of a short, hollow steel mast. Prior to 1895 the lights were of the catoptric form, but nowadays dioptric apparatus is generally fitted. Owing to the rolling of the vessel some means of maintaining the horizontal direction of the beam is necessary. This is accomplished by means of gimbals and counter-balance weights, or by a device called a constant level table, where the lens table is balanced on a pivot in the lantern and connected by vertical wires to a pivoted counter-balance weight placed at the rolling centre of the vessel, which controls the movement of the upper table. This latter method has the advantage of causing less motion to the lens table than the gimbals-and-pendulum arrangement. The illumination in Ls. is provided by incandescent-acetylene or incandescent-oil burners and, in some cases, electricity.

Lights, Northern (Aurora Borealis, Australis, Polar Light), natural phenomenon which occurs in many forms, often of great beauty. The prin. types are arcs, bands, rays, curtain or draperies, patches, diffused aurora, and, perhaps most beautiful of all, corona. These all vary in shade from smoky black or grey to brilliant yellow, green, violet, or flaming red. The aurora usually begins with an arch. Its apex to the magnetic meridian. It is often better defined on its lower side, and underneath the sky seems darker than the rest of the heavens. Stars are visible through this 'dark segment' as well as through 'the aurora' itself. The bright streamers of light which often extend 20 or 30 degrees upwards are known to the Swedes as the 'merry dancers.' Auroral displays are most frequent and most brilliant in higher latitudes. Recent investigations have located the position of the aurora borealis, which is found to lie within a region from 50 to 300 m. above the surface of the earth. Spectrum analysis has identified the pronounced green line in the auroral spectrum as an oxygen line, but the precise nature of the aurora is not definitely known. This much seems fairly certain, however: magnetic storms (see MAGNETISM) and displays of the aurora borealis synchronise with a period of great sun-spot activity. Hence the aurora is in the same way connected with emanations from the sun—emanations that must be electrical in nature to create the magnetic storms on the earth. These electrons ejected by the sun reach the earth in

about a day or less and the earth's magnetic field produces certain dispositions in their arrangement which are responsible for the aurora.

Ligne, Charles Joseph, Prince de (1735-1814), Austrian soldier and writer, b. at Brussels, descended from a princely family of Hainault. He distinguished himself in the Seven Years war, afterwards rising to the rank of lieutenant field marshal. In the War of the Bavarian Succession he commanded the Austrian artillery at the siege of Belgrade in 1789. At the conquest of Belgium by the Fr. he lost all his estates, but was given the rank of field marshal and an honorary command at court. From this time onwards till his death he devoted himself to literary work. His collected works, of which *Military Fancies and Prejudices* (1780) is the best known, appeared in 34 vols. at Vienna during the last years of his life, selections being pub. in Fr. by Mine de Stael. See lives by J. Thunheim, 1877, and V. Du Bed, 1890.

Lignite (Lat. *lignum*, wood), mineral substance of vegetable origin like coal, but often showing a distinct fibrous or woody structure. It is light, friable, and porous, closely resembling charcoal, but brown in colour, hence 'brown coal.' It occurs in beds like true coal, but is of much later geological age, dating from the Tertiary Miocene period. Deposits of L. are found in many parts of the world, the chief Brit. deposit being at Bovey Tracey, Devon. It is used as fuel, also in the manu. of producer gas and synthetic liquid fuel; wax and resin are obtained from certain types. Jet is a variety of L.

Lignum Vitæ, wood of *Guaiacum officinale*, a tree of the order Zygophyllaceæ. It is a native of Jamaica and has a smooth, variegated bark. The leaves are divided into two pairs of oval leaflets, and the blue flowers grow in clusters. From the stem exudes the fragrant resin known as gum guaiacum, used medicinally in rheumatism, etc. When first cut the wood is soft and easily worked, but on exposure to the air it becomes much harder. It is a heavy wood and is used for rollers, presses, pestles, shovels for ships' blocks, skittle-balls, bowls, etc.

Ligny, vil. in the prov. of Namur, Belgium, 13 m. N.E. of Charleroi, was the scene of Napoleon's victory over Blücher, June 16, 1815, two days before the battle of Waterloo. L. has an important export trade in granite and marble. Pop. 1900.

Ligonjil, see ELIGON, MOUNT.

Ligor (Siamese Sakor), chief prov. and tn. of Lower Siam in the N.E. of the Isthmus of Kra, Malay Peninsula. The tn. is on the N. of Lakhon (Ligor) Right. Tin is mined. Pop. of prov. 3575,000.

Liguori, Alfonso Maria di (Saint Alphonsus) (1696-1787), Rom. Catholic theologian, founder of the Redemptorist order, b. at Marianella, near Naples. In 1726 he became a priest, and in 1732 organised the 'Congregation of the Most Holy Redeemer,' being appointed by Pope Benedict XIV. founder-general for life. He was canonised in 1839, and declared a doctor of the Church in 1871. Moral theology was the

most important dept. of his teaching, and his system of eusnistry is well known. His chief work is his *Theologia Moralis*. See lives by A. M. Faanoja, 1798-1802; A. Caspeclatro, 1893; and A. C. Bortho, 1900.

Liguria, in auct. Italy, dist. between the Ligurian Sea (gulf of Genoa) and R. Po, bounded W. and E. by R. Varus and R. Macra. In early times the ter. extended into Gaul. The Ligures were conquered by the Romans in the second century B.C. In modern times it is a region of N.W. Italy, comprising Genoa and Porto Maurizio provs. The climate is good; oranges and wine are produced. Area 2085 sq. m. Pop. 1,506,000.

Ligurian Alps, most S. part of the Alps. The L. A. lie between the low ground N.W. of Savona and the Maritime Alps. The chief pass in the W. is the Col di Tenda (6145 ft.) and to the E. of it is the Mengioia massif (8629 ft.) which sends out spurs overlooking, from 6000 ft., the Riviera. The E. part lies further back from the Mediterranean and is lower.

Ligurian Republic, name given to the republic of Genoa during its last years (1797-1805), when it was recognised by Bonaparte and made to substitute a democratic for an aristocratic constitution. Till 1803 it was ruled by a Directory, when a doge appointed by Bonaparte became the chief executive. Finally it was annexed to France in 1805.

Li-hsi, king of Korea, came to the throne in 1861. Previous to the war of 1894-95 he had resisted the encroachment of China, but he was of a somewhat weak and vacillating character, and was largely influenced by the Russian agent residing at Seoul. In 1897 he was proclaimed emperor of Korea, but in 1910 the country was formally annexed by Japan.

Li Hung Chang (1823-1901). Chinese statesman, b. at Hefei in Anhui. In 1864 he became governor of the Kiang provs., and on the outbreak of the Taiping rebellion in 1866 again took the field and ultimately succeeded in suppressing the movement, with the aid of Gordon's forces. He subsequently became the viceroy of Tientsin, which position he held till his death. At the time of the war with Japan Li was in a position of great responsibility. He recognised the necessity of reorganising the Chinese forces to meet the threatening encroachments and rising influence of Japan, and under his supervision both army and navy were greatly strengthened. Notwithstanding the Chinese forces were routed, and in 1895 the emperor sued for peace, Li being sent to negotiate. In 1896 he represented the emperor at the coronation of the tsar. He died shortly after the conclusion of the Boxer movement, the peace being mainly brought about through his exertions.

Lilac, name for various species of *Syringa* (family Oleaceae). They are very hardy, deciduous shrubs, bearing large terminal panicles of flowers, which vary in colour from white to blue, violet, and purple, and are in most cases delightfully fragrant. *S. vulgaris*, a native of Persia,

with its many modern varieties, is one of the commonest shrubs, and grows under the most unfavourable conditions, but is more floriferous when regularly pruned and its faded flower heads and also its suckers removed. It is easily forced to produce blooms in mid-winter. *S. persica* is a dwarf l., and very free flowering. The buds, leaves, and bark of *S. vulgaris* contain illicine, an alkaloid with febrifugal qualities, highly valued in S. Europe.

Lilburne, John (1614-57). Eng. political agitator and pamphleteer, b. at Greenwich. He became the leader of the 'Lovellocks' (q.v.), an ultra-democratic party in the Parl. army. He was repeatedly whipped, pilloried, and imprisoned under the Star Chamber, and afterwards under Cromwell. L. had his faults, being quarrelsome and litigious, but he was passionately concerned for liberty, for toleration, and for democracy. He subsequently became a Quaker. See M. A. Gibb, *John Lilburne, 1611-1657* 1918.

Liliaceae, see LILY.

Lilientron, Detlev, Freiherr von (1844-1903), Ger. novelist and poet, b. in Kiel. He served in the campaigns of 1866 and 1870-71, and held gov. posts till 1887, when he began to follow the pursuit of literature. His best work is his poetry *Adfuhantenritzt, Gedichte, Nebel und Sonne*; he also wrote novels, including *Breide Hummelshuffel* (1887); *Der Muen* (1889); and *Kriegsnordlen* (1891); also a very popular humorous epic, *Poggyrd* (1896). His *Sammtliche Werke* appeared in 11 vols. (1904-5). See H. Braum, *Lilientron und der Naturalismus*, 1923; also lives by D. J. Bierbaum, 1892; F. Oppenheimer, 1898; F. Bockel, 1904; H. Mayne, 1920; and J. Elema, 1937.

Lilienthal, Otto (1848-96), Ger. engineer and aeronaut, b. at Auklam, trained as a mechanical engineer, but devoted his attention to the potentialities of flight. He made many successful glides, his original glider being a monoplane, later transformed into a biplane. It was in this latter machine that he met with a fatal accident. L. was the first to demonstrate the advantage of cambered aeroplane wings and his experiments with gliders enabled Wilbur and Orville Wright to construct their machine. See lives by A. and G. Lilienthal, 1930, and G. Halle, 1936.

Lilith (Heb. night monster, night fairy), female demon mentioned in the O.T. (Isa. xxxiv. 14), trans. in Eng. 'screech owl' or 'night-monster.' The name is probably Babylonian in origin, Lulu and Lilitu being Babylonian sprites that plague men, particularly at night (*layil*, night). She was believed especially hostile to children, and amulets were worn for protection against her.

Lilium, see LILY.

Lille (auct. Insula; Flemish Rijsel or Ryssel), fortress and city of France, cap. of Nord dept., on the Deule, 26 m. from Arras. One of the chief manufacturing centres of France, it produces flax and hemp-yarn, linen, and cotton goods, thread, tulle, velvet, ribbons. There are

numerous bleaching grounds and beet root plantations nearby, and machine shops, soap dye and chemical works and sugar refineries. Among its chief public buildings are the Univ., Pasteur Institute and the Porte de Paris. The Palais des Beaux Arts (1892) contains one of the best picture collections outside Paris. Wrecked from Spain (1867) L. was defended by Boufflers against Prince Eugene but finally yielded (1708). It was restored to France (1713) and withstood the Austrians (1792). Vaub in built its fortifications (rebuilt nineteenth century) early in the eighteenth century. Taken by the Gers in Aug 1914 and occupied by them until 1918 the Brit Fifth Army entered it on Oct 18. During the occupation most of the industrial plant and machinery

units adopted the tune as a march in the Second World War.

Lilliput, name of a fabulous kingdom described in Swift's *Gulliver's Travels*, 1726. (Gulliver was wrecked on its shores, and the inhabitants (Lilliputians) were so diminutive being merely about the size of a man's finger that Gulliver seemed a giant to them. Hence as an adjective lilliputian means tiny, dwarfish.)

Lillo, George (1693-1739) Eng drama-
tist was the son of a Dutch jeweller. His first play was produced at Drury Lane in 1730. Of his works *George Barnwell* (1731) commended by Pope and *Fatal Curiosity* (1736) produced at the Haymarket by Kildare are the best known.

Lilly William (1602-81) Eng astrologer and fortune teller said to be in Butler's

LILIAEUM (left) and ASPARGUS (right) LILIIUM REGALE

was taken into Germany. During the Second World War the city was again occupied by the Gers, remaining in their hands from May 1940 to Sept 1944 when it was liberated in the course of the advance of the Brit Second Army towards Belgium. The city suffered from air attack but was not extensively damaged. Pop 158,900. See V in Hende, *Histoire de Lille*, 1874.

Lillebonne (incl Juliabona) tn in the dept of Seine Inférieure. Pop c 20 m. 1 of Havre. Cotton is an important export.

Lillehammer, tn in Telemark, Norw. Pop 80 m. N.W. of Oslo. Pop c 400.

Lillers, tn in the Pas de Calais in the arron of Bethune. The tn suffered damage in the Second World War. Pop 8300.

Lillibullero, refrain of an Irish revolutionary ballad words attributed to Lord Wharton and music to Purcell. The word 'Lillibullero' was probably used by the Irish Rom. Catholics during the Protestant massacres of 1641, and the ballad, a scurrilous attack on the Catholics had great political effect helping to bring about the revolution of 1688. Commando

Hudius as 'Siddrophil'. He issued a series of early almanacs. *Mercurius Anglicus* 1647 (1644-81). *Christian Astrology* (1647) the *Introduction to Astrology* (1647) and in 1652 by a London publisher 'with numerous emendations'. *True History of the Kingdom of the Netherlands* (1651) see 1. *but b. pay* (1711).

Lilly John, c 1711.

Lily (*Lilium*) large genus which includes one of the most beautiful bulbous plant members of the family Liliaceae containing also species such as the tulip, bluebell (*Scilla*) lily of the valley, and many other. There are no true Brit species of the genus. The various species grow under widely different conditions in most of the warmer parts of the world but in Brit gardens the best position for the majority of them is a sheltered one with partial shade and a light loamy soil. The European Ls usually do best in ordinary gardens the best of these is the Madonna lily (*L. candidum*) with pure white bell-shaped flowers. *L. maritimum* (Turk's Cap) bears numerous purple or white flowers on tall stems. Other European Ls are *L. croceum* and *L. bulbiferum* both orange. *L. pyrenaicum* with yellow blooms spotted

with brown; *L. pomponium*, producing an umbel of scarlet flowers; and *L. chalcidonicum*, also scarlet. One of the most popular species is *L. auratum*, enormous numbers of bulbs being imported annually from Japan. It does best when grown among peat-loving shrubs. A very early species is *L. hansonii*, spotted yellow. *L. speciosum*, white and red, is a valuable plant for providing cut flowers, but is much grown also in pots and borders. *L. tigrinum* (tiger L.), with its orange red and black blooms, is one of the hardiest, coming up regularly in borders after once being planted. *L. giganteum* is a native of the Himalayas. From a large fleshy bulb a thick stem rises 10 ft. high, and bears numerous trumpet-shaped flowers, white, tinged with purple. The bulb dies after flowering.

Lilybæum, see MARSHAL.

Lilye, or **Lily**, William (c. 1465-1522), Eng. grammarian, b. at Odham, Hampshire. He became headmaster of St. Paul's School and is reputed to be the first to teach Gk. in London. He assisted Colet in compiling the Eton Lat. Grammar, and pub. sev. vols. of Lat. verse.

Lily, **Giant**, or **Spear Lily** *Paranthes exelsa*, family Amoryllidaceæ, not to be confused with *Lilium giganteum*, magnificent Australian flowering plant with ornamental foliage, sometimes grown in large greenhouses. It bears clusters of scarlet blooms on huge stems, 10 to 12 ft. tall, in late summer. Old plants throw off suckers very freely, and the plant is easily propagated.

Lily of the Valley (*Convallaria majalis*), native Brit. plant, much grown in gardens. Its fragrant drooping bells rising from the characteristic leaves are highly decorative. The plant forces exceptionally well, and for this purpose large numbers of crowns are retarded by refrigeration, and from these with gentle heat the flowers can be produced all the year round. A number of fine varieties have been introduced.

Lima: 1. Maritime dept. of Peru, S. America, bounded on the W. by the Pacific. The surface is very mountainous, with fertile valleys in the W. Sugar is produced; nitre, copper, and silver are mined; and there are exports of chinchilla skins and vicuña wool. Area 1,018 sq. m. Pop. 828,300. 2. Cap. of above and of Peru, on the Rhinæ, 6 m. from its port, Callao, on the Pacific. Among its chief buildings are the cathedral (begun 1535, rebuilt after the earthquake of 1716), a public library with rare books, the univ. (1551), and mint (1565). Founded by Pizarro (1535) as Ciudad de los Reyes it became the seat of the Sp. viceroys of Peru, and later cap. of the republic. Its manufs. include gold lace, glass, pottery, textiles, tobacco, furniture, cocaine, aircraft, etc., and silver, copper ore, bark, chinchilla skins, vicuña wool, nitre, soap, and cinchona are exported (mainly from Callao). Pop. 522,900. See J. Valera, *History of Peru*, 1938. 3. Co. seat of Allen co., Ohio, U.S.A., on Ottawa R., 72 m. from Toledo. The centre of the Ohio oil-fields, it produces much petroleum, has oil-refineries, steam-engine and

motor-car works, and manufs. boilers, torpedoes, tile roofing, mattresses, cigars, etc. Grain is grown in the dist. Pop. 16,000.

Liman von Sanders, **Otto Viktor Karl** (1855-1929), Ger. general in Turkish service, b. Feb. 17 at Stolp, Pomerania, son of Karl L., country gentleman. Receiving a commission in the Grand-Ducal Hessian Foot-Guards, 1875, he was major-general by 1908, and in 1911 was appointed to command the 22nd Div. in Kassel. Ennobled in 1913 he added von Sanders to his name. In the same year he was sent to Constantinople, made Ger. general, and marshal and inspector of the Turkish Army, Jan. 1914. Commanding the Turkish Fifth Army at the Dardanelles (q.v.), he compelled the allied forces to retire. Just before the end of the war he was preparing for the defence of Palestine; but the Turkish defence collapsed, and L. narrowly escaped capture at Nazareth, Sept. 18, 1918. At Adana, where his forces reformed, he heard of the armistice, and gave up his command. On his voyage from Constantinople to Hamburg he was detained sev. months by the Brit. at Malta. There he began writing his *Five Years in Turkey* (Eng. trans., 1928).

Limasol, **Limasol**, or **Limisso**, seaport of S. Cyprus, 35 m. S.W. of Larnaka (Larnaca). It has a good road head, exports plaster of Paris, and has much trade in wine, carob trees, and salt. Richard I. here married Berengaria (1191). Pop. 23,000.

Lima Wood, see BRAZIL WOOD.

Limax, see SLUG.

Limb (Lat. *limbus*, border), in astronomy the border or edge of the apparent disk of a heavenly body, especially the sun and moon.

Limbach, tn. in Saxony, Germany, 7 m. N.W. of Chemnitz. It manufs. hosiery, machinery, and gloves. Pop. 19,700.

Limbe: 1. tn. of Haiti, W. Indies, 12 m. S.W. of Cap-Haïtien. It is the centre of a cotton- and coffee-growing dist. Pop. about 15,000. 2. One of the chief settlements of Europeans in the Nyassaland Protectorate in Africa. It is situated in the Shire Highlands (pop. with Blantyre 600 Europeans). It is one of the chief trade ports of the country and there is an electric light and power plant.

Limber, that part of a gun-carriage, consisting of two wheels and shafts, and forming an ammunition container to which horses are harnessed or the traction vehicle attached. See MACHINE GUNS; ARTILLERY.

Limbliss, **Aids for the**, see ARTIFICIAL LIMB.

Limbo, see LIMBUS.

Limborch, **Philip van** (1633-1712), Dutch Arminian theologian, was b. at Amsterdam. He was pastor at Gouda and Amsterdam, and in 1668 was appointed prof. in the Arminian College, Amsterdam. Of his works, the *Institutiones theologiæ christianæ* and the *Historia Inquisitionis* have been trans. into Eng.

Limbourg (Flemish *Limburg*), old prov. of the Netherlands, divided between

Holland and Belgium (1839). The Belgian L. is a N.E. prov., with Dutch Limburg to N. and E., Antwerp, Brabant, and Liège to W. and S. The Maas (Meuse) R. forms part of the E. boundary. The N. half of the prov. forms part of the sandy Kempen (Cambino) plain, agriculturally the poorest ground of Belgium. Industrially, however, this region has a rich future. Extensive coal-fields were located and in 1920 their exploitation began. They are estimated at present to hold a reserve of about 12 milliard tons of coal. Opened to cheap transport by the Albert Canal, this region attracts many industries. To the S. the soil is more productive. Sugar beet and corn are the most important crops. There are also extensive orchards and the breeding of horses, cattle, and swine is carried on. Hasselt (cap.), Genk, St. Truiden, Tongeren, and Lommel are the chief tns. Area 931 sq. m. Pop. 160,000 (367,000 in 1930 and only 271,000 in 1910). See Dr. J. Lyua and others, *De Limburgsche Kempen* (Hasselt), 1936.

Limburg, prov. of S.E. Holland (Netherlands), with Germany to E., N. Brabant (Netherlands), Liège, and Limbourg (Belgium) to N., W., and S. It is drained by the Meuse and the Roer. In the N. is part of an extensive marsh, the Peel. Its cattle are famous, and coal is mined. Maastricht (cap.) and Roermond are the chief manufacturing tns. The prov. was the scene of considerable fighting in Nov. 1914, during the advance of the Brit. Second Army and the U.S. Ninth Army against the Ger. occupying forces. In 1919 a small area of Germany near Maastricht was transferred to Dutch sovereignty. Area 850 sq. m. Pop. 677,600.

Limburg-an-der-Lahn, tn. of Hesse, Germany. 22 m. from Wiesbaden. It has a twelfth-century cathedral with seven towers, a medieval bridge across the riv., and is a bishop's see. The *Limburger Chronik* is in the possession of this tn. Iron is mined in the dist., and manufs. include machinery, railway stock, and cloth. Pop. 12,000.

Limbus, more commonly **Limbo** (Lat. border, edge). In scholastic theology the name applied to the place where departed souls are detained as being unfit to be admitted to the divine vision, and who, nevertheless, have a certain amount of natural goodness and have not offended by any personal act of their own. Dante, in his *Inferno*, describes Limbo as the uppermost of the nine circles subdividing the place of final expiation and doom, the *L. patrum* and the *L. infantum* containing the spirits of the virtuous heathen and unbaptised infants.

Lime is the common name for calcium oxide, CaO . It can be obtained pure by burning calcium in oxygen, but commercially it is prepared by strongly heating limestone or calcium carbonate, CaCO_3 , in a lime-kiln: $\text{CaCO}_3 = \text{CaO} + \text{CO}_2$. Carbon dioxide escapes, and quicklime, *L. alba*, burnt *L.*, or caustic *L.* remains. When wetted a rise in temp. occurs, and the resulting mass is known as hydrated, slaked, or slack *L.*, Ca(OH)_2 , chemically

named calcium hydroxide. In the form of quicklime (i.e. CaO) *L.* is most commonly used by farmers and gardeners. The action of *L.* upon soils containing a large amount of organic matter is a disorganising one, making plant food available to the crop and burning up decomposing organisms. For this reason *L.* must only be applied to soils which contain plenty of organic material, such as animal manures or decayed vegetation. On poor light land *L.* accentuates the poverty. In addition to this action, freshly slaked *L.* is of great value as a fungicide. In soils where turnip culture has been impossible owing to club root, applications of *L.* for two or three successive seasons have made it possible to grow a good crop. (Ground limestone, powdered limestone rock, or chalk is frequently applied to land, and though the action is slower the ultimate effect is the same. Dressings of marl are applied to land, chiefly for the *L.* contained in it. Much fertile land still depends for its *L.* on the heavy dressings applied many years ago. Slaked *L.*, as mixed by builders with sand for mortar and plaster, sets by reason of its loss of water and absorption of carbon dioxide from the air, and consequent hardening. *L.* is an important substance in chemical industry, ranking (either as *L.* or limestone) in importance with coal, salt, air, and water.

Lime, fruit of sweet *L.* (*Citrus limetta*) and the W. Indian *L.* (*C. medica indica*). It is greenish-yellow in colour, about 1½ in. in diameter, and almost globular, but with a nipple at the top, and has a smooth, shiny rind. The juice is very acid, and is much used as a summer drink.

Lime, or Linden, handsome and useful deciduous tree. *Tilia cordata*, the small-leaved *L.*, while hardy and quick growing, is cleaner and handsomer than *T. vulgaris*, the common street tree throughout Europe and in the Berlin promenade. Later den Linden *T. platyphyllo* has large hairy leaves, which often fall in Aug. *L.* flowers are very attractive to bees.

Limeira, tn. in the state of São Paulo, Brazil. It is a centre for orange cultivation, and has a modern packing house. There is also silk worm culture and mulberries are grown. Pop. 20,000.

Lime light, illuminating effect produced by heating lime to an extremely high temp. The principle of *L.* is based on the fact that calcium oxide, like the alkaline earths generally and the rare earths, withstands the disintegrating effects of heat to a high degree. They are very difficult to fuse, and are bad conductors of heat, so that when intense heat is applied to the surface of one of these substances the temp. of the area rises immediately to the point at which the radiant energy is emitted in the form of brilliantly white light. This principle has been adopted in the manuf. of gas mantles, which are suspended in an atmosphere of non-luminous flame. In 1825 Thomas Drummond (1797-1840) introduced a light for signalling purposes in which a flame of high temp. impinged upon a small area in a block of lime. As manufactured nowadays the

'limes' consist of small cylinders with a hole running along the axis, so that a cylinder may be set upon a spindle and caused to revolve at intervals, thus presenting a new area to the flame every few minutes. The flame used requires to be at a high temp., and to this end oxygen is combined with hydrogen or coal-gas, the more complete and rapid oxidation of the hydrogen or organic gases producing an enormous liberation of heat. The oxygen and other gas are generally provided separately, the oxygen being contained in metal cylinders under increased pressure, and the coal-gas being supplied from the mains, though if this is subjected to high pressure treatment, the illumination is still more intense. The jets are so arranged that the current of oxygen blows through the flame at the nozzle of the hydrogen or coal-gas tube and drives it on to the cylinder. Cylinders of mixed gases are employed with excellent results as regards temp., but there is an element of danger consequent upon the explosive nature of the mixture. L. has been used in the theatre, in signalling apparatus, and in optical or 'magic' lanterns, but for some years the greater convenience of electric lighting has now rendered it obsolete.

Limerick: 1. W. co. of Clare, in the prov. of Munster, bounded N. by the estuary of the Shannon. The surface is mostly level, but in the S. and S.E. it is hilly, and the Galtee Mts. reach a height of 3015 ft. The prin. riv. is the Shannon, navigable up to L. tn. and famous for its salmon fisheries, Castleconnell being one of the centres. Above L. are the rapids of Doonas and Castleroy. The fertile Golden Vale lies mainly in this co., and the pasturage is excellent, the rearing of cattle, sheep, goats, pigs, and poultry being extensive; oats and potatoes are grown. Woollen goods and paper are manufactured, and there are flour and meal mills. Area 1062 sq. m. Pop. 112,500. 2. Co. and parl. bor. and city of above co. It lies on the banks of the Shannon and includes King's Is. It is divided into three parts, Eng. Tn. on the Is., which is the old city, Irish Tn., and Newtown Pery, the modern quarter. On King's Is. is a fine Norman building, King John's Castle, used as barracks. The cathedral of St. Mary on the Is. dates from 1142. As a port it is the most important on the W. coast, having a graving dock and about 3000 ft. of quay, and considerable trade. The beautiful L. lace is made at the Convent of the Good Shepherd. Pop. 42,600.

Limerick, 'metrical frivolity' of five lines of verse of which the first, second, and fifth rhyme with an intermediate distich. The following example celebrates the tn. of its origin with, however, a change of accent:

All hail to the town of Limerick,
Which provides a cognomen, generic,
For a species of verse
Which for better or worse,
Is supported by layman and cleric
(Langford Reed).

The L. originated as a popular song, made up impromptu and sung at Irish feasts of

a hundred years ago, each L. dealing with an inhab. of some Irish tn. The first printed Ls. appear in Chap Books, dated 1820. The nursery rhyme, *Hickory, Dickory, Dock*, is possibly the oldest L. Lear's *Book of Nonsense* (1816) started a vogue for Ls. to which Rossetti, Swinburne, and Ruskin subscribed. In 1907 a popular L. craze was started by a series of competitions in the *London Opinion* which at length excited the hostility of the National Anti-Gambling League. See Langford Reed, *Complete Limerick Book*, 1921.

Limestone, rock consisting principally of calcium carbonate (CaCO_3). Many varieties contain a good percentage of impurities, which affect the colour of the rock. Pure L. is white; the presence of iron oxides gives a yellowish appearance, iron sulphide causes a bluish colour, and white silicates in crystalline Ls. give rise to many different colours. Silica is often present in stratified Ls. in the form of chert or flints. Magnesian L. contains carbonate of magnesium. Ls. vary in physical properties according to their constitution, but fairly pure L. has a hardness of 3 and a specific gravity of from 2.6 to 2.8. It is not soluble in pure water, but is readily acted upon by dilute acids, and dissolves in water containing carbon dioxide in solution, which converts it into the soluble calcium bicarbonate. Water in coming through the air as rain, and in percolating through the soil, dissolves quantities of carbon dioxide which is present as the product of combustion or oxidation. In L. regions the water of springs, streams, etc., wears away the rock in a typical manner. Rounded boulders in the beds of streams, deep channels with occasional pot-holes, underground water-courses, caves, and waterfalls are all characteristic of L. dists. Large quantities of dissolved L. are carried out to sea, where it becomes the material from which many marine animals construct their shells or skeletons. When the animals die their skeletons remains fall to the bottom of the ocean, and, in course of time and with alteration of level, form layers of chalk and L. Chalk is the best-known organic L., and is made from the shells of certain species of foraminifera. Carboniferous or mt. Ls. contain in addition the remains of coral animals. Goolite Ls. consist of small rounded grains and contain many fossils. Besides organic Ls. there are many varieties of crystalline Ls. formed by the effects of neighbouring plutonic intrusions. These lose their organic structure and are commonly known as marbles. L. may also be deposited from solution without the agency of any animal; in this way stalactites and stalagmites are formed. Ls. are used for the manuf. of lime and cement, as a flux for iron ores, and for building purposes. Crystalline Ls. are used for making statuary and erections of an ornamental nature.

Lime Water, solution of calcium hydroxide. Calcium oxide, or quicklime (CaO), reacts with water with the evolution of considerable heat. The lumps of

lime crumble to powder, and the product is called slaked lime (calcium hydroxide, Ca(OH)_2). If sufficient water be added to bring it to a creamy consistency, the product is called milk of lime; when water is added in sufficient amount to produce a clear solution, L. W. is formed. L. W. has an alkaline reaction and has useful medicinal properties. In the chemical laboratory it is used as a convenient test for carbon dioxide, which turns it milky owing to the precipitation of finely divided calcium carbonate.

Limit, in mathematics, is a finite quantity which the sum of an infinite convergent series approaches but never reaches, e.g. the series $1, \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \dots$ has 2 as its L. The term is also used for each of the values between which the definite integration of a variable is made.

Limitation of Estates means the marking out by the grantor of land (*q.v.*), to another or others of the quantum of estate (*q.v.*), or interest which each is to take in the land conveyed. It is advisable always to use recognised technical expressions in limiting an estate, because unless appropriate words of limitation are employed the intentions of the grantor may be defeated. (See under ESTATE as to the words for a grant in fee simple and fee tail; and also under ESTATE AND DOVE.) A grant by deed to X without more confers a life estate only, but by the Wills Act, 1837, a devise of real estate without any words of limitation, will, in the absence of an apparent intention to the contrary, pass the whole fee simple or other the whole disposable estate or interest of the testator. As to perpetuities or remoteness of limitation, see PERPETUITY AND LAND LAWS. See also CONTINGENT REMAINDER; REVERSION; SETTLEMENTS; SHELLEY'S CASE, *ILL. L.*

Limitations, Statutes of. It is the policy of the law to impose a time limit on the right to bring actions, not only that there may be some end to litigation, but because, if not, the resulting harm to vested interests that may have grown up in the meantime on the strength of a certain state of circumstances would probably be altogether disproportionate to the detriment of the individual who has lost his right of action by lapse of time. The various periods of limitation in the different classes of actions are all the creation of statute law, the common law (*q.v.*) permitting an action to be maintained at any distance of time from the accrual of the cause of action. The earliest of the S. of L. is that of 1623, which barred all personal actions, i.e. to recover debts on simple contracts (see CONTRACTS; DEBT) and torts (civil wrongs) after six years (slander excepted). The Mercantile Law Amendment Act, 1876, extended the Act of 1623 to actions on merchants' accounts. It is to be noted that the S. of L. do not, for the most part, expressly destroy the right, they only bar the remedy for its infringement; and though the effect may, generally speaking, be the same, the right may often be available as a set off, e.g. if A sues B on a debt for £50, B can set off a stale debt from A to B; and again a

person having an equitable (see EQUITY) charge upon personal property to secure a debt can enforce his security after the debt itself is barred. But the Real Property Limitation Act, 1874, expressly extinguished title to land where the owner being out of possession does not sue to recover his land within twelve years. The statutes run from the earliest time at which an action could be brought, e.g. if A sells B goods on credit, A's right to sue for the price arises only on the expiration of the credit, and the period commences from such expiration; similarly if one of the parties to a contract dies before the cause of action arises, the period runs only from the moment there is a personal representative capable of suing. Once time begins to run it does so continuously, notwithstanding the happening of something to prevent a person from bringing an action. But a debt may be revived so as to cause the period to begin to run afresh; for, as said above, the debt itself is not extinguished, and a *new promise* to pay will be inferred from (1) part payment, or (2) a written acknowledgment of indebtedness. But such part payment or acknowledgment must be of such a nature as not to be inconsistent with an *implied promise to pay the whole debt*, e.g. if the debtor writes 'I admit I owe the money but the goods you sold me were so bad that I should not think of paying for them,' is not sufficient; and again if A owes B £50, and after three years pays £10 on the supposition that this is all he owes, such part payment will not stop the period from running. An acknowledgment or part payment by one of two joint contractors or debtors will bind the other. If an acknowledgment or part payment is made by letter written 'without prejudice,' the continuity of the period will not be broken. These and other fundamental principles of the Statutes of Limitations are for the most part repeated in the consolidated Limitation Act, 1939. Actions in tort, simple contract, recognizance, and for an account are barred in six years from the accrual of the right of action. Actions on a specialty contract (i.e. on a deed) or on a judgment are barred in twelve years; actions to recover a penalty or forfeiture, in two years. A crown action to recover land is barred after thirty years (but an action to recover foreshore is not lost until sixty years); actions for recovery of land by eleemosynary or spiritual corporations are barred in thirty years; but actions for the recovery of land by any other persons are barred in twelve years. If the plaintiff has been in possession of the land and been dispossessed or otherwise has discontinued his possession, the time begins to run from the date of dispossession or discontinuance. No right of action to recover land accrues or continues unless there is 'adverse possession,' i.e. unless the land is in the possession of some person in whose favour the period of limitation can run. No right of action can be preserved by merely formal entry. An action to enforce a right to present an eccles. benefice (see ADVOWSON) as

patron cannot be brought after a period during which three clerks in succession have held the benefice adversely to the right of the claimant or sixty years, whichever period last expires. Actions to recover money secured on mortgage or the proceeds of the sale of land and foreclosure actions are barred in twelve years. No period of limitation prescribed by the Act of 1939 applies to an action by a beneficiary under a trust, being an action in respect of a fraudulent breach of trust to which the trustee was a party, or being an action to recover trust property from the trustee; otherwise action by a beneficiary is barred after six years. Actions against public authorities are barred after one year, except where the act, neglect, or default of the authority is a continuing one, when the right of action will only accrue after the act, etc., has ceased. The Act applies to arbitrations in the same way as to actions in the high court. Persons under disability of infancy, insanity, etc., have six years' grace in which to sue after the disability has ceased. A disability arising after the period has begun will not stop the period; nor will ignorance of one's right of action, unless such ignorance was induced by fraud. As to the application of the S. of L. to suits in equity, see *under* **LACUS**. The Committee on Limitation of Actions, which was appointed in Jan. 1948, under the chairmanship of Lord Justice Tucker, in its report presented to the lord chancellor (July 1949), recommends that the Public Authorities Protection Act, 1893, as amended in its application to England and Wales by the Limitation Act, 1939, and in its application to Scotland by the Crown Proceedings Act, 1947, should be wholly repealed. The report also recommends that the period of limitation for actions in respect of personal injuries should be two years from the accrual of the cause of action, but the court should have a discretion to grant leave to bring an action after the expiration of that period, but not later than six years from the accrual of the cause of action. In actions founded on contract or tort (other than personal injuries) it is recommended that the period should remain at six years. The periods in respect of actions against the Crown and the public corporations set up by the nationalisation and similar Acts should be the same as the periods applicable to other public authorities and to private individuals. Where actions are brought under the Fatal Accidents Act, 1846, the period should be two years from the death of the deceased. The dependents should have the same right to apply for an extension of the period of limitation applicable to the deceased's cause of action as he would himself have had.

Limited Liability, see **COMPANY AND COMPANY LAW**.

Limma (Lat. *leimma* from *leipin*, to leave), interval in the musical system of the anct. Gks., which does not appear in modern music by reason of its smallness. The Gks. determined the L. by subtracting two whole tones, each in the proportion of 8 : 9, from the perfect

fourth (3 : 4), thus obtaining the ratio 243 : 256.

Limni, see **LEMNOS**.

Limnos, see **LEMNOS**.

Limoges, city and military station, cap. of Haute-Vienne, France, 38 m. W. of Clermont-Ferrand, and overlooking the r. b. of the Vienne. It has extensive manufs. of porcelain and enamel, woollen fabrics, paper, candles, leather, etc. It has remains of a Rom. fountain and amphitheatre, and an old cathedral commenced in 1273. During the Second World War the tn. was liberated from Ger. hands in Aug. 1914 by the Free Fr. forces led by Gen. Koernig. Pop. 107,800.

Limón: 1. Prov. of Costa Rica. Pop. 40,100. 2. Chief seaport of Costa Rica, on the Caribbean coast, 102 m. by rail E. of San José. There are steamship lines to New York, New Orleans, and Europe. There is a fine harbour, with two wharves. Most of the country's exports of coffee, bananas, dyewoods, and rubber pass through the port. It has a wireless station. Pop. 10,200.

Limonite, **Brown Iron Ore**, **Brown Hematite**, or **Bog Iron Ore**, ferric hydrate with the formula 2FeO₃.3H₂O. It does not occur crystalline, but is found in fibrous, earthy, or concretionary masses. Its colour ranges from yellow to dark brown, and its streak is distinctly yellowish. It has a sp. gr. of 3½ to 4, and a hardness of 5½. It is often formed from other oxides or pyrites by the influence of the weather, and is the reason found on the outcrop of other iron ores. Its occurrence in bog or meadow land has given rise to the name 'bog iron ore.' Yellow ochre is clay mixed with L. Abundant deposits of L. have been found in the oolites and other sedimentary rocks.

Limousin, or **Limosin**, **Leonard** (c. 1505-c. 1577), Fr. enamel painter and engraver, b. at Limoges, one of the celebrated family of seven Limoges enamel painters, famed for this special branch of art for many centuries. He was painter to Francis I. and Henry II., and for both monarchs executed many portraits in enamel. Some of his best work is to be seen at the Louvre, notably 'Le Chasseur,' and many portraits, including those of Marguerite de Valois and the Duc de Guise. Fine examples of his work are also to be seen at the Wallace Collection and Victoria and Albert Museum, London. See E. Molinier, *L'Émailleur*, 1891.

Limousin, anct. prov. of Central France, now forming the dept. of Corrèze, Haute-Vienne, and Creuse, and parts of Charente and Dordogne. In 1152 it came into the possession of the Eng., Henry II., acquiring it with Eleanor of Aquitaine as part of her dowry; but in 1369 it was restored to France. (Cap. Limoges.)

Limousins (*the* **Henri L.**), group of cardinals, natives of the prov. of Limoges, who dominated the papal court at Avignon from Clement VI. to Gregory XI. (1312-78).

Limpets, gastropod molluscs with oval tent-shaped shells firmly attached to rocks or stones. The adhesion is made with a circular mass of muscle which when raised

in the centre forms a sucker. The shell is lined with a fringed mantle which bears a circle of folds that take the place of the gills of other molluscs. Within the L.'s mouth lies a long radula or spiny tongue armed with about 2000 glassy hooks. This is used to collect vegetable food. *Patella vulgata*, the common limpet, is widely distributed on Brit. and other rocky coasts. Some tropical species attain great size.

Limpopo, Innampura, or Crocodile River, riv. of S. Africa, rising in the Magaliesberg to the W. of Pretoria in the Transvaal. It flows in a semicircular course, forming the boundary on the W. of the Transvaal. Vessels of 200 tons are able to navigate it for 60 m., but its mouth is obstructed by sandbars. Its prin. trib. is the Olifants. It has a total length of about 1000 m.

Linaero, or Lynaker, Thomas (c. 1460-1524), Eng. physician, humanist, and divine, b. at Canterbury. He visited Europe and on his return he was made court physician to Henry VII., and subsequently to Henry VIII. and Mary. In 1503 he took orders and became rector of Merham and prebend of Wells. His chief works are his Lat. trans. from Galen, amongst them being *De temperamentis* and *Methodus medendi*. He was among the first to teach Gk. at Oxford, where Erasmus and Sir Thomas More were among his pupils. See lives by J. Johnson, 1835, and Sir W. Osler, 1908.

Linares: 1. Tn. of Spain, 23 m. N.E. of Jaen. It has rich mines, worked from ant. times, of argentiferous lead and copper, employing nearly 20,000 people, yielding some 670,000 oz. of silver and 126,000 tons of lead ore annually. It has manufs. of sheet-lead, pipes, rope, and explosives. Pop. 47,800. 2. Tn. of Mexico, prov. Nuevo Leon, 65 m. S.E. of Monterrey. It gives its name to a bishop's see. Pop. 6000. 3. Inland prov. of Chile with an area of 3790 sq. m. It is barren and arid in the centre, but fertile in the N. sev. volcanic peaks are in the neighbourhood, and the headwaters of the R. Maipo intersect it. Pop. 135,000. 4. Cap. of above, 166 m. S.S.W. of Santiago. Pop. 10,000.

Linas, or Lynas Point, cape off the N. of Anglesey, N. Wales, 2 m. E. of Amlwch. It has a lighthouse 128 ft. high, and is a signalling station for Liverpool vessels.

Lincoln, Abraham (1809-65), sixteenth President of the U.S.A., and one of the greatest figures in the roll of American national heroes, was b. near Hodgenville, in what is now Larue co., Kentucky. The log cabin in which this event occurred long stood there unprotected, but is now safeguarded in a stone structure. His father, Thomas L., was both ignorant and shiftless, but his mother, Nancy Hanks, was a woman of superior character. The family descent on his father's side has been traced back to a certain Samuel L., of Norwich, England, who emigrated to the colony of Massachusetts in 1638. L. was left motherless at an early age. With his father he moved to S. Indiana, where the elder L. married a widow with sev. children. For ten miserable years

this increased family dwelt in a log cabin in the forest. Abraham had to make clearings, chop logs, and plough with a crude implement. He grew up tall and strong and gaunt, but with little education. The family moved on to Springfield in 1821. By turns he earned his living by splitting rails, keeping a country store, acting as postmaster and surveyor, and working on the riv. as a boatman. On one of his trips he went as far as New Orleans, where he saw something of slavery. This made a lasting impression. In his small circle he became popular. But he was twenty-five,

L.N.A.

ABRAHAM LINCOLN

and nothing had succeeded with him until his neighbours elected him to a term in the Illinois Legislature. Then he read law and was admitted to the Bar at the age of twenty-eight. In 1846 he was elected to Congress, but served only one term.

He returned to Springfield, and from 1843 to 1861 practised law with W. H. Herndon. He had wedded Mary Todd, but this was not a happy marriage. It was the question of extension of slavery in the ter. of the U.S.A. which stirred L. into action. In 1854 Stephen A. Douglas, senator from Illinois, had aroused the N. by his Kansas-Nebraska bill, which repealed the Missouri compromise (see MISSOURI COMPROMISE). Douglas found himself universally denounced in the N. and soon afterwards (1858), when he was again a Democratic candidate for U.S. senator from

Illinois the Illinois Republicans regard less of the support which Republicans in the N. were giving to Douglas for his subsequent resistance to the pro-slavery advocates in Kansas put L. forward as their candidate. The nation at large was surprised for they had never heard of this Springfield lawyer. When the Republicans nominated him at Springfield L. addressed the delegates and used words which were to be quoted over and over again. A house divided against itself cannot stand. I believe that this gov. cannot endure permanently half slave half free. It will become all one thing or the other. L. then challenged his opponent to a series of joint debates, a daring challenge in view of Douglas's reputation as the greatest orator and debater in the U.S.A. Douglas promptly accepted. L. more than held his own. He pinned the debates down to one question—that of slavery in the territories. In the end L. had a majority of the popular vote, but the Legislature chose Douglas. L. was shut out of the Senate where his field would have been limited. But he had an opportunity for bigger things for now he put his energies to the use of a candidate for the presidency in 1860 and his name began to be canvassed. The Democrats had split over the slavery question. It was felt that the Republican would surely name the next president. Wm. H. Seward seemed the outstanding candidate. He had been governor of New York and he was the acknowledged leader of his party. But though in the S. slave states it was freely said that if L. was elected they would secede from the union, L. was chosen receiving 180 electoral votes—152 being sufficient to elect.

The threat of the S. to secede proved to be no idle one. Even before L. was inducted into the presidency seven S. states led by S. Carolina had proclaimed their formal secession and formed the S. Confederacy and chosen Jefferson Davis as president. Very soon the Confederates had seized most of the government navy yards and post offices. During that fatal winter Congress made futile attempts to bring about a peaceful settlement. When L. was inaugurated on March 4 1861 his address was a conciliatory one. He declared he had no intention to interfere with slavery where it already existed. But he said the union was indissoluble and that no state had a right to secede from it. He would execute the laws in all the states and declared the union must and would maintain and defend itself. In April what everybody feared came to pass. The Confederates fired upon and captured Fort Sumter guarding the port of Charleston. The time for union action had come and L. was quick to take it. Two days later he issued a call for 75,000 volunteers, and from every village and boy came to enlist. The S. responded. The remaining S. states seceded. L.'s call for volunteers was answered by Davis, who called for 100,000 men. The great civil war, which had been threatening for forty years, was now a reality. L.'s test had

begun. There followed the anxious years in which things seemed to be going against the union. But on Jan. 1, 1863, L. showed how far he had advanced by proclaiming emancipation of the slaves in all the States then in rebellion. By his fiat he freed 1,000,000 human beings. What baffled L. at this time was to find a general who could win victories. Eventually he found the victor in U.S. Grant. In March 1864 L. made him commander in chief of all the union armies. When some averred that Grant was a drinking man L. retorted that he wished Grant would give some of the same brand of whisky to his other generals so that they too might win victories like Grant.

The war stubbornly went on. The N. was filled with gloom. In the midst of this came a presidential election. The leaders of the Republican party who never understood and never liked L. were against him. They backed one of his own Cabinet S. P. Chase for the nomination but Chase withdrew when his own state declared for L. The Democrats nominated Gen. McClellan who for so long headed the union armies. The war however was taking a new turn in favour of the S. Admiral Grant won a great victory at Mobile Bay. Sherman captured Atlanta and began his famous march to the sea. Sheridan was sweeping everything before him in the Shenandoah valley thus ensuring the safety of the cap. The people acclaimed L. who received 212 electoral votes to 21 for his opponent. On Feb. 3 1865 S. soldiers entered Fort Sumter in an attempt to bring about peace. But L. would listen to no overtures save on the basis of a restored union and the total abolition of slavery. He also made it clear that he would not treat with the Confederates as equals. On April 9 1865 the greatest of the S. generals Robert E. Lee surrendered to Grant at Appomattox. The war was virtually over. On the night of April 14, 1865 L. attended a theatre. John Wilkes Booth an actor crept to the box where the president sat and shot him through the brain. On the morning of the 15th he died.

A whole nation mourned his passing. He was unique in their nation's story. With little real school education he had shown all the qualities of statesmanship and revealed himself one of his country's greatest orators. His humility his patience his long silence under misunderstanding and attack his steadfast grasp of things when the fate of the nation seemed darkest his courage when other strong men wanted to yield or compromise, the matchless beauty and eloquence of his Gettysburg address and the simple charity and kindness of his second inaugural address—all these things a mourning people now remembered. Secure in the hearts of his own countrymen the whole world has adopted him as one of its greatest men. It is no insignificant thing that in England, where men radically differed upon the question of recognizing the Confederacy as a belligerent nation, to-day in most prominent places

in London and Manchester there stand monuments to the great Amer. He, whose lowly ancestors came from Eng. soil, is to-day honoured on that same soil.

Bibliography.—L.'s complete works were ed. by J. G. Nicolay and J. Hay (12 vols., 1905). Nicolay and Hay also produced a monumental *History of Lincoln* (10 vols., 1890). Among the large number of biographies on L. mention may be made of those by W. H. Herndon and J. W. Weik, 1889 (new ed. by P. M. Angle, 1930); C. Schurz, 1891; Ida M. Tarbell, 1900; Lord Charnwood, 1916; N. W. Stephenson, 1924; W. E. Barton, 1925; and A. J. Beveridge, 1928. See also H. B. Rankin, *Intimate Character Sketches of Abraham Lincoln*, 1924; C. Sandburg, *Abraham Lincoln, the Prairie Years*, 1926; E. Ludwig, *Lincoln*, 1930; J. G. Randall, *Lincoln the Liberal Statesman*, 1947, and *Lincoln the President*, 1947; and K. C. Wheare, *Abraham Lincoln and the United States*, 1948.

Lincoln: 1. Parl., municipal and co. bor. and city of England, cap. of Lincolnshire, on the Witham, 139 m. from London. L. was the ant. Brit. Lindun (*lin*, pool; *dun*, hill fort), and according to Claudius Ptolemy the chief tn. of the Coritani (cf. LEICESTER) and the nucleus of the Rom. military station of Lindum. It was at first (A.D. 47) the headquarters of the Ninth Legion, and after the Rom. advance to Eboracum (York) (A.D. 70), became a civil settlement 'behind the line' with the title of a 'colonia' or 'coln.' L. (as *Lindocolina* or *Linnolle*) is mentioned in the *Itinerary* of Antoninus of the early fourth century. Numismatic evidence indicates that the Rom. occupation continued until about A.D. 100. An interesting feature of L. is Newport Arch, which was the N. gate to the Rom. city and which is supposed to be the only Rom. archway in the Brit. Isles which still spans a main road used by modern traffic. After the sack of the tn. by the Angles its hist. is silent until the seventh century when, according to Bede, Paulinus built a stone church at L. in which he consecrated Honorius, archbishop of Canterbury. When the Dan. armies settled on the land one of them, the 'army of Lincoln,' occupied Lindsey and made L. its headquarters. It seems that although theretofore L. never attained any great size, it was, at the Conquest, one of the three or four chief tns. of the kingdom, with a considerable trade with Norway and Denmark. The Conqueror theretofore decided to build a castle there and it was chosen as the seat of a bishopric and the place for a cathedral. The institutions of the city were, however, left inviolate, including the lawmen, who continued to hold their position till it died out. At the Conquest L. was divided into private *socs* or jurisdictions, of which only one, the manor of Hungate, or Beaumont Fee, survived into modern times. Other communities, civil and eccles., were reformed; such were the Jews, whose settlement is still represented by the Jews' House. Later came the religious houses: Monks Abbey, a cell of the Benedictine abbey of St. Mary of

York and St. Catherine's priory of the order of St. Gilbert of Sempringham; and the friars, whose only remaining building is the beautiful Grey Friars, which later housed the grammar school (founded in 1090) and to-day is the museum. The many mediaeval par. churches are now represented only by St. Benedict, St. Mary-le-Wigford, and St. Peter-at-Gowt's. Of the buildings of the many religious and trade guilds of the Middle Ages there still stands St. Mary's Guildhall, a valuable example of twelfth-century architecture. Civil rule in L. dawned with the first appearance, in 1206, of the mayoralty, whose aldermanry would appear to have been the headship of the merchant guild. Owing to disorders, sev. times the city's charters were withdrawn. In 1300, after a ten-year's forfeiture of privileges, Edward I. granted L. a new charter and after this there gradually developed a select body of 'common councilmen,' who (from the sixteenth century onwards) met in the present guildhall over the Stonebow gatehouse. Many years elapsed before this gatehouse was completed, and the S. face, with figures depicting the Annunciation, was not built before about 1520; the royal arms above the arch probably commemorated the visit of James I. in 1617. The prosperity of medieval L. was based upon the wool trade. The raw wool was brought to L. mainly along the waterways (Fossdyke connecting the Witham and the Trent, and the Carylke connecting the Nene and the Witham), and there made up for export to Flanders and the Hanseatic tns. Cloth was being made in L. by 1157, at which date there was a guild of weavers. The wool staple, however, was removed to Boston in 1369 and with the departure of some of the great merchants L. began to decline. The Civil war helped on the process and laid a number of churches in ruins; besides which the Roundheads did much mischief in the cathedral, while the Cavaliers burnt down the bishop's palace. Things began to improve in the eighteenth century, the first evidence of civic recovery being the erection of St. Peter-at-Arches, the corporation church adjoining the Butter Market. In 1741 Richard Ellison acquired a lease of the Fossdyke tolls from the corporation, and his improvement of the navigation brought a steady increase of trade. The first railway to reach L. was opened in 1846 and soon there followed the development of industrial enterprises in the manuf. of agric. machinery and, later, heavy engineering products—oil engines, excavators, winding engines, tractors, and motor-car components.

The historic features of L. are the castle, the cathedral (see separate article, LINCOLN CATHEDRAL), the Stonebow, and the guildhall. The castle was built by William the Conqueror in 1068 to supplement the defences of the city, whose Rom. walls and gates had for the most part survived. The upper tn. was annexed to the new castle as a kind of outer bailey—hence the name 'Baillgate' of modern times. The castle had two gateways, an E. one

opening upon Castle Hill, inside the city, and the W. one leading to open country, the E. gate being still in use, though the round Norman arch has been covered by a fourteenth-century pointed arch with flanking turrets. L. castle departs from the usual Norman plan in having two mounds instead of one. Both stand on the S. side of the castle yard, their bases being only about 200 ft. apart. The Stonebow (mentioned above) stands on the site of the S. gate of the lower Rom. enclosure. The medieval gate which stood on the same site was pulled down in the fourteenth century. Like its successor the present gate, the medieval gate had the guildhall situated above it. The hall itself is partly panelled and has a magnificent open timber roof with carved bosses. This hall and the inner hall beyond it contain a number of portraits of monarchs and local personages. On the roof is the mote bell (1371), still rung to summon council meetings. The civic insignia include a fine specimen of a fourteenth-century sword, believed to have been presented to the city by Richard II. in 1387; a fifteenth-century sword believed to have been given by Henry VI., and two maces, one of the Commonwealth period and one of the time of Charles II. The most interesting buildings on Steep Hill are the Jews' Houses. In the Strait is the one known as the Jews' House. The front has been mutilated but it preserves its beautifully moulded doorway with interlacing pattern. Next door to it is the Jews' Court, which has lately been rescued from destruction under slum clearance legislation and restored to the Lincolnshire Architectural and Archaeological Society. These houses and that popularly known as Aaron's House belong to the twelfth century, when L. was at the height of its prosperity as a centre of the wool trade. Aaron was a great figure in Eng. Jewry, having financial transactions through agents in many parts of England. He d. in 1186, and by the usual rule his property passed to the king.

The Usher Art Gallery contains important permanent collections. One special feature is the Usher Collection, which was left to the city by James Ward Usher, together with a bequest from which the gallery was built in 1927. The other special collection is of works by Peter de Wint (1781-1819), the water-colourist. The City and Co. Museum in the Grey Friars contains many important Rom. remains recovered from casual excavations in the city. These discoveries, however, throw little light upon the growth of Rom. L. and, to obtain further evidence, systematic excavation is carried on by a research committee formed in 1945. The High bridge, which spans the Witham, dates, as to its central portion, from the twelfth century. On the W. side of the bridge are fine examples of half-timbered houses, built about 1540, and on the E. side there once stood the wayside chapel of St. Thomas of Canterbury, built in the thirteenth century and demolished in 1763. The Grey Friars is approached from the Stonebow by way of Saltergate, but all

that now remains is the chapel built about 1230. Adjoining the museum is the Central Public Library, built in 1913 with the aid of a Carnegie grant and designed by Sir Reginald Blomfield. The three most interesting medieval par. churches, St. Benedict, St. Mary-le-Wigford, and St. Peter-at-Gowt's, are all S. of the riv. In front of St. Benedict is the city war memorial. St. Mary-le-Wigford is notable for its noble tower of Saxon type. St. Peter-at-Gowt's also has a Saxon tower, with features similar to those of St. Mary-le-Wigford. Pop. 66,100. See J. W. F. Hill, *Medieval Lincoln*, 1948.

2. Tn. in Providence co., Rhode Is., U.S.A. It has cotton manufs. Pop. 10,500. 3. Co. seat of Lancaster co., Nebraska, U.S.A., and cap. of the state, 54 m. S.W. of Omaha. In 1871 the univ. of Nebraska was opened, now accommodating over 10,000 students. It is the centre of a rich agric. area. Its manufs. include chemicals, bricks, tiles, and railway wagons. Pop. 81,900. 4. City of Logan co., Illinois, U.S.A., 29 m. N.E. by N. of Springfield. The chief industry is coal-mining; grain is shipped, and mattresses, footwear, machinery, and furniture are manufactured. L. is the seat of the Cumberland Univ. Pop. 12,700.

Lincoln Cathedral. Apart from its imposing position 200 ft. above the lower city, the cathedral church of L. has a special interest for the student of Eng. eccles. architecture in that it exhibits the growth of that architecture from its early Norman stages to the most fully developed forms of Eng. Gothic. The earliest seat of the bishops of Lindsey is traditionally identified with Stow, 10 m. from Lincoln. On the Dan. invasion the see was removed first to Leicester and then to Dorchester (near Oxford). On the death of the last Saxon bishop in 1067, King William appointed Remigius, abbot of the abbey of Fecamp, to succeed him and c. 1073 Remigius removed the see from Dorchester to Lincoln and here he built a church on the highest part of the city. The central portion of the W. front and the lower stages of the Norman towers are surviving portions of his church, a grim and massive building, half fortress, half church. After a disastrous fire in 1141 this church was restored to more than its former beauty by the third Norman bishop, Alexander the Magnificent. The three richly decorated Norman doorways, the arching above the lateral recesses, the upper stages of the Norman towers, and the gables on the N. and S. faces of the W. towers belong to this period. In 1185 an earthquake shattered the church and a new work of restoration was begun by Hugh of Avalon and carried on by his successors. The choir of St. Hugh and two bays of the E. wall of the great transept were completed before 1200, and during the next fifty years the nave, the screen surrounding the Norman front, the chapter-house, and the lower stages of the central tower were added to the building. The canonisation of St. Hugh in 1220 led eventually to the erection of the Angel Choir, which replaced the apsidal

end of St Hugh's church and into this choir in 1280 the body of the saint was translated and deposited in a costly shrine. The choir belongs to the closing years of the thirteenth century and the completion of the central tower to the period of Bishop John of Dailcroy (1300-20). The latest stage was reached about 1380 by the erection above the W towers of the great bellfries which have been described as 'among the noblest towers in Christendom'. Among the various works of restoration in later times the most extensive was begun in 1922 and completed in 1932 at a cost of £140,000, the stability of the building having been

LINCOLN CATHEDRAL FROM THE NORTH-WEST

prejudiced by various disasters of fire, earthquake and tempest. A further work of restoration became necessary owing to the discovery, in 1931, of the dangerous condition of the Angel Choir and the tracery of the E window.

The Exterior—The W front though lacking in unity of design, has an impressive grandeur. The severe Norman work of Remigius is relieved by the richer work of the period of Alexander, notably the much-restored mouldings and capitals of the doorways. The erection of the screen in the thirteenth century led to the raising of the central arch and the insertion of the beautiful cinquefoil window. The window below like those in the other arches, has been replaced by a Perpendicular window (fourteenth century), though it retains its original arch and Early Eng. shafts. The lattice-work around the arch and windows is a feature of the period of Bishop Grosseteste (1235-53) (*q.v.*). The statues of kings above the central door were inserted late in the fourteenth

century. The central tower, the loftiest of Eng. cathedral towers is 271 ft. high. The perfect proportions of this tower and its combination of majesty and grace, of richness and simplicity, constitute it one of the grandest towers in the world. In it hangs 'Great Tom', a bell weighing 5½ tons. The S. end of the great transept contains a beautiful rose window (of the Decorated period). Beyond the great transept extend the choir of St Hugh and the E transept the possession of two transcripts being a feature which E. shares with Canterbury and Salisbury. Begun in 1255 and completed early in the fourteenth century, the Angel Choir with its five bays is one of the crowning achievements of Eng. Gothic architecture. The richly carved marble capitals, the fine arch mouldings, the delicate tracery of the triforium, and the foliated corbels all claim attention. The choir takes its name from the thirty figures of angels in the spandrels of the arches of the triforium. Above the easternmost pier on the N. side is the tiny celebrated figure of the Lincoln Imp. On the N. side of the sanctuary are six canopied niches the three easternmost containing the Easter Sepulchre with homagium on duty depicted in the panels below. The other three niches cover a tomb which bears an inscription by Bishop Luller (1667-70) indicating that the body of Remigius rests here. Some years ago a leaden coffin containing riches, with a paten and chalice and a fragment of pastoral staff, was discovered within the tomb and justifies his attribution. A conspicuous feature on its S. side is the splendid portal of Judgment porch with its recessed arch mouldings and sculptures. Of the two Perpendicular chapels which flank the porch the easternmost was built by Bishop Russell (*d.* 1441) the other by Bishop England (*d.* 1447). The E end with its lofty central gable is of stately proportions and contains the magnificent window of geometrical tracery. The chapter house (1220-35) connected with the E transept by a vestibule and cloister is the chief chapter house in the Early Eng. style.

Interior—The nave of seven bays in the Early Eng. style was completed during 1200-35. The clustered columns of the piers of freestone and Purbeck marble, the richly carved capitals and beautiful triforium combined with the spaciousness of the building give an effect of one of lightness and elegance. The vaulting of the nave with its carved bosses and of the two lateral chapels opening at the W end into the nave are interesting examples of Early Eng. vaulting. Near the crossing on the N. side of the nave a richly carved slab of marble has been assumed to be the original tomb of Remigius, whose body was later translated to the sanctuary in the Angel Choir, but it is probably of a later date. The great rose windows in the N. and S. ends of the great transept are known as the Dean's Eye and the Bishop's Eye. The former is an early and splendid example of 'plate tracery' and contains some very fine thirteenth-

century glass. The S. end of the transept was reconstructed in the fourteenth century when, as a result of the offerings made at the tomb of Bishop John of Daldery, locally revered as a saint, the present magnificent window, with its leaf-like tracery, was inserted under an arch of pierced quatrefoils. The shrine of this bishop was on the W. side of this transept and was excelled in splendour only by that of St. Hugh.

Entering the choir by the S. aisle we see the beautiful double arcading, which is a feature of the work of St. Hugh's time. The S. aisle contains the mutilated shrine of little St. Hugh, the Christian boy whose death in 1255 was laid to the charge of the Jews of Lincoln. The story is recalled by Chaucer in the *Prioresse's Tale*, and is the subject of anct. ballads. The E. transept has two apsidal chapels on the E. side, both of St. Hugh's time, and a relic of the Romanesque planning of churches. In this transept are buried sev. bishops of Lincoln, the most celebrated being Robert Grosseteste, whose tomb was a place of pilgrimage. The wrought iron screens at the N. and S. entrances from the L. transept into St. Hugh's choir are beautiful examples of thirteenth-century work. The interest of this choir is that it is one of the very earliest examples of the Early Eng. style. The clustered columns, the rounded abacuses, the character of the foliage, and the deep mouldings of the arches are characteristic features, and unlike contemporary Fr. work. The cloister, which is entered by a covered passage from the N. transept, was built by Bishop Sutton about 1296. The N. side of the cloister, demolished at an earlier period, has been replaced by the colonnade, with the library above it designed by Sir Christopher Wren. From this colonnade a fine view may be obtained of the cathedral towers and the E. and W. transepts. Among the treasures of the cathedral is one of the four original copies of Magna Carta.

Lincoln College, one of the colleges of Oxford Univ., founded in 1227 by Richard Fleming, bishop of Lincoln, and reorganised by Thomas Rotherham, arch-bishop of York, and lord high chancellor in 1479, who thus earned for himself the title of second founder. John Wesley, Lord Crew, John Morley, and James Cotter Morrison were distinguished members of the college.

Lincoln Judgment, The, celebrated Eng. eccles. suit which came up in 1889, the bishop of Lincoln, Edward King, being cited before the archbishop of Canterbury (Dr. Benson) to answer charges of various ritual offences committed at the administration of Holy Communion in the church of St. Peter-at-Gowt's and in Lincoln Cathedral in December of 1887. Proceedings were commenced in June 1888 by a petition presented by the promoters (two of whom were inhab. of the diocese of Lincoln, and two parishioners of St. Peter-at-Gowt's) to the archbishop. The matter was referred to a committee and the case then referred to Dr. Benson, who heard it in Lambeth Palace on Feb. 12,

1889. The offences alleged against the bishop of Lincoln were, for the most part, breaches of various rubrics in the Communion service of the Prayer Book, viz. the mixing of water with the wine, the non-visibility of the performance of the manual acts, the making of the sign of the cross at the benediction, etc. It was argued that a bishop is not a 'minister' and thus not bound by the rubrics. Judgment was given by the archbishop in Nov. 1890, but he confined himself to the legal declarations, and pronounced no monition on the bishop of Lincoln in respect of the breaches of eccles. law committed by him. The promoters appealed to the Judicial Committee and their appeal was heard in 1891, judgment being given in Aug. 1892, and the appeal failing on all points. The case has a permanent importance, first, because certain disputed questions of ritual were legally decided, and, secondly, because the jurisdiction of the archbishop of Canterbury to try one of his suffragan bishops for alleged eccles. offences, alone, was declared to be well founded and legal.

Lincoln Mount, peak 14,297 ft. high in the Park Range of the Rocky Mts., Colorado, U.S.A. There are silver-mining works at the summit, to which a railway has been constructed, and there are two meteorological stations, one conducted by Harvard Univ.

Lincoln Sheep, see SHEEP.

Lincolnshire, Charles Robert Wynn-Carrington, first Marquess of, and first Earl Carrington (1813-1928), joint-hereditary lord great chamberlain of England, eldest son of second Baron Carrington, was educated at Eton and Cambridge. He was M.P. for High Wycombe, 1865-68, captain of the Royal Bodyguard, 1881-1885, governor of New S. Wales, 1885-90. Created an earl, 1895, and from 1892 to 1895 he was lord chamberlain of the household, chairman of the National Liberal Club, and an energetic member of the L.C.C. President of the Board of Agriculture from the beginning of Campbell-Bannerman's administration, 1905; he resigned that post in 1911, and was lord privy seal till Feb. 1912, when he retired with a marquessate.

Lincolnshire, E. co. of England, bounded E. by the North Sea and the Wash. It is the second largest co. in England, and possesses, including the shore of the Humber, nearly 110 m. of coast, mostly marshy, but with some stretches of sand. The co. generally is flat, a considerable part being fens and marshes, but there are two ranges of hills, the Lincoln Edge, or Heights, or the Cliff, on the W. running from Grantham to Lincoln and on again to the Humber, and the Wolds running from Spill-by to Barton-on-Humber. The prin. rvs. are the Humber, Trent, Witham, and Welland. The Isle of Axholme, the vale of Ancholme, and a good deal of the co. to the S.E. of Lincoln is occupied by the fens (q.v.). The soil as a whole is rich, and it is one of the first agric. cos. in England. It has the largest bulb-growing industry in the United Kingdom. A quantity of grain is grown, the largest

crop being barley, and cattle and sheep are reared in large numbers, also a fine breed of horses. Limestone, freestone, and ironstone are quarried, but the manufs. are not very considerable, there are machine and implement factories, and also brickfields. It is divided into three 'parts' (Lindsey, Kesteven and Holland), and eight parls. divs. each returning one member. Area 2640 sq. m. Pop. 647,600. See Victoria County History *Lincolnshire*. T. Allen, *The History of the County of Lincoln* (2 vols.), 1831, G. S. Streetfield, *Lincolnshire and the Danes* 1884. L. M.

and Gujerat during the first Sikh war. During the Indian mutiny it participated in the siege and capture of Lucknow. During Kitchener's Egyptian campaign (1897-98) it was present at the battles of Atbara and Khartoum. It fought at Paderburg in the S. African war, 1899-1902. During the First World War it raised nineteen battalions which served in France, Flanders, Gallipoli and Egypt. During the Second World War the L. R. fought on the W. front, in the battle of Normandy, and in the advance to the Rhine. They also fought as part of the

Lincolnshire Handicap, The, see HORSE-RACING RACE MEETINGS.

Lincolnshire Regiment, formerly the 10th Foot, was raised in 1685 by the earl of Bath. It took part in Marlborough's campaigns during the War of the Sp. Succession, and gained honours at Blenheim, Ramillies, Oudenarde, and Malplaquet. In 1801 it fought in Egypt, where it gained the 'Sphinx' badge. During the Peninsular campaign it served on the E. coast of Spain. In 1842 it went to India, and fought at Sobraon, Mooltan,

Elghth Army in the invasion of Italy and yet other units were part of the Chindits in Burma. The 4th Lincolns were part of the 116th Brigade of the 49th Div., which fought in Normandy in 1944. Previous to fighting in France this div. was in Norway. In France the Lincolns (together with the Durham Light Infantry and the Duke of Wellington's Regiment) particularly distinguished themselves in the bocage country in the battle for Juvigny and Raucourt. Also, later, the Lincolns crossed the Escourt Canal and forced a bridgehead over the Turnhout-Antwerp Canal (Sept. 25, 1941), taking 145 prisoners. They were also in the attack on Tilburg.

Lincoln's Inn, see INNS OF COURT.

Lind, Johanna Maria, better known as Jenny Lind, and afterwards as Madame Jenny Lind-Goldschmidt (1820-87), Swedish singer, b. at Stockholm. At the

Royal Theatre in Stockholm she made her debut in 1838 as Agathe in *Der Freischütz*. She was at once successful, but after two years' work decided to continue her studies for a while under Manuel Garcia. She sang in the prin. cities on the Continent, but it was not until 1847 that 'the Swedish nightingale,' as she was called, appeared before a London audience. She aroused tremendous enthusiasm and became a popular heroine. In 1852 she married Otto Goldschmidt of Hamburg. She had before this (in 1849) retired from the operatic stage, but she continued to sing at concerts until 1883. In 1859 she had become a naturalised Brit. subject. See lives by H. S. Scott-Holland and W. S. Rockstro, 1891; N. W. Stephenson, 1922; and her daughter, Mrs. R. Maudo, 1926.

Lindau, Paul (1839-1919). (Ger. critic, dramatist, and novelist, b. at Magdeburg. In 1863 he became editor of the *Dusseldorfer Zeitung*. He then went to Berlin, and in 1866 to Elberfeld, where he ed. the *Elberfelder Zeitung*. In 1869 he founded *Das neue Blatt* at Leipzig, and, three years later, *Die Gegenwart* at Berlin. He also founded *Vord und Sud* in 1878, which he ed. till 1904. L.'s works include biographies, essays, criticisms, stories, sketches, and dramatic adaptations. Among his better known plays are *Maria und Magdalena* (1872); *Tante Therese* (1876); *Die Erste* (1895); and *Der Abend* (1896). He also adapted some plays of Dumas and Sardou for the Ger. stage. His other works include *Litterarische Rücksichtlosigkeiten* (1872); *Dramaturgische Blätter* (1875, essays on Moliere and Alfred de Musset; also *Herr und Frau Baer* (1882) and *Spitzke* (1888) (novels). See E. Hüdlich, *Paul Lindau als dramatischer Dichter*, 1876; life by V. Klemperev, 1909; and his own *Autobiographie*, 1917.

Lindau, unct. tn. of Württemberg-Baden, Germany, formerly in Bavaria, 25 m. E.S.E. of Constance, on a small is. in the lake. The chief building of interest is the medieval tn. hall, which has been restored. A railway bridge connects it with the mainland, and a new road bridge was opened in 1927. It was the scene of fighting in the Second World War in May 1945 when it was captured by the U. S. Army. Pop. 6000.

Lindbergh, Charles A. (b. 1902). Amer. airman, b. at Little Falls, Minnesota, his father being a Congressman from that state. He entered the engineering class of the univ. of Wisconsin, and in 1922 entered the flying school at Lincoln, Nebraska. In 1925 he became an officer in the Missouri National Guard, and began to earn his living as a pilot in the gov. air mail service between St. Louis and Chicago. Learning that Raymond B. Orteig had offered a prize of \$25,000 for the person who first made a non-stop air flight between New York and Paris, he appealed to some St. Louis business men who agreed to finance him. They had built for him the 220 h.p. Ryan monoplane, which was named *The Spirit of St. Louis*. He left in this plane from San Diego, California, to New York, via St. Louis, and arrived at his destination on

May 12, having made a record overland continental flight. His time of departure was 7.52 on the morning of May 20, 1927, and he landed at Le Bourget field, Paris, on the night of May 21, or 33 hrs. after starting. He was promoted to the rank of colonel in the Amer. Army and received the Woodrow Wilson medal as well as the prize money. Soon afterwards he met and married Anne Morrow, daughter of the Amer. ambas. to Mexico. In 1933 L. and his wife flew the S. Atlantic from the Gambia to Port Natal (Brazil), a distance of 1900 m., in 16 hrs., thereby completing a survey flight of both the N. Atlantic air route from America to Europe and of the S. Atlantic route. On March 1, 1932, the infant son of L. was kidnapped from his home in New Jersey and held for ransom. In May the skeleton of the child's body was found near the L. house. In 1933 a Ger. named Hauptmann was tried, convicted, and executed for the murder. L.'s popularity, however, suffered severely from his isolationism in the period preceding America's entry into the Second World War, and his public utterances on President Roosevelt's policy suggested that he was not only against Amer. intervention but was bitterly hostile to Britain. See his autobiography, *Wings* (Pilot and Plane) (1927).

Linden: 1. Suburb of Hanover, Germany, has iron foundries, textile mills, and rubber and chemical works, and manufs. textiles, ultramarine, and artificial manures. Pop. 30,000. 2. Vil. of Westphalia, Germany, 7 m. E.S.E. of Essen. It has machine shops and iron foundries, and coal is mined. Pop. 15,000.

Linden-tree, see LIME.

Lindgren, Waldemar (1860-1939). Amer. geologist and mineralogist, b. at Kalmar in Sweden. He was prof. at the Massachusetts Institute of Technology from 1912 to 1933 and had a considerable influence on the newer developments in the study of mining geology. He pub. *Mineral Deposits* (4th ed., 1933) and *Ore Deposits of the Western States* (1935, with bibliography).

Lindi, dist. and prov. (S. Prov.) headquarters and port of Tanganyika, 60 m. N. of the Portuguese E. African boundary. The port and tn. are situated on L. Bay on the estuary of the Lukuledi R. and there is a good harbour. L. is important as the main distributing centre of the S. Prov., dealing in or exporting grain, ground-nuts, rice, cashew nuts, cotton, tobacco, beeswax, copra, mangrove bark, and colombo root. There are Anglican and Rom. Catholic churches and a wireless station for aircraft. L. has golf links, tennis, excellent bathing and fishing. Rainfall averages 35 in. Pop. (dist.) 122 Europeans, 675 Asiatics, and 133,000 natives. The tn. has about 5000 natives.

Lindisfarne Gospels, or *St. Cuthbert's Evangelistarium*, most celebrated production of the Anglo-Illiberian monastery of L., founded by St. Aidan and the Irish monks of Iona or Icolmkill, in 634. St. Cuthbert (q.v.) d. in 687 and as a monument to his memory his successor, Eadfrith, caused to be written in Lat. this

beautiful vol., which is known also as the Durham Book of St. Cuthbert's Gospels. It formerly belonged to the dean and chapter of Durham, but is now in the Brit. Museum. The MS., surpassed in grandeur only by the Book of Kells (*q.v.*) in the same style, was greatly enriched by Ethelwald (Ethelwold), bishop of L., who succeeded Eadfrith in 721 and caused St. Cuthbert's book to be richly illuminated by the hermit Hrith, who prefixed an elaborate painting of an evangelist to each of the four Gospels and also illuminated the capital letters at the commencement of each book. Bishop Ethelwald had the whole encased in a binding of gold set with precious stones; and in 950 a priest named Aldred (Ealdred) rendered the book still more valuable by interlining it with a Saxon version of the original MS., which is the Lat. text of St. Jerome. The peculiar importance of this vol. in the hist. of illumination (*q.v.*) consists in its clearly establishing, by its coincidence with earlier examples, the class of calligraphy practised by that primitive church and people to whom Gregory the Great sent St. Augustine at the end of the sixth century. The L. G. were ed., with a learned introduction, by Bouterweck in 1857 and by Stevenson and Waring for the Surtees Society in 1851-63.

Lindley, John (1799-1865). Eng. botanist, b. at Cotton, near Norwich. In 1819 he pub. *Observations on the Structure of Fruits* (a trans. from the Fr.), followed the next year by an original work, *Monographia Rosarum*. In 1829 he became prof. of botany at Univ. College, London, and lecturer to the Apothecaries' Company. Amongst his prin. pubs. are *A Synopsis of the British Flora* (1829); *Flora Medica* (1838); *The Vegetable Kingdom* (1846); and *Theory and Practice of Horticulture* (1855). In conjunction with Sir W. J. Hutton he also wrote *The Fossil Flora of Great Britain* (1841).

Lindley, Nathaniel Lindley, Baron (1826-1921). Eng. jurist, b. at Acton Green, Middlesex. He was called to the Bar in 1850, beginning practice in the court of chancery. In 1872 he became queen's counsellor and in 1875 a justice of common pleas. In 1881 he was raised to the court of appeal and made a privy councillor. He succeeded Lord Esher as master of the rolls in 1897, and three years later was made a life-peer, and thence until 1905 he was a lord of appeal in ordinary. His pubs. are *An Introduction to the Study of Jurisprudence* (1855) and *Treatise on the Law of Partnership, including its Application to Joint Stock and other Companies* (1893).

Lindley, William (1808-1900). Eng. civil engineer, b. in London. In 1838, after travelling in various parts of Europe engaged in railway work, he was appointed chief engineer to the Hamburg-Bergedorf railway. He began by constructing a complete sewerage system, and between 1844 and 1848 he designed the Hamburg water-works. He also designed the rebuilding of Hamburg after the fire of 1842, erected the gas-works, and executed the trigonometrical survey of the city (1848-60).

Lindo, Mark Prager (1819-79), Dutch prose writer, of Eng. parentage, b. in London. He went to Holland at the age of nineteen and set up as a private teacher of Eng. In 1853 was appointed teacher of Eng. language and literature at the Royal Military Academy in Breda, a post he continued to fill till 1865. He wrote sketches for the *Arnhemse Courant*, afterwards pub. in book form under the pen-name of De Oude Herr Smits ('Old Mr. Smits'). In 1856 he founded the *Nederlandsche Spectator*, in which much of his best work appeared. L.'s chief serious original Dutch writing was *De Opkomst en Ontwikkeling van het Engelsche Volk* (The Rise and Development of the British People) (2 vols., 1868-74).

Lindsay, Alexander Dunlop Lindsay, first Baron Lindsay of Birker (b. 1879). Brit. philosopher, educated at Glasgow Univ. and at Univ. College, Oxford. Former Shaw fellow, Edinburgh Univ.; he was lecturer in philosophy, Victoria Univ.; fellow of Balliol and classical tutor, 1906; Jowett lecturer in philosophy there, 1911; prof. of moral philosophy, Glasgow Univ., 1922-24; vice-chancellor, Oxford Univ., 1935-38. Master of Balliol College from 1924 to 1948, when he retired to take up the position of head of the new Univ. College of N. Staffordshire. His works include *The Philosophy of Bergson* (1911); *Karl Marx's 'Capital'* (1925); *The Nature of Religious Truth* (1927); *Christianity and Economics* (1933); *Kant* (1934); *The Church and Democracy* (1934); *The Moral Teaching of Jesus* (1937); *The Two Moralities* (1940); *The Modern Democratic State* (1943); and a trans. of Plato's *Republic* (1907).

Lindsay, Lady Anne, see BALNARD, LADY ANNE.

Lindsay, or Lyndsay, Sir David (1490-1553). Scottish poet and Lyon King-of-Arms, b. at Garnglynn, near Haddington. He was attached to the Scottish court in 1508, and later became an usher to James V. of Scotland, holding this position till 1522. From his writings it is evident that although L. took part in the court life his sympathies were with the people, and he was not afraid of rebuking the vices of the young king, with whom notwithstanding he was a favourite. *The Testament and Complaint of our Sovereign Lordis Papping* was written by L. as a satire on the court, prelates and nobles, and the *Answer to the Kingis Flyting* as a rebuke of the king's licentiousness. His earliest poem is *The Dreame* (c. 1528), an allegory in the style of Chaucer, written in the seven-line stanza. L.'s famous morality play, *An Satyre of the Thrie Estatis*, denouncing the clergy, appeared in 1540. His longest poem is *The Monarchie*, giving an account of the rise and fall of Syria, Persia, Greece, and Rome. Others include *The Complaint of Ragsche, the Kingis quid Houde, to Bawtie, the Kingis best belovyd Dog, and his companyonis, Kittis Confessioun* (an attack on the Church), and *An Description of Pedder Coffels* (i.e. pedlars), a study in low life. See life by P. F. Tytler, in *Scottish Worthies*, 1831-38.

Lindsay, David (1856-1922), Australian

explorer, b. at Goolwa, S. Australia, of Scottish parents. He began his career in the Survey Dept. of the Australian Gov. He explored and surveyed many parts of the country, and in 1888 achieved the feat of crossing Australia on horseback from N. to S. His explorations in the MacDonnell Mts. in Central Australia in 1889-1890 led directly to the opening up of the famous goldfield of W. Australia. In later life he was concerned largely in the development of mining.

Lindsay, Nicholas Vachel (1879-1931), Amer. poet, b. at Springfield, Illinois. He studied art in Chicago, and for a time was a lecturer for the Y.M.C.A. and the Anti-Saloon League. Finding in himself a genuine aptitude for smooth, easy-flowing verse, he imitated the ancients, bards and minstrels by tramping the highways and securing from unsophisticated everyday folk on the farms a night's board and lodging, in return for which he recited to them some of his own compositions. He may be said to have injected the spirit of jazz into his rhymes, which appear better when recited than when read. Among his books of verse, are *General William Booth enters into Heaven* (1913); *The Congo and Other Poems* (1914); *The Chinese Nightingale* (1917); *The Golden Book of Springfield* (prose, 1920); *The Golden Whales of California* (1920); and *Collected Poems* (revised ed., 1925). See life by E. L. Masters, 1925.

Lindsay, Norman Alford William (b. 1879), Australian artist, b. at Creswick, Victoria. L. is principally known for his illustrations of Petronius, Rabelais, Villon, and of Aristophanes' *Lysistrata*, trans. by his eldest son Jack who is also a novelist. His etchings were reproduced in a collected ed. in 1927 with a chronology of his work from 1918 to 1915. His work is decorative, and in the style of Aubrey Beardsley, but he has not Beardsley's capacity for continuous line. Other publs.: *Creative Effort* (1921); *Madam Life's Lovers* (1929); and *Age of Consent* (1938). His second son, Philip, has gained recognition as a writer of historical novels.

Lindsay, (n. in Victoria co., Ontario, Canada, 70 m. N.E. of Toronto. He manufs. carriages, leather, agric. implements, etc., and has a tannery and saw mills; also knitting and woollen mills. Pop. 9000.

Lindsays, Earls of Crawford and Balcarres, see CRAWFORD AND BALCARRES, EARLS OF.

Lindsey, Benjamin (1869-1913), Amer. jurist, b. at Jackson, Tennessee. Educated at Notre Dame Univ., Indiana, and the Baptist Univ. of his native tn., he moved to Colorado, and was admitted to the Bar in Denver in 1894. Becoming interested in the fate of juvenile offenders, he secured the passage of the Colorado juvenile court law in 1899 and was named judge of the court in Dec., being re-elected for ten successive terms. He met with opposition, but succeeded in his aim of enforcing the rights of children. In 1934 he became a judge of the Superior Court of California. His work *Problems of*

Children appeared in 1903. Other writings include *The Herold of Modern Youth* (1925); and *The Compassionate Marriage* (1927); both in collaboration with Walnwright Evans. His autobiography, *The Dangerous Life*, was pub. in 1931.

Lindsey, Earl of, see BERTIE, ROBERT.

Lindsey, Parts of, dist. of Lincolnshire, the largest of the three administrative divs. (or 'parts') of the co., occupying the N. half. The S.E. dist. of Lincolnshire is called 'Parts of Holland' and the S.W. 'Parts of Kesteven.'

Line (after the Fr. *ligne*), measure of length, the twelfth part of an inch, now used only technically, e.g. 'The numbers indicate the quantity of "lines" in diameter.'

Linea, or La Linea de la Concepcion, tn. in prov. of Cadiz, Spain, 1½ m. N. of Gibraltar. Pop. 36,000.

Line Engraving, see ENGRAVING and PROCESS WORK.

Linen, Yarns and fabrics spun and woven from the fibres of flax (*Linum usitatissimum*) are all comprehended under this name. The flax plant belongs to the order Linaceae, and grows from 2 to 3 ft. high. It is cultivated widely in Europe, Asia, and America. The manuf. of L. was one of the most widely spread and extensive industries of European countries from quite early times. Egypt, too, was long celebrated for its L., many L. mummy cloths of fine texture and great age having been found there. The cultivation of flax was extensive in Italy shortly before the Christian era, and it was probably introduced into Britain for textile purposes by the Romans. In recent times it has ceased to be a domestic industry, and has become an important textile manuf. in certain dists. The inventions of Arkwright, Hargreaves, and Crompton in the latter half of the eighteenth century were a blow to the L. trade as it then existed. In 1787 the foundation of machine spinning of flax was laid by John Kendrew and Thomas Porthouse of Darlington, who obtained a patent for the first mill for spinning yarn by machinery which was built at Darlington. Their invention ultimately developed into the present-day perfect system of machinery, although the weaving of L. yarn by power loom was of slower growth than that of cotton, the first really successful factory for the former not being erected till 1812. The modern manuf. of L. is divided into two branches, viz. spinning and weaving, apart from bleaching and the numerous finishing processes. After the flax fibre is received in bundles from the mill, where it gets a rough sorting, its manuf. into yarn comprises the operations of (a) heckling; (b) preparing; and (c) spinning. The first-named process consists of disentangling, splitting up and separating into their ultimate filaments the fibre strands. It was originally performed by hand, and is so still in Ireland and in some Continental mills. The 'heckler' takes a handful of flax by the middle and draws the root end sev. times through the heckle-teeth, an oblong stock of wood with strong steel teeth inserted, then reversing the handful and heckling

the opposite end in a similar fashion. The flax is then subjected to the same process on a heckle with finer teeth, the object being to separate the flax into 'line' the best portion, and 'tow,' the short and ravelled end. Nowadays heckling machines are extensively employed in the place of hand-heckles.

(b) *Preparing*—This stage consists of various operations for sorting the flax-line into qualities and then subjecting it to certain treatment on different machines, viz. the spread-boards, drawing-frame, and roving-frame. On the spread-boards

flies across the warp yarns, over and under alternately, to weave the cloth.

Bleaching—In the modern process of bleaching the cloth is rapidly passed over a red hot cylinder to render it quite smooth. It is then boiled in lime water and soda lye, dried over heated tin rollers and rendered glossy by mangling, starching and drying.

Making up—Cloth is woven in lengths of 60 to 80 yds. and, when bleached, requires to be made up which consists of cutting and hemming the lengths into the various articles for household and other

Irish Linen Guild

LINEN DAMASK TAKES SHAPE IN THE LOOM

which are moving belts of leather, the lengths of flax fibre are laid end on end and brought through graduated series of pins and roller which combine the individual lengths into one continuous sliver which is drawn out finer and finer until the roving frame imparts a slight twist to the sliver in preparation for the operations of the actual spinning frames.

(c) *Spinning*—This operation consists of dry and wet spinning, the first being used for the very coarse yarns and the second for the finer. The weaving of the L. yarn into cloth is accomplished in three main operations: (1) 'Drawing in' the warp yarns, which run the length of the cloth, through reeds which space the yarns according to the fineness of the cloth required. (2) Winding the warp yarns on a beam for insertion in the loom. (3) Winding the weft yarns on little pins or cones for fitting in the shuttle which

purposes. The making up branch of the L. trade in N. Ireland employs some 10,000 people.

Belfast is the chief tn. in the United Kingdom engaged in the manuf. of fine L. and in England Leeds and Barnsley are the centres of the trade. The value of L. exported from the United Kingdom during 1934 was £5,180,000 and practically the whole of this came from N. Ireland. The Ulster industry normally provides employment for approximately 70,000 persons (exclusive of those engaged in growing the fibre). On the Continent L. is manufactured in France, Belgium, and Germany. See also *FLAX*. See T. Woodhouse and T. Milne, *The Finishing of Jute and Linen Fabrics*, 2nd ed., 1928; T. Woodhouse and P. Kilgour, *Spinning, Weaving, and Finishing of Flax and Jute*, 1929; and E. A. G. Caldwell, *The Preparation and Spinning of Flax Fibre*, 1931.

Line of Communications. routes by which, in wartime, supplies and ammunition are conveyed from the base of operations to the main body of the army or the zone of operations. The direction in which the army is preparing to move forward is termed the *line of operations*; thus the latter is followed up closely by the L. of C. which grows in length, and in importance from a strategical point of view, as the march of the army is prolonged. In the olden times armies were absolutely dependent for their supplies upon the resources of the country in which they were campaigning. When one part of the country was no longer able to support it, the army moved on, thus leaving in its train, in the majority of cases, a blighted, devastated countryside. The introduction of Ls. of C. brought about a revolution in the art of strategy. Strategical movements and operations have always, from the very beginnings of war, depended ultimately upon the question of supplies. 'An army travels on its belly,' as Frederick the Great is reported to have said, and Napoleon's dictum that 'the secret of war lies in the communications' embodies the same truth. Thus the L. of C. became the all important factor, for an army could be either forced out of a strong position or checked in its advance when its L. of C. was threatened or cut. If an army could land from the sea at a point near to a L. of C., especially if not well defended, it might force the enemy to renounce any projects against distant points, as the occupation of Plevna stopped the advance of the Russians through Bulgaria. In more recent times Ls. of C. have consisted either of the roads of a country, the rivers, the railways, or of the open sea. Railways can supply the needs of an army very quickly, but have several attendant disadvantages. The beds of railways are easily wrecked; the army relying on them is too hampered in its sphere of action, and as the carrying power of every railway is known a surprise attack cannot be successfully carried out when properly opposed, as Moltke showed in 1870. The sea is the L. of C. *par excellence* when it is available, as by its use secrecy and freedom of movement can be obtained and the enemy kept in a continual state of suspense. As has been seen on the efficiency of its L. of C. depends the efficiency of an army, but it is general is able to cut loose from his L. of C. and change it at will, he gains thereby an enormous advantage, as both Grant and Sherman showed in the Amer. civil war, and Lord Roberts in his march on Pretoria in the S. African war. In the First World War the stabilising of the W. and E. fronts, on which opposed armies of vast numbers each occupied many lines of trenches, behind which trench systems whole countries were organised for war, surprise attacks on Ls. of C. were out of the question, though the fundamental principles above outlined remained unchanged. Germany's advance into Belgium and N. France was rendered less precarious by reason of the pre-war construction of strategic railways in those

parts of Germany whence, in the event of war, the invading armies might receive reinforcements and supplies. Again secrecy and freedom of movement on the seas were by no means easy of attainment by reason of the use of sea-planes and wireless communication. A secret and surprise landing by the Allies at Suvla Bay would have cut off the Ls. of C. of the Turkish Armies in Gallipoli, but, as events proved, the venture was impossible. The great developments in modern aerial warfare have to some extent modified the above outlined principles. The Ger. conquest of Crete in the Second World War was accomplished entirely from the air, their L. of C. being, in effect, the aerial routes to the conquered airfields in Greece. Again beleaguered armies and cities were sustained for indefinite periods by air-borne supplies, as in the case of the Ger. Army in Stawaya Russia. The Brit. garrison in their epic resistance in Tobruk, Libya, were kept supplied both from the sea and the air, but the sea communication was always uncertain and hazardous. Operations of the allied forces in Burma became increasingly dependent upon air supply, both in defence and attack.

Line Spectrum, *see* SPECTRUM.

Ling, genus of Eriaceae, *see* CALLUNA VULGARIS.

Ling (*Molva vulgaris*), wide-ranging fish of the *Gadidae*, cod family. It is from 3 to 4 ft. long, and is orange-grey or bluish on the back and sides, and silvery on the belly. The caudal fin is rounded at the extremity as in the turbot. When fresh it is not much valued for food, but cured and dried it is consumed in great quantities in S. Europe. The roes sometimes attain a great weight, and the female is one of the most prolific fish known. The liver yields an oil which has been used as a lubricant, and is sometimes substituted for cod-liver oil as medicine.

Lingah, or **Bander Lingah**, seaport tn. of Persia, in the prov. of Laristan on the Persian Gulf. There is a good harbour, and the anchorage is excellent owing to the depth of the water a comparatively short distance from land. Shipbuilding is carried on and there is trade in cotton, pearls, and rice. Pop. 22,000.

Linga Puja, form of phallic worship practised among the Hindus. The Linga, or emblem of the male generative organ, is the symbol of Siva, under which form that god is worshipped by the Lingayats, an independent Saiva sect. The female counterpart is called the *Poni*, and the two are grouped together as the *Sakti Puja*.

Lingard, John (1771-1851), Eng. historian, studied at the Eng. Rom. Catholic College at Douay, and was from 1795 until 1811 vice-president of Crookhall College, near Durham. In 1806 he pub. *The Antiquities of the Anglo-Saxon Church*, and five years later began his famous *History of England*, the first two vols. of which appeared in 1810 and the last in 1830.

Lingayen, large gulf on the W. coast of Luzon, Philippine Is. The cap. of Pangasinan, a dist. of Luzon, is called L., and is

situated on the S. shore of the gulf, 100 m. N.N.W. of Manila. The climate is good and rice is extensively cultivated. The coast of L. Bay, which has the naval base of Cavite, was the scene of the Jap. invasion of Luzon on Dec. 22, 1941. Three years later, in Jan 1945, the U.S. Sixth Army also made landings here, following a naval bombardment of the coast, and estab. beachheads from which the liberation of Luzon was successfully conducted. Pop. 20,000.

Lingen, tn. on the R. Ems, in Lower Saxony, Germany, 13 m. N.N.W. of Munster. Pop. 1600.

Lingua Franca, language adopted by traders in the Mediterranean, is really a corrupt form of It. This term is now applied to any language which is adopted for commercial purposes, such as pidgin Eng. in China.

Linguaglossa, tn. in the prov. of Catania, Sicily, on the N.E. slope of Mt. Etna, with tannous pine woods. Pop. 14,000.

Linguet, Simon Nicolas Henri (1736-1794), Fr. advocate and writer, b. at Rheims. One of the most celebrated advocates of his time, he quarrelled with other members of the Bar and was dismissed. He then took to journalism, founding the *Journal de politique et de littérature*, but as a result of a clash with the Fr. Academy he had to leave the country, returning some years later as an Austrian councillor of state. He was eventually guillotined in Paris. He wrote *Histoire du siècle d'Alfred le Grand* (1762); *Histoire des révolutions de l'empire romain* (1766-68); *Histoire impartiale des Jésuites* (1788); *Théorie des lois civiles* (an attack on Montesquieu's *Esprit des lois*, 1767); and *Mémoires sur la Bastille* (1789).

Linguistic Families. It is not to be assumed that every language belonging to one of the three main groups of languages, classified according to their structure (see under LANGUAGES, CLASSIFICATION OF), is related to every other of the same group. Until about 150 years ago all languages were referred to as Heb. in origin, and this was taken for granted since Heb. was the language of the Bible. In 1767 the Fr. Jesuit Cœuvres pointed out certain resemblances between Sanskrit and the European languages. Nearly twenty years later Sir Wm. Jones described Sanskrit as being more exquisitely refined than Gk. and Lat., yet bearing to both of them a stronger affinity, both in the roots of verbs and in the forms of grammar, than could possibly have been produced by accident. In 1816 Franz Bopp, later a prof. in the Univ. of Berlin, pub. a comparative grammar of the Sanskrit, Gk., Lat., Persian, and Germanic languages, and thus laid the foundation for the comparative method of linguistics. On the other hand, already in 1822 the great Ger. scholar Wilhelm von Humboldt rightly stated that languages are so different in form that it is impossible to classify them both accurately and comprehensively, or to divide the languages of the world into groups or families in such a way as to account satisfactorily for absolutely

all of them. Indeed the later and more detailed study of linguistic science has proven many conclusions of earlier scholars to be groundless, and their classifications often inaccurate. Still, nowadays the great majority of forms of speech, including all the important languages, can be classified.

The nineteenth century witnessed the formation and development of a new branch of study known as comparative philology (see under PHILOLOGY). Already in the late eighteenth century it was discovered (see above) that certain forms of speech such as Sanskrit, anc. Gk. and Lat., Persian, and Germanic showed various linguistic features which were more likely to have been inherited from a common ancestor of these languages than to have originated independently. Applying the so-called comparative method eminent philologists have attempted to reconstruct the original languages of modern linguistic branches, such as Germanic, Slavonic, Celtic, and so on (these were called proto-Germanic, proto-Slavonic, proto-Celtic, etc.), as well as of larger L. F., or sub-families, such as Indo-European, Semitic, or Finno-Ugric (called proto-Indo-European, proto-Semitic, proto-Finno-Ugric). At the same time it was possible to establish the close relationship between the members belonging to the same linguistic family, the closer relationship between the members of a linguistic sub-family, the still closer relationship between the members of a linguistic branch, sub-branch, or group. It must, however, be pointed out that there are still many open questions, and problems which to-day seem to be solved to-morrow may be considered as again open. For instance, until recently the Semitic and the Hamitic languages were considered as distant L. F.; nowadays most authorities consider all the Semitic and Hamitic languages as belonging to the same linguistic family.

With these and other reservations it may be said that the great majority of the 2500-3000 languages of the world may be classified in the following fifteen to thirty L. F.; the number depends on the way in which the native languages are classified, whether the various groups be considered as L. F. or sub-families or only branches or sub-branches. Each of the L. F. may be divided into various sub-families or branches, most of which may be again subdivided into sub-branches or further languages or groups of languages. It must be emphasised, however, that the classification of languages is not the same thing as classification of races or nationalities. Languages have spread by military and political conquest, or cultural and religious influence, as well as by wholesale migrations, to peoples biologically quite unrelated to the original speakers. The most conspicuous example is the U.S.A., where 150,000,000 people of Eng., Irish, Welsh, Scottish, Ger., It., Polish, Amerindian, African, Jewish, and other descent all speak a language, wholly once a Ger. dialect influenced by Lat., Norman Fr., and other forms of speech, is

to-day the richest language in the world. In various parts of the world, and particularly in N. America (where, for instance, according to Voegelin, only 'over half the aboriginal languages are still spoken'), Eng. has driven out other languages temporarily estab. In Lat. America the aboriginal languages are slowly disappearing before Sp. and Portuguese. In Siberia Russian has replaced many aboriginal languages.

Main Linguistic Families.—Indo-European languages (*q.r.*); Semitic-Hamitic (*q.r.*); and Ural-Altaic (*q.r.*).

The Caucasian Linguistic Family.—The region of the Caucasus Mts. to-day presents a bewildering complexity of diversified tongues spoken by fairly small groups, neighbours to one another, many of which are mutually unintelligible. Of these only one, Georgian or Kartvliana, achieved literary expression at a comparatively early date (fourth or fifth century A.D.), while others have remained practically unknown outside their own ter. On the other hand, various important anc. languages, long extinct (*e.g.* Elamite and Hittite, and perhaps also Lydian and Carian; see under ALPHABET and CUNEIFORM WRITING), have been considered as having Caucasian affinities.

European Remnants of Linguistic Families.—Many more L. F. existed of which very little is known. For many thousands of years languages have been developing, changing, and disappearing throughout Europe as throughout all the other continents, without leaving any trace, because the people who spoke them disappeared and there was no method of recording them for future generations. Other peoples left written documents which as yet cannot be read or cannot be understood. Interesting is the instance of the anc. Cretans or Minoans, who left many thousands of documents written in various scripts, but none of the attempted decipherments has yielded results. Scholars, however, are generally agreed that the language was not Indo-European. Even more interesting from the linguistic point of view is the case of the Etruscans (*q.r.*), who were the leading power in Italy in the first half of the first millennium B.C. Much of their civilisation passed, through the Romans, into the fabric of European civilisation. The simple reading of the numerous Etruscan inscriptions does not present great difficulties, but their language has not yet been deciphered, and its relationship with other L. F. is still uncertain. Another linguistic problem is that of the Basques. Their language is as alien to Indo-European as can be imagined. It has been suggested that the Basques are the remnants of the anc. Iberians who were supposed to have been connected with the anc. Caucasian Iberians. Some scholars consider Basque as the sole surviving fragment of a common speech spoken by Neolithic peoples scattered over Europe long before the conquest or immigration of the Indo-Europeans. Others connect the Basques with the anc. Ligurians, who in Neolithic times ap-

parently inhabited the whole N. part of the W. Mediterranean, and consider the anc. Iberian language as the offshoot of an early Libyan tongue. However, the problem remains unsolved.

The Tibeto-Chinese Linguistic Family has a great number of languages (partly agglutinating and partly isolating; see LANGUAGES, CLASSIFICATION OF) and dialects, and is spoken over a very wide area, from Peking to Baltistan, and from Central Asia to S. Burma. It falls into two sub-families, Siamese-Chinese and Tibeto-Burmese, the former comprising Chinese, Annamite, Karen, Siamese, Thai Lao, Thai Lu, Thai Ya, Thai Yuan, Thai Mao, Lu, Hkun, Ahom, Khamti, Paili, Shukla, and other Shan dialects, the latter comprising the numerous Bhotia languages (including Tibetan) spoken in Tibet, Bhutan, Sikkim, Nepal, Ladakh, and Baltistan; Burmese; Pyu (extinct); the Lo-lo and Mo-so group of languages; the Mon group (Miao or Miao-tzu, with many dialects in S.W. China; Yao or Yao-ming, with various dialects, in the Chinese provs. of Kwantung and Kwangsi, and in upper Burma); Li-su (Yunnan); the extinct Tangut of Si-Hia (powerful kingdom, A.D. 982-1227, between China and Tibet); and other languages and dialects.

Malay-Polynesian is another of the most widespread L. F. in the world, extending from Madagascar (Malagasy) through the Malay Peninsula, the E. Indies, and the Philippines, to Formosa, New Zealand, Hawaii, and Easter Is. Hundreds of languages and dialects belong to this family, many of them having anc. literatures (especially Javanese) and indigenous scripts (Javanese, Batak, Kedjang, Lampung, Macassar, Burmese, Filipino; see under ALPHABET). Some of these languages are extinct (*e.g.*, Cham in Fr. Indo-China). To-day the entire Malay-Polynesian language problem is simplified by the existence of a kind lingua franca, 'basic' Malay, known as 'pidgin' or 'bazaar', which is understood in all except the interior dists. of the larger Is.

Dravidian Languages (S. India).—Bishop Caldwell, who devised the term Dravidian from *Dravida* or *Dravida*, the Sanskrit form of Tamil, distinguished twelve Dravidian languages or dialects, six cultivated and six uncultivated. Many other dialects and sub-dialects exist. However, four are the main languages: Tamil (18,000,000 speakers), which possesses the earliest Dravidian literature; Telugu (about 22,000,000), the Dravidian speech most widely spoken; Malayalam (about 5,000,000), closely akin to Tamil, but more influenced by Sanskrit; and Kanaree (about 8,000,000), more akin to Telugu than to Tamil.

Austro-Asiatic Linguistic Family.—The anc. Khmer language (Khmer is the indigenous name for Cambodia, which is the Europeanised form of the Sanskrit term *Kambuja*) and the Mon language (the Mon or Talings, also known as Peguans, were the earliest civilised people of Burma) constitute the Mon-Khmer

branch of a family of languages which in the remote past occupied a very extensive area. Kindred languages are still spoken in Assam (Khasi), on the Malay Peninsula (Senoi), and over the whole of Central India (Kolarian or Mundu).

Other Linguistic Families of the Pacific.—The numerous languages and dialects of the Australian Aborigines, of the Papuans, of the Tasmanians (extinct in 1876), are remnants of various L. F. having no apparent affiliation to others.

Remnants of the Aboriginal or Palaeo-Siberian Linguistic Family.—The Yukagir, the Chukcha or Tusk, and the Koryak are Mongoloid tribes inhabiting the shores of the Arctic Ocean and Behring Sea in N.E. Siberia. They speak Uralo-Asiatic, Siberian Palaeo-Asiatic 'aboriginal' languages.

Negro-African Languages (q.v.).—Apart from the extremely primitive linguistic family of the Bushmen and the Hottentots, who actually are not Negro peoples, the numerous forms of speech (numbering perhaps 1000) of the Negro peoples of Africa are considered as belonging to the following main L. F.: Bantu, Sudanic or Sudanese (also known as Sudanese-Guinean), and Nilotic.

Native Languages of the American Continents.—These languages and dialects, numbering over 1000, are termed Amer., Indian, or Amerind, or else, even more improperly, Red Indian. Their classification is far from easy. Some families have been more or less carefully studied, but the variety is so great that even experts differ widely in their estimates of the numbers of groups, of their mutual cultural interpenetration, and the various results of migration and conquest in the distant or recent past. It must be pointed out that the study of relationship between various languages and groups of languages, is extremely difficult when the hist. of the single languages cannot be studied, as is the case of nearly all the Amer. native languages. However, a broad geographical div. can be made into the following linguistic groups: (1) Canada and the U.S.A. (see under NORTH AMERICAN NATIVE LANGUAGES); about ten linguistic groups. (2) Mexico and Central America (see under MEXICAN AND CENTRAL AMERICAN NATIVE LANGUAGES); various linguistic groups. (3) S. America (see under SOUTH AMERICAN NATIVE LANGUAGES); about ten L. F.

Linguistic Science, or Linguistics, is the science or body of knowledge which concerns the speech of human beings, i.e. language (q.v.). L. S. is concerned with the origin of speech (see LANGUAGE, ORIGIN OF); it notes variations in speech, laws governing these variations, and their transmission to other people, as well as the alliances and the differences between the various languages. A branch, known as historical linguistics, relates how, as a result of the movements of pop. and the migration of peoples, and of various cultural influences, the linguistic families (q.v.) have formed, how they have been brought into contact, and how they have influenced one another. See also LANGUAGE, ORIGIN OF; LANGUAGE, CLASSIFICATION OF; LINGUISTIC FAMILIES; and PHILOLOGY.

Linklater, Eric (b. 1889), Scottish writer, b. in Bonny, Orkney Is.; educated at Aberdeen Grammar School and Aberdeen Univ. He served with the Black Watch in the First World War and was invalided out in 1918. After the war he studied medicine but gave this up to take his degree in Eng. literature (1925). He then went to India, where he remained two years as assistant editor of *The Times of Bombay*, and was lecturer in Eng. literature at Aberdeen, 1927-28. He pub. two novels in 1929, *White Man's Saga* and *Poet's Pub*. For two years until 1930 he was in the U.S.A. as commonwealth fellow. His impressions of America were witty, and sometimes unkindly, fictionalised in *Juan in America* (1931), a book which helped to make his reputation as a humorous, zestful, and inventive writer. A number of books followed during the next ten years, including two biographies, *Mary Queen of Scots* (1933) and *Robert the Bruce* (1934). *Juan in China* appeared in 1937. On the outbreak of war in 1939 L. took part in the defence preparations of the Orkney Is., and in 1941 went to the public relations dept. of the War Office for which he wrote *The Defence of Colais*. After the war he became rector of Aberdeen Univ. (1945-1948). He has written plays for the stage and for broadcasting, and an

autobiography, *The Man on my Back* (1941). His book for children, *The Wind in the Moon* (1944), won the Carnegie prize.

Linköping, cap. of Östergötland in Sweden, 142 m. from Stockholm. It has a fine museum and a cathedral second only in importance to Uppsala Cathedral. It manufactures cloth and hosiery. Pop. 49,200.

Linley, Thomas (1732-95), Eng. musical composer, b. at Wells in Somerset. In 1775 he came to London, where he remained as musical director of Drury Lane Theatre for many years. He supplied the music to Sheridan's *Dianna*, as well as to other operas. But he is chiefly memorable for his charming setting to songs, and his music is sweet and melodious.

Linlithgow, John Adrian Louis Hope, first Marquess of (1860-1908), son of the sixth earl of Hopetoun, received, in 1902, the title of marquess of L. as a mark of appreciation for his services as first governor of the commonwealth of Australia. He d. six years afterwards, when his eldest son succeeded him as second marquess. The earldom of L. was a title held by the Livingstones in the beginning of the seventeenth century, some of whom also held the title of earl of Callender (see HOPETOUN). His son **Victor Alexander John Hope**, eighth earl of Hopetoun and second Marquess L. (b. 1887), soldier and administrator, was chairman of the joint select committee on Indian constitutional reform, which prepared the L. report, 1933. He was viceroy and governor-general of India, 1936-43.

Linlithgow, cap. of Linlithgowshire in Scotland, is a royal park burgh. It lies in a valley overlooking a loch 102 ac. in extent and is 17½ m. W. of Edinburgh. L. Palace was the bp. of Mary Queen of Scots, and is a quadrangle enclosing an acre of ground overlooking the lake. It is a massive edifice, crowned at each end by a tower. Pop. 8000.

Linlithgowshire, see WEST Lothian.

Linnæus, or von Linne, Carl (1707-78), Swedish botanist, b. at Rasmåla. He was intended for the Church, but his leanings towards botany led to his being given the charge of Prof. Rudbeck's botanical gardens and acting as deputy lecturer for Rudbeck in 1730. From the age of twenty-four he began to work at his famous classification of plants according to their reproductive organs, which he began to describe in his *Hortus Upsalensis*. In 1732 he undertook botanical explorations through Lapland and Dalecarlia, and in 1735 he went to Holland, where he met Gronovius and Boerhaave. While in Holland he completed his *Systema Naturæ*, *Fundamenta Botanica*, and *Genera Plantarum*. In 1736 he visited England and France, and returned to Sweden in 1738, when he estab. himself as a physician in Stockholm. In 1741 he became prof. of botany at Upsala. Besides the work already mentioned he pub. *Bibliotheca Botanica* (1738); *Critica Botanica* and *Classes Plantarum* (1738); *Philosophia Botanica* (1750); and *Species Plantarum* (1753). L.'s contributions to natural hist., more especially botany, are of great value. Although much of his work con-

sisted of the summing up of conclusions already reached by his predecessors, and although his classifications are sometimes at fault, the passion for order which he introduced into natural science, and his terse descriptions, proved of inestimable value to later botanists. His method of classification was based upon the examination of pistils and stamens. First he distinguished the plants without flowers from those which have flowers, redividing the latter according to their special characteristics. To him later naturalists owe the definition of genera and species and the uniform use of generic and specific names (i.e. the binomial system, under which the first name is that of the genus and the

CARL LINNÆUS

second that of the species, e.g. *Homo sapiens*; species named by him are distinguished by the letter L. following the scientific name, as *Bellis perennis* L. His style is a model of brevity and precision, with no possibility of ambiguous meaning; he methodically treated of each organ in its proper turn and used a special term for each, which never varied in meaning. The library and herbarium of L. were purchased by Sir James Edward Smith and transferred to England in 1781; they are now preserved in the rooms of the Linnean Society (founded 1788) at Burlington House, Piccadilly, London. See C. Linné, *Observations on Himself*, 1823; J. V. Carus, *Geschichte der Zoologie*, 1872; J. Sack, *History of Botany*, 1875 (Eng. trans., 1879); and W. Junk, *Linnaeus in Lichte neuerer Forschung*, 1925; also lives by D. H. Storer, 1792, and H. P. Malmsten, 1879 (in Ger.), and E. M. Fries (in *English Botanical Yearbook*, 1907). **Linnankoski, Johannes** (real name, **Viktor Peltonen**) (1869-1913), Finnish author, one of the men who with Kivi

founded modern Finnish literature was O. W. at Askola. His father was a vagabond labourer who often, tired of working on a farm, went from market to market with horses or laboured with the bands who pilot the timber floating down the rivers and lakes. The boy thus knew no settled home and had no chance of schooling but he heard from the lips of his illiterate parents many of the current folk tales, and managed to learn his letters and to read books. In 1881 he entered a school for teachers at Jyväskylä, not so much with the idea of making teaching a profession as to become educated. His fame chiefly rests on *The Song of the Red Flower* (1905) a novel which details the amours of a young man who works in guiding down the river the gigantic output of logs. Other novels and plays followed in rapid succession and he became the animating spirit of the Finnish League. Among other things he led a vast public movement to substitute genuine Finnish for Swedish family names. He then made a tour of Europe including England, France, Italy and Germany to see all he could of old civilisations. He issued another fine novel, *The Luggies* (1908) seven dramas and a number of short stories. See lives by W. Soderhjelm 1918 and A. Anttila, 1921.

Linnet, small bird belongs to the *Fringilla canabina* of Linnaeus. *Linola canabina* of modern ornithologists. It resembles the finch family and is very abundant in Britain, Europe, Asia and N.W. Africa. It received the name *L.* partly from its partiality for the seed of the flax plant (*Linum*) but it feeds readily on other seeds. The colour is grey or brown indicate the sex as well as the seasonal changes. The *L.* barely measures 6 in. in length, begins to breed in April and generally chooses some low lying bush for its home. The eggs, ranging from four to six in number are a delicate pale blue streaked with a purish brown.

Linoleic Acid ($C_{18}H_{34}O_2$) organic acid found as a glyceride linolin in linseed oil, it is the cause of the drying properties of that oil and may be prepared by saponifying the oil with caustic soda.

Linoleum, name given to a specific type of floor covering which was initially invented in 1860 by an Englishman, Fredrick Walton. It is a hard surfaced, pliable floor covering prepared by pressing or calendaring a plastic mass in a smooth sheet on to jute canvas or some similar material. The plastic mass is derived initially from linseed oil. Walton observed the rubber-like properties of thick, dried paint films and conceived the idea of making a rubber-like product by drying thick films of linseed oil. In his first process, the so-called *serim* process, he dissolved lead drier in linseed oil (the lead speeds the drying) and flooded the oil from the roof of a tall building on to sheets of fine cotton material called *serim*, hanging in the building. The oil in this film form dries to a skin. By repeated floodings at daily or more frequent intervals, over a period of several months, quite thick skins, sometimes 1 in. in

thickness are built up. The skins are cut down and after a suitable maturing period they are made into cement by heating with resin and gum in a steam heated vessel. At the correct point the cement is discharged on a cooling floor and cut up. *L.* composition in various colours is made by mixing the cement so formed with fillers such as ground cork or wood flour and colouring material using conventional mixing machinery such as is used for rubber or plastic compounding. The compound can be obtained in sheet or granulated form and various pattern effects can be obtained by the way the granulated or sheet material is fed to the calendar during the process of calendaring or hot pressing, the mix on to the jute fabric. After calendaring the *L.* is given a stoving treatment in warm stoves and this sometimes lasts for as long as twelve days. The backing may be protected with a paint surface.

L. can be made in various sizes and patterns. Thus plums, grape leaves, diamonds and marbles are common. Alternatively the plain material can be given a pattern effect by printing using print plants. A special type of *L.* is that called *mailed*. In the printed and pattern designs this is made by hand or machine shaped pieces on the jute fabric prior to entering the calendar. Fancy designs can be made on a separate horizontal machine which colours the compound in a particular form is fed through a screen on to the backing prior to hot pressing.

Walton claimed to have invented the same product twice. Thus in his alternative process he mechanically oxidised the linseed oil on steam heated vessels fitted with strong blades. The oil heated in the vessels is churned up by the rotary arm whilst air is blown through the mix. The product is discharged just before it becomes semi-liquid, and is then mixed into cement in the normal way. After returning to the process he invented an plant machine in which sheets of various coloured *L.* (unbacked) are fed to a rotary machine which automatically cut out a portion of the sheet to press on to the canvas.

The variety of *L.* has been much increased since the recent wide development of the plastics industry. The chief centre of *L.* production in Britain is Kieckhefer in Liffshill, but there are other centres in Dunfermline, Lame White and at Stain in Middlesex.

L. is not to be confused with felt back floor covering. This is made by printing a design on to a bitumen saturated felt. The back is given a protective coating too. Felt backs are hard wearing but quite cheap floor covering (see *Floorcovering*). See F. Walton *The Infancy and Development of Linoleum Floorcloths* 1923.

Linoleum Art, relief process of printing. High quality *L.* is mounted on a wood block, and the design cut thereon and transferred to paper by pressure or rubbing exactly as in woodcut (*q.v.*). *L. C.* is a twentieth century development of the printer's art, but despite being easy

to use the process is inferior to woodcut when fine work is required. See A. M. Hind, *A History of Engraving and Etching*, 1923, and M. Dolson, *Block Cutting*, 1928.

Linotype, see TYPE-CASTING AND TYPE-SETTING MACHINES.

Linseed seed of the common flax plant or flax, is used for making L. oil and oil cakes. The seeds are a transparent brown and of a narrow oval shape. The L. oil is obtained from the innermost coating of the seed, which consists of a thin layer of albumen containing a pair of large oily cotyledons. L. is a valuable food for cattle and poultry. It is used for poultices, but should never be applied to open wounds.

Linseed Oil is made by the process of pressing the seeds either with or without heat. The seeds are first bruised or crushed, then ground, and finally subjected to pressure in a hydraulic or screw press. The cold-drawn oil is purer than that obtained by means of steam, and yields 18 to 20 per cent oil. L. O. obtained by steam heat of about 200° C. yields 22 to 27 per cent oil, but is more rancid in quality. Cold pressing of the seeds yields an amber-coloured oil which is edible. The oil yielded by the steam process is a yellowish-brown, but if stored all moisture and mucilaginous matter gradually settle out; this kind of oil is used for varnish-making. Edible oil has a somewhat peculiar and unpleasant smell and flavour. Both raw and boiled oil are used by painters, the latter being serviceable especially for oil painting; it forms moreover, the chief basis of all varnishes. The simplest method of preparing boiled oil is to heat the raw oil in an iron or copper boiler three parts filled. When brought to the boil it must be allowed to boil for two hours longer, all scum and froth being removed. L. O. forms the basis of all printing and lithographic inks.

Linsingen, Alexander Adolf August Karl Klaus Ohmar von (1850-1935), Ger. general; b. at Hildesheim, Hanover, son of Wilhelm Friedrich Klaus von L. (1815-1889). Entering the infantry in 1868 he saw active service in 1870-71. In various corps he was captain, 1882; major, 1889; and colonel, 1897. He was major-general commanding 81st Infantry Brigade, 1901; lieutenant general commanding 27th Div., 1905; and general commanding 2nd Army Corps, 1909. In Jan. 1915 he took command of the 8. Army, and in July that of the army of the Bug—afterwards amalgamated with group of armies with which he held back the Russians, 1915-17. In March of 1918 he advanced into Ukraine, and in June was made chief in command of the Mark of Brandenburg.

Lint, material consisting of the fibres of the inner bark of the flax plant, is used for manufacturing the stoutest fabrics as well as the finest cambrics. It is also a special dressing for wounds, consisting of soft fluffy unravell'd linen cloth.

Linthwaite, tn. in the W. Riding of Yorkshire, England, 3½ m. S.W. of Huddersfield, on the Colne and Manchester Canal. Pop. 10,000.

Linton, William James (1812-98), Eng.

wood-engraver, b. in London. After some years' experience as journeyman engraver, he entered into partnership with John Orrin Smith in the production of the *Illustrated London News*. He became acquainted with Mazzini, the It. revolutionary, whose ideals and theories he eagerly embraced. He started a political jour., the *English Republic*, which proved a financial loss, and he was compelled to try his fortunes abroad. He set up a printing press in America, and wrote many valuable treatises on wood engraving and literary subjects generally.

Linton: 1. Tn. in Greene co., Indiana, U.S.A., 12 m. W. of Bloomfield. Pop. 6000. **2.** Small tn. in Cambridgeshire, Eng. on the R. Grant, 11 m. S.E. of Cambridge. The par. church is an interesting building of twelfth-century origin. There are a number of anc. houses, some with decorated plaster fronts. The fifteenth-century guildhall is near the church. There were formerly two fairs and a market. Barnham Hall, now a farmhouse, stands on the site of a priory of Cistercian Friars, founded about 1292. Here is one of the four vil. colleges of Cambridgeshire. Pop. 1600.

Lintol, Barnaby Bernard (1675-1736), Eng. publisher who figured as one of the victims in Pope's attacks in the *Parnell* and *Prologue to the Satires*. He pub. works of Steele and Gay.

Linum, or Flax, genus of hardy annuals and perennials of the family Linaceæ. The toughness of the fibre contained in the slender stems and the oil derived from the seeds make the genus of great economic importance. The Common Flax (*L. usitatissimum*) is not indigenous to Britain, though it is now being cultivated on an increasing scale, but three species are true natives: *L. catharticum* (Purgative Flax) is a small plant common on dry pastures bearing cymes of small white flowers. *L. perenne* is occasionally found in chalky places. Its petals are a beautiful but fugacious sky-blue. *L. angustifolium* has lilac flowers. The perennials are good rocky plants. *L. grandiflorum* and its varieties are rose and scarlet. *L. arboreum*, of shrubby habit, is yellow. For L. in industry see FLAX and LINEN.

Linus, formerly a heroic figure in Gk. legend, now typifies a digger or lamentation. Homer mentions the L. song, and the word is conjectured by most authorities to be derived from the Semitic *al-lanu*, 'woe to us.' The ordinary legend treats L. as a youth who has either succumbed to the fury of some god or goddess, or has been subjected to a violent death.

Lin Yu-tang (b. 1895), Chinese writer, b. at Chang-how. He was a high school teacher in China, and in 1936 emigrated to the U.S.A. His chief works are *My Country and My People* (1935); *The Importance of Lining* (1937); *Moment in Peking* (1939); and *Leaf in the Storm* (1944); (ed.) *The Wisdom of China* (1949).

Linz, or Linz, cap. of Upper Austria, on the Danube, and connected with its commercial suburb, Urfahr, by an iron bridge. It possesses two cathedrals, and a bishopric was instituted in 1784. Its

manns. include textile, engineering, and chemical products. Hitler (q.v.) attended the four lower classes of a secondary school at L., which was at the time a centre of Pan-Germanism, a fact which may have influenced his thought and subsequent career. The tn. subsequently became the site of the Hermann Goering aircraft works, and was subjected to heavy bombing by the Allies during 1944. It was entered by the U.S. Third Army in the last days of the war in May 1945. Pop. 129,000.

Lion (*Felis leo*), one of the largest of living carnivora (q.v.). At one time it undoubtedly lived in Europe, but now it is confined to the less civilised parts of Africa and S.W. Asia. Though a single species a number of varieties with more or less well-marked distinctions have been identified. The L. of Barbary extends over the whole of N. Africa, and has a deep yellowish brown fur. Its mane is more magnificent than in the other varieties, covering the neck and shoulders and reaching to the under parts. The L. of Senegal occurs further S.W. and is lighter in colour. A third variety ranges throughout S. Africa. Its chief distinction is a darker mane. The Persian or Arabian L. is smaller than any of the Africans and is paler. The so-called 'maneless' L. of W. India is not altogether without a mane. The L. hunts entirely by night, his favourite prey being such ungulates as antelopes, zebras, cattle, and pigs. A taste for human flesh is usually a sign of old age, when the teeth are worn and hunger makes the animal less shy. The lioness goes with young fifteen or sixteen weeks, and produces from two to six blind cubs at a litter. Mating appears to be for life, from one to four females to each male, and the cubs remain with their parents for about three years. The size of a full-grown male L. may extend to 10 ft. from nose to end of tail. The L. has been crossed with the tiger; the resulting hybrid, faintly striped, is known as a 'tigon.' The 'mountain lion' of the Rockies is the cougar or puma (q.v.).

'Lion,' Adin. Beatty's flagship in the battle of Jutland (q.v.). Launched in 1910 the L. had a broadside of eight 13.5-in. guns and sixteen 4-in. (10,000 lb.), being one of six swift battle cruisers. Tonnage 26,350, speed 28 knots.

Lion of Lucerne, see LUCERNE.

Lion of St. Mark, see VENICE.

Lions, Gulf of, the broad bay of the Mediterranean, washing the shores of S. France, and called by this name because of the roughness of the sea. The Rr. Rhone, Orb, Aude, and Tet discharge their waters into this bay, and the shore is indented for some distance by many miniature bays. The chief tn. is Marseilles.

'Lion, The,' see LEO.

Liocart, Jean Etienne (1702-89), Swiss painter who was renowned for his portraits, enamels, and pastel drawings. After studying under Gardille he visited Paris, Naples, and Rome, where he received a commission to paint the portraits of the pope and various cardinals. See life by F. Fouca, 1928.

Lipa, tn. in the is. of Luzon, Philippine Is., situated in a very fertile dist. Pop. 38,000.

Lipari Islands (anc. *Æolies Insulae*), group of volcanic is. in the Mediterranean off the N.E. of Sicily. They are seven in number: L., Vulcano, Stromboli, Salina, Panarola, Filicudi, and Alicudi, and are all mountainous, the climate being healthy and the soil very fertile. L. is the largest and produces quantities of grapes, figs, olives, and corn, while pumice-stone sulphur, nitre, soda, capers, and fish are also exported. Its cap. L. (pop. 15,600), on the E. side, has an active trade, and is the seat of a bishop. Salina is the most fertile of the group, and produces good Malmsay wine. Stromboli and Vulcano have still active volcanoes. The is. were a Carthaginian naval station during the Punic wars, until their capture by the Romans, in 352 B.C.; they were afterwards used by the Rom. emperors as a place of banishment for political prisoners. Its anc. use for this purpose was revived by Mussolini, who made the is. a penal settlement for those hostile to the Fascist regime. Following the successful invasion of Sicily by the allied forces during the Second World War, the is. were occupied by U.S. naval forces (Aug. 17, 1943). Area of group, 15 sq. m. Pop. 17,000.

Lipetsk, tn. in the Voronezh Region of the R.S.S.F.R., situated on the r. b. of the R. Voronezh, 70 m. S.W. Soap, sugar, and iron goods are produced. There are chalybeate springs in the vicinity. Pop. 66,700.

Li Po, see CHINA, *Chinese Literature*.

Lipogram (Gr. *Λιπω*, I leave out; *γραμμα*, a letter) is a species of composition in which the author leaves out one or more letters of the alphabet. The Gk. poet Lucian wrote lipogrammatic verse, and Triphiodorus, a writer of the sixth century B.C., compiled an *Odyssey* in twenty-four books, from each of which he excluded one of the letters of the Gk. alphabet. Lat. verse was also written in this style, and Ruckert wrote Ger. poems excluding the letter r. The Fr., too, and the Spaniards, have been addicted to this trick; Lope de Vega wrote five novels from each of which one of the vowels is excluded.

Lippe, or Lippe-Detmold, state of N.W. Germany, now embodied in N. Rhine-Westphalia, with the status of a Regierungsbezirk, known as Detmold. The surface is hilly, and in the S. are the Lippe-Scheer-Wald Mts. The chief rivs. are the Weser and its tribs. The area is noted for its forests, which yield excellent timber, and the rearing of cattle, sheep, swine, and horses (especially the 'Senner' breed). Potatoes, rye, beetroot (for sugar), oats, wheat, and barley are cultivated, and Lemgo is famous for its meerschäum pipes, and Salzuflen for its brine springs. The chief tns. are Detmold, Lemgo, and Horn. Before Nov. 1918 the state was a principality, but after that date it became a republic. Pop. 1,387,000.

Lippe-Schaumburg, see SCHAUMBURG-LIPPE.

Lippi, Fra Filippino (c. 1457-1504) natural son of Fra Filippo L., b. at Prato. He studied under Fra Duccio. His father's pupil and in 1480 painted the 'Vision of St. Bernard' an altar piece in the chapel of the Badia, Florence. Many others followed and in 1495 he executed the famous 'Madonna and Child between St. Victor, John the Baptist, Bernard and Zenobius' now in the Uffizi Gallery. He afterwards went to Rome and painted frescoes representing scenes from the life of St. Thomas Aquinas for the chapel in

W. I. Muns

A FILIPPINO 1311

W. I. Muns

Santa Maria della Minerva but returned to Florence in 1493 and painted Christ appearing to the Virgin, now in the Uffizi Gallery. 'The Adoration of the Magi' (Uffizi) and frescoes for the Strozzi chapel (three works: 'Virgin and Child', 'St. Francis in Glory' and 'An Angel Adorning a fragment') are in the National Gallery. See lives by P. G. Konody 1911, A. Schaff, 1935 and K. Neilson 1938.

Lippi, Fra Filippo (c. 1406-69) Italian painter b. at Florence. About 1431 he began some pictures for a Florentine monastery, and also executed other paintings, but his greatest work was the collection of frescoes in the choir of Prato Cathedral which represent events in the lives of St. John the Baptist and St. Stephen. These exhibit fine painting of costume, and are also remarkable for their

colour and grouping the two best pictures being the 'Last' the 'Death of St. Stephen' in which he introduced the portrait of himself and that of S. Giordano. He spent his last years in Spello to working on some frescoes scenes from the life of the Virgin for the choir of the cathedral. These were finished by Fra Duccio. His 'Vision of St. Bernard', 'The Annunciation', 'St. John the Baptist with ox and lamb' and 'The Virgin and Child' are in the National Gallery. See C. Strutt *Ital. Paint.* 1906, H. Mendelsohn *Ital. Paint.* 1909 and B. Berenson *Italian Paint.* 1909.

Lippincott, Joshua Ballinger (1811-1893) American publisher b. in July 1811 in New Jersey. He was a bookseller in Philadelphia 1831-36 and founded in 1836 the house of J. B. Lippincott & Co. which by 1850 was at the head of the book trade in Philadelphia. After his death the firm was converted into a company. *Lippincott's Magazine* was founded in 1858.

Lippmann, Gabriel (1841-1911) French physicist b. at Houlbecq. He invented the capillary action for the measurement of the surface tension of liquids. In 1879 he was elected to the chair of mathematical physics at the Sorbonne and in 1882 became a professor of experimental physics. He was elected a member of the Académie des Sciences in the same year. Under his leadership and presidency of the scientific mathematical section of the Ecole Polytechnique, Hautes Etudes, Sorbonne. He published works on thermodynamics, acoustics and optics, capillary colour photography and electrical units, and was awarded the Nobel prize for physics in 1910. During the First World War he invented an apparatus to discover the presence of submarine submarines.

Lippmann, Walter (b. 1889) American editor and author b. in New York City, graduated at Harvard Univ. On the staff of the New York Herald until 1931 he was columnist or special writer for the New York Herald Tribune thereafter. In his *Factets to Words* (1929) he expounds the thesis that modern society requires radical analysis and objective value for the attainment of individual freedom rather than loyalty to causes and persons. In his *U.S. Foreign Policy* (1943) he gives the impactability of the doctrine of isolationism (the traditional American principle of non-interference or entanglement in European affairs) and in effect shows that the one dominant factor that made that policy apparently effective was the policing of the seas by the British Navy. His most remarkable work is perhaps the sequel *U.S. War Aim* pub. in 1944, in which he outlines a constructive international policy for the U.S.A., emphasizing that the association of states for the prosecution of the war against the Axis must be consolidated for the peace. He further critically analyses the unsoundness of President Wilson's policy after the First World War, demonstrating the

extent to which the Fourteen Points (q.v.) was unworkable. With prophetic vision he foresaw the concentration of countries, so far as their foreign policy was concerned, into those of an Atlantic community and those within the Russian orbit and develops the thesis that the rights of small nations are not identical with the right to have an independent foreign policy. His social philosophy, as set forth in *The Method of Freedom* (1931) and *The U.S. in World Affairs* (2 vols., 1932, 1933), is one that is opposed to any planned society, much less a collectivist economic system, but which reposes faith in a liberalism which is not far removed from the Victorian doctrine of *laissez-faire*, or one that justifies governmental interference in the interplay of economic forces only in cases of abuse.

Lippspringe, Bad, in. in Westphalia, Germany, renowned for its saline springs, the Arminius Quelle and the Liborius Quelle. Pop. 3000.

Lippstadt, in. in Westphalia, Germany, on the R. Lippe. The architecture of its prin. church, St. Mary's, belongs to the Transitional period. Engines, wire, and iron are manufactured. On April 1, 1945, contact between the U.S. First and Ninth Armies was made at L., thus encircling the Ruhr. Pop. 13,000.

Lipsius, Justus, or Joest Lips (1517-1606), Belgian classical scholar, b. near Brussels. He was for a time a teacher in the univ. of Jena, and in 1579 was prof. of hist. at Leyden, finally settling at Louvain as prof. of Lat. in the Collegium Busildianum. He was successively a Rom. Catholic, a Lutheran, a Calvinist, and again a Rom. Catholic. His greatest work was his *Tacitus*, which first appeared in 1575 and was five times revised and corrected. See F. van der Haeghe, *Bibliographie Lipsiana*, 1886-88, and V. A. Nordmann, *Justus Lipsius als Geschichtsforscher und Geschichtslehrer* (Helsinki), 1932.

Lipsius, Richard Adelbert (1830-92), Ger. theologian, b. at Gera. He studied at Leipzig, and was prof. at Vienna in 1861, at Kiel in 1865, and at Jena in 1871. He was largely responsible for the foundation and management of the Evangelical Protestant Missionary Union and the Evangelical Alliance. His writings deal chiefly with dogmas and the hist. of early Christianity. Among them are *Philosophie und Religion* (1865); *Glaube und Lehre* (1871); *Lehrbuch der Evangelisch-protestantischen Dogmatik* (1876); and *Die apokryphen Apostelgeschichten* (1883-87). See A. Neumann, *Grundlagen und Grundsätze der Hellenscharung von Lipsius*, 1896; also life by H. Weinel, 1910.

Lipton, Sir Thomas Johnstone (1850-1931), Scottish merchant, b. at Glasgow. He emigrated to America at the age of fifteen, and supported himself by working in a grocery store, etc. After some years he returned to Scotland and started a provision shop at Glasgow. His business gradually increased, and he was able not only to open shops all over the kingdom, but to purchase tea and coffee plantations in Ceylon. He also provided his own

fruit farms, bakeries, and bacon-curing estates, in England, as well as a packing-house for hogs in Chicago. In 1898 his business was converted into a limited company, of which he was chairman until his retirement in 1927 when he became life president. He competed unsuccessfully for the America Cup in 1889, 1901, 1903, 1911, 1920, and 1930, and owned the yachts *Erin* and *Shamrock*. He founded the Alexandra Trust to provide the poor with cheap and wholesome meals. He was knighted in 1898, made a baronet in 1902 and, subsequently, K.C.V.O.

Liquation, process of transforming a solid into a liquid. The term is used particularly of the melting of metallic mixtures in order to separate their constituents. The process is an important one in the refining of certain metals, as impurities can thus be efficiently and economically removed. In the purification of lead, for example, the metal is melted down slowly in a reverberatory furnace, and the scum formed by the oxidation of impurities is removed as it forms. This is continued until pure litharge is formed on the molten surface, by which time all the tin, arsenic, and antimony have been removed. L. is also useful in separating the constituents of an alloy, as under certain conditions there is a tendency for the metals to separate as they approach their respective melting-points in cooling.

Liquefaction of Gases, or GAS AND GASES.

Liqueur. This term is applied to beverages which have been sweetened and flavoured in such a way as to be highly palatable. The ingredients are essential in the preparation of these beverages, viz. (1) a powerful spirit or alcohol; (2) sugar or syrup; (3) some flavouring matter such as aniseed, elderberry, lemon, cloves, citron, peppermint, etc. Kummel is the popular L. of Russia, and is flavoured with caraway and caraway seeds. Noyau, or Crème de Noyau, is a Fr. cordial flavoured with bruised bitter almonds. Kirschwasser is a favourite L. in Germany, whilst Benedictine and Chartreuse are two highly favoured Ls. invented by two ancient monastic communities.

Liquid, substance which is capable of flowing, but which is practically incompressible. The physical states of matter may be classified as solid, L., and gaseous. A solid has a definite shape and a definite volume, a L. has a definite volume, but it assumes the shape of the vessel that contains it, while a gas is highly compressible, has no shape of its own, and fills any vessel into which it is put, e.g. if a gas tap is turned on for a few moments, coal gas will soon be found in every part of the room. The fundamental properties mentioned above are explained by the kinetic theory of matter, which, as we shall see, accounts for the many physical properties characteristic of a L.

Matter in all three forms consists of an aggregation of very small particles called molecules, whose linear dimensions are of the order of 10^{-8} cm.; it is, of course, quite impossible to see molecules even with

the most powerful ultra-microscope, and the number of molecules in 1 cubic centimetre of a L. is measured in millions of billions. These molecules are moving incessantly, and their velocities are affected by changes of pressure and temp. Further, in accordance with the universal law of gravitation, the molecules attract each other, and the freedom of movement of a molecule depends on its velocity and the attractions of other molecules on it. In a solid the molecules are packed together so closely that while they can move to and fro the attraction of the other molecules is great enough to restrict these motions within very small limits. Hence a solid has a definite shape, a definite volume, and is highly incompressible. In a gas the molecules are relatively widely separated from each other, and their mutual attractions are so small that they exert only a negligible control over the movements of each other. It is true that the numerous collisions that occur deflect the molecules from their paths and change their velocities at each collision, but the molecules are not anchored to a family group, and each one has its own life.

The state of affairs in a L. is of an intermediate character. While the control of the mutual attractions of the molecules is not strong enough to prevent a molecule from wandering about, it is sufficiently strong to prevent the molecule from breaking away from the general body altogether; thus a L. has a definite volume but no definite shape. An exception to the last statement occurs when a molecule, near the surface of the L., is travelling with sufficient speed and in the right direction, to break away from its fellows. This breakaway constitutes the phenomenon of *evaporation*. The molecule of a L. in its new freedom is termed a molecule of *vapour*. Only the high-speed molecules escape and the escape thus reduces the average speed of the molecules of the L. Now the average speed of the molecules increases with a rise in temp. and falls with a fall in temp. It follows, that evaporation is accompanied by the cooling of the L. If the L. is contained in a closed vessel, e.g. ink in a stoppered bottle, the escaped molecule, after various collisions with the molecules of air and the molecules of glass, returns to the L. and is dragged back to captivity. In the meantime other molecules are escaping and a state of equilibrium is soon reached when the number of molecules leaving the L. is equal to the number returning in the same time. The net evaporation is nil henceforward and the vapour is said to saturate the space about the L. If, however, the bottle is unstoppered few molecules will return once they have escaped and evaporation will proceed until there is no L. left.

Suppose a steady supply of heat is given to a L. The average velocities of the molecules are increased thereby and evaporation will be accelerated until the rate of loss of heat due to evaporation just balances the rate at which the heat is supplied. Evaporation, however, only takes place at the surface of the L.,

and the area of this surface may be relatively small, e.g. a kettle, while the rate of supply of heat may be considerable. In such a case the temp. of the L. rises and evaporation increases but not sufficiently to establish equilibrium. In that event a stage is reached when a bubble of vapour forms inside the L. and the pressure of the vapour is sufficient to prevent the bubble collapsing under the pressure outside it. Evaporation now proceeds into the bubble which increases in size and rises to the surface where it bursts. The L. is now *boiling* and it will be seen that the necessary conditions for boiling are (1) small surface area of L. and large supply of heat, (2) L. at a temp. where its vapour pressure is equal to that of the external atmosphere. Under 'normal' conditions of pressure, viz. 760 cm. of mercury, water boils at 100° C. On the top of Mont Blanc it boils at 85° C.

The molecules at the surface of a L. are subject to conditions quite different from those obtaining in the interior of the L., where a molecule is attracted in all directions because it is surrounded by molecules. A molecule at the surface is indeed attracted upwards by the molecules of air that pay fleeting visits to the surface, but it is subject to a much greater downward force of attraction due to the molecules of L. beneath it. Thus although there is no difference in the *constitutions* of the L. at the surface, the effect of this downward pull on the molecules there is very similar to an elastic skin confining the L. as it were, in a bag. The effect is known as *surface tension*. In spite of gravity tending to flatten them, small drops of L. are pulled into a shape that presents the least surface area for a given volume, viz. a sphere. Where the effect of gravity is small compared with the surface tension we get spherical surfaces, e.g. soap bubbles. Again if there is resistance to gravity so that a L. falls quite freely, the surface tension moulds it into drops, e.g. raindrops, the result of lead shot by pouring molten lead from the top of a shot-tower. The phenomenon of *capillarity* or the ascent of L. in fine tubes that is responsible for the distribution of sap in plants and trees is due to forces of attraction between the L. molecules and those of the material of the tubes, and it is connected with the phenomenon of surface tension. The mechanics of L. are discussed in the articles on *HYDROSTATICS* and *HYDROKINETICS*. See Sir W. H. Bragg, *Concerning the Nature of Things*, 1925, and *Critical Temperature and Heat*; J. S. Hildane, *Gases and Liquids*, 1928; T. Preston, *The Theory of Heat*, 1929; and H. Moore, *Liquid Fuels*, 1935.

Liquid Air, see GASES AND GASES.

Liquefaction of Gases.

Liquidation, see COMPANIES AND COMPANY LAW.

Liquid Fuel, see under FUEL.

Liquid Measure, see under WEIGHTS AND MEASURES.

Liquor Control. A part from the licensing laws legislation to restrict the practice of alcoholic indulgence began under the Defence of the Realm Act of 1914, which

embodied a regulation which prohibited the making of soldiers or sailors drunk while they were engaged in the defence of railways, docks, or harbours. It soon appeared advisable to extend the restriction to the civilian pop., especially in industrial dists., where the output of munitions was jeopardised by alcoholic intemperance. Later the need for drastic economy in food supplies caused a further extension of restrictive legislation. In 1915 a new gov. dept. was created under the D.O.R.A. of that year, called the Central Control Board (Liquor Traffic). It had wide powers, and its area of supervision by 1916 extended over practically the entire country. Its powers included the closing of any licensed premises or club, the regulation of hours of opening, etc. *See* under LICENCES AND LICENSING LAWS, and the inspection of licensed premises and clubs. Clubs were placed on the same footing as public houses. In 1921 the Board was abolished, and its powers were transferred to the Home Office. For existing statutory provisions concerning hours within which intoxicants may be sold or supplied in Great Britain *see* LICENCES AND LICENSING LAW. Various Bills have been introduced in recent years supporting Local Option (*q.v.*) and Prohibition (*q.v.*), but none has reached the statute book. The Scottish Temperance Act, 1913, contains local option sections and these came into force in 1920. An order was made about six months after the outbreak of the Second World War restricting the output of spirits to one-third of the 1939 production. Powers to deal with 'bottle parties' and other night resorts were contained in a Defence Regulation (12 C) issued on July 25, 1940. The Licensing Act of 1919 provides for the extension of state management in all 'new towns' (*see* SATELLITE TOWNS) and to adjacent areas. The powers of the secretary of state in a state management dist. include power to sell or supply intoxicating liquor for consumption on or off the premises; maintenance of hotels and inns; brewing of beer; and the purchase of any business carrying on any of the foregoing activities.

The earliest restrictive legislation in America prohibited the sale of alcoholic drinks to Indians. In 1857 prohibition was adopted in the state of Maine and spread later to other states. (For further information *see* PROHIBITION.) After many years of unsatisfactory local control Canada passed an Order in Council in 1919 prohibiting importation into a prov. which had estab. prohibition. Thenceforward till 1921 all the provs. except Quebec adopted general prohibition, but drink in Canada is now almost wholly under state control. In New Zealand liquor laws are based upon the Licensing Act of 1908, with amending acts in 1918, and a licensing poll is taken on the day of each general election. The system of 'restricted liberty' in Finland under the drinking law of 1932 came into operation early in that year. It gave the State a monopoly in the sale of alcoholic liquor. *See* E. Selley, *The English Public House*

as it is, 1927; C. E. G. Catlin, *Liquor Control*, 1931; *Report of the Royal Commission on Licensing in England and Wales, 1929-31*, 1932; R. B. Fosdick and A. L. Scott, *Toward Liquor Control* (New York), 1933; L. V. Harrison and E. Laine, *After Repeal: a Study of Liquor Control Administration*, 1936; E. A. Lewis, *Liquor Laws of the U.S.A.*, 1938; and G. B. Wilson, *Alcohol and the Nation*, 1940.

Liquorice, substance which is extracted from the roots of *Glycyrrhiza glabra*, a herbaceous perennial plant found in S. Europe. It has pinnate leaves, bluish flowers, and a tap root. This latter, which is about an inch in diameter, is sliced and boiled, and an extract known as Sp. juice is obtained by evaporation. As this solidifies it is rolled into sticks about 6 or 8 in. long and wrapped in bay leaves. It is sweet to the taste, and is much used as a demulcent in medicine.

Lira (Lat. *libra*, balance, pound), a modern It. silver coin which corresponds to the franc of the Belgians, Swiss, and Fr., and is divided into 100 centesimi. Also a Turkish gold coin.

Liriiodendron, *see* TULIP TREE.

Lisbon, cap. of Portugal, on the Tagus, 10 m. from its mouth. It is built on a succession of hills, some of them 300 ft. high, and has a very picturesque appearance. It is divided into four municipal dists.: the Alfama, or old tn., in the E.; the Cidade Baixa extending inland from the naval arsenal and custom house; the Bairro Alto, the high ground W. of Cidade Baixa; and the Alcantara, or westernmost dist. L. was a Rom. municipium, and a few relics remain. The Alfama contains the Castelo de São Jorge, a Moorish citadel, the St. Patriarchal, a cathedral founded in 1150, said to have been a Moorish mosque; the twelfth-century church of São Vicente de Fora; and the church of Nossa Senhora da Graça (sixteenth century), which contains a wonderful figure of Christ. The modern tn. dates from the period after the great earthquake in 1755, and has promenades squares, long, straight streets, and handsome buildings, including a national museum of art, containing Flem.-Portuguese paintings of the fifteenth century, gold and silver works of the fifteenth and sixteenth centuries, and a public library with about 250,000 vols. and 15,000 MSS. L. has a univ., and is also the seat of an archbishop with the title of patriarch, and of Parliament, the Palácio da Assembleia Nacional, in which the Houses sit, being a sixteenth-century Benedictine convent. Its port is one of the best in the world, and is well protected, and there is communication with S. America and Africa, as well as with all European ports. Fishing is important, and a variety of manufs. includes shipbuilding and textiles. New housing projects, by 'social assistance syndicates', of good design, and with much use of interior marble, have enhanced the beauty of L. Pop. 709,200.

Lisburn, tn. in N. Ireland, in the co. of Antrim. There are interesting historical ruins, such as Castle Robin and the Giant's Ring, an old fortification. Thero

is a monument to Bishop Jeremy Taylor in Christ Church Cathedral which embraces the three dioceses of Down, Connor and Dromont. The chief trade is the linen manuf. Pop. 12,000.

Lisieux, tn. in the dept. of Calvados, France, on the Louques, 30 m. from Caen. Before the campaign of 1941 it was a beautiful tn. with a pop. of 16,000, presenting quite a medieval appearance with its old timbered houses and ancient ruins. Buildings of interest were St. Peter's Church and the episcopal palace. There was an extensive woollen textile and manuf.

L itself stands on a hill overlooking the St. Loo. Pop. 4,200.

Lisle, Alicia (c. 1611-85), daughter and heiress of Sir White Beckenshaw and wife of John L., whom she married in 1640. During her husband's lifetime she probably shared his fortunes, but after his death in 1661 she retired to Moyles Court, and in 1665, at the time of Monmouth's rebellion, sheltered some of his supporters. She was tried before Jeffries and beheaded at Winchester. See J. Howell, *State Trials* 1809, 28, and H. B. Irving, *Life of John Jeffries* 1898.

F N 1

LISBON. TRAIÇA DOM PEDRO IV. (1) ROCCO

of cloth and shoddy and cotton. **L** is famous as the domicile of a modern saint, Thérèse de Lisieux (1873-97), who was canonised in 1925. In June Aug. 1941 the tn. was reduced to a shattered ruin, being wrecked by bombing in the first week of invasion (June 6-13), when it was one of the Ger. vital communication centres. The Gers fought a determined rearguard action here and the tn. was finally freed by Brit. and Canadian forces on Aug. 24. The beautiful white Basilica of St. Thérèse de l'Enfant Jésus, the great white dome of which dominates the entire valley in which **L** is situated, is undamaged. Pop. 12,700.

Liskeard, tn. and municipal bor. in the co. of Cornwall, England, 12 m. S.E. of Bodmin. The surrounding country is picturesque and hilly and there are stone and slate quarries in the neighbourhood.

Lisle, Charles Marie Leconte de, see **LECONTE**.

Lisle, Claude Joseph Rouget de, see **ROUGET**.

Lisle, hard twist cotton yarn having a twist per inch greater than that put into ordinary cotton. Because of this high twist **L** is strong and resilient and possesses cool, absorbent and evaporating qualities. It is more expensive than ordinary cotton. *Merised L* is formed by the same process in which two threads, one with a flat-hand and one with a right hand twist, are finally twisted together, but in addition the cotton is treated with a caustic soda solution. An appearance of lustre is thus obtained. It is used to reinforce the toes and heels of stockings and in the manuf. of fine gauge sheer stockings called Chiffonables. See A. W. Fley, *Stockings*, 1916.

L'Isle-Adam, see **VILHERS DE L'ISLE-ADAM**.

Lismore: 1. Is. at the mouth of Loch Linnhe, Argyllshire, off the W. coast of Scotland. It measures 9½ m. in length and 1½ m. in breadth. The lower portion of Loch Linnhe is divided by this Is. into two channels, the Lynn of Morven and the Lynn of Lorne. The Is. was at one time the seat of the bishops of Argyll, who occupied Achinduln Castle, now a ruin. Pop. 400. 2. City and municipality in the co. of Ross, New S. Wales, Australia, on the R. Richmond. It was first settled in 1814 and named after the Scottish Is. (see above). It is the seat of a Rom. Catholic bishop. The dist. is fertile, and there is a brisk trade in dairy produce and timber. L. was proclaimed a city in 1946. Pop. 16,000. 3. Tn. of Ireland in the co. of Waterford, 15 m. W.N.W. of Dungarvan. It stands on a rocky height overlooking the Blackwater R. It possesses a fine baronial castle and the cathedral of St. Carthagh. L. was the site of a monastery founded in 633 by St. Carthagh. In the National Museum, Dublin, is the L. Crosier (q.v.). Pop. 1500.

Lismore Crosier. An outstanding example of medieval Irish art, believed to date from the twelfth century, like the equally well-known Cross of Cong. The staff is of yew and the crook of bronze with bosses of coloured enamel. It was recently presented by Lord Hurlingham to the National Museum in Dublin.

Lissa: 1. The outermost is. of the Dalmatian Archipelago, Yugoslavia. The prin. products are wine and sardines. Two naval actions have been fought near the Is. The first was in 1811 between a Fr.-Venetian squadron of frigates under Commodore Dubordien and a Brit. squadron under Capt. (afterwards Sir) Wm. Hoste. Dubordien was killed and Hoste was severely wounded. The result was a Brit. victory against great odds, four prizes being taken to Malta by the victor. The second was an engagement between the Austrian and It. Navies in 1866 and resulted in a victory for the Austrian commander, Tegethoff. The battle was remarkable as being the earliest sea fight between modern ironclad steam-driven warships. Pop. 19,110. 2. Tn. in Poznań, Poland, 25 m. N.E. of Glogow. The chief manufs. are cloth, linen, shoes, and machinery, and there is also some trade in fur. Pop. 14,400.

Lissauer, Ernst (1882-1937). Ger. author, b. in Berlin, son of Hugo L., councillor of commerce. He attended the univs. of Leipzig and Munich. His publs. began with *Der Acker* (lyrics) (1907). In 1914 he began issuing at Göttingen a 'flying sheet' called *Worte in die Zeit*, which was discontinued the next year. The first issue contained his celebrated Hymn of Hate (*Hassgesang gegen England*). He wrote some plays, *Werkmann* (1921); *York* (1921); and *Das Weib des Jephta* (1928). See life by C. K. Brand, 1923.

Liszt, Friedrich (1789-1846). Ger. economist, b. at Renthlingen. He was a disciple of Adam Smith, but agreed with Hamilton

in his strictures on his doctrines. His chief work was *Das Nationale System der Politische, Ökonomie* (1841). L. strongly advocated the extension of the Ger. railway system, and the estab. of the 'Zollverein' was largely due to him. See E. M. Hirst, *Life of Friedrich List and Selections from his Writings*, 1903; A. Sommer, *Friedrich List's System der politische Ökonomie*, 1927; also life by F. Lenz, 1936.

Listel, see under **FILLI T.**

Lister, Joseph, Lord (1827-1912). Brit. surgeon, b. at Upton, Essex. From 1860 to 1869 he was prof. of surgery at Glasgow Univ., from 1869 to 1877 prof. of clinical surgery at Edinburgh Univ., and from 1877 to 1893 at King's College, London. He became sergeant-surgeon to Queen Victoria in 1878, was created a baronet in 1883, and first baron in 1897. He was president of the Royal Society from 1899 to 1900, and president of the Brit. Association in 1896. He is famous for the discovery of the antiseptic system of treatment, which has revolutionised modern surgery. His earlier work consisted in research on muscle cells, and he discovered that the size of the pupil of the eye was regulated by the plain muscle cells of the iris. L. proved conclusively that the presence of ammonia in the blood was due to disease, and not, as his contemporaries held, to the natural liberation of this gas to coagulate the blood. As a surgeon L. was deeply concerned over the number of deaths occurring as a result of infection of wounds. He had heard of Pasteur's work, and, connecting pus formation with the possible presence of bacteria or other minute organisms, L. sought chemical methods of sterilising apparatus and wounds. He tried carbolic acid with such marked success that he pub. *On the Antiseptic Principle in the Practice of Surgery* (1867). He did much to improve surgical dressings and the sanitation of hospitals. He recommended the use of antiseptics in war, and invented a method of isolation of single bacteria. He was also responsible for the introduction of the catgut ligature. See R. L. Godlee, *Life of Lord Lister*, 1921, and H. C. Cameron, *Joseph Lister, the Friend of Man*, 1913.

Liszt, Franz (1811-86). Hungarian composer, conductor, and virtuoso pianist, one of the most important figures in the development of modern music, b. at Raiding in Hungary, and studied under Czerny and Salieri in Vienna (1821-23), Paer (1823), and Reicha (1826) in Paris. By this time he had won considerable fame as a pianist in Vienna, Paris, and London. During his sojourn in Paris in 1830-32 he came into touch with the Romantics (Berlioz, Chopin, George Sand, etc.), and two years later he began his liaison with the Countess d'Agoult. The next few years were spent travelling in Switzerland and Italy; he has recorded his impressions in the famous *Années de Pèlerinage* (1842). These pieces, the great B minor Sonata (1853) and the two Concerti, are the finest of his innumerable contributions to piano-forte literature, which include transcrip-

tions of songs and of symphonic works for wind instruments etc. His chief orchestral writings are connected with his Weimar career (1818-61), e.g. the symphonic poems, the *Dante* and *Faust* symphonies, etc. In 1865 he took holy orders becoming an abbot, and henceforward his works were principally of a sacred character: the *Trance* (1866) and other masses, *Christus* (1866) psalms and the Requiem for male voices and organ. He also left

FRANZ LISZT

some very beautiful songs. See F. P. Mann *Liszt: Artist and Man* (1911) 10 (trans. by E. Cowdell 1882) F. Newman *The Man Liszt* 1934 and S. Siltwell *Liszt* 1934.

Litany (Lk. xvi. 7) form of prayer consisting of a repetition of supplications for the needs of the Church. At first an essential part of the liturgy or mass later it developed a new form in which it was sung in procession on the way to the church before the service. It was particularly associated with times of penitence or calamity and so acquired a penitential character. The earlier form was used in Christian assemblies from the earliest times but the date of introduction of the processional form is uncertain, 416 is given for Constantinople and the time of Justinian for Antioch and Marseilles of Vienne is said to have composed (c. 470) a L. for use at Ascensiontide in parts of Gaul. But whatever the date was Ls. were common in the sixth century, the first synod of Orleans (A.D. 511) enjoined their use for three days before Ascension all over Gaul, while the synod of Gerunda

(517) provided for two sets of Ls., one to be observed for a week at Whitsuntide and another at the feast of All Saints. Again a synod of Paris (573) ordered Ls. to be said for three days at the beginning of Lent, and the fifth synod of Toledo (639) gave injunctions for the recital of Ls. for three days from Dec. 14. In 590 Gregory the Great introduced at Rome a *litania septiformis* or a sevenfold procession of clergy laymen virgins married women, widows poor and children. Of Roman institution also is the procession for St. Mark's Day which the synod of Claveshoe (747) ordered to be held 'after the manner of the Roman Church'. The L. probably consisted at first of the repetition of the words 'Kyrie eleison,' but became gradually enlarged and later on was addressed to the Holy Trinity the Blessed Virgin and saints the people's response being 'Ora pro nobis' if it was directed to the Blessed Virgin or a saint, and 'Libera nos' if addressed to God. The form in the Anglican Prayer Book contains no invocation of the Virgin or saints but otherwise is similar to the ancient form. In this part of the morning prayer. In the Roman Catholic Church the recitation of the Ls. in procession if possible is enjoined on St. Mark's Day (April 25) the Rogation days Holy Saturday the eve of Whitsun and at the Forty Hours Devotion. It also precedes the ceremonies of ordination and the consecration of a church. Six other Ls. are recognised for optional use the best known of which are the L. of Loreto in honour of the Blessed Virgin; L. of the Sacred Heart and L. of the Holy Name Jesus. See N. Strass *Litaneien und Litaniae* 1901 and J. Schuster *See a monachia* vol. 1 (Paris 1924).

Litchfield, city of Montgomery co. Illinois, U.S.A., 6 m. N.W. of St. Louis. It is an important railway centre and vital to the city and one are found in the neighborhood. It manufactures and could use milk. Pop. 7000.

Literary Forgery consists in the pub. of literature which purports to be what it is not. It has been practised by many writers and a notable example was the *Epistles of Phalaris* a late Greek forgery, traced to the school by Bentley in 1697. Among literary forgers may be mentioned (1) George Isidore Maza (c. 1679-1761) who invented an elaborate alphabet and grammar and religion of his own, and presented Bishop Compton with the catechism in his invented language which he styled Lormosa. He also pub. a fabricated Description of Lormosa in 1704. (2) James Macpherson (1736-96), who issued two epic poems *Inglal* (1762) and *Femora* (1765) which he alleged to be trans. from the Gaelic of a poet called Ossian. (3) Thomas 'Hatterton' (1752-1770) who began to fabricate Thomas Rowley's verses (1765) which were pub. as genuine fifteenth century poems in 1777 and 1782. (4) Bodmann (1734-1820), prof. and librarian at Mainz, who forged two at least of Johann Gutenberg's works one of which he put forward as an autograph letter of Gutenberg to

a fictitious sister of his named Bertha. (5) Wm. Henry Ireland (1777-1835), who forged deeds and signatures of, or relating to, Shakespeare (1794), made a transcript of *Lear* and extracts from *Hamlet* in feigned handwriting, deceiving even such experts as Joseph Warton and George Chalmers, and fabricated pseudo-Shakespearean plays, *Fortierna* and *Rowena*, and *Henry II.* (6) John Payne Collier (1789-1883), who forged marginal corrections in the Egerton folio of Shakespeare before 1841, and in the Perkins folio before 1852, and brought out eds. of Shakespeare based on these forgeries. (7) Richard Pigott (c. 1828-89), who wrote articles entitled 'Parnellism and Crime' in *The Times* newspaper, in which he labelled the Home Rule party, and also pub. letters purporting to have been signed by Parnell which condoned the Phoenix Park murders. (8) Thomas J. Wise (1859-1936) was a successful London business man and a genuine bibliophile. He amassed one of the great libraries of the world and compiled bibliographies and catalogues which are described as 'unmatchable as the performance of one man' by Wilfrid Partington, in his *Thomas Wise in the Original Cloth* (1917). However, he was simultaneously forging first eds. for sale, which his many literary friends in all innocence recommended as collectors' treasures. One of his triumphs was to persuade Browning of the genuineness of a 'first ed.' of Mrs. Browning's *The Runaway Slave*. Correspondents in the *Athenaeum* attacked his 'first eds.' of Stevenson's *Some College Memorabilia* and Morris's *Sir Galahad* as forgeries; and Cook and Wedderburn exposed 'first eds.' of some Ruskin pamphlets. Wise, however, pursued his career unperturbed, but shortly before his death Messrs. Carter and Pollard, in *An Enquiry into the Nature of Certain Nineteenth-century Pamphlets*, made it clear that he had forged more than fifty 'first eds.' of the writings of sev. famous authors. Wise died without attempting any defence. His usual method was to circulate reprints to which he had given a date earlier than the genuine one, and he was detected by the fact that the paper and type used could not in fact have been utilised at the dates given.

Literary Prizes. Their main purpose should be to encourage comparatively unknown authors and to create a wider public for those who deserve to be better known. The monetary value of prizes for which Brit. authors may compete is, except for the Nobel prize for literature, far outweighed by their potential publicity value. Since 1919 few of the awards in Britain have been to unknown authors, but a high proportion have been given to works of a lasting value. The James Tail Black memorial prize is the most valuable offered in Britain, and was founded in memory of a partner in the publishing firm of A. & C. Black. Two prizes of about £250 each are given, one for a work of fiction, the other for a biography. In 1940 they were won by H. F. M. Prescott for *Spanish Tudor* and Charles Morgan for *The Voyage*. The Hawthornden prize was

founded by Miss Alice Warrender for a work 'of imaginative literature' by an author under forty-one years of age; it consists of £100 and a silver medal. In 1939 it was gained by Christopher Hassall's *Penthesilea*, and in 1940 by James Pope-Hennessy's *London Fabric*. The Stock prize was formerly known as the Prix Fémina-Vie Heureuse Anglus, and is an ann. prize of £10, presented by the Fr. magazines *Fémina* and *Vie Heureuse*, for the best work of imagination by one of the younger Brit. authors, or one considered not to have received adequate recognition. (There is a reciprocal Eng. prize for Fr. authors now known as the Hemenann prize.) Robert Graves's *Count Belisarius* gained the prize in 1939. The king's gold medal for poetry is offered, though not always awarded, by the king for a vol. of poetry in Eng. by a Brit. subject; it is given for a poet's first or second book, or to a poet under thirty-five. In 1937 it was given to W. H. Auden's *Look, Stranger!*, and in 1940 to Michael Thwaites's *Milton Blind*. The Carnegie medal is awarded for the year's best book of Brit. authorship and production for children; the decision rests with a committee of the Library Association. Not only literary merit, but printing, paper, etc., are taken into account. It was won in 1940 by *Visitors from London*, written by Kitty Burne, illustrated by Ruth Gervis, and pub. by Dent's. The Nobel prize for literature is the most valuable of literary awards, being worth about £8000. It is one of the five prizes founded by Alfred Bernhard Nobel (1833-96), and is awarded to 'the person who shall have produced in the field of literature the most distinguished work of an idealistic tendency.' In fact, an author gains the award for the general excellence of his work rather than for any specific pub. Authors are nominated by the Fr., Sp., and Swedish Academies, the final choice being made by a committee of the list of these. There is no consideration of nationality. Among the Brit. prizewinners have been George Bernard Shaw (1925), John Galsworthy (1932), and Pearl Buck (1934).

Literary Societies flourish in most towns, and are conducted so that persons interested in literary studies may meet together for the exchange of discussion, usually following a thesis expounded by a particular member on some literary topic. Many churches conduct such societies, the popular circle associated with the City Temple, London, being an example. Most univs. and schools organise such societies. In the univ. centres of most countries L. S. are formed in conjunction with archaeological and historical associations, and conduct research on an international scale. In Great Britain the leading L. S. and the dates of their foundation are the Royal Society of Literature, 1825; the Manchester Literary Club, 1847; the Scottish Society of Literature and Art, 1886; the Irish Literary Society and the Library Association of, 1887. In the U.S.A. there is the Amer. Literary Association, 1876, and the Carnegie

Institute of Washington, 1902, while important centres of literary activity are found in all the prin. tns. In France the prin. L. S. are the Société Philologique, 1827, and the Société des Bibliophiles, 1820.

Literature, see **DIDACTIC POETRY**; **EPIC POETRY**; **NOVEL**; **PROSE**; **SHORT STORY**; **VERSE**, etc.; also **ENGLISH LITERATURE**; **FRENCH LITERATURE**; and the sections on *Language and Literature* under the names of countries.

Litharge, monoxide of lead (PbO). It is obtained by oxidising lead at high temp., two forms of the monoxide being known; one form, called massicot, is obtained at moderately high temps., while the second form, or *L.*, is obtained by fusing massicot and allowing the molten mass to solidify. In the process of cupellation of argentiferous lead the lead is heated in a furnace made of, for example, bone ash mixed with pearl ash, and subjected to an oxidising atmosphere. The lead is oxidised to *L.* (hence the name *L.*, which means 'silver stone'), and this is blown off by a special blast, or is absorbed by the bed of the furnace, leaving the molten silver behind. *L.* is a yellowish powder, and is used in the manuf. of flint glass, and of glazed earthenware, and in the preparation of quick-drying oils and varnishes. It is the source of the preparation of lead nitrate and the basic acetate used for pharmaceutical purposes.

Litherland, par. and mkt. tn. of Lancashire, England, 5 m. N. of Liverpool, of which it is a suburb; it has manufs. of matches. Pop. 18,700.

Lithgow, William (1582-1650), Scottish traveller and writer, b. in Lanark. He left Scotland about 1610 and for nineteen years travelled in Europe, the Levant, Egypt, and N. Africa. The account of his adventures, including his narrow escape from the Inquisition at Malaga through the intervention of the Eng. consul (1621), will be found in his *The Totall Discourse of the Rare Adventures and Painfull Perambulations of long Nineteene Yeares Travayles* (London, 1632; new ed. 1906). Other writings of his are *A True and Experimental Discourse upon the last siege of Breda* (1637); an account of the siege of Newcastle and battle of Marston Moor (1645); and six poems (1618-40).

Lithgow, township of Cook co., New S. Wales, 70 m. W.N.W. of Sydney, in a valley of the Blue Mts. There are potteries, breweries, iron works, saw mills, and brickfields. Pop. 11,000.

Lithic Acid, see **LITHIC ACID**.

Lithium, symbol *Li*, atomic number 3, atomic weight 6.94, a metallic element of the alkali group discovered in 1817 by Arfvedson, is a rare metal, but is widely distributed in small quantities in sea and riv. water and in plants. Important mineral silicates containing *L.* are petalite (2.7-3.7%), lepidolite, or lithia mica (1.3-5.6%), triphylite, and spodumene. It is prepared by electrolysis of the fused chloride obtained from lepidolite. *L.* is a silvery-white metal which cuts easily and tarnishes readily; it is extremely light (sp. gr. .53) and has a higher melting-

point (186° C.) than the other alkali metals. An important difference between *L.* and the rest of the alkali metals lies in the fact that its phosphate and carbonate are almost insoluble in water. The carbonate and citrate are used in medicine in cases of gout and gravel.

Lithography (Gk. *lithos*, a stone, and *graphein*, to write), which may be classified in two groups, fine art and commercial, is a planographic process, the original principles of which were based on the antagonism of grease and water, the disposition of greasy substances to adhere to one another and the property of absorption possessed by calcareous stones. Lithographic stone is a sedimentary limestone (calcium carbonate, $CaCO_3$) belonging to the Oolite strata of the Jurassic system. It varies in colour from creamy yellow to dark brown grey, the darker the colour the harder the stone. The best varieties yet discovered are in the Pappenheim-Kellheim dist. in Bavaria, near to the home of the inventor of the process, Aloisius Senefelder. But for this coincidence *L.* might never have been discovered. The stone is quarried in large flat slabs in a small manner to slate, and interesting fossils are frequently disclosed in quarrying. Until employed in *L.* the stone was principally used for paving and was used in St. Peter's Cathedral, Rome, for this purpose. It is porous and brittle but can be polished to an almost glass-like smoothness. This makes it an ideal surface upon which to work and artists can obtain extremely delicate results with pen and brush; the size in general use vary up to 64 x 11 in., thickness being 2 to 1 in. according to size.

Before use for *L.* the stones are levelled by either planing or grinding, the edges are rounded off, and finally the surface is ground and polished with sandstone, water-of-Ayr stone, and water. In this chemically clean condition the surface of the stone is extremely sensitive to grease. The design or image is then imposed by the artist using brush, pen, and lithographic writing ink on polished stone, or by using lithographic crayon or chalk on grained stone. It is impossible to draw a continuous tone-picture on smooth stone owing to the fact that all grease applied ultimately attains the same density when rolled up with printing ink. It is therefore necessary to obtain tone values by line shading (cross hatching, etc.). Softer and more gradual tone values may be obtained by first grading or roughening the surface of the stone with fine sand. This permits the artist to apply his crayon or chalk much as he would apply pencil to cartridge paper, the drawing in effect being divided into particles of varying size, large in the shadows and small in the light. Interesting effects were obtained by some early artists by the use of needles and pickers. Once the image has been applied to the surface of the stone it is necessary to desensitise the non-image areas to simplify printing. This is done by the application of dilute nitric acid and gum arabic solution. This has the effect of lessening

the possibility of the ink on the roller adhering to the non-image areas, also the gum settles in the pores of the stone and being hygroscopic attracts moisture to itself and keeps the surface more uniformly moist for a longer period. After the stone has been treated it is moistened with water and while in this damp state an inking roller is rolled back and forth across it, the moisture is repelled by the greasy image to which ink from the roller adheres. Rolling must stop before the moisture dries out from the non-image areas or these will also take ink. It will be readily observed that in this way the image may be charged with ink. A sheet of paper is then laid on the surface of the stone, and this is covered with a few sheets of waste paper and a sheet of metal, usually zinc or brass (the tympan). The stone is then passed through a press under considerable pressure and the ink on the image is transferred to the paper. Innumerable impressions may be taken in this way. This method of printing is known as direct printing, the impression being taken by forcing the paper into direct contact with the printing surface. One great disadvantage of the method is that all matter has to be drawn in reverse. Because of this complication specially coated papers known as transfer papers were devised. These consist of a good paper coated with a mixture of plaster of paris, flour and starch with sometimes some gelatine. When dry this coating can be hot rolled to give a glazed surface or rolled between grained plates of any desired grain. Much work was and is done by drawing the design in the greasy ink or crayons on paper right way round and then transferring it to the stone. In the same way, when multiple reproduction of the work is required, labels, etc., impressions may be pulled on transfer paper from the original drawing using an extra greasy ink on the roller. These transfers are patched or stuck on a sheet in any required number, transferred back to a large stone and impressions taken from the multiple. This commercialization of L. led to a demand for greater speed of production. Various improved hand-presses were produced and in 1872 a machine was built by Sigsbee with a reciprocating bed and a cylinder. This was known as a direct flat-bed machine and was driven by steam power; the speed increased to about 800 impressions per hour. It is to be noted that in direct lithographic printing a good smooth paper is essential for results of high quality.

Multicolour L. was common about this time and much time and skilled work was necessary to obtain the desired facsimile reproductions, as many as twenty to thirty colours being employed. The method adopted is simple: the artist prepares an outline drawing of his subject showing all the details in the colour scheme. This outline is transferred to stone and impressions are pulled, one for each colour. These are dusted with an aniline powder and retransferred each to separate stones. The artist then draws each colour separately, and the

stones are then prepared for printing. The yellow is usually printed first, then the other colours are superimposed in perfect register one after the other until the job is complete. In the early days of L. fine work was sometimes engraved or etched on stone in much the same way as on copper plate (see below).

About 1860 when rotary letterpress printing was being developed attempts were made to build rotary lithographic machines incorporating stone cylinders. These proved costly and useless, and although paper plates coated with stone were tried later, they met with very limited success. Somefelter had proved that sheet zinc could be used, but the chemical control of work on the metal proved a great barrier. Finally in the early years of the present century a direct rotary machine utilizing aluminium plates was built by the Aluminium Company of New York. The method was successful and similar machines are in use to this day. Further experiments with plates of zinc proved its value as a printing surface and owing to its lower cost this metal practically ousted aluminium. Both zinc and aluminium, however, are non-porous and in order to make the metal retentive of water and grease, it was found necessary to create an artificial porosity on its surface; this was done by graining the metal in much the same way as stone. Modern graining is done by fixing the plate in an oscillating tray and graining with carborundum or a similar abrasive under a layer of glass marbles. Sand blasting is also used in some continental countries. In direct printing, however, this grain tended to break up the sharpness of the design, and although speed increased to some 1800 impressions per hour the quality of the impressions deteriorated. On nearly all lithographic machines moisture is applied by means of rollers covered with flannel and imitation moleskin. Zinc and aluminium plates also give trouble owing to the ease with which both metals oxidise in damp conditions. This necessitates considerable care in use.

The indifferent quality of work printed on direct rotary machines prompted investigation of better methods, and it was discovered that a process known as offset printing (which had been in use for some twenty to thirty years in the tin printing trade) could be applied to paper. About 1875 R. Barclay invented a machine for printing by offset on tin. Instead of forcing the tin against the stone a cylinder clothed with a rubber blanket was rolled over it. The tin was then pressed lightly against the rubber blanket by another cylinder and the impression was passed or offset from one to the other. This not only gave a vastly improved impression but removed the necessity for heavy pressure and thus permitted higher speeds. This machine was ultimately adapted for paper printing and it was found that owing to the flexibility of the rubber blanket perfect impressions could be taken without effort on rough-surfaced paper because the

rubber reached down into the grain quite easily. This gave new life to the fine art side of L. and to-day cartridge paper is one of the favourite papers of the offset printer. From 1900 to 1905 Ira Rubel, an Amer., developed the rotary offset process and brought it to this country. Eng. machine designers adopted it and George Mann designed a machine based on the existing direct rotary carrying a rubber blanket on what had been the impression cylinder and an additional cylinder for the impression. This was known as the Mann Standard offset machine, and models are still in use to-day. One of the advantages of offset was that now the artist could draw his work the right way round. Much trouble was experienced with indifferent types of rubber blanket in the early days, but now these blankets have reached a very high standard of perfection. Some idea of the versatility of offset may be gathered from the fact that perfect impressions may be printed on surfaces ranging from glass to canvas. With the advent of offset machines construction became lighter; this permitted much speeds and it became necessary to fit automatic feeders. Multicolour machines were designed and to-day sheet-fed machines in common use print two, three, and four colours simultaneously and speeds of 6000-8000 impressions per hour on single colour machines are commonplace. The development of the offset machine led to the design of web- or reel-fed machines doing similar work to the newspaper rotaries. The latest developments tend to even greater speeds and already an Amer. machine prints four colours back and front of the sheet at the rate of 20,000 impressions per hour.

With the development of offset came the development of photo-L. This is simply a method of imposing an image on the printing surface by photographic means instead of by transferring or drawing in greasy inks. Experiment in this sphere started at much the same time as plate printing, but development was slow and not until about the time of the First World War did it become widely used. Now it is gradually superseding transferring in commercial L. It involves slightly different principles from ordinary L. Whereas the latter is definitely grease-repelling water photo-litho image is one which repels water or is water-resistant. In repelling water it dries and will accept ink of a much less greasy nature from the roller. This makes it useful from the printer's point of view because greasy inks tend to scum and tint in printing. In order to protect the photo-litho image it is reinforced with greasy substances which serve to increase water repulsion and reduce wear in printing. The process is divided into two groups in much the same way as stone work, i.e. line work and tone work. In line work an ordinary negative is prepared in dry plate, wet plate, or film by normal photography. Tone work, however, covers similar subjects as would normally be done on grained stone and it is necessary to break up the image into

tiny particles for the same reason. This is done by placing a crossline screen in front of the plate in the camera which divides the subject into tiny dots and produces a result similar to the illustrations normally seen in newspapers (see *Process Work*). An almost unlimited range of tonal values may be obtained in this way. When making a printing-plate by photo-litho the plate is coated evenly with a light-sensitive collod, usually a mixture of egg albumen and ammonium dichromate, and dried. The negative is laid in position on the plate in a vacuum frame, unwanted areas are screened off, and the plate is exposed to the light of arc-lamps. The light passes through the transparent areas of the negative, reacts on the coating and causes it to harden. After suitable exposure the plate is developed out and the unhardened areas washed clean with water. The hardened albumen gives a very durable image and photo-litho plates generally stand longer machine runs than do transferred plates. The need for still more hardwearing plates led to the development of the deep etch process. Plates made by 'deep etch' are produced from a positive. The plate is coated with a slightly different coating, usually gum arabic or fish glue, and ammonium dichromate, and exposed to light under a positive. It is developed out and the non-image areas in the form of a negative on the plate are protected with an acid 'resist,' the plate being then etched with a corrosive solution which eats slightly into the plate. This slight intaglio is then inked in and finally the original fish glue coating is removed. This provides a sharp image, almost indestructible.

This search for better plates led to the invention of 'bi-metal' plates. This new development once again changed the principles of L. to some extent, involving the use of a metal which will accept ink or grease and another metal which will repel grease with the aid of very little water. Between 1933 and 1941 some twelve or more patents were taken out for sev. methods using various metals. The more popular, however, involve the use of chromium or stainless steel (grease-resistant) and copper (grease-attracting), some processes using two layers and some three. Two popular in England are the Aller process and Coates Bros. process. In the original Aller process the image areas are photographed on to a copper-plated stainless steel plate in a similar manner to that employed for deep etch. The actual image is then toughened and protected electrolytically. The ink-gate stencil is then removed, and finally the non-image areas are cleared of copper in an acid bath, leaving the copper image in very slight relief. In the Coates process a chromium-plated copper plate is coated and exposed to light as for deep etch, the chromium in the image areas is then etched away exposing copper and giving a slightly intaglio image. The principal advantages of bi-metal plates are the elimination of plate grain with corresponding improvement in sharpness of

detail and an almost indestructible printing plate which can be printed from at the highest possible speed. Ruins of sev. millions have failed to injure the image. Auto-L. brings the artist back into the place he originally occupied when he drew his work on stone; some artists still work on this medium, but most are working on zinc and aluminium plates. This revival of the fine art side of L. brings the work of famous artists into commercial L. and many beautiful posters have been done in this way recently. The latest method of working incorporates the use of various translucent plastics; these are grained and worked upon like plates or stones, they are then printed down by the photo-litho process onto machine plates for printing. Lithographic drawing ink is made from tallow, bees-wax, soap, shellac and lamp black, the soap permitting it to become water-soluble. Lithographic crayon is a similar mixture, the soap being reduced and the lamp black and shellac increased to permit handling without discomfort. Various grades of crayon are obtained by varying the amounts of the ingredients. Engraving on stone is now almost obsolete. The freshly polished stone is lightly coated with gum arabic, dried and rubbed in with lamp black. The image is then scratched into the surface and rubbed in with linseed oil. Impressions are taken by charging the line with ink, removing the surplus and pulling on an ordinary hand press. See A. Senefelder, *Complete Course of Lithography*, 1819; C. Harrap, *Text Book of Lithography*, 1909, and *Offset Printing from Stone and Plates*, 1927; Edgell and J. Pennell, *Lithography and Lithographers*, 1910; H. J. Rhodes, *The Art of Lithography*, 1921; B. Brown, *Lithography for Artists*, 1929; D. Cumming, *Handbook of Lithography*, 1932; A. S. Hatrick, *Lithography as a Fine Art*, 1932; N. Montagne, *Lithography*, 1933; R. Miksed, *Encyclopedia of Lithography*, 1938; G. Arnold, *Creative Lithography and How to do it*, 1941; J. S. Mertle and H. Kersch, *Photolithography and Offset Printing*, 1942; F. L. Griggs, *The Technique of Colour Printing by Lithography*, 1945; H. Whetton, 'Practical Printing and Binding', chapters XIV, xvi., *Lithography*, by A. Kirk, 1946. See also articles in the various trade journals.

Lithology, see **PETROLOGY**.

Lithophagidae (Lk., *Arctos*, stone; *phag*, to eat), family name formerly applied to some bivalve molluscs, but its component species are now divided among other families and the term is no longer used. The significance of the name is that the animals burrow in rocks and other hard objects.

Lithopone, pigment made of a mixture of barium sulphate (BaSO_4) and zinc sulphide (ZnS). It is useful as a substitute for white lead.

Lithosphere, see **under EARTH**.

Lithotomy (*lithos*, stone; *tomé*, cutting), cutting operation for removal of stone from the bladder. It is an operation of great antiquity, and in Great Britain is associated particularly with the name of

the famous surgeon lithotomist, Wm. Cheselden (1688-1752). Formerly the incision was made from the perineum, but this method is now superseded by the supra-pubic operation. The patient is placed upon his back and a hot boracic lotion is injected into the bladder, so that it rises above the region of the pubes, and the lotion is retained by plugging the end of the catheter. The incision is then made in the abdomen low enough to avoid the peritoneum, and the bladder wall opened. As the contained lotion rushes out the bladder wall is temporarily sutured to the surrounding muscular fibres, so that the opening is kept above the pelvis when the lotion is discharged. An examination of the size and position of the calculus is made with the fingers, and the removal is effected with forceps. The operation is now in many cases superseded by lithotripsy (*q.v.*), except in young boys, where the danger from L. is comparatively small, and where the urethra is too small to permit the passage of a lithotrite.

Lithotripsy (*lithos*, stone, *tribos*, I crush), operation for the removal of stones from the bladder by crushing. The method is now often called *litholapaxy*, to distinguish it from the older method, which was performed in two or more sittings. The modern operation is performed by means of a special instrument called a lithotrite, consisting of two blades which may be brought together by means of a screw. This is introduced into the bladder by way of the urethra, the stones are grasped one by one and crushed between the blades, care being taken not to rip the wall of the bladder. The crushed material is then withdrawn from the bladder by means of an 'aspirator,' a rubber ball filled with boracic lotion which discharges lotion into the bladder on being squeezed and withdraws it on being relaxed. A special trap is provided to catch the crushed stones as they are withdrawn.

Lithuania, constituent republic of the U.S.S.R., cap. Vilna (298,000), bounded by the Latvian S.S.R. on the N., Poland E. and S., and the former E. Prussia and the Baltic on the W. Its area is about 20,000 sq. m. L. became an independent duchy early in the thirteenth century, but was finally united to Poland in 1569. Gediminas was the earliest of L.'s notable rulers; he first made Vilna the cap. At the time of its greatest power, after its ruler Jagiello became king of Poland and Vytyld the Great (1392-1413), Gediminas's grandson, succeeded him, L. extended to the E. almost as far as Moscow and southward to the Black Sea. The Lithuanians were pagans up till 1397. After the union with Poland Rom. Catholicism was the prevalent form of religion, though in the former Memel Ter. Protestants largely predominated. From the date of its union with Poland the hist. of the two is the same (see **POLAND**). At the fall of the kingdom of Poland Russia took the provs. of Moghilev, Polotsk, Vilna, Troki, Novogrod-Syeversk, Brest, and Vitelsk, and constituted them 'the Lithuanian Gov.'; the

name of Lithuania in prov. was, however, generally used only for Vilna and Kovno which were described as such even in official documents in spite of the tsar's prohibition of the name in 1810. During the First World War L. was occupied by the Gers., but stoutly resisted Germanisation. Her right to self-determination was admitted by Russia at the treaty of Brest Litovsk (q.v.) 1918 and so on afterwards she proclaimed her independence which was recognised by Russia in the treaty of Peace 1920. The great powers recorded the new state recognition in 1922. The Memel L. was granted to L. in 1923 thus greatly extending her coastline and giving her a good port Klaipėda (Memel).

taken from Poland. In June 1940 the whole country was occupied by Soviet troops and the following month became a part of the U.S.S.R. During the German invasion of R. in 1941 the country was occupied by Nazi troops. It was reconquered by the Lithuanians in 1944 and was again incorporated as a republic of the U.S.S.R.

L. is flat all looking rising occasionally to low wooded hills. There is marsh land in some districts and owing to much glacial action the country contains over 2000 little lakes. The chief river is the Niemen (Memel) which is navigable below Kaunas for much of the year, above that it is only available for

LITHUANIA: KAUNAS AND THE RIVER NIEMEN

On the left is Trinity Church between the two bridges, and that the oval hall. The building on the right is the city hall.

Other important towns are Kaunas (Kovno) (152,400) the seat of the univ. founded in 1922, Siauliai (Shavili) (11,000) and Panevezys (Ponewicz) (26,500). In 1933 the German pop. of Memel spurred on by the Nazi Gov. in Germany intensified their agitation for separating Memel from L. and attaching it to the Reich, despite Hitler's declaration that he had no further territorial claims in Europe. Von Ribbentrop (q.v.) bluntly told the gov. of L. that if they wished to remain on good terms with Germany it would be advisable for them to surrender Memel. L. had no alternative and so gave up Memel in consideration of the usual meaningless pact of non-aggression and the empty promise of a free harbour in the port of Memel (March 1939). In Oct. L. shared the fate of the other two Baltic states, being brought under the virtual control of Russia and compelled to receive Russian garrisons at selected points, but, in exchange, L. obtained the long-coveted city of Vilna (Vilnius) which the Russians had

planning timber. The harbour at Klaipėda is blocked by ice for about a fortnight each winter. There are about 1000 m. of railway in L. and some 25,000 m. of roads. The winter in L. is long and severe, the summer short and very hot. Timber is the chief product but agriculture is important, rice, wheat, barley, oats, potatoes, peas, and flax being grown. Dairy and poultry farming have been developed. The fisheries are profitable. Since 1940 there has been much industrialisation in L.

The Lithuanians, a people of Aryan stock closely related to the neighbouring Latvians, arrived in Europe 2000-1000 B.C. The language is far the most archaic of spoken Aryan languages, and approaches Sanskrit more closely than any other European tongue. Between 1561 and 1905 its use was prohibited by Russia. Literature of the old L. lives only in songs, poems and legends, the earliest writer of note was a poet, Christian Donalčius (1714-80). Bishop A. Baranauškas, Baronas and Maltonis were poets.

of the latter part of the nineteenth century, when, owing to the Russian embargo on printing in L., the national literature was kept alive abroad, mostly in Poland and the U.S.A. It was during the First World War that W. Idens began to affect Lithuanian literature. There was a flood of trans. of foreign literature, and many eminent writers spent years in European countries, among them being Putinas and Binkis. Of modern writers the best are Jurgis Baltrušaitis (1873-1911), novelist; W. Vidūnas, scholar, poet, and dramatist; J. Tumas-Vaižgantas, essayist and novelist. The leading lyric poet of the nation in the twenties was still Maironis, and among his successors are Juozas Tysklevičius (b. 1906), Baltrušaitis, and Salomeja Neris (1905-45). L.'s greatest artist was M. K. Ciurlionis (1875-1911); A. Varnas is a great name in present-day Lithuanian art. L. has always been renowned for music, especially songs and dances. Area 31,600 sq. m. Pop. 2,879,100. See E. J. Harrison, *Lithuania*, 1925; E. C. Davies, *A History of Estonia, Latvia, and Lithuania*, 1937; B. Newman, *Baltic Background*, 1939; and F. W. Pick, *The Baltic Nations*, 1945.

Litmus, colouring matter, manufactured in Holland from the lichen *Lecanora tartarea*, and in S. Africa and Chile from *Rocella tinctoria*. It is prepared by fermenting the matter obtained from the lichen with potassium carbonate. It is sold in small blue tablets, which contain a good deal of calcium carbonate and sulphate as well as the pigment itself. It is largely used by chemists in testing, being turned blue by alkalis and red by acids. L. paper is made by impregnating an absorbent paper with L. solution. See INDICATOR.

Litoměřice, Ger. tn. and episcopal see on the r.b. of the Uhl. in Bohemia, Czechoslovakia, 36 m. N.W. of Prague. There are iron foundries, and malting, brick-making, and printing are carried on. The country round L. is called the Bohemian Paradise. Pop. 18,500.

Litre, or **Liter** (fr. *litre*, from Gk. *kyra*), measure of capacity in the metric system of France, being a cubic decimetre and equal to 61.022 cub. in. or 1.76 Eng. pints. It is used both as a dry and liquid measure.

Little Auk, see ROUGH.

Little Bear, The, see URSA MINOR.

Littleborough, tn. in Lancashire, England, 5 m. N.E. of Rochdale. It has manufs. of woollen and cotton goods, chiefly calico, and artificial silk, and there are collieries, iron mines, and stone quarries in the vicinity. Pop. 11,500.

Little Brethren, see FRATERNITY.

Little Egypt, country from which the wandering tribes of the gypsies asserted that they had been driven by the Turks when they first appeared in Europe in the fourteenth century. According to the historian Albert Krantz, these first appeared in Germany in 1417 an uncouth, dark-skinned, barbarous people, called by the Ita. 'Ciani', who alleged that they came from 'Little Egypt' and were on their way to Rome on a pilgrimage of

expiation for some sin of which the accounts differ. By 1500 they had reached England, for in 1505 James IV. of Scotland gave to 'Antonius Gargina, Count of Little Egypt,' letters of recommendation to the king of Denmark. Where they originally came from is still uncertain. Grellmann (1733) asserts that their speech is closely allied to some Indian tongue, and that they came from India, and various writers have upheld the theory that they are genuine descendants of the ant. Egyptians driven out of Egypt by the Saracens. The most generally accepted site of 'Little Egypt' however, is in the Peloponnesus, probably in Epirus. Mazaris, a Byzantine author, writing about 1116, mentions the 'Egyptians' as living in the Peloponnesus, and their own earliest story, that they had been driven out of 'Little Egypt' by the Turks, is supported by the adoption of the Turkish emperor, Achmet IV., in 1652 of the title 'King of Greater and Lesser Egypt' See also under GYPSIES.

Little Entente in Central Europe was the outcome of an alliance formed between the kingdom of the Serbs, Croats, and Slovenes (Yugoslavia), the Czechoslovak republic, and the kingdom of Rumania. The prime mover in the negotiations was the Czechoslovak foreign minister, Eduard Benes (q.v.), who concluded treaties with Yugoslavia and Rumania in Aug. 1920. These treaties were renewed and enlarged in 1922 and 1923. The prin. object of the L. E. was to prevent the restoration of the Hapsburgs to the throne of Hungary, and in this the alliance was effectual, since the three states were pledged to mutual military support in the event of Hungarian aggression against any one of them. As the political situation in S.E. Europe became less acute the members of the L. E. entered upon important relations with France and Italy, with a view to widening their relationships, though without imposing military obligations, rather than place themselves under obligations to any one great power. But the L. E. could not survive the aggression of the Nazi gov. of Germany. Czechoslovakia (q.v.) lost its independence to Germany (1938-1939). Yugoslavia was overrun and conquered (apart from protracted and eventually successful guerilla resistance) by Ger. and It. armies in 1941. Rumania fell under Ger. domination in the course of the Second World War and supplied armed forces to assist Germany against Russia. Even Slovak troops were incorporated in the Nazi armies. Thus the L. E. became an alliance of merely historical interest.

Little Falls: 1. City and co. seat of Morrison co., Minnesota, U.S.A., on both banks of the Mississippi, 88 m. N.W. of Minneapolis. Granite is quarried in the dist., and wheat and cattle farmed. L. F. has flour, pulp and paper mills, creameries, and hydro-electric power plant. Pop. 6000. 2. City of Herkimer co., New York, U.S.A., on the Mohawk R. 21 m. N.E. of Utica. Manufs. include bicycles, cotton, yarns, hosiery and knitted goods, paper, and leather. Dairying is carried

on in the dist. and milking machines are manufactured. Pop. 10,100.

Little Fenton, see *under* FENTON.

Little Fish Bay, see *under* MOSAMEDES.

Littlehampton, par., seaport, and watering-place, Sussex, England, at the mouth of the Arun R., 10 m. E.S.E. of Chichester. It has a safe harbour and is the trading port of Arundel. Its fine beach and golf links make it a favourite health resort. Pop. 14,900.

Little Hulton, see *under* HULTON.

Little Java (Malay Archipelago), see *under* BALL.

Little John, see *under* ROBIN HOOD.

Little Lever, see *under* LEVER.

Little Missouri, trib. of the Missouri R., U.S.A., rises in Crook co. in the N.E. of Wyoming, and flowing in a N. and N.E. direction through S.E. Montana, N.W. of S. Dakota, and N.E. of N. Dakota, to join the Missouri. Length 150 m.

Little Popo, dist. and tn. of Togoland, Fr. W. Africa. Chief tn., Anecho.

Little Rhody State, see *under* RHODE ISLAND.

Little Rock, city and cap. of Arkansas, U.S.A., and co. seat of Pulaski co., on the Arkansas R., 131 m. W.S.W. of Memphis, Tennessee. It is an important railway centre, and the most populous and important commercial and manufacturing city of the state. The chief industries are cotton and lumber works, cotton-seed oil and cake, foundries and machine shops. Natural gas is utilised. Pop. 88,000.

Little Russia, name formerly given to an area in S.W. Russia, now part of the Ukraine (q.v.). The Little Russian and Ukrainian language is a variant of Russian into Polish influences, and resembles the Ruthenian spoken in Poland and Czechoslovakia. See *under* RUTHENIA.

Little's Disease, see *under* BIRTH Palsy.

Little Solsbury Hill, between Swainswick and Bathaston, 2½ m. N.E. of Bath, 22½ ac. of flat hill-top (625 ft.) with the remains of an Early Iron Age camp. There are extensive views over the Avon valley, the city of Bath, and four cos. Presented in 1930 by Mrs. Hick through the Somerset Rural Community Council.

Littlestone-on-Sea (Kent), see *under* ROMNEY, New.

Littleton, Sir Thomas (c. 1107-81), Eng. judge and legal author. He became a judge on the N. circuit in 1155 and judge of the court of common pleas in 1166. His *Treatise on Tenures* was probably written after his last appointment, but was not pub. until after his death. It was addressed to his second son and was written in 'law Fr.' Its first ed. (probably 1481) was one of the earliest printed books, and it has since been repeatedly ed. and annotated, notably by Sir Edward Coke. See also *Paston Letters* (ed. by J. Gairdner, 1896), and W. S. Holdsworth, *Some Makers of English Law*, 1938.

Littre, Maximilien Paul Emile (1801-81), Fr. lexicographer and philosopher, b. in Paris. He fought on the barricades in the revolution of 1830. In 1835-36 he became a regular contributor to both the *National* and *Revue des deux mondes*. In 1839 appeared the first vol. of his trans. of Hippocrates, completed in 1862. At

this time he made the acquaintance of Comte, and adopted the positivist philosophy of his friend, popularising it in *Application de la philosophie positive au gouvernement* (1849); *Conservation, réputation, et positivisme* (1852); *Paroles de philosophie positive* (1859); and *Auguste Comte et la philosophie positive* (1863). His trans. include Pliny's *Natural History* (1848-50) and Strauss's *Vie de Jésus* (1839-40). He was also on the committee for the preparation of *Histoire littéraire de la France*. His great *Dictionnaire de la langue française* appeared in 1863-72, and *Histoire de la langue française* in 1862. In 1871 he was elected a member of the Académie Française. See G. Sainte-Beuve, *Notice sur Littre, sa vie, et ses travaux*, 1863; A. Poëy, *Littre et Auguste Comte*, 1879; and E. Caro, *Littre et le positivisme*, 1883.

Liturgy (Gk. λειτουργία), in its classical significance, denoted a service rendered by the individual to the state. In the N.T. we find it generally trans. by 'ministry,' as, for example, in Rom. xv. 16, where the word trans. 'minister' is λειτουργία. The word λειτουργία was early appropriated by Christians to designate the worship of the Church, and is now often used in a sense restricted to the Holy Eucharist, for which it is the usual name among the E. Orthodox churches, though in the W. it has fallen entirely out of popular usage. Here the holy sacrifice is commonly termed the Mass, though the anct. title is frequently used in liturgical treatises. It is possible that traces of a L. in the sense of a set form of eucharistic offering, is to be found in the books of the N.T. Many liturgical authorities have held it probable that some of the references to the celebration of the Lord's Supper in the Pauline writings are quotations from an early L. During the first centuries the sacred rites were celebrated with the greatest secrecy, and references to the manner of their celebration are therefore rare. An outline is given by Justin Martyr in his *Defence of Christianity* (Chaps. LXV., LXVI.), but a clearer idea of the form of the rite is given in the eighth book of the *Apostolic Constitutions* (q.v.). It bears a much closer affinity to the E. rites than to the later W. ones. Liturgists distinguish four great 'parent' Ls.: of Antioch, Alexandria, Rome, and Gaul, from which all later ones are derived. The first three were estab. in the great patriarchal cities and survive under many forms in E. and W. The Rom. L. are distinguished by the position of part of the great intercession being between the Sanctus and Consecration; also by the position of the Pax after the Consecration. Varieties of the Rom. use, differing but slightly from the modern Rom., are to be seen in the various local uses of the Middle Ages, such as the Eng. Sarum use (q.v.), on a trans. of which the present Anglican rite is founded. The Gallican rites were rather a family of different kindred Ls. in use in the W. than a single source. It is mainly represented to-day by the L. at Milan, and in another variety known as the Mozarabic in part, of

Toledo. Otherwise the Gallican Ls. have disappeared, though they considerably modified the original Rom. rite before doing so. The Gallican rite is of disputed origin. Duchesne attributes it to the Cappadocian bishop Auxentius of Milan (355-74); Schuster and others classify it as an extreme variation of the Rom. rite. Liturgical research has made great strides of recent years, and a large amount of literature is available on the subject. Numerous texts have been pub. by the Henry Bradshaw Society. See Martine, *De Antiquis Ritibus Ecclesiae*, 1700, 1736, and F. E. Brigham, *Liturgies Eastern and Western*, 1896; also Warren, *Liturgy of the Ante-Nicene Church*, 1897. L. Duchesne, *Origins du culte chrétien* (Eng. trans. of 3rd ed.), 1901; I. Schuster, *The Sacramentary*, trans. into Eng. 1924; *Dictionnaire d'architecture et de liturgie chrétienne*, a series of Christian Ls. pub. by Cope & Fenwick, 1908, etc.; P. Du-mont, *Eglises orientales unies et dissidentes*, 1933; A. Jungmann, *Verordene Liturgie*, 1941; J. Norman, *Handbook to the Christian Liturgy* (S.P.C.K.), 1944; and J. H. Crawley, *Early History of the Liturgy*, 1947.

Litvinov, Maxim (b. 1876). Russian statesman, b. at Bialystok of Jewish parentage (real name Finkelstein or Wallach). He joined the Communist party in Russia and worked for it in London, where he had a job first in the furniture trade and later as a journalist. He played a prominent part in the Russian revolutionary movement before the First World War. After the Russian Revolution he was made London representative of the Soviet, but later was forced to leave London, and he became Soviet representative in Stockholm. He was made commissar for foreign affairs in 1930 and frequently represented the U.S.S.R. at international conferences and, after 1934, at the League of Nations, where he led the movement for disarmament. L. played a decisive part in concluding the Franco-Soviet Pact of 1935. In May 1939, when Stalin and Hitler were negotiating their non-aggression pact, L. resigned on account of his known sympathies and collaboration with the democracies and was succeeded by Molotov. In Nov. 1941, some five months after the beginning of the Ger. invasion of Russia, he was appointed Soviet ambas. to the U.S.A. In 1943 he was replaced in Washington by A. Gromyko, and, until dismissed in 1946, was deputy commissar for foreign affairs.

Liu-Choun-Koon, see POET ARTHUR.

Liu-Kiu, see RYUKYU ISLANDS.

Liutprand, or **Liudprand** (c. 922-972), It. chronicler and bishop of Cremona. He became chancellor of King Berengar, and was sent on an embassy to Constantinople in 950. Falling into disgrace with Berengar he joined Otto I. of Germany, and accompanied him in his invasion of Italy. He was frequently employed in embassies, and his description of the one to Constantinople in 968, *Relatio de Legatione Constantinopolitana*, is one of the best satires of the tenth century. His *Antapodosis*, a hist. of the period from 887

to 949, was designed as a revenge upon Berengar. His *Historia Ottonis* (960-961) is of considerable historical value. All are to be found in *Monumenta Germaniae Historica*. See R. Kopke, *De Vita Liudprandi*, 1842; G. Baldeschi, *Liudprando*, 1889; and study by M. Lintzel, 1933.

Livadia, township on the S. coast in the Crimean Region of the R.S.F.S.R., 3 m. S.W. of Yalta. It had two palaces, and was a favourite resort of the Tsar Alexander II. It was the scene of the Yalta Conference (q.v.) in 1945.

Livinge, George Downing (1827-1918), Eng. chemist and spectroscopist, b. at Nayland, Suffolk. He was appointed lecturer on natural science at St. John's College, Cambridge, in 1853; prof. of chem. at the Royal Military College, Sandhurst, in 1860; and prof. of chem., Cambridge, from 1861 to 1908. Among his publs. are *Essays on the Transmutation of Matter* (1855); *Chemical Equilibrium* (1885); *Ultra-Violet Spectra of the Elements* (1855-1888), in conjunction with Sir James Dewar; and, with H. Warren, *Report on the University College* (1897), besides many papers on spectroscopy, crystallisation, etc.

Liver, largest gland in the body. It is situated on the right-hand side of the abdominal cavity, immediately under the diaphragm, and in front of and to the right of the stomach. Its anterior surface is convex, and lies close to the wall of the abdomen. Its posterior surface is lightly concave and accommodates itself to the shape of the organs with which it is in contact. On the right the upper and posterior surface is in contact with the diaphragm; below this is a deep depression fitting the surface of the right kidney, and the lower part fits round the intestinal portion of the stomach. The vena cava passes through a deep groove in the posterior median part of the L., and on the left, in the middle line of the body, a depression marks the passage of the oesophagus. The greatest thickness is on the right side, and from there the L. tapers down in front and below to a sharp edge. The colour of the L. is reddish brown, and its weight is in the neighbourhood of 3 or 4 lb. The L. consists of five lobes: the right, the left, the spigelian lobe, the quadrate lobe, and the caudate lobe. The lobes are made up of a large number of lobules, conical in form. Each lobule is covered with connective tissue and contains hepatic cells, capillaries, arteries, veins, lymphatics, and biliary channels. The blood is brought from the digestive tract, and the spleen to the L. by the portal vein, from which intralobular veins branch out to lead around the lobules, while the cells are fed by intralobular capillaries from the intralobular veins. The intralobular capillaries are received by a central vein in the core of the lobule, which leads to a sublobular vein, and ultimately into the vena cava. The L. secretes bile, which is conveyed either directly or by way of the gall-bladder to the common bile duct which leads to the second part of the duodenum.

The functions of the L., once thought

to be simple, are now known to be very complex. Much of its work consists in the secretion of bile. This is a golden-brown liquid secreted by the hepatic cells, and is probably mostly of the nature of an excretion, its functions in the digestive processes having been formerly overestimated. It contains two pigments, bilirubin and biliverdin, which are produced by the decomposition of hæmoglobin. It also contains organic salts, the chief of which are sodium taurocholate and sodium glycocholate, as well as mucus, cholesterol, lecithin, and fats. Some of these substances are reabsorbed in the intestines and aid in the absorption of other food material. They probably also

the L. aids in the supply of hæmoglobin. The excretion of effete and broken-down red corpuscles is undoubtedly one of the functions of the L. Whether the destruction of the corpuscles takes place in the L. is not known, but the waste products go to form the pigments of the biliary secretion, and are thus excreted. Still another function of the L. is the disposal of waste or excessive proteid matter. The proteins are broken up in the stomach into peptones; these are converted into amino-acids by the pancreatic juice, and are carried off by the blood stream to build up the tissues. Many of the amino-acids are, however, of little or no nutritive value, and these are con-

LIVER

Left, from the front A, bare area; B, falciform ligament; C, umbilical vein; D, round ligament.
Right, inferior surface 1, left lobe; 2, portal vein; 3, Spigelian lobe; 4, hepatic artery; 5, vena cava inferior; 6, peritoneal surface; 7, right lobe; 8, gastric surface; 9, round ligament; 10, quadrate lobe; 11, gall bladder; 12, impression for colon; 13, renal impression.

serve as a natural antiseptic for the intestines. Another important function of the L. is the production and storage of glycogen, or animal starch. Carbohydrates are converted by digestive action in the intestines into the sugar glucose, which is finally used up, particularly in muscular tissues, for the production of muscular energy. The muscles are capable of storing up a certain amount of glucose, but this is not sufficient to keep the body active for any length of time. The L. however, acts as a storehouse for sugar. As digestion proceeds the glucose is taken up by the L., converted into glycogen and reconverted into glucose gradually, according to the needs of the system. A disturbance of this function of the L. is, therefore, bound to be accompanied by a lack of enduring power in the muscles. Another function of the L. is the regulation of the number of red corpuscles in the blood. The production of hæmoglobin, the red colouring matter of the blood, is ordinarily a function of bone-marrow, but in the fetal stage there is little doubt that

verted by the L. into urea, which is then carried to the kidneys, and finally excreted in the urine.

With its multiplicity of function the L. is especially liable to derangement, either temporary or more permanent. Sheer overwork of the L. is undoubtedly the cause of many bodily ailments, and the obvious cure is a period of rest. The beneficial effects of a spare and plain diet are due, to a great extent, to a relaxation of the strain upon the L. The accumulated poisons may then be quickly eliminated from the body, and healthy conditions are likely to continue until self-indulgence again presents the L. with more work than it can efficiently perform. Prolonged irritation of the L. leads to an increased supply of blood and the development of new fibrous tissue within the organ. This leads to a condition known as cirrhosis of the L. The organ is at first enlarged, but afterwards becomes hardened and reduced in size. Cirrhosis is often the result of spirit drinking, and although it may not be accompanied by

painful symptoms, subsequent degeneration of its structure is likely. The blood is not able to pass through quickly enough, and in consequence serum may be exuded from the portal vein into the peritoneal cavity, forming what is known as ascites, or dropsy of the abdomen. Hepatitis, or inflammation of the L., is often the result of infection from some other diseased organ. The symptoms are pain and jaundice. Treatment involves rest, aperients, and fomentations to relieve pain. Jaundice is a symptom consisting of discoloration of the skin and excretions due to the presence of bile-pigments in the L.; it is a natural consequence of a derangement of the biliary functions of the L. Yellow atrophy of the L. is a rare disease characterised by intense jaundice and severe nervous symptoms. The L. is invariably much reduced in size; no treatment is of any avail. Gall-stones are concretions formed in the gall-bladder or bile-ducts. They give rise to painful symptoms, and may cause an obstruction in the bile-duct, with the possibility of ulceration and perforation of the duct. The stones should be removed by operation.

Liver Fluke, Liver Rot, Distomiasis, Fascioliasis, or Dropsy of the Liver, parasitic disease most common in sheep, but occurring also in goats, cattle, dogs, horses, and even man. The fluke (*Distomum hepaticum*) belongs to the order Trematoda, or flat suctorial worms. The disease is commonest after a wet summer on badly drained ground, as there must be standing water during the warmer weather for the eggs of the fluke to hatch in. The prin. intermediate host is *Limnaea truncatula*, a small water-snail; hares, rabbits, and deer are also carriers and hosts of fluke. Draining the land thoroughly both improves the herbage and prevents the fluke completing its several stages. Dressings of salt or lime destroy the embryos and the cysts when attached to the grass and also the snails. Liver rot does not occur on salt marshes. Salt may also be given in the animal's food. Symptoms of the disease are a yellowish tinge in the eye, diarrhoea, thirst, and great weakness, while the animals become 'pot-bellied,' or dropical. A dose of 15 grains of ethereal extract of male shield fern for each 11 lb. of the animal's weight is a remedy for this disease, but affected animals should be fattened on healthy pasture, and slaughtered as soon as possible.

Liver of Sulphur is formed by fusing sulphur with potassium carbonate, the substance being dark brown and unstable. Acids readily decompose it, liberating sulphuretted hydrogen; this occurs when exposed to air, owing to the action of carbonic acid. This has led to its being used internally as a medicine, though it is chiefly used externally in ointment for skin affections. Chemically it consists mainly of sulphides of potassium.

Liverpool, Charles Jenkinson, first Earl of (1729-1809), Eng. statesman, b. at Winchester. He became M.P. for Cockermouth (1761), and under-secretary of state, and led the 'king's friends' party

after Batos's retirement; he filled numerous high offices of state in the Grenville, Grafton, North, and Pitt ministries. He was created Baron Hawkesbury (1786) and earl of L. (1796). Of his numerous writings his *Treatise on the Coins of the Realm* (1805, reprinted 1880) is of value. See Ninetta Jucker (ed.), *The Jenkinson Papers*, 1760-66, 1949.

Liverpool, Earl of, see JENKINSON. ROBERT BANKS.

Liverpool, municipal city, parli. bor., and seaport, in the co. palatine of Lancashire, England. It lies on the slope of the r. b. of the Mersey, the open sea being some 3 m. from the centre of the city. The original bor., which was devastated by the plague in the sixteenth and seventeenth centuries, has long since disappeared, and the present city, with its fine streets and buildings, is as healthy as good natural drainage and sanitary reforms can make it. L. is to-day one of the largest trading centres in the world. Originally its dealings were mainly with Ireland, but the opening up of trade with the W. Indies and N. America, coupled with the development of the cotton industry in Lancashire, gave an impetus to its trade, which has continued to increase steadily since the time of the Restoration. One of L.'s prin. trades is with N. and S. America, to which lines of steamers run, besides those to the Canadian ports. In recent years trade with Australia, New Zealand, and S. and W. Africa has developed considerably. The chief imports are grain, cotton, cattle, provisions, and tobacco, sugar, timber, and fruit. The manufactured goods of Lancashire and Yorkshire form the prin. exports, but wool and salt are also important exports. L. ranks second to Manchester as a flour-milling centre; it has also extensive engineering works, sugar-refineries, and cattle-food and seed-crushing mills. Printing on pottery was invented by a L. merchant, John Sadler, and all the early Wedgwood goods were printed at L. Lever watches were also invented in the city by a manufacturer named Litherland. The prin. feature of L. and the main source of her prosperity is, of course, the docks, and some idea of the increase in her trade may be gained by the following figures: In 1800 the tonnage of ships entering the port was 450,969; in 1910 it was 16,651,071, and during 1938 the tonnage of vessels that arrived and departed with cargoes and in ballast was respectively 17,628,000 and 17,818,000. The volume of traffic passing through the port annually during the Second World War was 11,500,000 tons, exclusive of coastwise traffic.

The docks are owned by the Mersey Docks and Harbour Board, and lie on both sides of the Mersey. The corporation started the enclosed docks system in 1709, Thomas Steers being the engineer, but in 1857 the Mersey Docks and Harbour Board took over the management. This board comprises twenty-eight members, twenty-four of whom are elected by the ratepayers on ships and goods. It was not until 1843 that the docks were extended to the Cheshire side of the riv. at

Birkenhead, and twelve years later before they came into the possession of L. L. now possesses eighty-seven docks and basins with accommodation for vessels of every size, there is a water area of about 660 ac. and a lineal quayage of 38 m. The Birkenhead docks have about 10 m. of quayage; they are principally concerned with trade to the Far East and with ship building and repairing. Besides the wet docks there are eighteen graving docks at L. which possesses also the largest floating landing stage in the world and the most powerful floating crane in the United Kingdom. Originally (1847) the landing stage was only 300 ft. long and there was

array of warehouses supplies accommodation for a variety of goods.

The city is rich in fine parks and public gardens, the largest being Sefton Park (269 ac.) which was opened in 1872, though Prince's Park was laid out in 1843. Many other parks have since been made. Waverley Park having botanic gardens.

Buildings—L. contains many fine buildings, though they are all more or less modern. Of these St. George's Hall (1854) is one of the finest. The town hall in Castle Street was designed by Wood of Bath in 1794 and is notable for the grace of its interior. The municipal offices, in the Italian style, were built in 1860,

ST. GEORGE'S HALL, LIVERPOOL

Liverpool Corporation

a space between it and the Prince's stage (1000 ft.) in 1871 it was rebuilt but destroyed by fire and the present stage was constructed in 1896. It is now half an mile in length. It rests on floating pontoons and ten bridges join it to the river wall in addition to an inclined roadway for vehicles. The North Prince's stage is used by Atlantic and other liners, the St. George's stage by the ferry boats which by a continuous service connect L. with the Cheshire bank of the Mersey. The introduction of the latest aids to navigation has made the port one of the first in the world to utilise radar on a full-scale basis for the purpose of assisting in the pilotage of ships in and out of the port. A new deep water entrance to the Waterloo dock has been constructed to enable coastal shipping to use it at any time of day or night, abolishing delays caused by tides. Extensive dredging operations have been carried on to enable the largest vessels to come up the river, and a great

and the exchange and revenue buildings should be mentioned. The cathedral was commenced in 1904, the foundation stone being laid by Edward VII. and the foundation stone of the chapter house two years later by the duke of Connaught. The designs are by Sir Giles Gilbert Scott, and when finished it will be the largest cathedral in the country (see further under LIVERPOOL CATHEDRAL). A Roman Catholic cathedral is being erected on Mt. Pleasant to the designs of Sir Edwin Lutyens. When completed this will be the largest church in the world after St. Peter's at Rome. The Dock Board offices, the Liver Buildings, and the Cunard Line headquarters are other notable buildings.

Communications, Lighting, and Water Supply—L. is possessed of three terminal passenger stations, the Midland Region (two) and W. Region lines serving the city while the Mersey railway tunnel (1886) connects it with the railways on the

Cheshire side of the riv. The Mersey traffic tunnel is the longest under-water highway in the world. It took eight years to construct, and was opened by George V. in 1934. The total cost was £7,250,000; in 1946 over 1,000,000 vehicles passed through the tunnel. There is also an overhead electric railway (the first of its kind) running along the docks from Seaforth to Dingle on the S., and to Litherland on the N. (total length 6½ m.), and an extensive system of electric tramways run by the corporation. There is a fine municipal airport at Speke, approximately 8 m. S. of the city centre. The city is lighted by electricity, and the water supply is excellent, being obtained from reservoirs at Rimington (Lancashire) and Llake Vyrnwy (N. Wales); the latter opened by the Prince of Wales (afterwards George V.) in 1910.

Municipality.—The city is divided into forty wards, it possesses a lord mayor (1893), thirty-nine aldermen, and 119 councillors, and returns nine members to Parliament. Since 1309, when Thomas, earl of Lancaster, made a grant, the corporation have owned a good deal of property bringing in a considerable income, and in olden times the fee farm rents and tithes, purchased from the Molyneux family in 1672, and later converted into a perpetuity, were an additional source of income; but in 1856 an Act of Parliament transferred these to the Mersey Docks and Harbour Board for the sum of £1,500,000. Quarter sessions are held eight times a year, and the court of passage sits five times a year; this latter dates back to the time of King John, and deals with cases relating to the imports and exports of the city. Since the end of the First World War L. has become widely known for the size and high standard of its municipal housing projects. By 1947 the corporation owned 43,000 houses and flats. A twenty-two-year plan has been approved which should provide a further 90,000 houses by 1967.

Churches, Libraries, Museums, Schools, etc.—L. originally belonged to the diocese of Chester, but in 1880 this was divided, and L. was made a separate see, Dr. J. C. Ryle being the first bishop, while the old par. church of St. Peter became the pro-cathedral. It is also a Roman Catholic archiepiscopal see. The city supports sev. charitable institutions, of which the oldest is the Blue Coat Hospital for Orphans, founded 1708. The free library, which contains a very fine collection of books, was built by Sir Wm. Brown in 1860; adjoining it is the Walker Art Gallery, built by Sir Andrew Walker in 1877, and enlarged by him in 1884. It contains a beautiful collection of paintings, including the Roscoe collection of some 180 early It. paintings made by Wm. Roscoe in the early part of the nineteenth century, and presented to the gallery in 1894. He also helped to found the Royal Institution (1817). An exhibition of modern art is held annually. The museums possess a fine collection of stuffed animals collected by the 13th earl of Derby, and presented by his son and

the Mayer collection of historical antiquities presented by Mr. Joseph Mayer, F.R.S.A. The univ. (q.v.) was formerly Univ. College and part of the Victoria Univ. of Manchester. The medical school originally belonged to the Royal Infirmary, and includes a school of tropical medicine; there is also a veterinary school. L. possesses a fine collection of vols. in the Tate Library, and also interesting museums. Following on the old church schools and an anc. grammar school, the first elementary schools were estab. in L. in 1826, board schools appearing in 1870. Other schools founded by the city were the L. Institute (1825), comprising a high school and commercial school, and the L. College (1840). The former became a public secondary school in 1905, as did also the Blackburn House High School for Girls. The Merchant Taylors' School for Girls at Great Crosby was opened in 1888. St. Edward's (originally the Catholic Institute) and St. Francis Xavier's, taught by the Irish Christian Brothers and the Jesuits respectively, provide secondary education for the sons of the large Rom. Catholic pop. of the city and dist.; while the Mount Pleasant Convent training school and univ. hostel (Notre Dame) is the best known of Rom. Catholic educational institutions for girls.

History.—L. is first mentioned historically in a deed executed by King John, then earl of Mortain, in 1191. The name, no doubt, came from the early Norse inhab. and was *lithbar-pollr*, 'the pool of the slopes.' King John bought it and founded a bor. in 1207, and throughout the thirteenth century we find L. used for shipping troops and stores to Ireland and Wales. Charters were granted to the city by most of the monarchs from Henry III. to William and Mary, and in 1880 a royal charter converted the bor. into a city. L. remained the property of the Crown until 1628, when it was sold with other manors by Charles I. to some London merchants, and they in turn sold it to Viscount Molyneux of Maryborough (for £450), in whose family it remained until 1672, when it was acquired by the corporation. The Wars of the Roses considerably affected the prosperity of the city, and during the Civil war it was fortified and held by the Parliament, being taken by Prince Rupert in 1644. From 1709 until 1807 L. was actively engaged in the slave trade; privateering also flourished. During the Second World War L. became the headquarters of W. approaches where the battle of the Atlantic was organised. L. became the chief port for munitions and men from overseas, and over 4,700,000 men passed through. Not unnaturally this activity attracted heavy and sustained air attack, and many warehouses and about half the central shopping area were completely devastated; 120,000 houses were damaged, and in one week, in May 1941, 1453 people were killed and 1065 seriously injured. Sev. of the city's churches were destroyed, including St. Catherine's, Abercromby Square; St. Luke's, Bond Street; and St.

Michael's, Pitt Street Church House, headquarters of most diocesan organisations, suffered damage. Bluecoat Chambers where many cultural societies have their home were severely damaged but only minor damage was done to the Unity Buildings. India Buildings and the Corn Exchange were also damaged and the arcade in Cook Street was gutted. The area exclusive of water area is 43 sq mi, and the pop was estimated at 736 000 in 1941. See D. Doughton *History of Liverpool* 1810 J. A. Picton *Memorials of Liverpool* (2 vols.) 1873 Ramsay Muir *A History of Liverpool* 1907 J. Tourneau *The Rise and Progress of Liverpool from*

1921. A single section of the cathedral took fifteen years to build which affords some indication of the magnitude of the task. The tower arch is the largest Gothic arch ever constructed. The under tower and the crossings of the two transepts together form the central space, a rectangular area 136 ft long by 87 ft wide unobstructed by piers or columns and capable of seating a congregation of seventy thousands. The area of the central space, 11 000 sq ft is half as much again as that under the dome of St Paul's (the similar feature of St Peter's Rome is not quite 15 000 sq ft). The under tower the dominating feature of the interior as is

Liverpool Cathedral. L. Dundas

LIVERPOOL CATHEDRAL

A view of the cathedral from the east.

1901 to 1910. D. C. Jones *Survey of Merseyside* vol. 1 1934. J. J. Thompson *Merseyside Place* 1941. J. J. Allison *The Mersey Estuary* 1941. A handbook pub. by the corporation.

Liverpool 1. The seaport and city of Queen's Co., Nova Scotia (Canada) on the R. Mersey 65 mi S.W. of Halifax. It is the centre of a large fishing industry and shipbuilding trade. Lumbering is a tradition and some gold is mined in the neighbourhood. Pulp paper, and iron castings are manufactured. Pop. 3000. 2. In New S. Wales, Australia, on George's R. 20 mi W. of Sydney. It is on the site of an early settlement in the midst of fine agricultural country, and manufactures pop. 7100.

Liverpool Cathedral was commenced in 1904 to the designs of Sir Giles Gilbert Scott red sandstone being used, with roofs of copper. The Lady Chapel was completed and consecrated in 1910. The choir and E. transept were consecrated in

the tower itself of the exterior is lit on the N. and S. sides by groups of windows 14 ft high each filled with stained glass which may well challenge comparison with the finest work of the medieval glass painters. The under tower vault is 176 ft high or 60 ft higher than the choir vault and 71 ft higher than the nave of Westminster Abbey. The cathedral was the target of German bombers in 1941 and narrowly escaped serious damage. The red sandstone walls of the cathedral were pitted in thousands of places. A large bomb fell on the S. transept roof, which it pierced, but instead of being deflected inwards after striking the supporting inner brick wall, it was deflected outwards and exploded in the air high above the street level, but the tall transept windows were broken by the blast.

'**Liverpool Daily Post and Mercury**' dated from 1855 being one of the papers that appeared as a result of the repeal of the stamp duty. The *Post* was always

strongly Liberal in politics, and espoused the cause of the N. in the Amer. civil war. It was one of the first newspapers to adopt the use of maps and diagrams. In 1901 the *Post* absorbed a fellow Liberal jour., the *L. M.*, founded in 1811 and pub. as a daily paper since 1858. The companion evening paper is the *L. Echo*, a paper of independent views. The *L. Weekly Post* was estab. in 1878.

Liverpool Plains, picturesque and pastoral dist. from 800 to 1000 ft. above sea level in the N.E. of New S. Wales, Australia. It is divided from the Warrego dist. by the Darling R. The chief tn. is Tamworth.

Liverpool Range lies between the co. of Brisbane and the Liverpool Plain in New S. Wales, Australia, and forms part of the Great Dividing Chain; highest point, Oxley's Peak, 4500 ft.

Liverpool Regiment, see KING'S REGIMENT (LIVERPOOL).

Liverpool University. The Univ. College, Liverpool, Lancashire, was constituted by royal charter dated Oct. 18, 1881, and was affiliated to the Victoria Univ., Manchester, in 1884. Royal assent was given on Aug. 14, 1903, to an Act separating it from Victoria Univ. and constituting it as an entirely separate univ. The king acts in the capacity of visitor and the earl of Derby as chancellor. The faculties include those of arts, engineering, law, medicine, and science, with more than seventy chairs, most of which are well endowed. There are special schools of architecture, dental surgery, hygiene, local hist., and record, Russian studies, social science, social sciences and administration, tropical medicine (with research laboratories at Mafao and Sierra Leone), and veterinary science. The univ. ranks next after Oxford and Cambridge, London, and Manchester. The buildings are centralised and extensive, and the students are united in a self-governing guild of undergraduates. Many scholarships, student-ships, and exhibitions are awarded.

Liversedge, par. and tn. in the W. Riding of Yorkshire, England, 3 m. N.W. of Dewsbury. The reservoir of the Bradford water supply is at L. It has manufs. of cotton, woollen, and worsted goods, iron goods, machinery, and chemicals. Pop. 15,000.

Livery (from late Lat. *liberare*). In the special sense of distributing originally meant the provision of food, clothing, etc., for the servants of a household. From this the term came to be applied to a special uniform worn by the servants of great households, and really includes the uniforms of naval, military, and civil officials as servants of the State. In the fifteenth century the partisans of the great barons adopted their badges as 'liveries' as a pledge to support them in return for their promise of 'maintenance'; this custom of 'livery and maintenance' was suppressed by Henry VII. The term has been applied to an association wearing a distinctive garb, as in the livery companies of London. See also UNDER COMPANIES, CITY, LONDON; FEOFFMENT.

Livery of Seisin, see FEOFFMENT.

Livestock, see under AGRICULTURE; CATTLE; FARM, HORSE; PIG; SHEEP.

Livia Drusilla (c. 55 B.C.-A.D. 29), Rom. empress. She was originally the wife of Tiberius Claudius Nero, by whom she had two sons, Drusus and Tiberius. In 38 B.C. Augustus compelled her husband to divorce her in order that he might marry her himself. She exercised great influence over Augustus, and was suspected of various crimes to secure the throne for her son Tiberius, whom she persuaded Augustus to adopt formally in A.D. 4. At the accession of Tiberius she acted as joint ruler with him, and after his retirement to Capree (Capri) continued to rule in Rome until her death. See Tacitus, *Annals*, i. v., and S. Baum Gould, *Tragedy of the Caesars*, 1892.

Living Force, see ENERGY.

Livingston, famous Amer. family founded by Robert (1651-1728) who was b. at Anstruth, Scotland, and emigrating to America about 1673 received grants to 'L. Manor' on the Hudson. His grandson, Wm. L. (1723-90), became a political leader on the side of the Dis-senters. He served in the New York legislature (1759-60), but his influence was chiefly exerted in the columns of the *Independent Reflector* (1752-53) and the *New York Mercury* (1754-55). Wm.'s brother Peter van Brugh L. (1710-92) was a prominent merchant and a political leader on the Whig side in New York, and another brother Philip L. (1716-79), a signer of the Declaration of Independence, was also a leader of the same party. Wm. L.'s son, Brookholst L. (1757-1823), was an officer in the Amer. War of Independence and a political pamphleteer under the name of 'Deems'.

Livingston, Edward (1764-1836). Amer. jurist and statesman, b. in Germantown, Columbia co., New York, the younger son of Judge Robert R. L. the elder (1718-75), and great-grandson of Robert L., the founder of the L. family (see LIVINGSTON). He was Republican representative in Congress (1795-1801); U.S. dist. attorney for New York state, and mayor of New York city in 1801. In 1803 he removed to Louisiana and built up a great law practice at New Orleans. In 1820 he became a member of the legislature of Louisiana, and drew up the L. code of criminal law. He was again a member of Congress from 1823 to 1829, a senator from 1829 to 1831, and secretary of state under President Jackson, 1831-33. In 1833 he was appointed ambas. to France. See his *Criminal Jurisprudence* (1873) and C. H. Hunt, *Life of E. Livingston*, 1861.

Livingston, Robert R. (1746-1813). Amer. jurist and statesman, b. at New York, brother of Edward L. He was called to the bar in 1773, and was recorder of New York from 1773 to 1775. He was a member of Congress, and also of the committee which drew up the Declaration of Independence, as well as of the committee which drew up the first constitution of the state of New York.

of which he was the first chancellor (1777-1801). At the same time he was secretary for foreign affairs (1781-83) and president of the New York Convention (1788). From 1801 to 1804 he was ambassador to France and negotiated the Louisiana purchase (1803). He was an ardent agriculturalist introducing the use of gypsum as a fertilizer and in conjunction with Robert Fulton did much to further experiments with steam navigation. See I. de Peyster, *Biographical Sketch* 1876.

Livingstone, city and co. seat of Park co. Montana U.S.A., on the Yellowstone R. 100 m. S.E. of Helena. It lies at an altitude of 4495 ft. and is within easy reach of the Yellowstone Park region. It has coal, oil wells, and is mining in districts, lumber mills, lime works, machine shops, and flour mills. It has hot springs and has become a health resort. Pop. 6600.

Livingstone, David (1813-73) Scottish missionary and explorer in Africa. / at Blantyre, Lanarkshire, Scotland. At the age of ten he was working in a cotton factory at Blantyre. When he was twenty-three he entered on a course of study at Anderson's College, Glasgow, and later determined to become a missionary. With this aim in view he studied medicine and in 1838 he offered himself to the London Missionary Society, attracted by their unsectarian character and was accepted by them, and in Nov. 1840 he took his medical degree in the faculty of physicians and surgeons in Glasgow. His ambition had been to go to China, but a Great Britain war then at war with that country this was impossible and the field selected for him was Africa. He left England in Dec. 1840, arrived at Cape Town early in 1841 and went straight to Bechuanaland to the mission station established at Kuruman by Robert Moffat whose daughter Mary he married in 1843. In 1849, in company with the great hunter Oswell and Mr. Murray he discovered Lake Ngami. In the following year with his wife and children he made a journey to the Upper Zambesi, but owing to their illness he decided to send them home to England and so they worked their way back to Cape Town, which they reached in April 1851.

Returning to Livingstone the chief of the Makololo he determined to open up a route into the interior and ascending the Liba he reached Lake Dilolo, Feb. 1854, from there he went across the Kwanao and arrived at Loanda on May 31, half dead from fever and starvation. Having sent home particulars of his wonderful journey he returned to Livingstone arriving there in Sept. 1855. Realising that the W. route was of no use for his purpose he next set off to follow the Zambesi to its mouth and a fortnight after leaving Livingstone he discovered the famous Victoria Falls. Continuing his journey he reached Tete, March 1856, and then proceeded to Quilimane, where he arrived in May. In Dec. of the same year he returned to England, having accomplished one of the most marvellous journeys on record, necessitating a reconstruction of the map of Africa, and making

for himself a name something more than famous. While at home he quietly separated himself from the London Missionary Society, and in 1858 accepted an appointment as consul at Quilimane and the command of an expedition to explore East and Central Africa in which he was accompanied by his brother, Charles L. and Dr. (afterwards Sir) John Kirk.

This second visit to Africa was fraught with trouble, and ended in the recall of the expedition and the loss of his appointment. The Univa. Mission that he established broke down owing to the death of Bishop

DAVID LIVINGSTONE

L N A

Makololo and a greater blow was the death of his wife at Shupinge in April 1862. Owing to this, however, he had done valuable work. He had explored the Shire to discover Lake Shweta and Nyasa, lying the foundation for the Nyasaland Protectorate and, above all, he had opened the eyes of the world to the horrors of the slave trade. He returned to England in July 1864 and after a year at home started on his last journey to Africa. He was appointed consul to Central Africa, without a salary, the gov. contributing only £500 to the expedition and the Geographical Society supplying the same amount. His object was to find the sources of the Nile and from 1866 he was lost to the world for five years, while he wandered over vast tracts of country from Lake Nyasa to Lake Tanganyika, making valuable observations but losing his health and strength in the attempt. It was during this period that he encountered the famous Arab slave dealer, Tippoo Tib, and

It was due to the accounts he sent home of the horrors he witnessed that the trade was eventually suppressed. Worn out with all he had undergone L. reached Ujiji in Oct. 1871, and it was here that H. M. Stanley found him, having been sent out to search for him by Gordon Bennett of the *New York Herald*. They remained together until March 1872, exploring the N. end of Tanganyika, then Stanley reluctantly left him, and L. proceeded on his way S. alone, but his health grew rapidly worse, and on May 1, 1873, his faithful follower found him dead. They were then at Chitambo's vil. on the Luimola in Itala, and nothing so well illustrates the deep affection that L. inspired in his followers by his unflinching kindness and humour as that journey taken across Africa to carry his body to Zanzibar. From there it was conveyed to England and was buried in Westminster Abbey, April 1874.

As a missionary L. was the greatest pioneer there has ever been, for he opened up the whole of Central Africa to the influences of Christianity, and he was the means of abolishing the slave trade; as an explorer he was unequalled, for he travelled over a third of Africa and profoundly changed the map of the continent, the keenness of his observation and his scientific training rendering his work of the utmost value, while his life and example have made him an inspiration for all time. He pub. an account of his first journey in a book entitled *Missionary Travels in South Africa* (1857) and of his second journey in *The Zambesi and its Tributaries* (1865), and his *Last Journals* were ed. by his friend the Rev. Horace Waller (1874). See H. M. Stanley, *How I found Livingstone*, 1872; B. Matthews, *Livingstone the Pathfinder*, 1921; L. G. Adams, *David Livingstone*, 1922; and Sir R. Coupland, *Livingstone's Last Journey*, 1945; also lives by W. G. Blaikie, 1880, and R. J. Campbell, 1929.

Livingstone, Sir Richard (b. 1880), Brit. classical scholar and educational reformer, son of Canon L. of Liverpool. Educated at Winchester and New College, Oxford. Vice-chancellor of Queen's Univ., Belfast, 1924-33; president of Classical Association, 1940-41; vice-chancellor Oxford Univ., 1944-47; president of Corpus Christi College from 1933 and librarian there. Especially noted for his appreciation of the value of classical literature as a continuing and living force in modern culture and of the place of humanist study in educational reform. He was a member of the Prime Minister's committee on classics in 1920; editor of *Classical Review* (with J. T. Sheppard), 1920-22. General editor and originator of the method employed in the Clarendon Series of Gk. and Lat. authors. Pubs. on the classics include *The Greek Genius and its Meaning to Us* (2nd ed., 1915); *A Definition of Classical Education* (second impression, 1917); *The Pageant of Greece* (1923); *The Mission of Greece* (1928); *Greek Ideals and Modern Life* (1935); *Portrait of Socrates* (1938); *Selections from Plato* (World's Classics) (1940); and *Thucydides* (World's

Classics) (1943). Works on education: *The Future in Education* (1943); *Plato and Modern Education* (Rede Lecture) (1944); and *Some Facts for Education* (1947).

Livingstone: 1. Township of N. Rhodesia, on the l. b. of the Zambesi R., about 3½ m. from the Victoria Falls. A reach of the riv. about 3 m. from L. forms one of the finest boating courses in the world. L. was the administrative cap. of N. Rhodesia until 1935, when it was superseded by Lusaka. It is connected by rail with the Congo border. A telegraph line runs beside this railway. L. has a white pop. of about 300. 2. Par. and vil. of Linlithgowshire, Scotland, 3 m. E. of Bathgate. It has oil works. Pop. 11,000.

Livingstonia Mission was estab. in 1875 by the Free Church of Scotland at Cape Clear, on the S. shore of Lake Nyasa. It was called after Dr. Livingstone, its object being to carry out his plans for the suppression of the Portuguese and Arab slave trade on the E. coast of Africa. In 1883 the mission moved to Bandawé, on the W. shore of the lake, on finding its former situation very unhealthy. See LAWS, ROBERT.

Livius, Andronicus, see ANDRONICUS, LIVIUS.

Livno, fortified tn. of Bosnia, Yugoslavia, 70 m. W. of Sarajevo. There is a trade in grain and live stock. Pop. 5,500.

Livny, tn. in the Kursk Region of the R.S.F.S.R., 80 m. S.E. by E. of Orel. It stands on the R. Sosna, and has a considerable trade in grain, cattle, leather, flax, etc. Soap and candles are manufactured. Pop. 21,000.

Livonia, Livland, Livlandya, or Libmaa, formerly one of the Baltic provs. of Russia. In 1918 it was divided between Latvia and Estonia, and has therefore lost its separate identity. In the area are included the is. of Osel, Mohn, and Paternoster, which with others form a group in the gulf of Riga. The country is flat and marshy, covered with dense forests. The chief lakes are the Peipus, or Chudskoe, and Virzaumi, and there are many rivers and streams, which include the Dvina, with its trib., the Livonian Aa, Pernau, Salis, and Embach. The chief occupation of the inhab. is agriculture. Rye, barley, oats, hops, and flax are grown, and dairy-farming and gardening are carried on. There are many important manufs., including distilling, oil-pressing, sugar refining, and there are paper-mills, woollen and cotton factories, tobacco, cork, soap, and petroleum works. L. was won from Sweden by Peter the Great, and it was formally ceded to Russia by the treaty of Nystad (1721). In 1835 the Russian code was introduced, and in 1867 the Russian language was recognised as the official language of the law courts.

Livorno: 1. See LIGNORNO. 2. Tn. of Italy, situated in the prov. of Novara. Piedmont, 17 m. W. by S. of Verceilli. Pop. 6,000.

Livre, old Fr. coin and the unit of the old Fr. money system. Before 1607 two ls. were coined, the L. tournois and the L. parisien. The first was divided into twenty

sous, each of which was divided into four bards or twelve demurs and this L was general throughout France. The second was divided in the same way, but equal in value to twenty five sous tournois. This was suppressed later on. The 1 tournois remained the monetary unit until 1793.

Livy, or **Titus Livius** (59 B.C. - A.D. 17) Roman historian b. at Patavium (Padua). He came of good family and was well educated being a student of Greek literature, rhetoric and philosophy. He sympathized with the Republic in party during the civil war and later when admitted to the court of Augustus, unlike his contemporaries Horace and Virgil he declined to flatter the emperor and prophesied the fall of the Roman Empire. However, he enjoyed the friendship of Augustus and maintained friendly relations with Claudius but on the accession of Tiberius, in A.D. 14, he retired to his native place, where he died. His hist. *Ab urbe condita* (lib.) relates the hist. of Rome from its mythical foundation down to the death of Drusus in 9 B.C. It was divided into 142 books, of which only thirty five remain but epitomes of 1-115 and the 146th and 147th books have come down to us. It is on the whole open minded and sympathetic. His facts are not always trustworthy for he was too credulous of the traditional accounts of previous authors and did not avail himself as much as possible of authentic documents. See eds. of the text by A. Drakenborch, 1753-1744; W. Weissenborn, 1838-62; and J. N. Madvig and L. L. Using 1863-7; Franke, P. Holland 1600; D. Spillan, C. Edmonds and W. A. McDivitt, 1849-50; and W. M. Roberts 1912. See also W. S. Teuffel, *History of Roman Literature* (trans.) 1891; J. W. Mackail, *Latin Literature*, 1891; and M. L. W. Laughton *The Greater Roman Historians* 1915.

Lixovium, see LIXICH.

Lizard, a general name for a large variety of reptiles belonging to the order Lacertilia. The limbs may be well developed as in the common L. or almost absent as in the serpents. Ls. lack the scaly covering of the body, and have neither the bony plate armour nor the socket lodged teeth of the crocodile. Two Ls. only are found in Great Britain though the green L. (*Acrotia viridis*) is a native of the Channel Is. The common or viviparous L. (*Vivipara*) is found on heaths and banks from early spring to autumn. It is about 6 in. long and is greenish brown on the upper part. The under parts are bright orange spotted with black in the male and in the female plain pale greyish green. The eggs hatch as soon as laid. The sand L. (*L. agilis*) occurs in the S. of England. It is usually a sandy brown with darker bands and black spots at the sides and occasional greenish blue sometimes confused with the green L. It is 7 in. long. The eggs are laid in a hollow in the sand, covered, and left to incubate. These Ls. are insectivorous, many of the foreign Ls. devour birds' eggs, and mice and even larger animals. Some are purely vegetarian. One of the most remarkable Ls. is the *Chlamydosaurus Kingi* (q.v.), the

frilled L. of Australia. The frill is a crinated membrane arising from the hinder part of the head. In the same continent occurs the extraordinary horned moloch or thorn devil. It is covered with rows of prickles, fortunately it is only 6 in. long. Fmy also is the dragon like basilisk of Central America. The flying gecko of Java has developed powers of gliding, a membranous expansion of the skin from limb to limb acting, as a parachute. See also CHAMAISON. See H. M. Smith *Handbook of Lizards*, 1946.

LIZARD

Lizard, Battle off the, took place in the 1st Dutch war off the L. Point on June 12, 1652 when Sir George Ayscue succeeded in capturing six vessels out of a fleet of forty Dutch merchantmen which he overtook on their voyage to the Indies.

Lizard, Frilled, see CHAMAISON. KINGI.

Lizard Head, or **Lizard Point**, most southerly point of Great Britain situated in Cornwall, England, in lat. 49° 57' 30" N. and long. 12° W. The prom. is 1.5 in. In 104 m. from Heston. There are several small bays, the most notable being Kynance Cove. The Lion's Den, another interesting feature, is a chasm formed in 1817 by the collapse of a cave. A dangerous reef known as the Slag-stretches S. off the point. There are two lighthouses.

Ljubljana, see LJUBACH.

Llama, member of the camel family native of Peru is a diminishing extent used as a beast of burden. The L. is much smaller than the camel and has no dorsal hump. It is white and sometimes spotted with brown or black. The fleece is long and silky and of considerable value. The flesh is eaten by the natives.

Llanberis, vill. of Carnarvonshire, Wales. There are two lakes and the mt. railway up Snowdon starts here. Much quarrying is carried on. L. Pass (q.v.) is one of the most savage and awe-inspiring of Welsh valleys, with huge glacier-borne boulders. It lies between Glyder Iawr and Snowdon.

rising to 1170 ft., and carries a coach road leading to Capel Curig and to Beddgelert.

Llanberis Pass, romantic pass from L. to Capel Curig, between the crags of the Glyders and the lower slopes of Snowdon. The road reaches a height of 1170 ft. at Pen-y-Pass, where there is an inn with many climbing associations. The Pen-y-Gwrydd hotel, also a resort of climbers, is a mile from the top on the Capel side.

Llandaff, Henry Matthews, first Viscount (1826-1913), Eng. jurist and statesman, b. in Ceylon. He was admitted as a barrister in 1850 and became a Q.C.

on the Ithon, 6 m. N.E. of Builth. It is a popular health resort, possessing medicinal springs. There are numerous Roman remains. Pop. 4000.

Llandudno, popular seaside resort of Carnarvonshire, N. Wales, at the mouth of the Conway on the Irish Sea, 37½ m. W. of Liverpool. A very fine marine 'drive' encircles the Great Orme, and there are noted caves under the Little Orme, as well as Druidical remains. It is also a life boat station. Pop. 21,000.

Llanelli, seaport, parl. bor., and mkt. tn. of Carmarthenshire, Wales, on Buivy Inlet, 10 m. N.W. of Swansea. Coal is

LLANDAFF CATHEDRAL

Valentine & Sons Ltd. Dintee

and a benchor of Lincoln's Inn in 1868. He sat on the Conservative side in Parliament, representing Dungarvan (1868-74) and E. Birmingham (1885-92), being home secretary under Lord Salisbury from 1886 to 1892.

Llandaff, city of Glamorganshire, Wales, 2 m. N.W. of Cardiff. The see is regarded as the oldest in Great Britain; its cathedral was restored in 1844-69, but severely damaged by bombing in 1941. Pop. 13,000.

Llandeilo, par. and vil. of Carmarthenshire, Wales, situated on the Loughor, 5 m. S. of Llandilo. The dist. is mountainous, and coal and limestone are abundant. Pop. 8000.

Llandovery, municipal bor. and mkt. tn. of Carmarthenshire, Wales, 18 m. N.W. of Brecon. It is an agric. and mining centre. Near by there are ruins of a Norman castle. Pop. 2000.

Llandrindod Wells, urban dist. and mkt. tn. of Radnorshire, Wales, situated

extensively shipped from the three docks. It is the centre of the tinplate industry, and there are large copper smelting works, potteries, rope works, saw mills, and manuf. of bricks and chemicals. Pop. 34,000.

Llanes, seaport of Oviedo, Spain, on the bay of Biscay. The prin. trade is in agriculture and dairy produce, fish and timber. Pop. 19,000.

Llanfalfiechan, urban dist. and seaside resort of Carnarvonshire, Wales, 7 m. S.W. of Conway, near the foot of Pen-y-mawr. Pop. 3000.

Llangollen, par. and tn. of Denbighshire, Wales, on the Dee, 9 m. S.W. of Wrexham. It is a popular summer resort. L. is noted for its linen and woollen manuf., especially flannel, and there are slate quarries, coal-mines, etc. The vale of L. is noted for its beauty. Pop. 3000.

Llanos, enormous plains lying E. and S. of the Andes, sloping towards the affluents

of the Orinoco and the Amazon. This plains region is 640 m. long and 300 m. wide, and is covered in part with forest and elsewhere with grass, the elevation being from 300 to 500 ft. above sea level. A part of this ter. is unexplored, and offers an interesting field to the adventurous traveller. In the rainy season the l. are inundated for thousands of sq. m., with a network of connecting channels. In the dirts, formerly occupied their character has changed somewhat, due to the decline of stock and horse raising. The Llaneros were a hardy race of horse-men of Venezuela and formed some of the best fighting material in S. America, but they were so greatly reduced in the War of Independence, and in later civil strife, that both they and their herds have nearly disappeared.

Llanquihue, prov. of S. Chile, between the Andes and the sea. Cap. Puerto Montt, on the bay of Reloncavi. The N. part of the prov. consists of a broad plain, but in the S. it is intersected by narrow fords and has fine rugged scenery. There are extensive forests. Timber, wheat, barley, and livestock are produced. It covers an area of 7000 sq. m. and has a pop. of 117,200.

Llanquihue Lake, in the prov. of L. S. Chile, 14 m. N. of Puerto Montt. Is the largest fresh-water lake in Chile, and covers an area of about 225 sq. m. It has an altitude of 170 ft., and is deep and clear. The volcanoes of Osorno and Calbuco rise above it. The lake is drained S.W. by the R. Maullin into the Pacific.

Llanwrst, tn. in Denbighshire, Wales, 12 m. S. of Conway, on the Conway, spanned by a handsome bridge. It has tanning and mulling industries. Pop. 2100.

Llerena, tn. of Badajoz, Spain, 62 m. S.E. of Badajoz. It possesses a copy of the tower of the Giralda of Seville. There are silver mines in the dist. Near by the Fr. cavalry were routed by the Brit. on April 11, 1812. Pop. 7000.

Llewellyn the Great (d. 1240), prince of N. Wales, b. after his father's expulsion, recovered the paternal inheritance in 1191, while still quite a young man. After his accession he married the illegitimate daughter of King John, but continual quarrels arose between him and his father-in-law, who reduced L. to submission in 1211. In the following year the latter recovered all his losses in N. Wales, and in 1215 took Shrewsbury. Throughout his reign he was continually at war with the Marchers of S. Wales and, at the beginning of Henry III.'s reign, was frequently attacked by Eng. armies not acknowledging that king's suzerainty till 1230. In the following year he abdicated in favour of his son David and retired to a Cistercian monastery.

Llewellyn, Richard (real name Richard David Vivian Llewellyn Lloyd), (b. 1907). Welsh author and playwright, b. at St. David's, Pembrokeshire, Wales. *How Green was my Valley* (1939), his story of a Welsh mining community at the end of the nineteenth century, was made into a film, proving very popular. His other works include *Pinson Pen*, a *Play in*

Three Arts (1933), and *None But the Lonely Heart* (1933).

Lloyd, Edward (1815-1927), Eng. tenor, b. in London, son of Richard L., vicar-choral at Westminster Abbey. He was trained in the abbey choir, 1852-60, and later became solo tenor at the Chapel Royal. In 1867 he appeared at concerts, and in 1871 took part in the Gloucester musical festival. After 1888 he was the prin. tenor at the Handel festivals, and toured in the U.S.A. 1888, 1890, and 1892. He formally retired in 1900, and sang in public for last time at a Mansion House concert for Belgian refugees in Feb. 1915.

Lloyd George of Dwyfor, David Lloyd George, first Earl (1863-1945), Brit. statesman, b. at Chorlton-on-Medlock, Manchester; son of Wm. George, a native of Fishguard, S. Wales, and a schoolmaster, who left school-teaching for farming when David was less than a year old, and who d. on his farm near Haverfordwest, 1864. His family were looked after at Llanystumdw, Carnarvonshire, by his brother-in-law, Richard Lloyd, shoemaker of that place, and preacher to a sect called the Disciples of Christ. David was educated at the vil. school. He was articled in 1879 to a member of the firm of Breeze, Jones, & Casson, solicitors, Portmadoc. In 1880 the family moved to Cricieth, where in due time David was baptised by his uncle in the brook in front of the Disciples' chapel. Apropos of the general election of 1880 David wrote, under the pseudonym Brutus, some 'Political Shreds' for the *N. Wales Express*.

thus early displaying his taste for invective and high-flown oratory. In 1884 he was admitted solicitor, and began practice at Cricieth. He constantly spoke in court and on platform. In 1886 he organised a Farmers' Union for the Lleyn and Eifonydd. In 1889 he became one of the new co. aldermen. At a by-election, April 10, 1890, he was elected to Parliament by a small majority for Carnarvon Dors., replacing a Conservative. He never ceased to represent that constituency.

He went to Westminster rather as a Welsh nationalist and Nonconformist than as a Liberal. In his maiden speech, June 13, 1890, on the compensation clauses of the Local Taxation Bill, he made his first parl. attack on Joseph Chamberlain. In Welsh matters he was frequently in conflict with his leaders. It was largely through his efforts that Welsh disestablishment became an item in the Liberal programme. Under Lord Salisbury's last gov. he was, May 22, 1896, suspended for obstruction. He spent that year's vacation in S. America. In 1899 he was in Canada. When the trouble with Kruger began in S. Africa he was by no means opposed to the Boer cause, and indeed increased his majority in the 'khaki election' of 1900. He had no fear of the fervour of patriotic mobs, but had a narrow escape on Dec. 18, 1901, when the police insisted, for his safety, on disguising him as a constable before allowing him to leave Birmingham tn. hall, where his meeting had been broken up.

In 1905 he was made privy councillor and joined Campbell Bannerman's Gov. as president of the board of trade with a seat in the Cabinet. When Asquith succeeded Campbell Bannerman in 1908 L. G. became chancellor of the exchequer. In 1909 he brought in a counterblast to Chamberlain's Tariff Reform his famous second budget, with its graduated direct taxation and its beginning of Henry George taxation on land values. On July 30 he made his famous speech at Limehouse, echoing Chamberlain's old gospel of 'ransom'.

Elliot & Fry

DAVID LLOYD GEORGE

The agitation over the Lords' rejection of the budget ended in the Parliament Act of 1911 (*q.v.*). In that year L. G. carried his National Insurance Act which was his main achievement in social legislation. On July 14 of the same year at the Mansion House, he shook the mailed fist of the Brit. Gov. at Germany over the affair of Agadir (*q.v.*). As a debater L. G. had few equals in the House of Commons of his day, and certainly no superiors. On the public platform he was equally effective, though his style of oratory occasionally lapsed from the best flights of his more radical days. Many a striking phrase which illumined his fighting addresses, such as 'the ramshackle Empire,' in allusion to the dual monarchy, and 'the silver bullet' in allusion to war loans, gained something more than a temporary currency.

In May 1915 L. G. became minister of munitions when the Asquith Gov. was reorganised on non-party lines. In June 1916 he succeeded Lord Kitchener as war minister. Shortly afterwards he resigned

as he was at variance with Asquith over the method of conducting the war. This led to Asquith's resignation on Dec. 5, 1916. Bonar Law supported L. G. who thereupon formed a new Coalition Gov. with himself as Prime Minister. For the remainder of the war which he prosecuted with vigour his position was unchallenged. When the war ended the specially prolonged Parliament of Dec. 1910 was succeeded by that of Dec. 1915 which supported L. G.'s Coalition Gov. His election was known as the 'coupon election', because L. G.'s supporters both Tory and Liberal received countenance that was denied to other Tories and Liberals and were in the position of coupon holders in a competition.

L. G. was the principal representative of the Brit. Empire at the peace conference and remained a member of its council when that body was reduced to four members (see *TRUCE (CONFERENCE)*). Peace having been settled at Paris war broke out in Ireland which had ceased to send its nationalist representatives to Westminster. After the disaster in Ireland of the Black and Tans (see *IRA (1914-1916)*) and the peace treaty that set up the Irish Free State and alienated much of the Conservative support which was entirely withdrawn in 1922, L. G. and the Coalition fell and L. G. invited the Liberal leader, Mr. Asquith, to visit the U.S.A. in 1923. But L. G.'s strength against the other wing of Liberalism was a fund of election war chest contributed while he led the Coalition. He became leader of the whole Liberal party in the Commons when Asquith became Earl of Oxford and Asquith in 1925. In 1926 he sided with the Labour leaders against an own colleague as to the action of Baldwin's Gov. over the general strike.

On the death of Lord Oxford and Asquith L. G. was still Liberal leader but his party in the Commons was small its chief importance after the general election of 1929 arose from its balancing power. At that election his daughter Megan was returned for Anglesay as a member of his party.

After the death of L. P. C. in Nov. 1929 L. G. became the father of the House of Commons and from 1931 in which year he underwent a serious operation he retired into the position of an elder statesman. He was opposed to Ramsay MacDonald's Gov. on the Loco Trade issue and the Ottawa agreements. In 1931 also he left the Liberal party, setting up an Independent Liberal party, but rejoined forces with the Liberals in 1935. In the years which led up to the Second World War he was critical of the appeasement policy followed by Neville Chamberlain's Gov. Shortly before his death he was created Earl of D. He had been awarded the O.M. in 1919 and the Grand Cordon of the Legion of Honour in 1920. In 1948 he married Margaret Owen (created D.B.E. 1949), who d. in 1941, and in 1943 Frances Stevenson, his private secretary. He d. on March 26 1945. His memoirs were pub. in 6 vols. in 1933-38. See lives by J. H. Edwards, 1913, B. G.

Evans, 1916; J. H. Spender, 1922; J. Mills, 1924; A. W. Sylvester, 1917; and by M. Thomson (with the collaboration of Frances, Countess L. of D.), 1918.

Lloyd of Dolobran, George Ambrose Lloyd, first Baron (1879-1941), Brit. diplomat, administrator, and statesman, b. of a Welsh family. He was educated at Eton and at Trinity College, Cambridge, and later travelled widely in Asia and N. Africa, acquiring an intimate knowledge of E. affairs. After serving as attache in Constantinople he entered Parliament as Unionist member for W. Staffordshire and strongly supported Joseph Chamberlain's tariff policy. In the First World War he served in Egypt and Gallipoli, and later in Mesopotamia, organising Kitchener's intelligence service in the E. and assisting in the organisation of the sheriff of Mecca's forces in the Arab revolt. In 1918 he became governor of Bombay, where he suppressed, without recourse to martial law, outbreaks of mob violence at Ahmednagar. Later, in 1922, he had to deal with disorders caused by the breakdown of negotiations between the viceroy, Lord Reading, and the Indian extremists led by Gandhi *q.v.* Among the achievements of his term of office in India were slim clearance in Bombay, the setting up of the first Indian Labour Bureau, the introduction of 'permit-free' free compulsory education, and the inauguration of the Sukkur (Lloyd) Barrage scheme, which brought fertility to a great area of Sind and led to its constitution as a separate prov. in 1936. He was made privy councillor in 1923 and was Unionist member for Eastbourne for six months. In 1925 he was appointed high commissioner for Egypt and the Sudan and later in the same year raised to the peerage. His three years in Cairo marked the turning point in his career: for though disapproving of the declaration of 1922 he was prepared to respect Egypt's independence in internal affairs but equally demanded respect from Egypt for the Brit. reservations. In 1929, when Arthur Henderson became foreign secretary under the Labour Gov., L., who was home on leave, resigned the high commissionership, this being interpreted in Unionist circles as tacit dismissal. The check, however, did not interfere with his work for the nation. He became president of the Navy League, was closely associated with Winston Churchill from 1933 onwards in opposition to the legislation for an All-India Federation and, in 1937, became chairman of the Brit. Council. When Churchill formed his Cabinet in May 1940 L. was appointed colonial secretary, but his unexpected death came too soon for him to leave his mark on colonial administration. He wrote *Egypt since Cromer* (1933-34). See C. F. Adam, *Lord Lloyd*, 1948.

Lloyd, Robert (1733-64), Eng. poet and dramatist. His dramatic pieces include *The Tears and Triumphs of Parnassus* (1760); *The Death of Adam* (1763); and *The Capricious Lovers* (1764). There is a biography by W. Kenrick, in the *Poetical Works*, 1771.

Lloyd's, association in London of underwriters, shipowners, and marine insurance brokers. The name is derived from the coffee-house of Edward Lloyd (seventeenth century) in Tower Street, where merchants met together for social and business purposes. In 1692 Lloyd moved into larger quarters at the corner of Lombard Street and Abchurch Lane, where his house became the great centre of business and exchange in all matters concerned with marine commerce. In 1696 this enterprising proprietor founded *Lloyd's News*, a single sheet containing both general news and some marine intelligence; in 1726 it was renewed as *Lloyd's Post*, *Lloyd's List* and *Shipping Gazette* was founded in 1734. In 1774 L. moved to the old Royal Exchange, under the control of John Julius Angerstein, and in this year gathered full details of the character and structure of every ship of size, publishing them in a vol. called *Lloyd's Register*; from this grew the vast association known as L. Register of Shipping. About this time the various-merchants, brokers, and underwriters seem to have united for their common interests. In 1811 the association was reorganised, after a committee appointed by Parliament had inquired into its affairs, and in 1871 it was formally incorporated by Parliament. In 1838 the Royal Exchange was destroyed by fire and most of L. records were lost. The Exchange was rebuilt and opened in 1844 by Queen Victoria. The business developed enormously and a new home had to be erected. In 1923 the site of the old L. India Company in Leadenhall Street was purchased; in 1925 George V. laid the foundation stone of the new building, and on March 21, 1928, accompanied by the queen, he declared it open. L., besides insuring property afloat, is the great centre of supply and distribution of shipping intelligence. Individual underwriters of L. have absolute independence in all business transactions, but are required to deposit heavy securities of approved first-class investments, each of which, by a trust deed, is made applicable exclusively to the underwriter's liabilities to L. Every form of insurance is now included, except life (but contingency business was recommended for restrictions following the inquiry into the disclosure of budget secrets in 1936). L. was the pioneer in burglary, fire, marine, and earthquake insurance, and during the First World War it insured against damage from enemy aircraft. A committee appointed by the members manages the affairs of the institution. For the list of the project see C. Wright and C. E. Fayle, *History of Lloyd's*, 1928, and R. Straus, *Lloyd's Historical Sketch*, 1937. Many journals on marine matter are issued by the institution, such as *Lloyd's Weekly Shipping Summary*, *Lloyd's Daily Index*, *Lloyd's Weekly Casualty Reports*, *Lloyd's Loading List*, *Lloyd's List Law Reports*, *Lloyd's Confidential Index*, *Lloyd's Calendar*, and *Lloyd's Reports of Price Cases*.

Lloyds Bank, estab. in 1765 under the name Taylor and Lloyd, was incorporated

100 years later, in 1865, as a joint stock company with the name L. Banking Company Ltd. Originally the business of the bank was in Birmingham and the Midlands. The name was changed to L., Barnett's, and Bosanquets in 1884, and the present title was adopted in 1889. It is now one of the 'Big Five.' Its subscribed capital is over £73,000,000, composed of 'A' shares (£5 each, of which £1 is paid up), and 'B' shares (£1 fully paid). L. is interested with the National Prov. Bank in the L. and National Prov. Bank Ltd., with branches in France and Belgium, and it is also associated with the National Bank of Scotland, the Bank of London and S. America, the National Bank of New Zealand, and others. The head office is at 71 Lombard Street, E.C.3.

Lloyd's Bonds were devised by an Eng. barrister, John Horatio Lloyd, to enable a company to borrow in excess of its statutory powers. They were issued by railway companies, under their seal, as an obligation for work done or materials supplied by contractors, and as a promise to pay the due amount with interest at a future date. Such bonds could not be issued without consent of the shareholders of the company, and were not valid as an obligation to pay back a mere loan of money.

Lloyd's Register of Shipping, society formed for the classification of ships according to their strength and efficiency for carrying cargoes. Its affairs are managed by a general committee of 111 members, composed of merchants, ship-owners, underwriters, shipbuilders, and marine engineers, who are elected at the chief ports of the country. An advisory technical committee assists the general committee, and there are national committees in the prin. maritime countries abroad. Under the committee is a staff of surveyors, who supervise and report on the construction of ships and engines, and who hold periodical surveys on the hulls, machinery, boilers, chains, anchors, etc., of a ship after construction. Under their authority the society assigns maximum load lines to merchant ships and tests the anchors and chains at all public proving houses. *Lloyd's Register Book*, containing particulars regarding the classification of Brit. and foreign sea-going ships, is issued annually. The society also publishes annually *Lloyd's Register of Yachts*, etc. The society, which originated in Lloyd's Coffee House, was founded in 1760 and reconstituted in 1831. The 'Underwriters' Registry for Iron Vessels, Liverpool, was united with Lloyd's Register in 1885, as was also the Brit. Corporation Register of Shipping and Aircraft, Glasgow, in 1919.

Llywarch Hen Poems, see WALLIS.

Language and Literature.

Loach, small fish peculiar to the old world. There are three European genera and two are represented in Britain, each by a single species, the common or stone L. (*q.v.*) and the spotted L. or groundling (*q.v.*). The giant L. occurs only on the Continent.

Load, in mechanics, the amount of work done by an engine working up to its

capacity; the power generated by an engine or the output of an electric motor, etc., under any given circumstances.

Load Line, line 18 in. long, drawn through a circular disk, 12 in. in diameter, painted on a vessel to indicate the depth to which a vessel is allowed by law to sink in salt water after being loaded. The distance between the centre of the disk and the edge of the topmost continuous deck at the middle of the length is called the 'freeboard' (the freeboard mark is regarded by sailors as the Plimsoll line). The centre of the disk indicates the freeboard for the summer season and other lines give the loading for winter and for winter N. Atlantic services. It was enacted by the Merchant Shipping Act of 1876, through the influence of Plimsoll, that every Brit. ship must be so marked and ships. In 1890 the law was amended so that the fixing of the height of the L. L. should be under the control of the Board of Trade. In the Merchant Shipping Act of 1906 the L. L. was raised as a concession to the shipowners. In 1929 a

LOAD LINE

FW, fresh water; IS, International Summer; S, summer; W, winter; WNA, winter N. Atlantic.

Board of Trade committee framed new rules for determining the maximum L. L. of merchant ships, together with conditions under which loading deeper than hitherto allowed could be permitted in the case of tankers and steamers carrying deck cargoes of timber. The first International L. L. Convention was signed in 1930. This convention applies to all ships engaged on international voyages belonging to the signatory nations, excepting warships, fishing boats, pleasure yachts, ships not carrying cargo or passengers, and ships of less than 150 tons gross. Under this convention the maximum summer freeboard for ordinary steam ships of 100 ft. length is 71.5 in.; for a tanker of the same length it is 62.5 in. For voyages across the N. Atlantic during the winter the minimum freeboard for tankers is the winter freeboard plus an addition of 1 m. for 100 ft. in length. The ordinary minimum N. Atlantic freeboard applies only to ships not exceeding 330 ft. in length and is an addition of 2 in. to the winter freeboard. The law on the L. L. is contained in the Merchant Shipping (Safety and Load Lines Conventions) Act, 1932. The Board of Trade is empowered to make L. L. rules to implement articles of the L. L. convention. There are provisions

for marking of deck and L. La. conditions of issue of L. La. certificates and loading of timber. Submersion of the L. La. entails a fine up to £100. See PRIMSOL, SAMUEL MERCHANT SHIPPING. For full details see Brasse's *Naval and Shipping Manual* and Lloyd's *Calendar*.

Loadstone, see MAGNETITE.

Loam, soil mixture of sand silt, and clay with some humus; a high proportion of sand gives a light L. of clay a heavy L. Heavy Ls. need to be liberally manured with divish organic matter (stable manure, rotted dung or compost, leaf mould, peat, etc.) to improve texture and limed regularly to improve soil structure and to liberate inherent fertilising elements, as plant foods. Light Ls. are easily worked and need no draining, but are improved by liberal organic manuring with fresh or rotted organic matter by claying or mauling and when acid by liming profusely with chalk. The ideal L. is a medium one the clay fraction leaving a greasy mear when rubbed between the fingers and thumb. All loamy soils are good for farming and are of a gardening light L. being especially suitable for early cropping. Heavy loams for mow and late crops. L. forms the essential basis of composts for seed sowing, potting, and plants and is glass. Gardener's L. consists of turves 12 in. by 9 in. by 14 in. thick, cut from pasture land stacked grass side down in moist condition and allowed to rot for six to twelve months. It is taken from clean cultivated land and need not rotting down at all. In modern composts such as those of the John Innes formula the quality of the L. is not of first importance but is an abundance of fibre necessary since added fertilisers assure good nutrition and added peat provides texture. The L. portion of a compost should be sterilised separately.

John Innes formula. *Seed Compost* 2 parts by bulk L. 1 part peat 1 part sharp sand, plus 14 oz. superphosphate and 2 oz. ground chalk per bushel. *Potting compost* 7 parts by bulk loam 1 part peat, 2 parts sharp sand, plus 14 oz. L. Base (2 parts by weight hoof and bone dust 2 parts superphosphate, 1 part phosphate of potash), and 2 oz. ground chalk per bushel. *Cuttings Compost* 1 part by bulk L., 2 parts peat 5 parts by bulk sand.

Loan 1. Loan of things. If A delivers goods to B to be taken care of gratuitously, B, the depositary, is not entitled to make use of the goods, unless no harm would come to them by his so doing. In general a deposit is not a L. at all. The true bailment for L. is called after the civil law a 'commodation' or the L. of a thing to be returned just as it is. The borrower must return the thing in as good order as he had it, reasonable wear and tear excepted, but is not responsible for loss by accident or theft due to no carelessness on his part. In a *medium*, on the other hand, the borrower must, in all events, return an equivalent of the thing borrowed. The borrower has no lien (q.v.) on the thing for antecedent debts due to

him, nor can he retain the thing against expenses of keeping it, but he is entitled to damages if injured by defects in the thing which the lender was aware of but did not disclose. 2. **Loan of money** may be either on personal security only or as by note of hand or it may be secured by a charge (see EQUITABLE CHARGE), or mortgage of real or personal property. If nothing is said in a contract of L. about interest, the lender would ordinarily be entitled to be paid interest at the current or market rate. See also MONEY LENDER; LOANS PUBLIC.

Loanda, Sao Paulo de, capitol on the W coast of Africa, former cap. of the Portuguese colony of Angola, situated between the mouths of the Bengo and Kwango, and protected from the sea by a narrow strait, is 15 m. long. It affords good harbourage and there is also a floating dock. It has a meteorological observatory. The chief trade is in tobacco, Indian rubber, castor palm oil and coco nuts. Pop. 20,000.

Loango, 1. Port of W. Africa extending along the coast of the Atlantic, northwards from the Congo. It was divided between Portugal and Congo by the Berlin conference of 1885. The export consist of gums, wax, palm oil, copper, etc. 2. Im. port of port of E. Africa on the coast 100 m. N. of the mouth of the Congo. Steamers call here 3 m. off the coast. Wharf building began in 1912.

Loans, International, see INTERNATIONAL WOODS APPLICANTS INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT ORGANISATION FOR EUROPEAN ECONOMIC CO-OPERATION.

Loan Societies are societies or associations established under the Loan Societies Act, 1910 for the purpose of advancing money on loan to persons of the working class, to be repaid with interest by instalments. A S. must submit their rules for approval by the Registrar of Friendly Societies. No greater sum than £15 can be lent to any one person. No second or other loan can be made to the same person until the interest on loan has been repaid. No note or security given to a L. Society is either liable to stamp duty or capable of being transferred. By the combined effect of the Act of 1940 and the Loan Societies Act, 1913 loans are recoverable by demand in writing left with or sent by post to the borrower by the treasurer of the society, if the borrower neglects to comply with the demand the treasurer may prefer a *complaint* to a justice of the peace, who may order such sum to be paid to the treasurer as appears to be due.

Loans, Public. The Public Works Loan Commissioners are a body set up by the Public Works Loans Act, 1875, for the purpose of making advances to local authorities and other out of moneys placed at their disposal by the state, from time to time, for the execution of works of public benefit. They are authorised to lend on the security of the rates at a rate of interest which is fixed by the Treasury at various periods, and they are required to make a report of their transactions during

each financial year to the Treasury, which report is presented to Parliament. Money can only be borrowed for 'permanent works' such as electricity supply, gas works, light railways, docks, piers, canals, quays, tramways, markets and water ways. Subject to the agreement under which the advance was made a loan must be repaid either by equal annuities with interest, or by means of a sinking fund which, with the accumulation of compound interest from the investment of such fund in government securities, will suffice to pay off the loan within the sanctioned period.

Lobachevsky, Nicholas Ivanovich (1793-1866) Russian mathematician, b. at Nijni Novgorod. In 1826 he was made prof. of mathematics at Kazan. He was a pioneer of the modern geometries of the non-Euclidian theory. Amongst his principal works are *Principles of Geometry* (1829, 1830), *Imaginary Geometry* (1855), *Non-Euclidean* (trans. 1902), etc. See *Encycl. Brit.* *Lobachevsky* 1899.

Lobau 1. Fr. of Saxony (Germany) on the Schwarzwasser 12 m S.E. of Bautzen. There is a noted spa. The industries include pianoforte factories, sugar factories, spinning, weaving etc. and a trade in linen and yarn. Pop. 13,700. 2. Is. of Lower Austria 3 m below Vienna in the Danube. It is 4 m in diam. The Fr. were entrenched here in 1806 for six weeks. During the Second World War the is. was used for the storage of oil in underground tanks, and was in consequence heavily bombed.

Lobby, term in American politics signifying to loiter in the lobbies of political committees and deliberative assemblies for the purpose of influencing members. In many states it is now a felony.

L'Obel, Matthias de (c. 1558-1611) Botanist, b. at Lille, who gives his name to the lobelia plant. James I. appointed him his botanist and Lord Zouche placed him in charge of his garden at Hardwicke, N. London. He was the author of a vast Latin work on plants.

Lobelia, large and varied genus of annuals and perennials, some hardy, some tender, belonging to the order Campanulaceae. *L. cardinalis* or cardinal flower is a tall perennial nearly hardy bearing flowers of a rich cardinal crimson during the late summer and early autumn. *L. inflata*, or Indian tobacco, yields lobeline, an alkaloid used as an antidote to overdoses of narcotic drugs. *L. crinus*, a S. African species, has given rise to a large number of dwarf bedding varieties of various shades of blue, white, and maroon. *L. fulgens* like *L. cardinalis* is an Amer. species, growing from 1 to 3 ft. tall, flowering in May. Its varieties include white, rose, violet, and blue colours. *L. siphilitica* is hardy, and has given rise to numerous blue and white hybrids. The dwarf *Ls.* thrive best in a light soil, but the taller species need abundant plant food and frequent watering.

Lobengula (1833-84) became king of the Matabele in 1870 on the death of his father, and made Bulawayo his cap. In 1883 he signed a treaty with England

admitting her suzerainty, but on the British Africa Company receiving permission to settle in Mashonaland in 1892, L. made repeated raids against the Eng. and in 1893 his cap. was taken and he was forced to fly, dying not long afterwards.

Lobito Bay, harbour on the W. African coast near Benguela, Angola. The W. coast of Benguela is built up from L. B. was completed in 1931. This line meets the main line from Cap Town at Penha. By the completion of this branch line, K. tanga is linked by rail with both E. and W. seaports, the first train to cross the continent of Africa (Lobito to Beira 2949 m.) leaving L. B. on July 1, 1931.

Lob Nor, or **Lop Nor**, lake of Central Asia at an altitude of 2600 ft. in the desert of Gobi-Sinkiang, divided into two sections, Kora-Buyn and Chon-Kul. It formerly constituted the final receptacle of the waters of the Tarim R. It dried up, but the investigations of L. Tchekolski in 1877 and 1882 and of Sven Hedin showed the boundaries to be shifting. The lake is now only a few feet deep and is rapidly becoming dried up. In 1883, Przhevalski found about 100 Turk and Mongol settlers on its confines. At the W. end of the former lake there is a vil. of Lob.

Lobo, Jeronimo (1595-1675) Jesuit missionary, b. at Lisbon. In 1621 he went to India, but in 1625 left for Abyssinia where he became his mission's Librarian, being superintendent of missions in the region for nearly ten years. He left 100 and paid a fortune of 10,000 Portuguese Mts. account of his travels in Abyssinia forms a valuable link in an otherwise lost by Dr. John H.

Lobositz, see *Leobersdorf*.

LOBSTER

Lobsters are aquatic crustaceans of the macrurus or long-tailed type of the order Decapoda. Their long tail distinguishes them clearly from crabs, in which the segments of the tail are short and flattened and expanded laterally. The common lobster (*Homarus vulgaris*) frequents rocky coasts, varying slightly according to locality. The general colour is a dull pale reddish-yellow, spotted with bluish-black. The female carries the eggs attached to the

false abdominal swimming feet, until they hatch into shrimp-like larvae, which lead an active existence in the open water, and are much preyed upon. When mature the average weight of the common lobster is from 8 to 12 lb. Enormous catches of *L.* are made annually from March to Aug., but the supply is augmented by imports of the large Amer. lobster and of the elegant Norway lobster. The common spiny lobster is of very ant. origin, and is found on the W. coast of England, often being taken in crab pots. The shell or carapace is thickly covered with spines of various sizes and a large spine occurs over each eye. It has the power of producing a loud noise by rubbing the antennae against the carapace. The size of *L.* is regulated by restrictions as to a minimum at Billingsgate and other fish markets, but in spite of the prolificacy of the females the numbers are believed to be decreasing.

Lob-worm, *see* LUG-WORM.

Local Defence Volunteers, *see* HOME GUARD.

Local Government is the part of the administration of a state, undertaken by bodies subordinate to the central gov., which deals with matters affecting the living conditions and welfare of the inhab. of a particular place or dist. The bodies entrusted with these matters are called local authorities. Their constitution is laid down by statute, and with some minor exceptions in the case of bors., they can only do those things which they are authorised to do by statute. In general, they undertake duties and exercise powers conferred upon them by the central gov., and consequently there are a considerable number of Acts of Parliament dealing with the powers and duties of local authorities.

L. G. has its roots deep in the hist. of the United Kingdom and the present-day structure is not markedly different in principle from what it was in the days when the freeholders assembled in the shire moot, assessed themselves to imperial burdens, and declared what the local usages or laws were; when the hundred (q.v.) was answerable for the good order of its inhab., and when the freemen of the tn. moot made their by-laws and the tithing-man kept the peace. The very form of the various local governing bodies of today is to be detected in their Saxon or Norman analogues: the co. council and the shire moot, the dist. council or municipal corporation and the tn. moot, the hundred moot and the co. sessions, present striking features of similarity. The functions *per se* of local governing bodies vary but little from those of ant. times. Convenience and economy make it essential that local bodies shall assume certain functions relating to public health, including food and drugs, refuse collection and disposal, maintenance of highways and bridges, preservation of order, provision of educational facilities, parks, recreation grounds, public baths and wash-houses, and cemeteries.

A remarkable feature of modern L. G.

has been the rapid advance in municipal trading. In 1868 the local expenditure of the United Kingdom was £36,000,000, at the end of the century it had grown to £152,000,000, and in 1939-40 the aggregate expenditure of local authorities amounted to £578,000,000. This expenditure, coupled with an outstanding capital debt of £1,631,000,000 in 1939-40, gives some idea not only of the great expansion, but also of the extent of local authority activities.

A large part of this increase has been due to the housing activities of local authorities which were first undertaken on a large scale after the First World War to help meet the acute housing shortage, and once again after the Second World War local authorities are incurring heavy capital expenditure on housing. The increase in the fifty years prior to the First World War was due partly to the progress in municipal trading enterprise a feature of public life which was regarded by such writers as Lord Avebury, and no doubt with strict historical accuracy, as entirely opposed to the liberal teaching of Cobden, Mill, and Bright. It was urged that municipal trading was undesirable, not only on account of the incidental increase in municipal debt, but because pre-existing functions of municipalities were enough to absorb all their energies, and to add to those functions was to check progress and discovery. Experience, however, showed that municipalities were not embarrassed by the added duties involved in providing and managing tramways, railways, omnibuses, steamboats, and various other public utility undertakings such as gas, electricity, and water. The nationalisation of electricity and transport in 1948, however, placed such undertakings outside the sphere of L. G., and similarly the National Health Service Act, 1948, and the National Assistance Act, 1948, transferred responsibility for public health and poor law administration away from the local to the central authority.

L. G. is carried on under the close supervision of certain gov. depts., the chief ones being the Ministries of Health, Transport, Education, and the Home Office. The Ministry of Health, as successors in 1919 to the L. G. Board, have a special place in the central control of local authorities. It is the gov. dept. responsible for the supervision of the financial and administrative economy and machinery of local authorities, exercised by means of loan sanctions for capital expenditure, necessitating detailed examination of the proposals, consents to sell land, and the examination of accounts. The Ministry of Health employ inspectors to assist in this supervision and the country is covered by a service of dist. auditors who, in general, examine in detail the financial transactions of local authorities and report thereon to the ministry.

The Poor Law Act, 1801, is the first big landmark in the present structure of L. G., as this statute estab. the principle of local responsibility by making the par. responsible for the relief of the destitute

found within the boundaries of the par. During the next two centuries L. G. advanced very slowly until the industrial revolution, which commenced in the latter half of the eighteenth century, altered the whole basis of the social and economic structure of Great Britain. Small vils. became, within a matter of years, large industrial tns., and the need for public health measures, which could be ignored when people were gathered together only in small communities, became not only apparent, but absolutely necessary. Other services were also required, such as lighting and watching, and the provision of highways as a means of quick and safe communication for industry.

Very few tns. had any body of persons to whom these services could be entrusted, and in general the method adopted for the country was to appoint a body or board of commissioners for each service. The areas of these boards did not coincide, and as separate boards were appointed for each service the hist. of L. G. in the first half of the nineteenth century was marked by a chaos of authorities, areas, and rates. In many of the corporate tns. boards were appointed to look after specific services, because of the corrupt nature of some of the corporate bodies. An attempt was made to reform these corporate bodies by the passing of the Municipal Corporations Act, 1835, and subsequent experience indicated that once reform had been carried out then these corporate bodies were satisfactory 'omnibus' authorities, that is, authorities which could undertake more than one service for their particular area. The setting up of separate authorities for the sev. services was not a satisfactory method of dealing with the problems of a changing economic order, and the remainder of the nineteenth century is marked by the reform of the L. G. structure of this country.

The extension of the franchise in 1832, 1867, and 1884 added considerable impetus to the need both for the reform of L. G. and for the provision of new services.

Between 1818 and 1838 Parliament attempted to deal with the unsatisfactory public health conditions, and local sanitary boards were appointed to grapple with the problems.

In 1871 the L. G. Board was estab., a dept. of the central gov. charged with the control of public health and other L. G. matters, and it was not long before reforms were introduced.

Public health legislation was consolidated in the Public Health Act, 1875, and the powers and duties conferred by that Act were entrusted to the local sanitary boards and later, in 1891, these boards became the urban and rural dist. councils of the present day.

In the cos. justices of the peace had been responsible for many administrative duties connected with L. G., but the Local Government Act, 1888, stripped them of most of their L. G. powers and conferred them on new bodies called co. councils, constituted by that Act.

These co. councils, with few exceptions, exercised jurisdiction over geographical

cos., but some of the larger and more powerful tns. which were constituted co. bor. councils, that is, cos. in themselves, were excluded from co. council control.

Some years previously a consolidation Act, the Municipal Corporations Act, 1882, was enacted, amending and consolidating the law with regard to the constitution and administration of bors., including those bors. constituted co. bors. by the 1888 Act. The Local Government Act, 1894, completed the pattern by constituting the urban and rural sanitary dists. as urban and rural dist. councils. Thus was set the mould for the present organisation of L. G. The boards of commissioners were abolished, and their powers conferred on the new local authorities with the one exception, that boards of guardians were retained until the coming into operation of the Local Government Act, 1929. This latter Act was passed on the recommendation of the L. G. Committee appointed in 1918 to survey the whole position of poor law administration with a view to the spreading of the burden of poor relief over a wider area, and at that time administration was transferred to the co. bor. councils and the co. councils. A further change was made as a result of the National Assistance Act of 1948. Under this Act local authorities were relieved of responsibility for poor relief which was transferred to a National Assistance Board and administered as a state charge. Co. councils and co. bor. councils in England and Wales, and co. councils and large burghs in Scotland, were, however, given under this Act the task of maintaining residential hostels for the aged and of extending the welfare service for the physically disabled.

Some of the larger and anct. bors. have the title of a city, but this title has no real significance at law, as it is only one of courtesy conferred on the large co. bors., or bors. formerly the site of a cathedral or a seat of a bishop. For the purposes of the law relating to the L. G. structure, cities are either co. bors. or bors., and at the present day the title of city can be conferred by the king by letters patent.

During this time the sphere of L. G. had been increasing, and the new services imposed heavy financial strains, and as many of the services were matters of national as well as local interest, a system of gov. grants was introduced. Until 1929 these grants were made in respect of specific services and the percentage grant varied according to the attitude of the central gov. towards the service, but in 1929 the grants were consolidated in an ann. grant called the general exchequer contribution. In addition to the consolidation of the earlier grants, the general exchequer contribution, commonly called the 'block' grant, also included a contribution from the Exchequer to cover the loss occasioned to local authorities by the de-rating provisions of the 1928 and 1929 Acts which exempted from rates farm lands and buildings other than dwelling houses and

reduced the rateable value on which rates were paid in respect of freight transport and industrial hereditaments to one quarter. In 1947 the likehequer contribution amounted to £57,000,000 for England and Wales and £8,000,000 for Scotland.

The Local Government Act, 1948, abolished the general exchequer contribution, and replaced it with a system of equalisation grants paid in England and Wales to co. councils and co. bor. councils, and in Scotland to co. councils and large burghs, provided that their rateable value per head of pop. is below the average rateable value per head of pop. of the whole country. Authorities below this figure receive a grant sufficient to bring their rateable value per head of pop. up to the average, and authorities higher than the average receive no equalisation grant apart from a transitional grant to help tide over the first five years of the introduction of the new system, from April 1, 1948. The equalisation grant is exclusive of grants on certain specific services such as education, police, and fire, which still remain on a percentage basis. The main revenue for L. G. derives from the rates. In 1913-14 the total amount received by local authorities in England and Wales from the rates was £76,276,000. The amount rose steadily and by 1928-29 had reached £186,294,000. It then fell to below £150,000,000 during the next four years, but by 1939-40 it had reached the £200,000,000 mark. It then fell during the war years, but by 1945-46 was again well over the £200,000,000 mark. The following year it reached £239,000,000 and in 1947-48 nearly £280,000,000. In Scotland receipts from rates reach over £20,000,000. Formerly the valuation for rating purposes was the responsibility of the local authorities; under the Local Government Act of 1948 it was transferred to the Inland Revenue. In 1938 the total rateable value of all properties in England and Wales was about £311,000,000. Ten years later this figure had increased by about £25,000,000. The average rate per £ of rateable value also increased from 12s. in 1938 to 17s. in 1948, but the extension of the existing and the introduction of new services, together with the increased cost of living in the absence of a corresponding increase in the rateable value, have necessitated this increase in the rates in the £.

The Local Government Act, 1933, carried the reform of the L. G. structure a further step forward by consolidating the law with regard to the constitution and general functions of the various types of local authorities, namely co. councils, co. bor. councils, bor., urban, and rural dist. councils, par. councils, and par. meetings. This was apart from London, which had a similar consolidating Act in 1939.

Now, it is only necessary to go to those two Acts of Parliament for the purpose of ascertaining the constitution and general administrative organisation of local authorities. The powers and duties, with regard to the various services undertaken by local authorities are to be found in

other statutes, such as the Public Health Acts, 1875 and 1932, Highways Acts, 1835 and 1929, Education Act, 1944, and the Local Government Act, 1948.

The inter-war movement of pop. and the changing economy of the country as a result of the Second World War have again brought L. G. under review, and the Local Government (Boundary Commission) Act, 1945, appointed a commission to review the whole structure of L. G. and its areas. The commission were empowered to make orders subject to confirmation by Parliament, for the purpose of establishing convenient and economic units of L. G. The commission consisted of five commissioners, and many eminent L. G. officers acted as assistant commissioners, and reports were pub. in 1947, 1948, and 1949. These reports contained recommendations dealing with the merger of certain co. councils, the constitution of a number of other co. councils for certain urban conurbations, the loss of co. bor. status for some existing co. bors., which it was proposed should become part of the co. organisation; but in 1949 the gov. decided to repeal the 1945 Act and do away with the commission. The gov. indicated that it was proposed to undertake a thorough review of the whole structure of L. G. with a view to introducing a comprehensive scheme for its reorganisation, and while no indication has been given as to what is intended it would appear that any proposals put forward must have regard to the findings of the L. G. Boundary Commission.

LOCAL GOVERNMENT IN ENGLAND AND WALES.—For purposes of L. G. England and Wales are divided into administrative cos. (62, including London) and co. bors. (83). The administrative cos. are further divided into non-co. bors. (309), urban dists. (572), and rural dists. (475). The rural dists. are divided into pars. controlled either by a par. council or by a par. meeting. Rural pars. having a pop. of more than 300 must have a par. council and rural pars. having between 200 and 300 pop. may require the co. council to establish a par. council, and below 200 pop. the co. council have a discretion as to whether or not a par. council is estab.; otherwise rural pars. with pops. of less than 300 are controlled by a par. meeting. There are 7000 rural pars. with par. councils and over 4000 controlled only by par. meetings.

The par. was an early unit of L. G. and was used for the purpose of implementing the Poor Law Act of 1801. Co. bors., bors., and urban dists. usually consist of more than one par., but there are no separate par. councils or par. meetings for the conduct of L. G. affairs, the control of these being vested in the co. bor., bor., or urban dist. council.

Broadly speaking, ignoring the co. bors., local administration is divided into cos., each governed by an elected co. council, and the cos. are divided into urban and rural co. dists., the former, as the name indicates, being those dists., urban in character, that is tns., and those are governed by bor. councils or by urban

dist. councils. Rural co. dists., as the name indicates, cover the rural areas of the co., that is the areas outside the tns., and these areas usually consist of a number of vils. The rural dist. is governed by a rural dist. council, but as the area is usually large it is divided up into pars., in most cases based on the vils., and those pars. are controlled by par. councils or by par. meetings.

Co. bor. councils stand apart from the co. councils as they are hors. which have been granted the status of co. councils for the area of the bor.

Present-day local authorities are general or 'omnibus' authorities. They are not designed to carry out only a specific service but they are bodies to which can be entrusted the carrying out of a number of services, the powers and duties in relation to those specific services being conferred by Acts of Parliament.

Qualifications of Local Government Electors and Councils.—The Representation of the People Act, 1948, has merged the par. and L. G. franchise so that all Brit. subjects over the age of twenty-one who are resident in the area on the qualifying date are entitled to be registered and vote as L. G. electors for that area. In addition there is a non-resident qualification for the purpose only of L. G. elections. Persons over the age of twenty-one years registered as electors or qualified to be registered as electors, with the exception of aliens, convicts, and adjudicated bankrupts, are eligible for election to the office of councillor. Co. council elections are held in April; co. bor. and bor. elections in May on a day which is the same for the whole of the country, and urban and rural dist. council elections on a day in May fixed by each co. council.

The Parish.—The L. G. unit known as the civil par. must be distinguished from the eccles. par. Originally their areas were co-terminus, but a series of statutes have made many alterations.

England and Wales are divided into civil pars. (urban and rural) for rating purposes, and these are the successors to the poor law pars. of Elizabethan days. The old parochial vestries have now lost all their L. G. functions, but still manage church matters, church property, and eccles. charities.

In urban areas the par. has now lost its significance in L. G. matters, but it is still an important L. G. unit in the rural areas.

The par. meeting consists of a meeting of all the L. G. electors for the par., and where there is no par. council the meeting must meet twice each year. The par. council consists of from five to fifteen members elected either at the par. meeting or, by order of the co. council, in the same way as councillors are elected to other local authorities. The chairman of the par. meeting is chosen by the meeting, but the chairman of the par. council is elected annually by the par. council from among its members, or from persons qualified to be councillors. Par. councillors hold office for three years, all retiring together. In every par. there must be an ann. par.

meeting and where there is a par. council the chairman of the par. council presides at the par. meeting. Decisions at par. meetings are taken by a show of hands, but five electors or one-third of those present at the meeting, whichever is the less, can demand at the meeting a poll of the par.

Where there is no par. council property is vested in the 'representative body' of the par., that is, the chairman of the par. meeting, and the member or members elected to the rural dist. council by the par. There must be two persons, and if the chairman and member of the rural dist. council are the same person, then the rural dist. council appoint a L. G. elector as the second member of the 'representative body', and on the direction of the par. meeting the 'representative body' may execute documents under seal. Where there is a par. council it is incorporated and its acts may be signified under the hands of, or if a seal is required under the hands and seal of, two members of the council. It manages secular parochial lands or buildings, provides a par. room or offices, and takes custody of all secular par. monuments of title. It can, with the par. meeting's consent, adopt the adoptive or permissive Acts for the provision of baths and washhouses, public libraries, and the making of public improvements. It can purchase compulsorily, with the consent of the co. council, land for the purpose of allotments, or hire land on the same terms, and if the co. council refuse their sanction can get permission from the Ministry of Health (*q.v.*, and see LANDS (LACHES ACTS; LANDLORD AND TENANT)). The sums required to meet the expenses of a par. council (other than expenses under the Adoptive Acts) may not, without the consent of the par. meeting, exceed an amount equal to a rate of 1/10 in the £ or such higher rate, not exceeding 8d., as the minister of health may allow; and a par. council cannot, without the consent of the par. meeting, and the approval of the co. council, incur any liability which would involve a loan. A par. council can provide recreation grounds and public walks; utilise any well, spring, or stream for the welfare of the inhab. (but not so as to interfere with private rights); drain and cleanse any stagnant pool, ditch, or pond; give its consent to the closing or diversion of highways (*q.v.*), and acquire by agreement a right of way.

Rural District Councils.—A rural dist. council is a body corporate with a common seal, consisting of a chairman and councillors. The councillors are elected for a period of three years and either one-third retire each year, or all retire together at the end of three years. The chairman is elected annually by the councillors and must either be a councillor or be eligible for election as a councillor. He is *ex officio* a justice of the peace for the co. during his period of office as chairman, and the council may pay to him, for the purpose of enabling him to meet the expenses of his office, such allowance as the council may think reasonable. The council is

required to appoint a clerk, a treasurer, a surveyor, a medical officer of health, and a sanitary inspector or inspectors, and such other officers as the council think necessary for the efficient discharge of the functions of the council. The council is required to meet four times each year, the ann. meeting being held in May. The main function of the council is the administration of the Public Health Acts, or Acts of a similar purpose. In this connection their duties consist in taking steps against the spread of infectious disease by enforcing the disinfection of houses and clothing; in regulating the carrying on of noxious trades, e.g. blood boilers, manure manufacturers, and tallow melters (see also FACTORY AND WORKSHOP ACTS); in forcing any householder whose house is within 100 ft. thereof to connect his drain with the main sewer; and generally in administering the Acts relating to dairies, factories, workshops, laundries, canal boats, cremation, alkali works, and brine pumping. (As to their powers see HOUSING ACTS.) They have extensive powers for supplying water within their dists., and may purchase or buy out existing water companies, and must provide and maintain sewers. (For their powers and duties in regard to highways see under HIGHWAYS.) They have supervisory powers over light railways; protect roadside wastes and rights of common; purchase land by agreement for allotments on the representation of the par. council; and proceed against persons or bodies for pollution of rivers. (If by factories or mines only with the consent of the Ministry of Health). They may make by-laws relative to the maintenance of public health, new street construction, erection of buildings, and removal of nuisances (as to relaxation of existing by-laws for the purpose of housing schemes see HOUSING ACTS); all by-laws require to be duly advertised and sanctioned by the Ministry of Health. Formerly the general expenses of a dist. council were paid from a fund to which the various pars. contributed, but the Rating and Valuation Act of 1925 provided for these expenses to be paid out of a consolidated general dist. rate. The dist. council may borrow for various purposes with the sanction of the Ministry of Health on the security of the rates. The council acts as rating authority for the rural dist.

Urban District Councils are similarly constituted to rural dist. councils, and they possess similar functions to the rural dist. councils, being bodies corporate with a common seal; but in some matters their public health powers are wider, and also they are highway authorities for dist. roads, and in many cases for classified roads, either as appointed by statute or by agreement with the co. council. Urban dist. councils are required to appoint similar officers to rural dist. councils. The constitution of urban dist. councils, including the election of chairman and councillors, is similar to that of rural dist. councils, and an allowance can be paid to the chairman of the council to meet the expenses of his office. The chairman of

the council is an *ex officio* justice of the peace for the co. during his period of office.

Borough Councils.—The most self-contained and compact unit for L. G., and indeed civic life generally, are urban dists. which have been incorporated by royal charter. The 'body corporate' consists of the mayor, aldermen, and burgesses, the latter term representing the L. G. electors of the bor., whereas in urban and rural dists. it is the council which is incorporated. However, a bor. can only act through its council, consisting of the mayor, aldermen, and councillors, and therefore the distinction is more apparent than real. The mayor is elected annually from among the members of the council or persons qualified to be councillors, and during his year of office and one year afterwards he is an *ex officio* justice of the peace for the bor. The mayor takes precedence in the bor. and presides at council meetings, and the council may pay to the mayor such remuneration as they think reasonable.

The aldermen constitute one-third the number of councillors, and hold office for 12 years, half retiring every three years; they are elected by the councillors either from the councillors or from persons qualified to be councillors. Aldermen cannot vote in the election of aldermen. The councillors are elected by the burgesses for periods of three years, one-third retiring annually; if the bor. is divided into wards then the number of councillors representing each ward is divisible by three.

The bor. council is required to appoint a (n. clerk, a bor. treasurer, a bor. surveyor, medical officer of health, and sanitary inspector or inspectors, and such other officers as the council consider necessary. Some bors. have their own police force, when they must appoint a watch committee and a bor. constable, while for others the police authority is that of the co. The bor. council must meet at least quarterly and the ann. meeting is held in May, after the elections held in the same month. Many bors. possess a quarter sessions court (see COUNTY SESSIONS), the advantage in such cases being that the bench is presided over by a trained lawyer selected by the home secretary, instead of by a bench of laymen. Nearly all bors. of any importance have a separate commission of the peace with power of appointing magistrates; those not so favoured are under the co. justices appointed by the lord chancellor. Some bors. also have a stipendiary magistrate appointed on the advice of the home secretary. Stipendiary magistrates act in the Metropolitan police courts outside the city of London; they may also be appointed for any urban dist. with a pop. of 25,000. The quarter sessions of London co. are presided over by a chairman or deputy chairman, whose salary is paid by the co. council, which latter body is responsible for the expenses of prosecution in cases of felony; in co. bors. the tn. council is liable for such expenses. The council of a bor. having its own quarter sessions, which is either a co. bor. or received its

grant of quarter sessions prior to the Local Government Act of 1888, must appoint a coroner. In other dists., including the co. of London, inquests are held by the coroners appointed by the co. council. Small bor., with less than 10,000 inhab., must keep their bor. sessions and magistrates' courts if they possess such courts, and also contribute to the court of quarter sessions for the co. Generally speaking bor. councils have all

the powers and are subject to all the duties of an urban dist. council, but over and above these they have additional powers in regard to explosives, fish conservation, inebriates, local stamps, industrial schools, asylums, motor-cars, weights and measures, and the Riot Damages Act. They also enjoy the privilege of making by-laws for the good rule and gov. of the bor., and for the suppression of nuisances not already punishable summarily by virtue of any Act in force within the bor.; though all such by-laws must be approved by the Home Office. The observance of these by-laws can be enforced by a fine not exceeding 4s. but not before they have been publicly promulgated for forty days in the manner prescribed by statute. Many bors. are justly proud of an exalted historic dignity, and can look back on an unbroken corporate life of over a thousand years. Others, however, have but recently

acquired that character by petitions referred to a committee of the privy council. As a rule the privy council do not recommend the issue of a charter to a tn. the pop. of which is less than 20,000.

County Borough Councils.—There are some eighty-three tns., each of which by virtue of having a pop. of 50,000 or upwards in 1888, or being an anct. L. G. co., is called a co. bor. Their councils are vested with the powers of co. councils and they are independent in most matters of the administrative cos. in which they are situated. They are governed by the general law applicable to bors., and their constitution is exactly the same.

The Local Government Act, 1888, constituted a number of co. bors. and other bors. were enabled to attain co. bor. status when they reached that pop., but in 1926 the pop. figure was raised to 75,000 and now the figure of 100,000 has been laid down. Bor. councils of this pop. figure can obtain the status of a co. bor. by private Act of Parliament.

London District.—London is, on a special footing. It is divided into the city of London, the authority for which is the unreformed corporation of common council, and twenty-eight metropolitan bors., including the city of Westminster, which were the creation of the London Government Act, 1899, and are governed by bor. councils. The entire area constitutes the administrative co. of London, the controlling authority of which is the London Co. Council.

County Councils.—The administrative co. does not necessarily coincide with the geographical co., as co. bors. are excluded, and also some geographical cos. have more than one co. council, e.g., Yorkshire is divided into three Ridings.

The co. council is a body corporate, consisting of a chairman elected annually by the council, either from the members of the council or persons eligible for election as councillors. He presides at meetings of the council and is *ex officio* a justice of the peace for the co., and may be paid such remuneration as the co. council think reasonable. The other members of the council are the aldermen and councillors, and the aldermen constitute one-third of the number of councillors, and are elected by the council from members of the council or persons eligible to be councillors and hold office for six years, half retiring every three years. An alderman cannot vote in the election of aldermen. Co. councillors are elected for three year periods by the L. G. electors, and retire simultaneously in the month of April. The co. council is divided into polling dists. and one councillor is elected for each polling dist.

The co. council is required to appoint a clerk of the council, who is usually also the clerk of the peace for the co., a co. treasurer, a co. surveyor, a co. medical officer of health, and other officers. The co. council carries out many important functions relating to public health, education, highways, small holdings, planning, fire and ambulance, libraries, food and drugs, etc., but some of these services are under-

taken by co. dist. councils by delegation from the co. council. Co. councils are responsible for classified and dist. roads in rural dists., but in bor. and many urban dists. the co. dist. councils are responsible, not only for the dist. roads, but for the maintenance of classified roads within their areas, either as authorities under the Local Government Act, 1929, or as delegated authorities by the co. council. The administration of the police force in the co. is exercised jointly with the justices of the peace in quarter sessions, the controlling body being known as the standing joint committee, consisting of equal numbers appointed by the co. council and the justices in the quarter sessions. The co. area is divided into petty sessional divs. for the administration of justice.

By virtue of the Local Government Act, 1948, members of local authorities other than par. councils may receive payment by way of (a) financial loss allowance where loss of earnings or additional expense (other than expense on travelling or subsistence) is necessarily incurred and (b) travelling allowance and subsistence allowance where expenditure on these items is necessarily incurred in the performance of any approved duty subject to maximum payments laid down by the minister of health. Records of payments may be inspected by electors.

Local Education Authorities.—The school boards created by the Elementary Education Act of 1870 gave place to the committees of tn. and dist. councils. Under the Education Act, 1902, the local education authorities were co. councils and bor. councils and in dists. of over 20,000 pop. the urban dist. councils. Under that Act the local education authority was empowered to promote higher as well as elementary education. The Act also enabled the education authority to establish education committees, constituted in accordance with a scheme made by the council, and approved by the Board of Education. The Education Act of 1918 varied and extended the powers and duties of Local Education Authorities (L.E.A.), and the questions of law concerning public education were consolidated by the Act of 1921. Under the Education Act of 1944 the Board of Education gave place to the newly created Ministry of Education, and the L.E.A. were confined to the co. councils and the co. bor. councils, with some few exceptions in the case of bors. and urban dists. with pops. of 60,000 or more. The urban dist. councils therefore lost the educational responsibilities granted to them under the 1902 Act. The co. councils were, however, empowered to delegate their functions to co. dist. councils set up for the purpose. The aim of this change in administration was to provide a more comprehensive system of primary and secondary education, both following a common interrelated policy. The L.E.A. under the 1944 Act were given responsibility for primary and secondary education extended up to the age of sixteen through the medium either of co. schools or of

voluntary schools which may be either controlled by the L.E.A. or aided. They are also required to provide education for persons over the age of sixteen by means of co. colleges and other institutions for commercial, technical, and art education. Special schools for the education of children with mental or physical disabilities were also put within the sphere of the L.E.A. (See under EDUCATION.)

LOCAL GOVERNMENT IN SCOTLAND.—The Scots L. G. law, like the Eng., is almost wholly statutory, and the main organs of administration are almost identical. Scotland was formerly divided into parrs. for purposes of public assistance and education, and into burghs and cos. for all other purposes of L. G. The Local Government (Scotland) Act, 1891, like the Eng. Act of the same date, re-adjusted the boundaries and relations of the various existing local bodies, and created new local bodies and a new central authority, the par. council superseding the parochial board and the L. G. Board (Scotland) the old Board of Supervision. In 'mixed' parrs. (partly urban and partly rural) a landward committee was appointed, composed of par. councillors elected for the rural wards. The urban par. councils' functions were practically confined to the administration of the poor law, but rural par. councils and landward committees exercised many of the functions of a tn. council. Under the Local Government (Scotland) Act of 1929, the par. councils were abolished. Under this Act local administration was divided between the co. councils (33), estab. in 1839, the burgh or tn. councils (195)—royal burghs (67), parls. (13), and police burghs (115)—and the dist. councils (199).

Royal burghs are those incorporated by royal charter, while parl. burghs are those created by the Reform Act of 1832, having the right to send members to Parliament. Police burghs are all other burghs with a pop. of 700 or more. The royal and parl. burghs are the Scottish equivalent of the Eng. co. bors., and the police burghs of the urban dists. and non-co. bors. The Act of 1929 transferred the function of maintaining a police force to the co. councils, except in large burghs, i.e. those with a pop. of 20,000 or more which appoint their own police forces. The tn. council of a burgh consists of the provost, bailies, and councillors. The provost, who is elected for three years, is the equivalent of the mayor in England and Wales, while the bailies, also elected for three years, are the equivalent of aldermen. The councillors are elected for three years, one-third retiring each year. The chief duties of a tn. council are those relating to public health, the maintenance, cleaning, and lighting of streets and footways, the maintenance of parks and public gardens, public libraries, and other public buildings, also sewernage, drainage, and the provision of a water supply. The tn. councils, except in large burghs, are not responsible for public assistance, which by the Act of 1929 was vested in co. councils. The tn. councils were made the rating authority for the burgh by the Rating (Scotland)

Act, 1926. Under this Act and the Local Government (Scotland) Act of 1929 all rates were leviable as one rate known as the consolidated rate of the area, but water rates continued to be leviable separately. All the money raised by the consolidated rate and other revenues of the rating authority are paid into 'the burgh fund,' and the expenditure of the tn. council payable out of the rates for each branch is defrayed out of this fund. Except where otherwise expressly provided all rates are payable by owners and occupiers in equal proportions.

The co. area for L. G. purposes is, generally speaking, the geographical co., excluding the royal and parl. burghs. Some smaller burghs and police burghs are, however, included in their cos for certain purposes and autonomous for others. Scots co. councils hold three statutory general meetings annually, but generally all the powers, except that of raising money, are delegated to committees. The functions of the co. councils are generally derived from the Local Government Acts of 1889 (under which the councils took over the administrative duties of the justices of the peace, and superseded the old Commissioners of Supply for all purposes except the management of the co. police force and the control, capital expenditure, and borrowing), 1894 (enabling co. councils to make orders for purchasing land, adjust or define the boundaries of par. wards, and entertain representations by par. councils as to leasing land for allotments, and as to lighting, scavenging streets, and maintaining baths and wash-houses), and subsequent Acts. The Commissioners of Supply were entirely superseded by the Act of 1929. Under this Act the par. councils and dist. boards of control were abolished, and their functions transferred to the co. councils, which were, with the approval of the secretary of state for Scotland, empowered to set up dist. councils to act as their agents. The co. councils were also, under the same Act, empowered to create standing committees for the exercise of their functions in regard to the police and in the administration of the poor law. The council also appoints a co. road board to control highways under its authority, but the detail of local maintenance is delegated to dist. committees. The council's powers over roads extend only over country roads, and those roads in small burghs which are classified as co. roads. The councils also exercise such powers under the Public Health Acts as were prior to 1889 exercised by the old parochial boards. In most other respects their powers are assimilated to those of independent tn. councils, and they may make a general assessment for public purposes, and levy a general purposes rate for any object not covered by any special rating statute.

Up to 1918 the local authority for education in Scotland was the parochial school board, which enjoyed compulsory powers for providing school premises and for continuation classes. But the Scottish machinery of educational adminis-

tration was reorganised by the Education (Scotland) Act of 1918 under which the school boards were abolished. Edinburgh, Glasgow, Aberdeen, Dundee, and Leith were left as separate educational areas (Leith has since been amalgamated with Edinburgh), but outside these four burghs the administrative area is the co. Most of the voluntary or denominational schools have been transferred to the education authority, an effective body, which delegates certain limited powers to school management committees.

LOCAL GOVERNMENT IN NORTHERN IRELAND.—The machinery for L. G. in N. Ireland is the same as in England and Wales, except that the function of the Board of Guardians in administering poor relief survives and has not as in England and Wales been transferred to the co. council. There are six co. councils and two co. bor. councils possessing the same powers and independent of each other. The non-co. bor. councils (5) and the urban dist. councils possess the same powers and have the normal responsibilities, being the rating authorities for their areas. The rural dist. councils (32) have those powers of the urban dist. councils applicable to rural areas, but have no power to levy rates.

LOCAL GOVERNMENT IN THE UNITED STATES.—The unit of L. G. in the N., especially in the New England states, is the rural township, governed directly by the voters, who assemble annually, or oftener if necessary, and legislate in local affairs, levy taxes, make appropriations, and appoint and instruct the local officials (selectmen, clerk, school committees, etc.). Where cities exist the township government, is superseded by the city government. Some 720 cities have 'city managers,' in whom are vested large executive powers. Townships are grouped to form cos., each with its commissioners and other paid officials who have control of public buildings, lay out highways, grant licences, and estimate and apportion the taxation necessary for co. purposes. In the S. the cos. are themselves the units of L. G., though subdivided for educational or other special purposes. In the middle and N.W. states the two systems are mixed.

For L. G. in other foreign countries see under the names of countries.

Local Government Board, see HEALTH, MINISTRY OF.

Local Option, or Local Veto, phrase used in political circles to denote the power extended in some countries to the electorate of specified dists to determine for themselves whether lic. ea. all liquor shall be allowed to be granted or not. This privilege exists in Canada and in Australia (see LIQUOR CONTROL) and is generally known as local prohibition. The only power in any way analogous to L. O. in England is that of the justices at Brewster sessions to refuse to grant or renew licences to obtain liquor licences. But the power or discretion is a strictly limited one (see LICENCES AND LICENSING LAWS). The one determined effort made to introduce such a system in England was in 1895 when Sir Wm Harcourt (then Chancellor of the exchequer) introduced his Intoxicating Liquor Traffic (Local Control) Bill. The idea underlying this Bill was that, if in a certain per two-thirds of the ratepayers voted for the prohibition of the granting of licences the votes should operate against the granting of all retail licences.

The principle of L. O. obtained before the First World War in Sweden and Norway, but in 1917 Norway resumed the sale of spirits which had been prohibited in 1916. It is a moot point whether reforms in those countries are to be traced to that system or to the co-existing 'Gothaburg' or company system. Under this system (called *Bolag* in Sweden and *Samlag* in Norway) the municipal authority is empowered to limit the number of licences and to sell them to a company formed *ad hoc*. This system applies exclusively to spirits, which, however, have always been the national drink. By 1906 about 100 tns in Sweden and 30 in Norway had adopted the system. L. O., however, was readily embraced in rural dists. in Sweden, where most of the people live, and it certainly produced good results. The power of local prohibition was introduced into Canada by the 'Scott Act,' and has been widely applied, though Ontario has since returned to 'wet' conditions. In Australia only Queensland has adopted L. O. and even that state has not applied it, while the other states either

have a limited kind of veto as to new licences or L. O. to reduce those existing. In Scotland under the Temperance (Scotland) Act, 1913, electors in moderate-sized dists are empowered to decide on the number of licences in their locality, and a requisition for a poll must be signed by at least 10 per cent of the electors. A resolution to limit licences must be passed by a resolution of 50 per cent of the electors while a majority of 50 per cent of the people can resolve to have no licences at all. But no poll was to take place till 1917, nor any house closed till 1918. The L. O. powers came into operation in June 1920. Out of 584 areas abolition of public houses was voted in forty. In the third poll, in 1926, no new areas secured a no licence order and the number of places 'dry' to day is but nominal. See *Parliamentary Debates* (vol. xxxii) 189, and E. A. Pratt, *Licensing and Temperance in Sweden, Norway, and Denmark*, 1907.

Local Rank see TEMPORARY RANK.

Local Taxation Grants, or grants in aid of local government expenditure. The list of grants in aid for local government dates from 1883; the local authorities receiving an annual grant towards their expenses in dealing with prisoners while prison administration remained under the partial control of the local authorities down to 1877. With the transfer of the prisons to national control this grant came to an end, but it was not till 1919 that the whole costs of the local police forces were subsidised to the extent of one half out of national funds; the grant for that purpose having been increased from 25 to 50 per cent as far back as 1874. Sir Robert Peel who was a strong believer in grants in aid for local government initiated a national grant towards poor law administration in 1846. Public health came within the sphere of grants in aid in 1872 when a grant was made in respect of sanitary inspectors. Peel wanted to extend the system to the upkeep of the main roads of the country, but it was not till Gladstone's time that the Commons agreed to paying a subsidy of £2,000,000 for this purpose (1852). With the institution of schools run by local authorities in 1870 the system of grants was applied to this branch of local government. By the end of the nineteenth century the grant in aid had thus been extended to the departments of education, police, poor law, public health and highways. New grants were added in respect of the treatment of mental deficiency in 1913, maternity and child welfare in 1915 and venereal disease in 1916 whilst the grants towards police and highways were extended in 1913 and 1923 respectively. This accumulation of grants was welcomed by some as a means of strengthening central control, as well as providing assistance to needy areas, but others condemned the system as tending to weaken local responsibility. Gladstone declared the whole system to be a vicious one and wanted to impose severe limits to future expansion. In 1889 when the new local councils were being established (Local Government Act, 1888) Goschen,

the chancellor of the exchequer, introduced a system under which certain taxes were earmarked for feeding the grants to local authorities, whilst future expansion of subsidy was to be limited to the amount of the increase in the product of these taxes due to the expansion of national trade. Under the Goschen system the 'assigned revenues' included all the little licence duties, e.g. for the sale of beer and wines, keeping of dogs, selling game, use of armorial bearings, and a sum equivalent to 10 per cent of probate duty on inherited estates. A further administrative change simplified the work of the central depts. by arranging for the payment of the grants not, as formerly, direct to each spending authority, but to the co. councils and the co. bor. councils, the cos. passing the money on to their constituent authorities. But the hope of calling a halt to future increases was dispelled in 1890 with the growing demand for secondary and technical education, and the 'assigned revenues' were increased by the imposition of new taxes on beer and whisky 80 per cent of the yield being allotted to the local authorities, whilst further grants were allocated for police pensions. But there followed a check on further advances for the next twenty years, though, under the surface of reaction, movements were developing which pointed to future changes conformably with the expansion of local gov. activities. In 1897 a royal commission was appointed to consider the whole system of imperial and local taxation, and it reported in 1901 in favour of considerable increases of grant for those services which were of national as distinct from purely local importance, i.e. poor law, education, police, and main roads. No action was taken, but ten years later a departmental committee of the Treasury reconsidered the whole question, and in 1914 drew up a scheme of classification of local services into national, semi-national and purely local services, assessing and allocating each particular grant on the basis of a block grant in accordance with the views of the minority report of the antecedent royal commission. Yet nothing was done to effect wholesale reform until 1929, when a revolutionary change was made in the grant system by the estab. of a formula for future assessment and apportionment.

The grants, with the exception of those in respect of education, police, and housing, were consolidated in the general exchequer grant, and a detailed formula was used for the distribution of this block grant, which was designed to benefit the poorer dists. The immediate cause of this overhaul of the grant system was the de-rating provisions of the Local Government (De-rating) Act, 1929, which would have involved the local gov. services in an enormous loss of revenue if it had not been also provided that the deficit should be made up by grants from the exchequer; and the occasion of the big transference of the burden from the farmers and industrialists involved under the above Act to the gov. funds was

utilised for a thorough examination of the whole system under which the various grants in aid were issued (*see also* De-rating). The Local Government Act, 1948, has replaced the general exchequer grant with an equalisation grant as from April 1, 1948, and this is distributed on a different formula even though it has the same objects as the earlier grant. Co. and co. bor. councils, with a rateable value per head of pop. below the average for the country receive a grant sufficient to compensate for their failure to reach that figure. Those above the average receive no grant other than a small transitional grant for five years. Co. councils distribute a proportion of the grant to the co. dist. councils. *See* bibliography for LOCAL GOVERNMENT.

Locarno, or Luggarus, tn. of Ticino, Switzerland, on Lago Maggiore (N.), 10 m. S.W. of Bellinzona. It is situated on the St. Gothard route. The church of Santa Maria del Sasso, founded in 1569, is a place of pilgrimages. Pop. 4000.

Locarno Conference and Treaties (1925). The L. T. represented an attempt to supplement the covenant of the League of Nations (*q.v.*) after the rejection of the protocol for the Pacific Settlement of International Disputes (1924). They purported to meet the Fr. demand for security, while at the same time involving Great Britain in only the most specifically limited obligations. The Locarno agreements comprised a treaty of mutual guarantee between Germany, Belgium, Great Britain, France, and Italy, arbitration conventions between Germany and Belgium and Germany and France, and arbitration treaties between Germany and Poland and Germany and Czechoslovakia. At the conference the first difficulty arose out of the question whether the Three Power Pact of Security, proposed between Great Britain, France, and Belgium, was to be bilateral or unilateral in character; Fr. opinion interpreted the guarantee of the 'present territorial status on the Rhineland' as a guarantee of Fr. and Belgian frontiers from Ger. attack, but Austen Chamberlain, for Great Britain, contended that the pact was a guarantee equally that the Rhineland frontiers should not be violated by France. In the course of this discussion came Germany's offer to join in a larger pact or treaty of mutual guarantee, signed by five powers, and, in the result, the obligation was made bilateral. The intention of Germany was to limit the pact to the Rhineland frontiers, but as regarded the E. she was only prepared to enter into arbitration treaties, and would not promise to maintain perpetually the territorial settlement on the E. The Brit. Gov., for its part, declined to enter openly upon obligations as guarantor of the territorial settlement elsewhere than on the Rhineland, whereas Briand, for France, saw no distinction between E. and W., and insisted that Fr. security could be guaranteed only by permanence of the E. settlement. In the result a compromise was arrived at to meet the Fr. demand, while limiting the Brit. obligations, France

being given an opportunity of claiming the right to assist Poland in the event of a breach of the Polish-Ger. arbitration treaty. An important article of the treaty of guarantee was that which provided that neither the obligation nor the right to take up arms would arise until negotiations for pacific settlement had been tried and failed; but the parties had the right to take immediate action against an aggressor in certain events, as, for example, in the case of an unprovoked act of aggression or by the assembly of armed forces in the demilitarised zones. Finally an important outcome of the conference was the admission of Germany to the League of Nations, and it was provided that the new engagement should come into force only when Germany had become a member. At the time of their conclusion it was widely believed that the L. T. were an effective instrument for peace in Europe, though critics (the so-called 'Isolationists') erroneously assumed that if Britain undertook no commitments or obligations to aid an attacked power, she might escape being involved in another European war. But the L. T. themselves had no inherent efficacy in bringing about the requisite contacts between govts., any more than had the League of Nations. But for some years the Fr. and Brit. Govs. refused to be disillusioned and the Brit. Gov. supported Barthou's (q.v.) proposals for an E. Locarno pact, both powers believing that these proposals would strengthen the collective system of the League and bring about Russian membership. One fundamental weakness of the L. T. lay in the E. compromise, for it should have been obvious that Germany would never accept, for all time, the Versailles territorial settlement interposing the Polish corridor between E. and W. Prussia and, in the event of a conflict over this question, it was difficult to see how Britain could avoid being drawn into war. In 1935 the Brit. Gov. discussed strengthening the Locarno Pact so as to make it specifically applicable to air attacks, but Germany refused (1936) to join in negotiations for such a pact, using the impending conclusion of the Franco-Soviet pact as a justification for denouncing the L. T. and thereafter proceeded to assert her unrestricted sovereignty over the demilitarised zone of the Rhineland, in token whereof Ger. troops had already been drafted in large numbers into that dist. Thus contrary to the Rhineland agreement empowering France to refer such questions to the League the Ger. Gov. penetrated the Rhineland *ins. so* as to present the other govts. with a *fait accompli*. Thus disappeared both the letter and the spirit of the short-lived L. T. See K. Strupp, *Das Werk von Locarno*, 1926; H. J. Ralston, *International Arbitration from Athens to Locarno*, 1929; Viscount d'Abernon, *Memoirs*, 1930; and A. François-Poncet, *Souvenirs d'une ambassade à Berlin*, 1946.

Loch, Henry Brougham, first Baron (1827-1900), Brit. administrator, b. at Drylaw, Midlothian. He served in the Sudan campaign of 1845, and throughout

the Crimean war in 1854. Dispatched on a special mission to China, he was, together with a small band, treacherously seized by Chinese officials while returning from Tung-chen, and endured terrible imprisonment for three weeks. The hardships he suffered left a mark on him all his life. In 1861 he quitted the army and became private secretary to Sir George Grey, secretary of state at the Home Office. From 1863 to 1882 he was governor of the Isle of Man. In 1884 Gladstone sent him to Australia as governor of Victoria, an office he filled for five years. In 1889 he became governor of the Cape and high commissioner in S. Africa, the most striking incident of this part of his career being his mission to Pretoria in 1891. He left Africa in 1895 and returned to England, when he was raised to the peerage.

British Railways

LOCHABER: THE HEAD OF GLEN NEVIS

Lochaber, wild, mountainous dist. of S. Inverness-shire, Scotland, with beautiful glens and moors, near Lochs Linnhe, Leven, and Eil. In 1926 was begun the L. hydro-electric power scheme. Two main dams contain the waters of Loch Treig and Loch Laggan, and it is conveyed by a 15-m. tunnel, the largest in the Brit. Empire, to a power plant at Fort William. The total catchment area is 300 sq. m. and the plant has a potential h.p. of 100,000. The power is used for the manuf. of aluminium in electric furnaces.

Loches (anc. Leuces), tn. in Indre-et-Loire dept., France, on the Indre, 23 m. S.E. of Tours. It has an old fifteenth-century castle and fortress within which is the tenth-century church of St. Ours. Beaulieu abbey is across the riv. There was a Rom. settlement at L. Pop. 3500.

Lochgelly, police bor. of Auchtermerran par. and tn. of S.W. Fifeshire, Scotland, 7 m. N.E. of Dunfermline. It has coal-mines, iron works, and blast furnaces. Pop. 9,200.

Lochleven, see **LEVEN**, **LOCH**.
Lochmaben, royal and police bor. of

Dumfriesshire, Scotland, 8 m. N.E. of Dumfries. In Castle Loch are the ruins of L. Castle, the traditional bp. of Robert Bruce. Pop. 2500.

Lock, Matthew, *see* LOCKE.

Lock is used, in its original sense of an enclosure or barrier, for a length of water in a riv. or canal enclosed at both ends by gates, the 'L. gates,' and fitted with sluices to render possible the raising of vessels from a lower to a higher water level or the reverse. *See* CANAL.

Lock, *see* GUN.

Locke, John (1632-1704), Eng. philosopher, b. at Wrington in Somerset. L. was at Westminster School from 1646 to 1652, when he entered Christ Church, Oxford. After taking his M.A. in 1658 he became a tutor of Christ Church in Gk. and philosophy. He early showed a dislike for the scholasticism of men like John Owen, the Puritan dean of Christ Church, and, though inclined towards an eccles. career, became interested in experimental inquiries, and for a time practised medicine in Oxford, though he never took his doctor's degree. During the summer of 1666 he met Lord Ashley, afterwards earl of Shaftesbury, and later became his confidential secretary, remaining with him for fifteen years.

While Shaftesbury was in power L. was appointed secretary of the board of trade (1672), but on Shaftesbury's fall in 1675 L. was deprived of office and of his Oxford studentship, and was obliged to find a retreat abroad. At Montpellier and Paris he devoted his time to study and writing. In 1679, Shaftesbury having been restored to power, he returned to England, and, though he took no part in the political plots of the following years, he was under suspicion as the friend of that prominent statesman. In 1683 he withdrew to Holland, which was then the refuge of many men who were not allowed freedom of thought in their own country. After the revolution of 1688 he returned to England, and was rewarded with a commissionership of appeals. L. now appeared, late in life, as an author, and won European fame. In 1689 his *Epistola de Tolerantia*, dedicated to Limborch (q.v.), the champion of Liberal theology in Holland, was trans. into Eng., and was followed in 1690 by *Two Treatises of Government* and the *Essay concerning Human Understanding*. The *Letter on Tolerance* had called forth an *Answer* from Jonas Proast, and L. contributed to the controversy that ensured a *Second* (1690) and a *Third Letter* (1692). Meanwhile his health was failing, and in 1691 he took up his permanent abode at Oates in Essex, the country seat of Sir Francis Masham. In 1693 he pub. *Some Thoughts concerning Education*, which were collected from a series of letters he had written from Holland to Edward Clark of Chipley concerning the education of his son.

Two years later he pub. anonymously *The Reasonableness of Christianity*, endeavouring to separate fact from dogma. This treatise also evoked a controversy, and L. defended himself in a *Vindication* (1695) and a *Second Vindication* (1697).

During 1696-1700, when he was busy with his duties as a commissioner of trade and plantations, he pub. answers to his various critics, an *Examination* of Malebranche's philosophy, additions to and alterations of his *Essay*, and wrote his *Conduct of the Understanding* (first printed in *Posthumous Works*, 1706). In 1700 he retired from public office, and during the remaining four years of his life spent much time in meditation and in close study of the Bible. He was buried in the par. church of High Laver, about a mile distant from Oates.

The object of the *Essay* is to examine the character of thinking and the extent of our abilities in thought, and L. took an empiricist and materialist standpoint, arguing that experience is the sole original

JOHN LOCKE

Engraving after a picture by Sir Godfrey Kneller.

source of knowledge. In his *Tolerance* he urges that there should be no disability attached to religious belief. The individual's absolute freedom of religious thought, which is widely taken for granted to-day, has been achieved by means of L.'s advocacy. His political philosophy, contained in the *Two Treatises of Government*, is based upon the doctrine of the ultimate sovereignty of the governed, and had a profound effect upon the future course of political thought and upon the constitution of the U.S.A. His method of presenting his ideas is straightforward and vigorous, but his style is lacking in grace.

L. left his papers and correspondence to his cousin Peter King (afterwards the seventh Baron King). These MSS., almost intact, were eventually deposited by their subsequent owner, Lord Lovelace, in 1942 in the Bodleian Library for which they were purchased later through the Pilgrim Trust in 1948. The Lovelace collection was already partly known through the medium of the *Life and Letters of John Locke*, which Lord King pub. in 1828. H. R. Fox-Bourne was not allowed access to them. Exhaustive reports of selected

papers, with a view to pub., have been made by Dr. W. von Leyden of Durham Univ. Of this collection there are ten journals, which form a record of L.'s life from 1675 until his death. Lord King printed long extracts from them, though only up to 1687. In addition to the journals there are twenty-eight of L.'s note-books, written in a shorthand to which Dr. von Leyden has found the key. It is from these note-books and from numerous loose papers in the collection that most new light can be thrown on L.'s writings. It was L.'s practice to enter in his note-books drafts of the treatises he wrote; thus while the *Essay concerning Human Understanding* was first pub. in 1690, the draft of it in Locke's note-books dates from 1670. Other treatises written by L. and as yet unpublished go to supplement the *Essay*, which deals but briefly with the ideas of pleasure and pain, their fuller treatment being reserved for a *Discourse on the Passions* and that *Discourse* is now found in the collection though it may not have the final form which L. would have given it. Of still greater interest is his hitherto unknown treatise, *The Law of Nature*, written in 1660-64. In this brief treatise he wrote his views on morality and knowledge almost thirty years before his first book appeared, and its discovery explains the curious absence from his published work of any detailed discussion of that natural law which forms the basis of his whole system. There is, however, nothing that bears upon his work as an educational reformer and little to throw new light on the political thought contained in the *Treatises on Government* (see *The Times*, Jan. 12, 1948). See also *INNATE IDEAS*.

L.'s works were first collected in 1714 in 3 vols. The best ed. is that of Bishop Law (1777); and there are eds. of *The Philosophical Works*, ed. by J. A. St. John (1843, 1854), and of *The Educational Writings*, ed. by J. W. Adamson 1912, 1922. The *Essay*, which has been trans. into most European languages, has passed through numerous eds., of which the best is probably Prof. Campbell Fraser's, with annotations (1894). See Jean le Clerc, *Bibliothèque choisie*, 1716; G. W. von Leibnitz, 'Nouveaux Essais sur l'entendement humain' in *Œuvres philosophiques*, ed. by R. E. Raspe, 1765. Sir W. Osler, *John Locke as a Physician*, 1901; J. Gibson, *Locke's Theory of Knowledge and its Historical Relations*, 1917; S. G. Hefelbower, *The Relation of John Locke in English Deism*, 1918; and K. MacLean, *John Locke and English Literature of the Eighteenth Century*, 1936; also lives by T. Fowler, 1880; A. O. Fraser, 1890; S. Alexander, 1908; and R. I. Aaron, 1937.

Locke, or Lock, Matthew (c. 1630-77), Eng. composer, b. at Exeter. He learnt music as a choir-boy at Exeter Cathedral under Edward Gibbons, and may afterwards have been a pupil of Wm. Wake there. He went to London c. 1650, and in 1653 collaborated in Shirley's masque *Cupid and Death* performed before the Portuguese ambas. In 1656 Wake, who had become a gentleman of the

Chapel Royal, asked him to write the *Little Consort* for viols in three parts for his pupils, and the same year he was one of the composers who took part in the setting of Davenant's *Steele of Rhodes*. For Charles II.'s coronation in 1661 he wrote instrumental music for the procession and was appointed composer in ordinary to the king. In 1663, having turned Rom. Catholic, he became organist to Queen Catherine. He was a vigorous and acrimonious defender of 'modern music,' writing in 1666 a pamphlet defending his church music and in 1672 opening a controversy with Thomas Salmon. Purcell wrote an elegy on his death. His works include anthems; Lat. hymns; consorts for viols in three and four parts (the latter in six suites); songs in three parts, duets; airs and songs for one voice with accompaniment, etc.

Locke, William John (1863-1930), Eng. novelist and playwright, b. at Georgetown, Demerara, W. Indies. Educated in Trinidad and at Cambridge Univ., he was a master at Glenalmond School, and later secretary to the Royal Institute of Brit. Architects. During the later part of his life he lived on the Riviera. His most popular novels include *At the Gate of Samaria* (1895); *The Morals of Marcus Ordeyne* (1903), later dramatised; *The Beloved Fagabond* (1908), later dramatised; *Septimus* (1909); *The Joyous Adventures of Aristide Puyol* (1912); *Stella Maris* (1913); *The Wonderful Year* (1916); *The Rough Road* (1918); *The Great Pandolfo* (1925); and *The Old Bridge* (1926). In 1930 he issued a vol. of short stories, *The Town of Tombarel*, and after his death appeared *The Shorn Lamb* (1931). His chief play was *The Man from the Sea* (1910).

Lockerbie, tn. of Annandale, Dumfriesshire, Scotland, 3½ m. from Lochmaben. The largest lamb fair in Scotland was held there annually in August. Pop. 2690.

Locker-Lampson, Frederick (1821-95), Eng. poet. In 1857 he pub. *London Lyrics*, a collection of charming light verse. He compiled *Lyra-Elegantiarum* (1867), an anthology of light verse, and *Patchwork* (1879), a selection of prose passages. *My Confidences*, an informal autobiography, appeared posthumously (1896) with a preface by his son-in-law, Augustine Birrell. In 1886 he printed a catalogue of his famous library at Rowfant. See A. C. Swinburne, *Studies in Prose and Poetry*, 1894, and A. Birrell, *Frederick Locker-Lampson: a Character Sketch*, 1920.

Lockhart, John Gibson (1794-1854), Scottish author and editor, b. at Cambusnethan. He was an early contributor to *Blackwood's Magazine* (founded 1817). In 1818 he met Walter Scott, and two years later married the novelist's eldest daughter, Sophia. He wrote many articles and novels, and in 1825 accepted the editorship of the *Quarterly Review*, and settled in London. He did not retire from the control of the *Quarterly* until 1833. In 1828 appeared his biography of Robert Burns; in the following year he contributed to Murray's *Family Library* a *History of Napoleon Bonaparte*, and in 1832 issued the *History of the late War*,

including *Sketches of Buonaparte, Nelson, and Wellington—for Children*. His greatest work was the *Memoirs of the Life of Sir Walter Scott* (7 vols., 1837-38), a biography which ranks second only to Boswell's *Johnson*. Very generously L. made over the profits of this book to the creditors of Sir Walter Scott. As a novelist L. was not particularly successful, but *Some Passages in the Life of Mr. Adam Blair* (1822) repays perusal. See S. Smiles, *A Publisher and his Friends*, 1891, and A. Lang, *The Life and Letters of John Gibson Lockhart*, 1897.

Lockhart, Sir William Stephen Alexander (1841-1900), Brit. general, entered the Indian (Bengal) Army in 1858, and served in the Indian mutiny, the Bhutan campaign (1864-66), and the Abyssinian expedition (1867-68). He won fame also in the Afghan war (1878-80) and the third Burmese war (1886-87). From 1890 to 1895 he commanded the Punjab frontier force, and became commander-in-chief in India (1898), after conducting the Tirah campaign.

Lock Haven, co. seat of Clinton co., Pennsylvania, U.S.A., on the Susquehanna R., 20 m. W.S.W. of Williamsport. It has dye works and silk and woollen mills. Pop. 10,800.

Lock Hospital, leper hospital, known as the Lock Lazar Hospital, was in Southwark as early as 1453. It was later turned into a hospital for the treatment of venereal diseases, in which sense only the term 'Lock Hospital' was subsequently used. In 1949 it ceased to exist, and its building was handed over to the W. London Hospital for Nervous Diseases.

Lockjaw, see TETANUS; in horses see under HORSE (DISEASES).

Lock-outs, see STRIKES AND LOCK-OUTS.
Lockport, co. seat of Niagara co., New York, U.S.A., 22 m. E.N.E. of Buffalo, on the Erie Canal. There are mills and manufs. of indurated fibre ware, steel, etc. Pop. 24,400.

Locks and Keys. A lock is a fastening which consists of a bolt held by one or more movable parts in a certain position, and requiring a key which will manipulate these movable parts in the required way, before they can be actuated. The most primitive forms of fastening were by means of knotted thongs or a wooden or metal bar placed across the inside of a door. The modern lock is the product of evolution from such a bar, sliding in staples and entering a hole in the door-post. A curved key, in shape somewhat like a sickle, was used to move such a bar, and examples have been found in many parts of N. Europe. The earliest L. of all are probably the Chinese, of which some specimens still extant are as secure as any made in Europe up to the eighteenth century. Some Egyptian L. are known to be 4000 years old, and L. on the Egyptian plan may be found in many parts of Europe. The Egyptians inserted a portion of the hole into which the key was inserted were inserted hollow, and the key was inserted upon it correspondingly. The key was inserted into the hole of the bolt. The

Roms. based their L. on the principle as the Egyptians, but the bolt is smaller and the dropping pins are pressed downwards by a spring.

The early Eng. and medieval keys were the forerunners of the modern keys from a mechanical point of view. In the L. of this period a pivoted tumbler is used instead of dropping pins. A number of impediments contained in the lock case were from an early period interposed between the key and the bolt; these are called wards, and the portion of the key which enters the lock is formed so as to escape them. Robert Barron improved the mechanism of L. in 1774 by placing two levers to guard the bolt, instead of only one, as had previously been done; and he also made it necessary for the levers to be lifted up to the right height exactly before the bolt could be turned. The Bramah lock of 1784, invented by Joseph Bramah (1749-1814), marks the next stage in the improvement of L. A number (generally six) of thin metal plates called sliders, the notches in which must be brought into certain positions before the key could be used, formed the distinguishing feature of the lock. The Chubb lock was patented in 1818, and since then has been many times altered and improved. It is a tumbler lock, and has more tumblers than usual with the addition of a lever called the detector. This is so placed that it moves and fixes the bolt if any of the tumblers be lifted a little too high. Notice is thus given of any attempt at picking the lock, even if unsuccessful, as the rightful key will not then open the lock until it has first been turned the reverse way. Both the Bramah and Chubb L. were erroneously thought to be 'unpickable.' The Yale lock was an Amer. invention of about 1860. It is also a tumbler lock, but the small flat key and the keyway interlock throughout their length owing to their peculiar cross section. When it is necessary to have a series of L. which shall all have their own separate keys, but also one master key which will open them all, one of two methods may be used for the latter. The wards of each lock may be different so that each key will fit only one lock, whilst the master key will have the bit filed off and so fit all the locks. This is open to the objection that any of the subordinate keys may be made into a master key by filing off the right piece. The other method is to make all the levers of each lock alike save one; another 'gating' is cut in the differing levers so that the master key, which is specially cut, will fit all the L. In safe deposits, unless a fresh lock were to be fitted every time a safe changed hands, which would be a troublesome and expensive proceeding, some invention by which the key of the out-going tenant of the safe might be rendered useless was necessary. Such an invention was patented by H. Newell in 1841, and introduced into Great Britain by A. C. Hobbs in 1881. The Chatswood Safe Company have for many years made an improved form of changeable key L. L. in which the internal parts were

arranged in their right position by the manipulation of external parts which were marked with letters, numbers, or other device have been common in China from remote antiquity, but the hist. of their invention remains obscure. Such L. are, of course, the predecessors of the combination L. which have been brought to such a degree of excellence in America. Blocks of metal corresponding to the different letters of the alphabet are introduced into the lock, and the person locking the door places these to spell any word or combination of letters he chooses. When the door is once locked no person can open the door without a knowledge of the same word as was used in shutting it, even if he has the key. Combination L. are also made in which the mere fact of setting the dial, mounted on the spindle which passes through the door to work the wheels, in the right manner opens or closes the door, no key being required.

The application of time to L., so that the period during which a door remains locked may be exactly predetermined, is a recent invention, and is very suitable for strong-rooms, etc., which can thus be locked during the night. Time L. are worked by a high-class chronometer movement, not liable to get out of order easily, which drives a disk provided with gating which the bolt can only enter at the time desired. One movement is sufficient to work a time lock, but three or four are usually provided. When once a time lock has been set it cannot be opened until the appointed hour by any key whatsoever.

Lockyer, Sir (Joseph) Norman (1836-1920), Brit. astronomer, b. May 17 at Rugby, son of Joseph Hooley L., an early worker on the electric telegraph. Educated at private schools and on the Continent, he entered the War Office in 1857; in 1865 he became editor of *Army Regulations*. In 1869 he was made F.R.S. and founded *Nature*, the scientific weekly. Transferred to science and art dept. in 1875, he became director of the solar physics observatory, S. Kensington, 1885-1913, and afterwards director of the Lill Observatory, Salcombe Regis. His researches are recorded in over 200 papers (mostly pub. of the Royal Society), and entailed many long journeys to observe eclipses. See life by M. and W. Lockyer, 1928.

Locomotive Engines, see under STEAM ENGINES.

Locomotives, see under RAILWAYS; STEAM ENGINES.

Locomotor Ataxia, in medicine caused by syphilis, of which L. A. is a late manifestation. The chief symptoms are the want of co-ordination of the muscular movements, from which the disease gets its name, but the eyes and other special senses are also disturbed. The disease may come on quite gradually and remain in any of its stages, but continued progress leads to paralysis. One of the earliest signs is the inability of the patient to stand upright with his feet together and his eyes closed; the pupil of the eye fails to contract in response to a bright light,

and the knee-jerk reflex is diminished. Anti-syphilitic treatment should be instituted and attention paid to the patient's general health. The posterior (sensory) columns of the spinal cord are the sites particularly affected; by careful training, as in Prof. Frenkel's method, it is sometimes possible to institute new paths in the spinal cord to replace those destroyed by the disease.

Loeri, two distinct tribes of ant. Greece; one occupied the dist. from the N.E. of Parnassus along the coast of the Maline Gulf, enclosed on the W. by Doris and Phocis, while the other occupied the dist. S.W. of Parnassus, on the N. shore of the Corinthian Gulf between Phocis and Aetolia. The former were divided into the L. Epimenidai to the N. and the L. Opuntii, from their cap. Opus, to the S., and they are mentioned by Homer. The latter, the L. Ozolae, do not appear in hist. until the Peloponnesian war. A colony called L. Epizephyrii, from which tribe is unknown, under the leader, Euanthes, settled in S. Italy, N. of Cape Zephyrium, about 683 B.C. It had a famous code of laws given by Zaleucus in 661 B.C.

Locse (Ger. Leutschau), tn. in Zips co., Czechoslovakia, near a trib. of the Hernad, 125 m. N.E. of Pest. It has a church dating from the thirteenth century. Pop. 6910.

Locus, in mathematics the line traversed or surface covered by a point limited in its motion by definite conditions. The L. of a point moving subject to the condition of constant distance from another, but fixed, point is the surface of a sphere; if, on the other hand, it be restricted to motion in one plane only, the L. will be the circumference of a circle. Every curve is the L. of a point constrained in motion and the investigation of the conditions is considered in analytical geometry.

Locus Standi, literally, a place of standing: (1) In law means the right of audience in a lawsuit. No counsel has a right to say anything during the hearing of a case unless he has been 'briefed' or instructed by solicitors acting for one or other of the litigating parties. A counsel who holds a 'watching brief' for parties interested, but not actually on the record as parties to the suit, may, like any member of the public, hear the evidence, but, having no L. S., he may not speak. (2) In parl. practice a term used in regard to the right of petitioners to be heard against private Bills in the House of Commons. Questions on the L. S. of the petitioners are heard by the committee (see COMMITTEES, PARLIAMENTARY) to which the bill is referred.

Locust, orthopterous (straight-winged) insect of the family Acrididae, closely allied to the grasshoppers (Tettigonidae), characterised by long antennae and typified by the great green grasshopper (*Tettigonia viridissima*). The true L. have short antennae, the head has three ocelli on the forehead, and the female lacks a projecting ovipositor. Perhaps their most remarkable physiological feature is the large apertures in the first segment of the

abdomen containing organs which undoubtedly possess auditory functions. The 'chirping' is produced by working the hind legs so that the thigms, on which are minute teeth pass over the wing cases. A number of species are responsible for the terrible ravages which, since agriculture began, have made *Locusta* its most feared enemies. The best known European species is the migratory *L. (Locusta migratoria)*, which is also widely distributed in other countries, and it may be said that *L.* range from the W. of Europe to China, while the Amer continents including Canada, are not infrequently visited by devastating migrations. When a migration occurs, probably owing to increasing density of pop in the solitary

phase of the insect, whereby the gregarious phase arises, the insects will eat anything that is green and, if need be, will devour animal substances, including their own young. The larvae, which hatch from eggs laid by the female in a hole in the ground, are destructive from the first. They resemble the parents except that they lack wings, and advantage is taken of this in waging war on the plants. While wingless they cannot surmount smooth surfaces, and the line of march of the migratory horde is intercepted by canvas screens 4 ft high. When they try to pass round the obstacle they fall into deep pits where they rapidly collect, and the pits are covered with earth when nearly full. Poison bait consisting of bran mixed with arsenic or 'gam maxane' is also used to destroy the 'hoppers,' as these immature flightless forms are called. Attempts have been made to spray both hoppers and flying swarms with poison dust from aircraft. Biological control has also been tried, e.g. by the fungus *Empusa grylla*, which parasitises the *L.* Elaborate systems of giving warning of the

approach of a migratory horde enable full precautions to be taken, and many well farmed districts claim that the screen method of destruction has had extraordinary success, though it cannot check the aerial migrations of adults. Swarms in the air have been known to darken the sun.

The periodicity of the appearance of migratory *L.* has been the subject of much speculation; it is governed by the rapid increase in their numbers and some divide their visitations in multiples of eleven, but, with the spread of systematic agriculture and persecution of the pests, any definite periodicity grows less likely. The activities of the anti-*L.* research centre at the Natural Hist Museum in Kensington, in charge of B. P. Uvarov (1949) are largely directed to tracing the headquarters of the solitary phase of the different species and so preventing migration. It is known, for instance, that the middle Niger is the breeding ground of *L. migratoria*. Similar work was initiated in the U.S.A. by C. V. Riley (q.v.), the state entomologist of Missouri. See also *ENTOMOLOGY*. See B. P. Uvarov, *Locusts and Grasshoppers*, 1928 and *Locust Outbreak in Africa and West Asia 1915-31*, 1933, and fourth report of Commission on Locust Control, 1932 (cmd 4124).

Locust Tree, see *ACACIA*.

Lodelinsart, Belgian tn., situated in Halnaut, 2 m N. of Charleroi. It has coal mines and blast furnaces, its chief industries are iron, glass, and machinery. Pop 10,700.

Lodes. Metals and metallic ores are usually found in cracks in the rocks of the earth's crust. *Lode* is the miner's term for these veins, as distinguished from non-metalliferous veins. The thickness varies from a few inches to hundreds of feet. Veins may traverse every kind of rock. They seldom run parallel to the bedding, but more or less vertically, though the branching is very varied and irregular, as also is their persistence and thickness. In contorted strata the veins may run along the bedding planes. There is no proof that the mineral deposits have intruded in a molten state from below; probably in most cases they are deposited from infiltrated solutions obtained from the surrounding strata or from deeper sources by mineral springs which have dissolved the mineral constituents from igneous rocks. The material often shows aggregated layers due to successive stages of deposit. The richness of a lode is extremely variable, but in general the portions nearer the surface which have been subject to attrition and exposed to oxidation by the atmosphere or to action of water, have waste matters (gangue) removed, the heavier minerals remaining collected together. They are, further, in the form of oxides and carbonates, and much more easily subject to extraction of the metal than the unoxidised sulphides, arsenides, etc., which are found deeper. Some rocks are so filled by reticulated masses of veins as to render them totally unworkable. The working of *L.* is very frequently rendered troublesome by the

appearance of faults (q.v.), but the same disturbances are useful in giving surface indications of their existence as mineral ores below. Thus dykes, cliffs, and steep valleys due to faults are surface valleys of veined rocks. Prospecting for such deposits is a matter of searching for the slightest and often very indirect indications, among which may be mentioned the stones washed down the beds of streams, mineral springs, the presence in soils of disintegrated and chemically transformed products, and the growth of plants feeding on such soils. Magnetic iron is indicated by the magnetic needle. See J. Phillips, *Treatise on Ore Deposits* (ed. by H. Louis), 1896; J. F. Kemp, *Ore Deposits of the United States*, 1900; H. H. Thomas and D. A. McAlister, *Geology of Ore Deposits*, 1909; F. H. Hatch, *Study of Ore Deposits*, 1929; T. Cook, *Theory of Ore Deposits*, 1933; and geological works of Sir C. Lyell, Sir J. Prestwich, and Sir A. Geikie.

Lodestone, see MAGNETITE.

Lodève (anc. Lutetia, later Forum Neronis), tn. in the dept. of Hérault, France, 36 m. W.N.W. of Montpellier. It has manufs. of arms, clothing and woollens, wine and spirits. Pop. 7000.

Lodge, Edmund (1756-1839), Eng. genealogist, b. in London. He became successively Lancaster herald, Norroy king-of-arms, Clarenceux king-of-arms, and in 1832 knight of the order of the Guelphs of Hanover. He is best known as the author of the *Portraits of Illustrious Personages of Great Britain* (1821-34). He also ed. *Illustrations of British History, Biography, and Manners in the Reigns of Henry VIII., Edward VI., Mary, Elizabeth, and James I.* (1791-1838). His chief work on heraldry was *The Genealogy of the Existing British Peerage* (1859).

Lodge, Henry Cabot (1850-1924), Amer. historian and sonator; b. May 12 at Boston, Massachusetts. Admitted to the Bar in 1876, he was Republican member of Congress, 1897-93, member of the House of Representatives, Massachusetts, 1880-1881, and U.S. senator from 1893 until his death. He was, before the First World War, strongly anti-Brit. During the war he was opposed to 'negotiated' peace; and it was he who, at the end of 1918, began the campaign that ended in America's rejection of the treaty of Versailles and the whole of President Wilson's foreign policy. His publs. include *Essays on Anglo-Saxon Law* (1876); *Life and Letters of George Cabot* (1878); *George Washington* (1889); *Daniel Webster* (1891); *History of Boston* (1891); *Historical and Political Essays* (1892); *Hero Tales from American History* (1895); *A Fighting Frigate, and other Essays and Addresses* (1902); and *Early Memories*, 1914.

Lodge, Sir Oliver Joseph (1851-1940), Eng. physicist, b. at Penkhull, Staffordshire, eldest son of Oliver L. of Wolstanton. He was educated at Newport (Salop) Grammar School and Univ. College, London. At the latter institution, which he attended after the hours of the business in which he was engaged, he graduated B.Sc., taking honours in physics. He

then studied in Prof. Carey's laboratory, became D.Sc., and was appointed assistant prof. of physics. Prof. of physics, Univ. College, Liverpool, 1881-1900, in 1898 he was Rumford medallist of the Royal Society. Principal of Birmingham Univ. from its estab., 1900-19, he was knighted 1902. Later in that year he was Romanes lecturer at Oxford; president of the Mathematical and Physical Section, Brit. Association, 1891; of the Physical Society of London, 1899-1900; and of the Society for Psychical Research, 1901-4. His works at first dealt chiefly with electrical science, but the immense sale in England of Haeckel's *Riddle of the Universe*, which had alarmed the orthodox, stimulated L. to publish, in 1905, his *Life and Matter* by way of refutation. Later he was industrious in promulgating doctrines that were religious in the modern Congregationalist sense, i.e. which make the most extensive and fundamental alterations in the anct. structure of Christianity, and yet deny that continuity is destroyed; the underlying motive being a dread lest religion be outmoded by science. The excursions into spiritualism and psychical research that he had made before the First World War (e.g. *The Surreal of Man*, 1909) were amplified soon after its outbreak. His son Raymond was killed on Sept. 14, 1915, and the book *Raymond* (1916) alleges contact with the spirit of that young soldier.

His place in the scientific world rests chiefly on his researches on radiation and the relation between matter and ether. His experiments on lightning conductors almost reached the Hertzian discovery of electro-magnetic radiation; and he invented the 'coherer' and disproved by experiment the existence of viscosity in ether. Using his 'coherer' as a detector he was the first to accomplish wireless telegraphy before Marconi had taken it up. He was also a pioneer in the theory of electrolysis and in the study of the movements of ions, and his inventions included an electrical method for dispersing fog, improved sparking plugs, and many contributions to physical science. Besides the works already mentioned he wrote, among others, *Modern Views of Electricity* (1889); *Pioneers of Science* (1893); *Signalling across Space without Wires* (1908); *Matter and the Universe* (1908); *The Ether of Space* (1909); *Parent and Child* (1910); *Modern Problems* (1912); *Christopher, a Study in Human Personality* (1919); *Making of Man* (1924); *Atoms and Rays* (1924); *Ether and Reality* (1926); *Relativity* (1925); *Electrical Precipitation* (1925); *Evolution and Creation* (1927); *Energy* (1928); *The Reality of a Spiritual World* (1930); *Beyond Physics* (1930). See his autobiography (1934).

Lodge, Thomas (1558-1625), Eng. dramatist and poet, b. at West Ham. He entered Lincoln's Inn in 1578, but soon abandoned himself to the lighter aspects of literature. In 1589-91, seeking variety and change of life, L. took part in two sea expeditions against the Spaniards near the Azores and Canary Is. During the latter expedition he composed his

prose tale of *Rosalynde*, which furnished Shakespeare with the story of *As You Like It*. He also pub. about the same time two romances, viz. *Robert, Second Duke of Normandy* and *Euphues' Shadow, the Battail of the Seneces*. He excelled as a lyric poet, and *Glaucus and Scilla* appeared in 1589; his main vol. of verse, *Philis: honoured with Pastorall Sonnets, Elegies, and amorous Delights*, appeared in 1593. L. is likewise the author of two second-rate dramas entitled *The Wounds of Cirile War* and, in collaboration, *A Looking-glass for London and England*, and he trans. the works of Seneca and Josephus. His works were ed. by Sir E. Gosse (4 vols.) in 1884. See C. J. Sisson, *Thomas Lodge and Other Elizabethans*, 1933; also lives by N. B. Paradise, 1931 (with bibliography), and E. A. Tenney, 1935.

Lodgers and Lodgings. It is notoriously difficult to define a 'lodger,' but the term most commonly connotes a person who hires rooms and attendance in a house in which the landlord himself resides. But it also means (1) a person who contracts with a boarding-house keeper for food and lodging regardless of exclusive occupation of a separate room; (2) the hirer of part of a house (that part being furnished or unfurnished), who brings his own servants and procures his own attendance, although the landlord resides on the premises; and (3) persons who live in separate tenements in model dwellings, or similar places, where there are a common staircase and a resident servant or porter appointed by the landlord to perform particular services for the tenants. A lodger's rights will ordinarily depend on the agreement he makes with the landlord on taking his rooms. But he is always entitled to have his goods properly looked after by the landlord, who will be liable for loss or theft occurring through his neglect. Under the Law of Distress Amendment Act, 1908, if the superior landlord threatens to distrain on the lodger's goods for rent due by the lodger's landlord, the lodger can protect his goods by serving on the superior landlord or his agent a written declaration stating his ownership, and containing an undertaking to pay any arrears of rent he may himself owe directly to the superior landlord instead of to his own landlord. But whatever he pays to the superior landlord he can deduct from his next payment to his own landlord (see also *Distress*). Any one who lets furnished lodgings which are not reasonably fit for occupation may be sued by a lodger for damages, but there is no warranty that the premises shall continue in a sanitary condition during the tenancy. A lodging-house keeper who knowingly lets lodgings to a prostitute for the purposes of her calling cannot recover his rent. Letting lodgings is probably not a breach of a covenant in a lease not to underlet or part with the premises without the consent of the landlord. If a person agrees to take apartments but does not enter into possession, he is liable for use and occupation, though he may be sued also for damages for breach of contract.

Lodi, tn. and episcopal see in the prov. of Milan, Piedmont, Italy, on the r. b. of the Adda, 20 m. S.E. of Milan. The cathedral dates from 1158 and the church of the Incoronata from 1488. Napoleon gained a victory at L. over the Austrians on May 10, 1796. There are manufs. of Parmesan cheese, majolica, linen, and silk. Pop. 23,300.

Łódź, co. and tn. of Poland, in the prov. of Piotrkow, on the Lodka R., 82 m. S.W. of Warsaw. In spite of a heavy death rate due to the unhealthy air, L. grew more rapidly than most other tns. in Europe before the First World War owing to the immigration of Ger. capitalists. The pop. of the prov. which in 1872 was 50,000 reached 100,000 in 1910 (composed of Poles, Gers., and Jews), and in 1931 was 2,633,000; tn. (1916) 497,000. The chief manufs. before 1939 were cottons, woollens, chemicals, beer, spirits, and iron goods. There were also dye works, flour mills, and agric. implement manufs. In the First World War the battle of L. was fought on Dec. 15, 1914. After the war L. became a Polish military dist. On Sept. 1, 1939, L. was bombed, together with many other Polish tns., by the Gers. On Sept. 7 the Gers. were approaching L. and next day the Poles retreated from the city. In the Ger.-Soviet demarcation line fixed on Sept. 28, L. was assigned to the Ger. sphere (see further under *POLAND*). The Russians turned the tables on the Gers. in 1945. Ger. resistance in Warsaw collapsed on Jan. 17, 1945, when the Russians forced the Vistula and took the cap. Simultaneously with their invasion of E. Prussia soon afterwards the Russians reached the Silesian frontier S. of Wielun, advanced 50 m. on the N. slopes of the Carpathians and captured Cracow and L.

Loeb, Jacques (1859-1924), Ger.-Amer. physiologist. In 1910 he became head of the div. of general physiology, Rockefeller Institute. His most striking book is *Tropisms and Animal Conduct* (1916).

Loeb, James (1868-1933), Ger.-Amer. archaeologist and devotee of the classics. After ceasing business life he pursued archaeology. President of the Amer. School of Archaeology at Athens, he was a member of the Societies for the Promotion of Hellenic and Rom. Studies, and of the Archaeological Institute. He will be chiefly remembered for launching the Loeb Classical Library at his own expense. The original scope of the library was intended to cover everything of any importance in literature from the time of Homer to the fall of Constantinople, but the First World War hampered progress. He trans. Paul Decharme's book on Euripides, Maurice Croiset's on Aristophanes, and Couat's *Alexandrian Poetry under the First Three Ptolemies*.

Loèche-la-Ville, see *LEUX*.

Loeffler, Charles Martin Tornev (1861-1935), Alsatian-Amer. musical composer and violinist, b. at Mulhausen; studied the violin under Joachim in Germany and composition under Guiraud in France. Later he went to Boston and devoted himself to teaching. He held a leading

place among modern Amer. composers with his orchestral compositions. His best known work is the *Villanelle du Diable*, an orchestral piece first performed in 1902. His *Five Irish Fantasiae* were first sung at Boston in 1922 by John McCormack.

Loëss, name given originally to a loamy deposit occurring in the basins of the Rhine and Danube. It consists mainly of clay with fine sand and chalk, evidently loosely deposited and since somewhat solidified by its own weight and the action of percolating water. Extensive deposits have been recognised and studied in many regions, notably China, where thousands of sq. m. are covered to a depth of over 1000 ft., the Black Earth of Russia, and the Mississippi basin. There has been much discussion as to its origin, leading to

ballads. His other compositions include sev. oratorios, *The Destruction of Jerusalem*, *The Seven Sleepers*, and *Jean Huss*, sev. operas; and overtures, choruses, symphonies, concertos, and lyrical poems *Sie A. B. Bach*, *The Art Ballad*, *Loewe and Schubert*, 1890, and L. Hirschberg, *Loewe als Instrumental-komponist*, 1919; also lives by H. Bulthaupt, 1898, M. Runze, 1903, and O. Altenburg, 1924.

Loft, Capell (1751-1824), Eng. author, b. in London. He was called to the Bar in 1775, but spent most of his life on his estates near Bury St. Edmunds. He was a prolific writer on miscellaneous subjects, a zealous advocate of parl. reform, and opponent of the Amer. war and the slave trade. Byron ridiculed him in *English Bards and Scotch Reviewers* as the Mincenas of 'distressed versemen.'

Norwegian Stule houses

THE FISHING TOWN OF SVOLVAR IN THE LOFOTEN ISLANDS

a general conclusion that it is wind-borne from desert or steppe land, desiccated like basins, glacial moraine, and the sediment left by vastly swollen rivers of the glacial epoch. The distribution of L. may be summarised with some approximation to correctness as forming a fringe on the equatorial side of the limit of glaciation and on the great desert and steppe lands. Prof. von Richthofen studied the great deposit in China, and concluded that it was the wind drifted fine dust from the central deserts of Asia, brought down by the moist air near the coast. Given sufficient rainfall L. is extremely fertile, it weathers into vertical cliffs and horizontal terraces; excavations in the former provide homes for large numbers in China. It gives colour and name to the Huang Ho and Yellow Sea.

Loewe, Johann Karl Gottfried (1798-1869), Ger. musician and composer, b. in Lobezin, near Halle, and studied at Halle. He settled in Stuttgart and produced an enormous quantity of compositions. His ballads are particularly expressive and original, and as the composer of *Edward and the Elf King* (1818) he takes a foremost place among the writers of 'art

Lofoten, or Lofoden, Islands, large group of 19 lying off the N.W. coast of Norway, between 67° 30' and 69° 20' N and 12° and 16° 30' E. The group is separated from the mainland by the Vestfjord, and is divided into two sections by the Rattsund, the N. I. proper lying to the W. and S., and the Vesteraken to the E. and N. The famous Maelström lies between Mosbøen and Mosken. The climate is not very rigorous, there is good pasturage for cattle, and barley can be grown. The chief industry is cod fishing; lobsters and harrings are also caught, and cod-liver oil and fish guano are manufactured. Brit. commando raiders landed on the is. on March 6, 1941, sank 18,000 tons of Ger. shipping, took 215 Ger. prisoners and destroyed an important fish-oil plant. Another raid was carried out on Dec. 29. Area about 2812 sq. m. Pop. 41,000. See under NAVAL OPERATIONS in THE SECOND WORLD WAR.

Lofting, Hugh (b. 1886), Amer. author and illustrator, b. at Maidenhead, England. He settled in the U.S.A. in 1912 as a practising civil engineer. After military service in the First World War he turned to writing and illustrating children's

books, the most successful being the 'Dr. Doolittle' series. This series includes *The Voyages of Dr. Doolittle* (1812), for which he received the Newbery medal; *Dr. Doolittle's Caravan* (1926); and *Dr. Doolittle's Return* (1933). Other books: *Porridge Poetry* (1924) and *Gub Gub Book* (1932).

Loftus, par. and tn. of N. Riding, Yorkshire, England, 9 m. N.E. of Gulsborough. Alum, stone, and iron are found, and there are brickyards and tile works. Pop. 9000.

Lofty, Mount, mt. of S. Australia, and the highest peak of the Lofty Range, situated near Adelaide. Its altitude is 2400 ft.

Log (a word of uncertain origin) in a nautical sense is an apparatus for measuring the speed of a ship. There are two main varieties of L., the common L. and the patent L. The origin of the former is obscure, and no mention of it is found until 1577. There are four parts to a common L., the L.-ship or L.-chip, the L.-reel, the L.-line, and the L.-glass. The L.-ship is a wood quadrant about $\frac{1}{2}$ in. thick, of a radius of 5 or 6 in., and having the circumference weighted with lead to keep it upright. There are two holes near the lower angles, through one of which the end of a short piece of thin line is passed and knotted; the other end of the line is spliced to a hard bone peg, which is inserted in the other hole. The L.-ship hangs square from this span of rope, to which the L.-line is secured. The first portion of the line (from 10 to 20 fathoms) is known as the stray line, and should be long enough to take the L.-ship out of the ship's wake. A piece of bunting marks the end of the stray line, and from this the line is marked with 'knots' at regular intervals. A nautical mile is assumed to be 6080 ft., and the distance between knots bears the same relation to this distance as the number of seconds in the L.-glass bears to an hour. If the glass is a 38-sec. one the distance is 47 ft. 3 in., if, as is more rarely the case, it is a 30-sec. glass the distance is 50 ft. 7 in. For speeds over 8 knots a 14-sec. glass is generally used, and the indicated speed doubled. To heave the log a man holds the L.-reel over his head, and an officer throws the L.-ship, with the peg in, clear to windward. The L.-glass is turned when the bunting reaches the officer's hand, and as soon as the glass has run out the progress of the line is stopped, and the distance measured.

Various patent Ls. have been invented, some of which are fixed on the taffrail and the speed read off. The 'Cherub,' for low speeds to 18 knots, 'Neptune,' for high speeds and rocket Ls., were invented by Walker. The prin. part is a rotator, the revolutions of which indicate the speed. All patent Ls. are liable to error, the extent of which should be ascertained by shore observation in calm weather.

Logan, John (1748-88), Scottish poet and divine, b. at Soutra, Midlothian. In 1771 he was presented to the charge of S. Leith, and ordained two years later. Some local scandal having arisen in con-

nection with his name, he resigned his charge in 1786, retaining part of his salary. He settled in London, where he contributed to the *English Review*. His undisputed works include *Essay on the Manners and Governments of Asia* (1782); *View of Ancient History* (1788-93); *A Review of the Principal Charges against Warren Hastings* (1788); and two vols. of *Sermons* (1790-1791). His poems, especially the ballad *Braes of Yarrow*, are marked by passages of rare beauty, but the charges of plagiarism and of appropriating the verses of Michael Bruce have led to a large amount of controversy, more especially in connection with the *Ode to the Cuckoo*, (though modern research tends to substantiate its authenticity as L.'s work. See J. Anderson, *Life of Logan*, 1795; D. Laing, *'Ode to the Cuckoo,' with Remarks on its Authorship*, 1873; and *British and Foreign Evangelical Review*, 1877 and 1879).

Logan, Sir William Edmund (1798-1875), Canadian geologist, b. at Montreal. From 1842 to 1871 he was director of the Canadian Geological Survey. He discovered the Stignaria under-clays and the *Eozoon canadense*. He was knighted in 1856. His *Geology of Canada* was pub. in 1863. See life by J. Harrington, 1883.

Logan, city and co. seat of Cache co., Utah, U.S.A., on the L. R., 70 in. N. of Salt Lake city. It is the seat of the Stato Agric. College, and of the Brigham Young College (1878). It is the centre of a rich agric. and mining dist. Pop. 11,800.

Loganberry, cross between the raspberry and the blackberry, originally raised by Judge Logan in California. The fruit resembles the raspberry in character, but is larger, darker coloured, and more prolific. Its core remains in the fruit when the stalk is removed, as in the blackberry. Its flavour is sharper and more acid than the raspberry. The cultivation of Ls. has rapidly developed; the chief use of the fruit is for bottling and preserving. The plant is hardy and easily grown.

Logan, Mount, in the S.W. corner of the Yukon ter., Canada. It is the second highest known peak in N. America, and has an altitude of 19,850 ft.

Logansport, city of Indiana, U.S.A., in Cass co., on the Wabash R., 68 m. N.W. of Indianapolis. Limestone is quarried for use in the iron manuf. L. has large manufs. of automobiles and bodies, electrical machinery, paper, etc. Pop. 20,100.

Logan Stone, The (Cornwall), see ROCKING STONES.

Logarithms. The preface to Chambers's *Logarithmic Tables* gives the following explanation: 'A table of logarithms is a collection of auxiliary numbers so constructed that by it Multiplication of common numbers can be performed by addition of their logarithms; Division by their subtraction; Involution, or the raising of powers, by their multiplication; and Evolution, or extraction of roots, by their division.' The definition of a logarithm is then given as follows: 'These auxiliaries

or logarithms are the exponents of powers to which an invariable number called the *base* has to be raised, in order to produce the number of which it is the logarithm. Expressed mathematically, if x is the logarithm of a number N to the base b , then x is defined by the equation $N = b^x$. A convenient way of stating the fact that x is the logarithm of N to the base b is $x = \log_b N$. In this article we shall show the usefulness of L , by verifying the facts stated in the explanation and, finally, how the tables are constructed and how they are to be used. For the moment let us suppose the tables are constructed and in our possession. (I.) *Multiplication of numbers.* Suppose M and N are two numbers and that $x = \log_b M$; $y = \log_b N$. From the above definition of L , $M = b^x$ and $N = b^y$. Hence $MN = b^{x+y}$, i.e. $\log_b MN = \log_b M + \log_b N$. In other words, $\log_b MN$ is found by *addition* of the logarithm of the two numbers; from the tables we then discover the required number.

Example. Using a table of L constructed to the base 10 multiply 26 by 47. We find $\log_{10} 26 = 1.4150$, $\log_{10} 47 = 1.6721$. Hence by our rule $\log_{10} (26 \times 47) = 1.4150 + 1.6721 = 3.0871$. From the same tables we find that $\log_{10} 1222 = 3.0871$; hence $26 \times 47 = 1222$. The above argument can be extended for the multiplication of any set of numbers. Thus $\log_b MNOP \dots = \log_b M + \log_b N + \log_b O + \log_b P + \dots$

(II.) *Division of numbers.* $\log_b \left(\frac{M}{N} \right) = \log_b M - \log_b N$, for if $x = \log_b M$ and $y = \log_b N$, then by definition $M = b^x$ and $N = b^y$. Hence $\frac{M}{N} = b^{x-y}$, whence $\log_b \left(\frac{M}{N} \right) = x - y$.

Example. Using tables to the base 10, divide 63 by 9. We find $\log_{10} 63 = 1.7993$ and $\log_{10} 9 = 0.9512$. Hence by our rule $\log_{10} \left(\frac{63}{9} \right) = 1.7993 - 0.9512$

$= 0.8481$. From the same tables we find that $\log_{10} 7 = 0.8451$; hence $\frac{63}{9} = 7$. This obvious answer has been used for simplicity. The reader may easily verify that $\log_b (N)^p = p \log_b N$, a rule that enables us to find $(N)^p$ by means of tables with a minimum of trouble. Further it

is easily shown that $\log_b (N)^{\frac{1}{q}} = \frac{1}{q} \log_b N$,

a rule that enables us to find $(N)^{\frac{1}{q}}$ at once by use of logarithm tables.

John Napier was the inventor of L , and he pub. his first work in 1614. Trigonometrical calculations had become unwieldy and his work was the result of a need for simplicity. Napierian L were calculated for functions of angles only, but Speidall improved the system and in 1619 added the L of natural numbers. In 1655 John Briggs commenced the calculation of L to the base 10. These have been extended and are now used in all

practical calculations. Briggs's tables were computed to 14 significant figures; for general calculations four-figure tables are sufficiently accurate, though seven-figure tables are often used in computations involved by measurements made to a greater degree of accuracy.

Logarithms to the base 10 and their use. In the first place since $10^1 = 10$, $\log_{10} 10 = 1$; $10^2 = 100$, $\log_{10} 100 = 2$; $10^3 = 1000$, $\log_{10} 1000 = 3$, etc. Again $10^0 = 1$, hence $\log_{10} 1 = 0$; $10^{-1} = \frac{1}{10}$, $\log_{10} 0.1 = -1$; $10^{-2} = \frac{1}{100}$, $\log_{10} 0.01 = -2$, etc. From the first part of this statement it follows that the logarithm of any number greater than 1 and less than 10 will be greater than 0 and less than 1, i.e. a decimal without an integer. The logarithm of any number greater than 10 and less than 100 will be greater than 1 and less than 2, i.e. 1 + a decimal. In general the logarithm of a number consisting of n integral numbers is $(n-1) +$ a decimal. The integral part of a logarithm is called its *characteristic* and the decimal part the *mantissa*.

Example. From tables we find that $\log_{10} 8 = 0.9031$. Find $\log_{10} 80$. $\log_{10} 80 = \log_{10} 8 + \log_{10} 10 = 0.9031 + 1 = 1.9031$. Similarly $\log_{10} 800 = 2.9031$. Thus the mantissa is the property of the number 8, the characteristic determined by the position of the decimal point.

When we come to deal with the logarithm of proper fractions we see from the second part of the statement at the beginning of the paragraph that they are negative. Thus $\log_{10} 0.8 = \log_{10} \frac{8}{10} = \log_{10} 8 - \log_{10} 10 = 0.9031 - 1 = -0.0969$. For the moment the simplicity of L seems to have disappeared as soon as we come to proper fractions. We might naturally inquire if the welcome property of the *mantissa* mentioned above can be retained for proper fractions as well. If we write $\log_{10} 0.8 = \log_{10} \frac{8}{10} = \log_{10} 8 - \log_{10} 10 = 0.9031 - 1$, or as it is usually written $\bar{1}.9031$ we get a logarithm in which only the characteristic is negative, and the mantissa is that belonging to the number 8 as before. Similarly we deduce $\log_{10} 0.08 = \bar{2}.9031$. The results may be summed up then as follows: The *mantissa* of the logarithm to the base 10 is the same for all numbers consisting of the same digits arranged in the same order. The position of the decimal point only affects the characteristic. Hence if the number whose logarithm we require consists of one or more integral figures, the characteristic is always *one less* than the number of integral figures, and it is positive. If the number is wholly a decimal, its characteristic is the same as the number of the place from the decimal point occupied by its first significant figure. This simple method is only true of L to the base 10, because that base is the same as the radix of the scale of the natural numbers. Napier's base or radix was a number denoted by e , whose value is 2.7182818 This number is defined by the mathematical series

$$e = 1 + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \dots \text{ad infinitum}$$

Its importance is due to the fact that for all values of x less than 1,

$$\log_e (1 + x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots \text{ad infinitum.}$$

Algebraical analysis enabled Napier to compute his L. to the base e by means of this expansion of $\log_e (1 + x)$, and L. to the base 10 are computed from an expression derived from the one above. It is shown in text-books on algebra that $\log_{10} (n + 1) - \log_{10} n = \frac{1}{n} - \frac{1}{2n^2} + \frac{1}{3n^3} - \dots$ where $\mu = \log_e$.

$10 = 0.43429448 \dots$ Hence if the logarithm of one number to the base 10 is found, the logarithm of the next number can be computed. Repeated application of this formula results in the table of L. with which we are familiar.

The reverse process of finding, from the tables, the number when the logarithm is given is also done in two parts. The *mantissa* is considered first; from it the actual digits of the number are found; the whole-number part of the logarithm, the characteristic, then gives the position of the decimal point. These results can also be obtained from antilogarithm tables, on which the L. are arranged round the edge of the table and the numbers in the centre. See also MATHEMATICS; SLIDE RULE. See W. Chanin, *Logarithms in Commerce*, 1931; Sir C. V. Boys, *Natural Logarithm*, 1935; F. W. Chambers, *Arithmetic of Logarithms*, 1935; and H. S. Hall and S. R. Knight, *Higher Algebra*, 1940. Good four-figure tables are those of Godfrey and Siddons, while Chambers's *Seren-figure Mathematical Tables* are invaluable for accurate work.

Logau Friedrich, Freiherr, von (1604-1656), Ger. poet, b. at Brookut, near Nimptsch in Silesia. He studied law at Biele and Frankfurt, and entered the legal service of the duchy of Liegnitz as chancery councillor. He is chiefly famous as a writer of epigrams. He joined the Fruchtbringende Gesellschaft, the most important of Ger. literary and linguistic societies, in 1648. Under the pseudonym 'Salomon von Golow' he pub. a collection of epigrams, *Zweyhundert deutscher Reimsprüche* (1638). A selection from his *Sinngedichte* was made by K. W. Ramler and G. E. Lessing in 1759, and a complete ed. of his works by G. Eitner in 1876.

Log-book, book into which the contents of the log-board or rough L. are transcribed daily. The columns of the L. make provision for the nature and velocity of the wind, the state of the weather, the observed lat. and long., the course, progress, etc. Under the heading 'Remarks' are entered the employment of the crew, the times of passing prominent landmarks, any alteration of the course, signals made and exchanged, drills performed, etc., and in the case of sailing ships the making, shortening, and trimming of sails. The deck L. is kept by the officer of the watch, is copied into the ship's L. which is the official L., by the navigating officer in charge, and is then initialled by the officer on watch. In

steam vessels rough and fair engine-room registers are kept, giving information as to the state of the engines, etc. All ships in the Brit. Mercantile Marine are compelled to keep an official L. in a form approved by the Board of Trade. Various Ls. are used in aircraft, the pilot's L. being the most important.

Loggan, David (1635-93), Ger. engraver and designer, b. at Danzig. He settled in London and pub. *Engravings of the Colleges of Oxford* (1690), and later similar engravings of the colleges of Cambridge. At the court of Charles II. he engraved sev. portraits of the king and of his courtiers.

Loggia, It. name for an arcade composed of galleries and verandas roofed over, but open to the air on one side.

Logging, see LUMBER AND LUMBERING. Logia (Gk. *Λογια*, oracles). Papias, a writer of the second century, who is said to have been a disciple of St. John, wrote that 'Matthew composed the oracles (*Λογια*) of the Lord in the Hebrew tongue.' It has been one of the tasks of modern biblical criticism to find out what these L. were. The most probable suggestion is that they were a collection of passages from the Heb. Bible such as were susceptible of a Messianic interpretation. Such collections must have been made by the early Christians, who aimed particularly at showing how Jesus fulfilled the Messianic prophecies. It is notable that St. Matthew's Gospel is marked by its insistence on this.

Logic may be most briefly defined as the study of the general conditions of valid inference. The three 'products of thought', the instruments employed by the logician are the term, the proposition or premise, and the inference. (1) A term may be said to denote an individual or a group of individuals or to connote an attribute or a group of attributes. (2) A proposition or premise asserts or denies one term or another as the result of comparison e.g. 'All triangles are bounded by three sides.' Here the term 'bounded by three sides' (an attribute) is called the predicate, while the term 'all triangles' (a group of individuals) is called the subject; the connecting verb 'are belongs to the copula. Thus 'bounded by all sides' is said to be predicated of 'all triangles'. Propositions or premises may be subdivided (a) according to quality, i.e. affirmative or negative, or (b) according to quantity, i.e. universal ('All men are fools') or particular ('Some men are fools'). There is a further possible subdivision into universal-affirmative ('All X is Y'), universal-negative ('No X is Y'), particular-affirmative ('Some X is Y'), and particular-negative ('Some X is not Y'). The most important part of L. deals with inference, i.e. the process of combining two propositions or premises so as to arrive at a proposition distinct from any that has preceded. Inferences are of two kinds, inductive and deductive. (1.) *Induction*, or inference from the particular to the universal. *Analogy*, or inference from the particular to an adjacent particular is

a form of imperfect induction, and, though justifying a more or less probable conclusion, never leads to certainty (e.g. War between A and B is wicked. War between A and B is similar to war between A and C. Therefore war between A and C is wicked). (ii.) *Deduction* or syllogism is inference from the universal to the particular (e.g. All war is wicked. War between A and B is war. Therefore war between A and B is wicked). Syllogisms may be combined in what is called a 'train of reasoning,' and the complex or hypothetical syllogism may be employed in which one or more complex (or hypothetical) premises occur. A complex premise is a combination of two or more simple premises in one sentence, in such a manner that the truth or falsity of one premise or set of premises is made to depend on the truth or falsity of the other premise or set of premises; when dependent on the truth of the one premise or group of premises, the complex premise is termed conjunctive, when upon the falsity, disjunctive. A conjunctive syllogism is a syllogism one or both of whose premises are conjunctive premises; a disjunctive syllogism one whose major premise is a disjunctive and the minor a simple proposition, the latter affirming or denying one of the alternatives stated in the former. A *dilemma* occurs when one premise of the complex syllogism is a conjunctive and the other a disjunctive premise (e.g. If A is B, C is D, and E is F; but either C is not D or E is not F; therefore A is not B).

The foundations of L. were laid by Plato, but Aristotle was the first to produce a definite and developed system of L. in the *Organon*. Among lat. schools of ant. philosophy the Stoics, Epicureans, Sceptics, and Neoplatonists all contributed to the science of L. To Abelard (1079-1142) is due in great measure the revival of L. in the twelfth century, his disciple John of Salisbury shows acquaintance with the entire *Organon*. St. Thomas Aquinas consolidated this advance in the thirteenth century. Thereafter L. tended to become a lifeless classification or meaningless dialectic in the hands of Wm. of Occam and the Nominalists until the Renaissance humanists revolted. Francis Bacon (1561-1626) in his *Novum Organum* introduced his 'new' inductive L. to replace Aristotelian deductive L. Modern L. has developed along the lines of empiricism (Hobbes, Locke, Hume, and J. S. Mill) and, in strong contrast, along that of Rationalism (Spinoza and Leibniz) and the transcendentalism of Kant. See J. S. Mill, *A System of Logic*, 1843; W. S. Jevons, *Elementary Lessons in Logic*, 1876; J. Walton, *Manual of Logic*, 1891; W. E. Johnson, *Logic*, 1921-24; A. Wolf, *Textbook of Logic*, 1930; L. S. Stebbing, *Thinking to Some Purpose*, 1939, and *Modern Introduction to Logic*, 1940; and A. N. Prior, *Logic and the Basis of Ethics*, 1949.

Logical Positivism, see **POSITIVISM, LOGICAL**.

Logistics, term used for the military science of quartering and moving men and

equipment. See **ARMY; COMMISSARIAT**. **Logos** (Gk. *λογος*), as a theological term has no exact counterpart in any other language. The use of *verbum*, word, in the Vulgate is perhaps the least satisfactory of sev. which have from time to time been adopted. In Gk. philosophy, as illustrated especially in Heraclitus of Ephesus and Anaxagoras, and among the Stoics, L. is the divine reason regarded as immanent in the cosmic process. But their systems are rather forms of pantheism, recognising no transcendent god and teaching that this truth or reality (half hidden, half revealed in the visible world) can be found in the self.

In the Septuagint L. signifies the uttered word of wisdom of God expressed in the threefold process of creation, providence, and revelation. Philo and the Alexandrian-Jewish school combined these two originally separate meanings, so that Philo's L. may be said to correspond to Plato's idea of the good endowed with the creative activity or universal causality of the Stoics. Thus arose the Christian use of the term applied to the Second Person of the Trinity. Heretical teaching in the early Church tended to include the person of Christ with the imaginary hierarchy of intermediary spirits or emanations between God and man. To all such views the L. of St. John's prologue was an effective barrier. It owes much to Philo and assumes that those to whom it is addressed are familiar not only with his thought but also with sev. of his technical terms. Somewhat later the apologists, Justin, Tatian, Athenagoras, sought to reconcile Christian doctrine with the *λογος σπερματικός* of the Stoics. See J. Réville, *La Doctrine du Logos dans le quatrième évangile et dans les œuvres de Philon*, 1881; A. Harnack, *History of Dogma* (trans.), 1894-99; A. Aall, *Der Logos*, 1896-99; and J. Lebreton, *Histoire du dogme de la Trinité*, 1928.

Logroño: l. is. prov. of N. Spain, S. of the R. Ebro. The Ebro basin is very fertile, producing cereals, olive oil, fruit, and the noted red Rioja wines. Iron, silver, lead, copper, and lignite are found. Area 1,498 sq. m. Pop. 233,200. 2. (Ant. Lucronus), cap. of the above, an ant. walled tn. with a twelve-arched bridge across the Ebro dating from 1138. It is on the r. b. of the Ebro, 30 m. S.S.E. of Vitoria, in the centre of the wine dist. Pop. 56,000.

Loharu, state of E. Punjab, India. Area 222 sq. m. Pop. 31,000. The cap. is Loharu. Pop. 3000.

Lohengrin, hero of an old High Ger. poem of the thirteenth century. He was the son of Parsifal and one of the knights of the Holy Grail. At King Arthur's command he was carried to Mainz in a car drawn by a swan to rescue Elsa, daughter of the duke of Brabant. He overthrew her enemy, Telramund, and married Elsa. In spite of her promise not to question him, she insisted on demanding his origin. Twice he persuaded her not to question him, but on her asking a third time he told her, and immediately was carried away by the swan-drawn car to

return to the Grail. Rückert's ed. of the poem (1857) is the best. It is a continuation of Wolfram von Eschenbach's *Parzival*. Wagner founded his opera *Lohengrin* (1848) on this legend.

Loidis, see LEKDS.

Loigny, vil. in the dept. of Eure-et-Loir, France, 29 m. S.S.E. of Chartres. The Gers. were here defeated by the Fr. in Dec. 1870. Pop. 400.

Loir, riv. of France, rising in Eure-et-Loir dept. and flowing S.W. It joins the Sarthe near Angers. Length 180 m.

Loire: 1. Longest riv. in France, rises in the Gerbier-de-Jonc (dept. Ardèche) at a height of 4500 ft., and flows N. and N.W.,

Rhone. The dept. is largely mountainous, but the plains of Forez and Roanne provide good agric. and pasture lands. The vine is grown in the valley of the Rhone. The basin of the St. Etienne is one of the richest coal dists. of France, and iron and lead are mined in large quantities. The chief manufs. are glass, ribbons, silk, cast steel, hardware, machinery, and cutlery. Cap. St. Etienne. Area 1852 sq. m. Pop. 631,500.

Loire, Haute-, dept. of S.E. France, formed from parts of Languedoc, Lyonnais, and Lower Auvergne, and divided into three arrons., Le Puy (cap.), Brioude, and Yssingeaux. Situated on the central

THE LOIRE AT NANTES

Yvon, Paris

S.W., and finally W. for a total distance of 625 m., until it flows into the bay of Biscay between Palmbœuf and St. Nazaire. Its chief tribs. are the Allier, Cher, Indre, Vienne, Thouet, and Sèvre Nantaise on the l. b., and the Arroux and Maine on the r. b. Navigation of the L. is difficult owing to the shrinking of the stream in times of drought and the frequent floods at other times. Dykes have been erected at sev. places, the most important being the circular dyke at Tours. The Maritime Canal of the L. (9½ m. long), opened in 1892, enables large ships to ascend to Nantes. The 'lateral canal of the Loire' accompanies the riv. from Roanne to Briare and thence proceeds to the Seine. The châteaux of Chambord, Chenonceaux, and others in the L. dist. are among the most famous in France. 2. Dept. of Central France formed from the old dist. of Forez and parts of Beaujolais and Lyonnais, is bounded on the N. by the dept. of Saône-et-Loire, and S. by Ardèche and Haute-Loire. It is drained in the N. by the L. and its tribs. and in the S.E. by the tribs. of the

plateau of France, it is traversed by four mt. ranges running from N. to S., viz. the Vivarais and its continuation the Bontieres Chain, the Massif du Mègal, the Velay Mts., and the Margeride Mts. There are numerous signs of volcanic activity. Chief rivs., the Loire, with its tribs. the Borne and Lignon, and the Allier. The climate is cold. Rye, oats, barley, wheat, lentils, peas, and root crops are grown, and cattle and goats are largely reared. Coal and antimony are mined, and there is a large lace-making industry. Area 1930 sq. m. Pop. 228,000.

Loire-Inférieure, maritime dept. of W. France, formed from part of auct. Brittany and the dist. of Retz, and lying between the bay of Biscay on the W. and Maine-et-Loire on the E. The surface is very flat, and is drained by the Loire, with its tribs. the Erdre and the Sèvre, and the Isac, a trib. of the Vilaine. The refining of the salt from the marshes between the Vilaine and the Loire is an important industry. Horse- and cattle-breeding prospers, and cereals, vines, flax, and fruit are cultivated. There are deposits of tin,

lead, and iron. There are foundries and shipbuilding yards at Nantes and St. Nazaire. The chief manufs. are hemp, linen, paper, sugar, biscuits, and soap. The cap. is Nantes. Area 2093 sq. m. Pop. 665,000.

Loiret, dept. of Central France, formed from the ant. prov. of Orléanais, with parts of Ile-de-France and Berry, and lying S.W. of Seine-et-Marne, W. of Yonne, and N.E. of Loir-et-Cher. The Loire valley in the S. of the dept., in spite of the frequent floods, is famed for its fertility and vineyards. A great part of the surface is covered by forests, but the plateau of Orléans is very fertile. All branches of agriculture form the chief industries. The chief manufs. are bricks and tiles, porcelain, leather, machinery, hosiery, and sugar. Cap. Orléans. Area 2629 sq. m. Pop. 346,900.

Loir-et-Cher, dept. of Central France, formed from portions of Orléanais and Touraine, and bounded on the N. by Eure-et-Loir, on the S. by Indre. It is drained by the Loir in the N., the Loire in the centre, and the Cher in the S. A large part of the surface is covered by forests, but in the riv. basins there are rich agric. dists., wheat and oats being largely cultivated. There are rich pasture lands, and fruit and vines grow well. Cloth and other woollens, gloves, leather, and glass are manufactured, and there are large distilleries. Stone and alabaster are quarried. Cap. Blois. Area 2475 sq. m. Pop. 212,200.

Loisy, Alfred Firmin (1857-1940), Fr. modernist theologian, b. at Ambrières, Marne. He studied at the Rom. Catholic theological seminary, Châlons, and was ordained priest in 1879. He was prof. of Heb. and biblical literature at the Institut Catholique, Paris, 1881-93, and lecturer at the École des Hautes Études, Sorbonne, 1900-1. From both these posts he was dismissed, and he was excommunicated in 1908. In 1909 he became prof. of church hist. at the Collège de France. There is considerable literature on the L. controversy, which arose out of his *L'Évangile et l'Église* (1902), which was a Catholic's reply to C. G. Harraek's *Il est des Chrétiens*. His excommunication came after the pub. of his most important work, *Les Évangiles synoptiques* (1907-8). Other works are *Les Actes des Apôtres* (1920); *L'Apocalypse de Jean* (1921); *Mémoires pour servir à l'histoire religieuse de notre temps* (1930); and *La Naissance du Christianisme* (1932). See studies by M. J. Lagrange, 1932, and M. D. Petro, 1911. *Loitane*, see *LITON*.

Loja, or **Loxa**, cap. of a prov. of the same name in the republic of Ecuador. (Cinchona bark is obtained in the neighbourhood. There is an airfield and a wireless station. Area of prov. 3705 sq. m. Pop. of tn. 18,000; of prov. 198,100.

Loja, city in the prov. of Granada, S. Spain, in a beautiful valley traversed by the R. Genil. Salt is found in the neighbourhood, and there are manufs. of woollens, silk, paper, and leather. It was one of the last Moorish strongholds. Pop. 20,500.

Lokeren, tn. of Belgium in the prov. of E. Flanders, 12 m. E.N.E. of Ghent, on the R. Durme. There is agriculture, and manufs. of linen, cotton, silk, wool, carpets, furs, ropes, chemicals, and tobacco. There is an active trade in flax, cattle, corn, hemp, and oil. Pop. 25,400.

Loket, see *ELBOGIN*.

Lokoja, tn. and cantonment of N. Nigeria, Africa, near the junction of the Rs. Niger and Benue. Pop. 7000.

Lollards, The (from Dutch *lollaerd*, a mumblor, mutterer, from *lollen*, to mutter), name applied at the end of the fourteenth century to the followers of Wycliffe (*q.v.*) and others who shared his tenets. The movement was to a large extent independent of Wycliffe. All over the country there was discontent with the eccles. and civil order. Wycliffe represents this discontent among the learned, and there is no doubt that his individualistic views were spread far and wide by his 'poor priests,' whose lives and preaching compared favourably with those of the friars. But many had already come to similar conclusions on their own initiative. The L. underwent much persecution, the chief statute against them being the *De Heretico Comburendo* in 1400, under which many were burnt. Lollardism was forced beneath the surface, but did not die out even after the death of Sir John Oldcastle under Henry V., but remained to give impetus to the Reformation. Many took in hand to reason against Lollardism, but the only successful writer was Bishop Reginald Pecock (*q.v.*). See J. Gairdner, *Lollards and the Reformation in England*, 1908; G. M. Trevelyan, *England in the Age of Wycliffe*, 1908; and K. B. McFarlane, *John Wycliffe and the Lollards*, 1950.

Loime, Jean Louis de (1740-1806), Swiss jurist, b. at Geneva, where he practised as a lawyer. In 1771 he pub. his chief work, *Constitution de l'Angleterre*, which was held in high esteem for many years. His other works include *Parallèle between the English Government and the former Government of Sweden* (1772) and *History of the Huguenots* (1782).

Losos, or **Nesus**, Chinese name for an aboriginal tribe which inhabits the mountainous country called Taliangshan, which lies between the Yangtszekiang and the Chienchang valley.

Lombard, Lambert (1506-60), Flemish painter, engraver, and artist. He was also known by the names of Lamprecht Susterman, Smevius, and Schwab.

Lombard, Peter (c. 1100-c. 1160), It. scholastic theologian and philosopher, b. at Novara in Lombardy. He is often referred to as 'magister Sententiarum' because of his famous *Sentences*, i.e. opinions. These are divided into four books, dealing with the Trinity, Creation, Incarnation, and the sacraments. L. divided each book into questions; later the questions were subdivided into distinctions and chapters, thus fixing the form of most later scholastic treatises. His aim was to unite the then received theology into a body giving weight both to scripture and reason. The Book of the Sentences' became after his death the

accepted manual of theology until the *Summa Theologica* of St. Thomas Aquinas (1225-74) gradually supplanted it. See life by F. Protoles, 1881.

Lombardic Architecture, style developed in the N. of Italy by the Lombards after the Gothic invasion, when Goths and natives had fused into one race. Its rise dates from the time of Charlemagne, and a few monuments remain from the eighth century. But the great architectural period was the eleventh and twelfth centuries. To the early part of this belongs the church of S. Antonio at Piacenza, dedicated in 1014. A later example is the cathedral of Novara, and later still we may note S. Michele at Pavia. S. Ambrogio at Milan is also Lombardic. L. A. is based primarily on Rom. tradition, though in detail it discards the debased forms of the later empire in favour of Byzantine importations.

Lombards, The: 1. Anct. Germanic tribe (see LONGOBARDI). 2. Class of It. merchants, brokers, and bankers who settled in England from the thirteenth to the sixteenth century. It is certain that all did not come from Lombardy, yet it is likely that the enterprise and intelligence they displayed were in large measure due to the fusion of Lombard blood with the indigenous It. In 1338 Edward III. pledged his jewels to the L. in order to raise money for his Fr. wars, and Henry V. did likewise in 1415. In that they were usurers and pawnbrokers they were unpopular, like the Jews, who, until their expulsion in 1290, had largely controlled those occupations. The L. first arrived in England in the reign of Henry III. (1216-72), and were formally banished by Queen Elizabeth. But prior to her reign Eng. merchants had already largely usurped their functions. It is related that Edward II. handed over as much as £56,000 to the Frescobaldi in payment of his father's debts, whilst the wealthy firms of the Peruzzi and Bardi, the leading L. of the day, were actually ruined by Edward III., who was never able to redeem his pledges. Lombard Street in the city of London, often reputed the wealthiest of the metropolis, commemorates their former residence in the neighbourhood. See T. Hodgkin, *Italy and her Invaders*, A.D. 376-303, 1892-1916; 2nd ed., vols. v. and vi. (*The Lombard King dom*). For hist. of the Lombard League see C. Vignati, *Storia diplomatica della Lega Lombarda*, 1886.

Lombardy, region of N. Italy, bounded on the N. by the Alps, on the E. by Venetia, on the S. by Emilia, and westward by Piedmont. It includes part or whole of Lakes Maggiore, Lugano, Como, Garda, Isco, and Varese, and is drained by the Po, which is a S. frontier, and the Ticino, a trib. of that riv., flowing along the W. boundary. The highlands are devoted to pastures, the lower slopes to chestnuts, etc., vines, and silk culture, and the fertile plains to mulberries, maize, wheat, flax, and rice. Milan, the chief railway centre of the country, is also the most flourishing silk market in the world, whilst silk-weaving is the main industry of

Como. There is some mineral working. L. is divided into the provs. of Bergamo, Brescia, Como, Cremona, Mantua, Milan, Pavia, and Sondrio. Area 9191 sq. m. Pop. 6,298,000.

The culture of L., from 500 B.C. to the nineteenth century has been rich and vital. Gk. and Rom. bronzes, MSS., and other treasures have been preserved. The Byzantine Empire and the Longobards (q.v.) added their own vitality. A gold and silver campaigning cross at Brescia Cathedral is a relic of the incursions of Frederick Barbarossa. Fr. rule in the sixteenth century is represented by Clouet's 'Portrait of Saint Marsault,' also at Brescia. Spain and Austria later left their mark. Notable paintings are Titian's altar-piece in the church of SS. Nazaro and Celso in Brescia, and Correggio's 'Portrait of a Man' in the Castello Sforzesco. See A. K. Porter, *Lombard Architecture*, 1915-17.

Lombardy Poplar, see under POPLAR. **Lombok**, called also Selaparan, is. of the Malay Archipelago, Dutch E. Indies, situated eastward of Java between lat. 8° 12' and 9° 1' S., and long. 115° 46' and 116° 40' E.; it is separated W. from Bali by L. Strait and E. from Sumbawa by the Strait of Alas. The area is 3136 sq. m. Two mt. chains extend along the N. and S. coasts, the former being volcanic. Between the ranges are well-watered fertile plains, where sugar, coffee, maize, indigo, cotton, and tobacco are cultivated. The cap. is Mataram and the chief port Ampanan, situated on the W. coast. The is. was captured, together with Bali, by the Jap. in Feb. 1912, but reverted to the Dutch in 1945. Pop. (with Bali) 1,802,000.

Lombroso, Cesare (1836-1919), It. criminologist and prof. of forensic medicine, later prof. of criminal anthropology at Turin; b. at Verona. In 1862, before holding the above positions, he was prof. of psychiatry at Pavia and then director of the Pesaro lunatic asylum. The name of this celebrated It. anthropologist is mainly associated with theories relative to the responsibility or irresponsibility of criminals and, as incidental thereto, with theories as to the physical and psychical characteristics that go to form the criminal type. For a general criticism of his theory of the evidence of a criminal type see under CRIMINOLOGY. In his last years he took up the subject of spiritualism. Chief works: *La Pellagra in Italia* (1885); *L'Uomo di genio* (1888); *L'Uomo delinquente* (1889); *La Donna Delinquente* (1893); *Delitti vecchi e delitti nuovi* (1902); *Nuovi studi sul genio* (1902); and *After Death—What?* (1909).

Lommel, tn. in the prov. of Limbourg, Belgium, 20 m. N. of Hasselt, near the Dutch border. It is one of the new industrial places of the Kempen (Campine) region. Chief manufs. are zinc, lead, tin, and bottles. Pop. 13,400.

Lomond, Loch, largest lake in Scotland, situated in the cos. of Stirling and Dumbarton. Its length is 23 m., and it varies in width from 5 m. to 4 m.; its area is 27 sq. m. It contains thirty is., of which

the largest is Inghmurrin Mts and valleys encircle the lake, and from these numerous streams fall to its banks. Its S shore near Balloch has been industrialized.

Lomonossov, Michael Vasilievich (1711-1765), Russian poet and scientist, b at Denisovka near Cholmogory, was the son of a fisherman of Archangel. In his *Klementa (hymnae Matematika)* (1711) he anticipated to some extent the atomic theory of the structure of matter, later developed by Dalton (q.v.). His other work includes poems and writings on hist. and astronomy. The former Franz Josef Land (q.v.) was named after him in 1929.

Lomonossov Land, see FRANTZ JOSEF LAND

ture (1911). A native of San Francisco, he was oyster pirate, sailor, prisoner, lecturer, and journalist, hunted seals in the Behring Sea, visited Japan and Klondyke (1897), and tramped over Canada and the U.S.A. See Charmian London, *The Book of Jack London*, 1921.

London Area and Population—The term L. is used more than one way, and it is necessary to begin by defining and distinguishing the most important of these meanings. (1) The city of L., the old L. of just occupies only 75 ac, scarcely 1 sq. m. in the centre of the huge area which is now popularly known as L. The old walled city has been swamped by the younger suburbs which have grown up all

LOCH LOMOND FROM TUNN

D. M. L. 1938

Lomza, cap. of a sub div. of Bialystok prov., Poland, an old fortified tn. on the Narev. It was taken by the Gers in 1915, restored to Poland later, was in the Russian area after the 1939 partition and fell to the Gers in 1941. On the 4 approaches to L. Prussia the Russian general, Zakharov, was checked in Aug. 1944 by the fortress of L. But the following month the Russians drove a wedge S. of the fortress and pressed toward the Narev against tenacious Ger resistance, and L. was gradually encircled from N. and S.W. On Sept. 13 L. was taken. Pop. 25,000.

London, Bishop of, see INGRAM, ARTHUR FOLLY WINNINGTON

London, John Griffith ('Jack') (1878-1916), Amer. author, especially famous for his remarkably sympathetic animal stories like *The Call of the Wild* (1903) and *White Fang* (1906). Other of his works are *The God of His Fathers* (1902), *The War of the Classes* (1905), *Moon Face* (1906), *Martin Eden* (1908); and *Aden-*

round it. It still lives as an administrative unit, with a civic constitution which would still seem familiar to a man of the Middle Ages. The estimated resident pop. of the city (1917) was 5490. (2) The modern administrative co. of L. includes the city and the surrounding dist. of 116 sq. m. with an estimated pop. in 1947 of 5,328,140 inhab. The dist. is under the local government of the L.C.C. and it is the area which perhaps most nearly approximates to the ordinary meaning of the term L. (3) There is, however, a still wider use of the term, the greater L., which is practically the Metropolitan Police Dist., together with the city of L., which, roughly, includes all parts within 15 m. of Haring Cross, and therefore comprises the co. of Middlesex and parts of the cos. of Hertfordshire, Essex, Kent, and Surrey. This greater L. has an area of 470,791 ac, with an estimated pop. in 1947 of 8,244,370. This area, at the moment, contains what are in fact still rural dists., but the growth

of the suburbs is rapidly making the smaller L.C.C. area an illogical definition of the term. (4) There are still other definitions of L., but the above are the main significations of the word.

Government.—1. The chief local governing body in the L. area is the L.C.C., controlling the first and second of the dists. described above. It was created by the Local Government Act, 1888. The council consists of 124 co. councillors, elected (in pairs, except the city of L., which has four councillors) in its parl. divs. The elections take place every three years, the electors being the co. and parochial electors. In 1945 there were 2,120,323 electors on the registers. The councillors may elect twenty aldermen for six years, and a chairman for a term of one year. The enormous powers of the L.C.C. can only be briefly suggested here. The council is the prin. money-raising body for all the local authorities in the co., and has a net debt, according to the most recently pub. return (1945), of £79,430,365 (£51,988,646 of which represents debt incurred for housing), and an ann. expenditure on revenue account of some £86,931,561. All borrowings of the council are subject to the provisions of a sinking fund, under Treasury approval, sufficient to repay all expenditure generally within a period of sixty years (in some cases the limit is eighty years). The total stock outstanding at the end of the financial year, 1936, was £128,749,784. The total assessable value of the area in 1947-48 was £101,081,293 (a fall occurred with the derating measures of 1929-30 and again in 1936 owing mainly to a fall in rental values in the city and the central bors., but the leeway was soon made up). On this area the council raised in total rates (1944-45) the sum of £31,572,342, for use in its various activities. Expenditure on education in 1946-47 was £16,992,340. The expenditure on rate accounts on other main heads in 1946-1947 was estimated to be, approximately: public health, £11,147,500; social welfare, £5,694,000; emergency services, £1,876,680 (there is an emergency hospital scheme); fire service, £1,384,800; housing (net deficiency), £1,250,000; main drainage, £1,185,000; means of communication, £1,187,000; other services, £1,868,800. The gross loan debt outstanding in 1945 was £128,749,784. By the Local Government Act of 1929 the L.C.C. now functions in place of the old Guardians of the Poor. 2. By the London Government Act, 1899, the older vestries and other bodies were abolished in the L. area, and their place was taken by twenty-eight metropolitan bors.: Battersea, Bermondsey, Bethnal Green, Camberwell, Chelsea, Deptford, Finsbury, Fulham, Greenwich, Hackney, Hammersmith, Hampstead, Holborn, Islington, Kensington (royal bor.), Lambeth, Lewisham, Paddington, Poplar, St. Mary-lebone, St. Pauls, Shoreditch, Southwark, Stepney, Stoke Newington, Wandsworth, Westminster, and Woolwich. These names are given in full, for besides their present administrative importance they represent the most important of the

anct. divs. of the area of L., as will be seen later. Each of these bors. is governed by a council of from thirty to sixty councillors who appoint aldermen up to one-sixth of their own number, and who also choose a mayor. The councillors are elected by the persons whose names are on the parl. and local gov. registers, and the elections take place every three years. The chief functions of the bor. councils are to perform the duties of a public health and highway authority, concerning nuisances, local drainage, lighting, and paving the streets, etc.; also the provision of libraries, baths, and wash-houses, etc. There has at times been friction between the L.C.C. and the bor. councils, the view of the latter, as a whole, being that there should be a greater degree of decentralisation. In 1933 a Transfer of Powers Order was passed, but it gave the bor. councils far less than they wanted. The common interests of the bor. councils are voiced, and their common battles fought, by their Standing Joint Committee, a voluntary organisation little known to the public, yet one of the most important local gov. bodies in the metropolis. The committee was formed in 1912, and the City Corporation is a member. Its functions are to perfect and advance the powers, rights, interests, and privileges of the bor. councils; it speaks on equal terms with the L.C.C. and does not hesitate to rebuke ministers of the Crown. It consists of three representatives from each bor. council, of whom the tn. clerk is usually one. It meets monthly, but much of its work is done by sub-committees.

3. Considered generally, the city of L., except for certain powers of the L.C.C., is an isolated, self-governing, and independent unit of L. Thus it has its own police, quite independent of the Metropolitan Police, and its own courts of law. The city of L. is governed by a council which is a survival from medieval times. With this council is closely bound up a great part of the hist. of L. For the moment we will describe it in its present form. The city is a corporation styled 'the mayor, commonalty, and citizens.' The governing councils are composed as follows: (a) The Court of Aldermen consists of twenty-five aldermen, each elected for life by the householders of one of the twenty-five wards or sides of wards into which the city has been divided almost throughout hist. The primary function of the aldermen is to act as justices of peace for the city. (b) The Court of Common Council consists of the above aldermen and 203 common councillors, elected annually by the wards on St. Thomas's Day (Dec. 21). The electors (see Acts of Parliament, 11 Geo. I., c. 18 (1724), and 12 and 13 Vict., c. 94 (1849)) are the rated householders of the wards, who need not be freemen or citizens of the city. The Common Council is the legislative body of the corporation, and the controller of the finances and property of the city. The council does its work in the form of many committees appointed for the various parts of the administration, e.g. the Library Committee, the City Lands

Committee, the Markets Committee, etc. There are about thirty committees in all. The Court of Common Council is thus the chief executive and legislative body in the city. It also elects the town clerk, the city remembrancer, the city coroner, and the under-sheriff. (c) The Court of Common Hall, the third of the main courts, is composed of the lord mayor, the sheriffs, the aldermen, and the liverymen of the city companies. The Court of Common Hall only meets twice each year; its main business is to elect the sheriffs and city chamberlain, and a few other officials, and to nominate two aldermen, from whom the Court of Aldermen chooses one as lord mayor. The ratable value of the city in 1947 was £6,178,208 (that of Westminster was £9,799,655).

The markets of Billingsgate, Leadenhall, Islington (Metropolitan), Smithfield (L. Control Markets), etc., are under the control of the City Corporation, which derives a yearly income therefrom of about £315,000, almost balanced by an expenditure of £271,000. The Smithfield markets are by far the largest of these. The city has a total revenue from rates, rents, markets, etc., of £6,178,208, with an expenditure of about the same amount, mainly used in the maintenance of the markets, the police, and the streets. In addition to the revenue from the markets mentioned above, the city possesses valuable general estates with a gross revenue of about £680,000, the balance of the expenditure required being raised by rates. There is a long list of highly paid officials of doubtful public utility. The whole City Corporation is a survival from the Middle Ages endeavouring to function under modern conditions. In the Commons debate on the Local Government Bill, 1888, strong objection was raised to leaving the city of London as an exercise on the new system, treated, as one member put it, 'as a sort of strange animal pickled in spirits of wine.' But the gov. was not to be drawn and merely promised that a Bill to deal with the rest of London government would be introduced later.

But the most interesting survivals in the city of L. are the livery companies, the remains of the medieval system of organising trade and industry under the control of guilds or companies of privileged tradesmen or craftsmen. There are about eighty of these companies still existing, in more or less archaic form, in the city of L. They possess a total membership of about 9700 liverymen, who form the larger part of the Court of Common Hall. The first twelve of these guilds are termed the Great Companies, which are (in order of civic precedence) Mercers, Grocers, Drapers, Fishmongers, Goldsmiths, Skinners, Merchant Taylors, Haberdashers, Salters, Ironmongers, Vintners, and Clothworkers. The majority of these are possessed of valuable estates; thus the Mercers have a corporate income of £58,000 a year; the Grocers have a corporate income of £37,500; the Drapers of £50,000, and a trust income of £28,000; the Goldsmiths' corporate is £43,000,

and trust income £16,000; the Skinners' £33,200 and £33,500 respectively; Merchant Taylors' £37,000 and £13,000; Haberdashers' £20,000 and £49,000; Salters' £20,000 and £2000; Ironmongers' £13,000 and £13,000; Vintners' £14,000 and £4600; and the Clothworkers' £57,000 and £27,400. The total property of all the livery companies is said to be about £18,000,000, producing an income of about £900,000 a year. The wealthiest of the lesser companies are the Leathersellers, the Carpenters, and the Brewers, though the property of the latter is mainly in the form of trusts. The halls of the companies are in some cases of great interest, and will be mentioned in the section on topography. Once the chief factor in L., both as trustees and governors, the livery companies have now become close private corporations, of little direct control over public affairs, but nevertheless powerful by reason of their historical reputation and their wealth. Their trading rights and duties are mainly nominal, though in some cases, e.g. the Apothecaries' Company and the Stationers', they are still, to some extent, in active existence.

We have now glanced at the three main local governing bodies in the L. area. There are other bodies of various kinds, not only of intrinsic importance, but also worthy of notice as illustrating the affairs of L. The most noteworthy are the following: (1) The Metropolitan Police, which, we have seen, are in police control over the whole area of greater L., except the city, which has its own force. The Metropolitan Police number about 15,142 men (excluding the reserve of pensioners, the Metropolitan Special Constabulary, and the Metropolitan War Reserve, this last-named force numbering over 10,000 in 1941). The Metropolitan Police are under the control of a commissioner who is appointed by the home secretary, and is entirely under his orders. It is thus the instrument of the central gov., of which the home secretary is but one member. The yearly cost in salaries of the police amounts to about £5,600,000, and the total cost of the service £11,820,052 (1946-1947), which is met by almost equal payments from rates and the national exchequer. (2) The Metropolitan Water Board was constituted by the Act of 1902 to take over and control eight hitherto private and separate L. water companies and two urb. dist. council supplies. Its estab. killed the L.C.C.'s last hope of becoming the water authority for L. The genesis of the board was in the findings of the Landaff Commission (1897-99) which rejected anterior proposals for providing L. with water from Wales, the commission being of the opinion that the existing sources were adequate in normal circumstances, and that in times of drought, as had occurred in 1898, the situation could be met by making further inroads on the minimum flow of the Thames. The board consists of sixty-six members, twenty-nine of whom are elected by the bor. councils, fourteen by the L.C.C., and the rest by the other local governing bodies of the area. The

yearly receipts of the board amounted in 1946 to £7,129,278, which allows a balance after debt charges and expenses had been paid. The previous shareholders were mainly paid by the issue of 3 per cent stock. The pop. supplied is 6,244,900 persons, and the area supplied is about 540 sq. m., which, to a large extent, coincides with the area of greater L. as defined above. The water supplied amounts to about 53.1 gallons a day per head of the pop. The water is drawn from the Rs. Thames and Lea and the New R., and the rest from springs and wells. The charges are uniform over the whole area, and are levied on net ann. value at such rate, not exceeding 8½ per cent, as the board may fix. Since the Act of 1902 the water supply of L. has been well provided and safeguarded. During the drought of 1935 the board applied to the Ministry of Health for power to abstract additional water from the Thames, so as to leave less than the statutory minimum of 100,000,000 gallons a day. That the board was able to agree to a reduction in their proposed abstraction reflects an improvement in the capacity of the water reservoirs of L., of which it has had the keeping since 1902. (3) The Port of L. Authority is another attempt to place private trading under popular control. It was estab. by the Port of London Act, 1908, to take over the chief L. docks (i.e. the L. and India docks, the Surrey Commercial docks, and the Millwall docks), which were bought at the price of £22,800,000. For many centuries ships were small and required little depth of water. Cargoes were loaded and unloaded while the ships were high and dry at low water alongside the banks or by means of lighters. Later small platforms of stone or timber, or piers, were provided. In course of time a great many wharves and quays became estab. on the riverside in the vicinity of L. So greatly had the trade of the port of L. increased by the end of the eighteenth century that vessels became congested owing to inadequate moorings and warehouse accommodation. Plundering and smuggling of goods was rife and agitation led to Parliament passing an Act authorising the construction of the W. India docks. These were the first docks for handling goods built in the port (opened Aug. 27, 1802). Other docks quickly followed. In the next decades competition between dock proprietors and wharf owners became very keen, and owners of dock undertakings eventually found that they could not deal with the larger ships that were being built. The gov. appointed a royal commission to investigate the problem and the result was the Port of London Act, 1908, which created a new authority or public trust to take over and administer as one unit all the docks and the whole of the tidal portion of the riv. The authority has constructed new docks and its total capital expenditure is £38,000,000. The expenses are met by the present revenue of £7,000,000 from tonnage dues, port rates, riv. tolls, etc. It was estimated that there was a net income of £800,000 from the

above three dock companies bought under the Act. The power to levy port rates on goods was first given by the Act, whereas the power to collect dock rates on goods already existed in the time of the private dock companies. The authority is constituted as follows: eighteen members are elected by traders using the docks, one by the Admiralty, four by the L.C.C., two by the Ministry of Transport, two by the city of L., and one by Trinity House. These members are elected for a term of three years. Their authority extends from Teddington to the Isle of Sheppey, on both sides of the riv., including all ls., rivs., creeks, channels, harbours, docks, etc., within those limits. But the City Corporation still retains its powers as port sanitary authority, and Trinity House retains its powers as to pilotage, lighting, and buoying. The powers of the Conservancy of the R. Thames are now restricted to the riv. above Teddington, extending to Cricklade in Wiltshire. (4) The London Fire Brigade, under the control of the L.C.C., is maintained at a cost of about £1,933,215, of which the fire insurance companies pay £98,000, and the central gov. £147,450, leaving the bulk of the balance to come out of the rates. There are 2233 officers and men attached to 61 fire stations, and serving the area of 117 sq. m. contained within the L.C.C. boundaries. In the year 1943 there were 3043 fires. There are three riv. stations (included in the 61 stations mentioned above) Lambeth, S. Wharf, and Woolwich, at which there are four fireboats (two at Lambeth). There is also a salvage corps. (5) The Central Criminal Court is the chief criminal court of L., sitting at the Old Bailey, and acting as the assize court for the L. area. The lord mayor and aldermen and the recorder and common serjeant of the city, theoretically at least, act as judges, in addition to the justices of the high court. In practice the recorder and the common serjeant try the less important cases, and the more serious charges are heard before a justice of the high court. Its jurisdiction covers an area of 419.3 sq. m. with a pop. of 6,750,000, which does not coincide, however, with the Metropolitan Police Dist. or any co. divs. It embraces the whole of the cos. of Middlesex and L., and the city, in addition to parts of Essex, Surrey, and Kent. (6) The Metropolitan Police Courts. There are fourteen of these, presided over by twenty-five magistrates appointed by the Crown, who have each the powers of any two justices of the peace, or to inquire into indictable offences. In other words, they take the place of the ordinary non-professional justices in other areas, except that they cannot sit at quarter sessions. Their unified jurisdiction covers the whole co. of L., except a part of Hampstead, and practically coincides with the L.C.C. area, except that the city of L. is outside their jurisdiction, and has two police courts (the Mansion House and the Guildhall) of its own, presided over by the lord mayor, or one of the aldermen in rotation. (7) L. Univ. is a body of somewhat complex character.

It received its charter in 1836 as a non-resident univ. which granted degrees by examination of students, who were free to acquire their education where they pleased. By the Act of 1898 it was provided that it should become a teaching univ. also, and, as a result, it took over Univ. and King's Colleges, King's College for Women (a part of the original college), and the Goldsmiths' College. Besides these constituent colleges, it also directly maintains the Frances Galton Laboratory for National Eugenics, the Brown Animal Sanatory Institution, and the Physiological Laboratory at S. Kensington. Beyond these constituent parts of the univ. there are 'schools of the university,'

ann. block grants, the amount being determined for five-year periods, that for 1935-40 being £129,000 a year. In addition a capital sum of £150,000, spread over five years, is being made towards the capital requirements of colleges and schools of the univ. Capital grants have also been made, or promised, to a total of £450,000 towards the cost of the new univ. buildings at Bloomsbury (see also LONDON UNIVERSITY). (5) Bridges. The city corporation, through its Bridge House Estates Committee, bears the cost of the bridges over the Thames within its own area (Blackfriars, Southwark, L., and Tower bridges) and shares the cost of other bridges over the

Valentine & Son Ltd., Dundee

the teachers of which the univ. recognises as possessing univ. rank, and the students of which it recognises as 'internal' students. The univ. of L. is governed by a senate formed by a chancellor and fifty-four members, four of these being appointed by the Crown in council, sixteen by the convocation (the doctors and proctors) of the univ., sixteen by the faculties of teachers, and the rest by various public institutions. The L.C.C., which has liberally assisted the univ., is represented on the senate, and, since the reorganisation of 1929, on the court. The council's relations with the univ. began through the Technical Education Board and from 1894 capital grants were made to some of the colleges and schools of the univ. as well as maintenance grants. Grants were enlarged after the L.C.C. became the education authority in 1904. Since 1930 the L.C.C. has made

Thames and most other streams, but not of certain bridges at the borders of the co. The L.C.C. inherited from the old Metropolitan Board of Works control of ten bridges over the Thames, and one over Deptford Creek. As successor to the justices of the peace it also became responsible for twelve co. bridges, wholly within the then new co. of L., and eight partly outside the co. In all the council has about sixty road bridges under its control, many of which have been wholly or partly reconstructed. The prin. Thames bridges maintained by the L.C.C. are Hammersmith, Putney, Wandsworth, Lambeth, Waterloo, and Westminster. Hammersmith bridge is likely to require reconstruction in the not distant future. Putney bridge was widened between 1931 and 1934 to take six lines of traffic, the cost being £337,000. Wandsworth bridge is being (1949) reconstructed at a

cost of £500,000. The former iron suspension bridge at Lambeth was demolished between 1929 and 1932 and a new bridge to carry four lines of traffic was built at a cost of £440,000. The old Chelsea suspension bridge, built in 1858, was pulled down in 1935, and in 1937 the Prime Minister of Canada opened the new bridge, which cost over £300,000. Waterloo bridge has been replaced by a wider and handsome structure, following much controversy over the architectural merits of Rennie's old bridge, which, in any case, was gradually sinking. Westminster bridge, the broadest and most heavily used in L., remains untouched. (9) The L. Transport Executive is the controlling authority for L.'s system of electric train and bus services. See below under *Traffic*.

These are the chief official bodies and councils which control L. in their respective ways, but there is an unofficial body which has perhaps as much influence as all the rest, although it has no charter or other formal recognition by the legislature. This very powerful body is composed of the landowners of L. A census of these was taken by the L.C.C., from which it appears that the area of the council's jurisdiction (117 sq. m.) was owned by about 34,600 landlords, the largest being the collective bodies or institutions of the Crown, the Eccles. Commissioners, the L.C.C., and the corporation of the city; all these together possessed about 19 sq. m.; there are about 180 owners who average one-third of a sq. m. each.

Parliamentary Representation.—The present (1949) distribution of seats gives 62 members of the House of Commons for the L. bors: 5 to Wandsworth; 4 each to Camberwell, Islington, and Lambeth; 3 each to Hackney, St. Pancras, Southwark, and Stepney; 2 each to the City of L., Battersea, Hermondesey, Bethnal Green, Fulham, Hammersmith, Kensington, Lewisham, Paddington, Poplar, Westminster, and Woolwich; and 1 each to Chelsea, Deptford, Finsbury, Greenwich, Hampstead, Holborn, St. Marylebone, Shoreditch, and Stoke Newington. In their proposals (pub. at the end of 1947) for L., the Parl. Boundary Commissions, set up under the House of Commons (Redistribution of Seats) Act, 1944, made the boundaries of the parl. bors., as far as practicable, coterminous with those of the metropolitan bors., and this they were able to do with regard to 20 of the 28 bors. In 5 instances, owing to the small electorate, they did not recommend that the bor. should continue to be represented separately. These five are Finsbury, Chelsea, Holborn, Shoreditch, and Stoke Newington. Finsbury and Shoreditch are united to form a single-member constituency; Stoke Newington is combined with Hackney, Holborn with St. Pancras, and Chelsea with Westminster, the parl. bors. thus formed each being divided into two single-member constituencies. See further under *ELECTORATE*.

Traffic.—The traffic problem of L. has long been one of its recurring anxieties, owing to the difficulty of an adequate

appreciation of coming changes. L. has not had the advantage of continental cities such as Paris (where imperial influence pushed through the bold Haussmann plan) or of New York, where the realisation that a relatively small town was soon to develop into one of the world's greatest cities warned the authorities that they must make plans well ahead of the present. Traffic in L. has had to adapt itself as well as possible to haphazard methods of development and change, and, with the two outstanding exceptions of the Victoria Embankment during the nineteenth century, and the Kingsway-Aldwych improvement of recent years, the general policy has been one of patchwork and expediency.

The L. road traffic problem came to a head with a report of the L. and Home Cos. Advisory Committee, to give effect to which Bills for the joint management of L. transport facilities were promoted by the L.C.C. and the L. traffic combine. While the Bills were still before Parliament the general election of 1929 returned a Labour Gov. to office; the leader of the opposition on the L.C.C., Mr. Herbert Morrison, became minister of transport, and the Bills were dropped. Within two years a Bill was passed setting up the L. Passenger Transport Board to take over the L.C.C.'s tramways and other public transport services. To-day the traffic facilities of L. compare very favourably with those of any great city.

L. is essentially the railway centre of the country, as the great trunk railways converge on the metropolis and have their prin. terminal stations within easy reach of any part of the area. Thus, the N.E. Region at King's Cross, Liverpool Street, and Marylebone; the J. and Midland Region at Euston and St. Pancras; the W. Region at Paddington, and the S. Region at Victoria, Charing Cross, Holborn, Cannon Street, London Bridge, and Waterloo. In addition to long-distance traffic Brit. Railways are developing local business as opportunity offers. Two other terminal stations, Fenchurch Street and Broad Street, as well as the semi-terminal station of Baker Street, are largely devoted to this purpose. L. is now served by electric trains from many dists., and further extensions of these services are planned. One of the most important forces in L. traffic is the underground electric railway, now part of the L.P.T.B., but previously a company, the outgrowth of the old L. General Omnibus Company. This body obtained the controlling interest in the following and other companies, either by the purchase of the majority of the ordinary shares, or by the guarantee of dividends (the percentage of shares follows each name): Metropolitan and Dist. 55.07 per cent. L. Electric 96.09 per cent (includes the Piccadilly, Bakerloo, and Hampstead and Highgate lines). Central L. 0.05 per cent. General Omnibus 100 per cent. L. and Suburban Traction 75 per cent (owned tramways outside L.C.C. limits). In the case of the Central L. Railway the dividend was guaranteed under the

London Railway Facilities Act of 1915. by the Underground Company. This powerful company thus controlled 114 m. of railway and 112 m. of tram route, and in addition its motor buses covered over 1000 m. of streets and roads. The other important force in L. traffic was the L.C.C. tramway dept. Until late in its hist. this system was really divided into two parts, through the impossibility of tramlines crossing the two chief streams of E. and W. traffic, but a tramway track running under the Strand into High Holborn via the Kingsway tunnel linked the two sections. The tramway service previously owned by the L.C.C. covered the E., N., and S. of L. very thoroughly, but only touched W. L. at a few points and by circuitous routes. From July 1, 1933, however, the L.P.T.B. became the sole owning and organising authority for the omnibus, train, and tube system of the metropolis and suburbs, the most revolutionary change ever made in the ownership and administration of the transport system of a great city. *See further under LONDON PASSENGER TRANSPORT BOARD.*

The Docks.—The docks are one of the most important features of L., as one might expect in the case of the greatest trading centre in the world. These docks are now under the control of the Port of L. Authority (see above and *under* PORT OF LONDON AUTHORITY). The prin. wet docks of L. are the following: Tilbury, Royal Albert, Royal Victoria, E. India, Millwall, W. India and S.W. India, L. (Shadwell), St. Katherine, King George V., all on the N. side of the riv.; and the Surrey Commercial docks on the S. side. These docks cover an area of 1217 ac. with a water area of 722 ac. and provide 45 m. of quays. The docks begin just below the Tower of London, and are named above in their geographical order from the mouth of the Thames to the Tower.

Aviation.—Two main airports serve L.'s commercial air transport. These are the L. airport at Heathrow, near Staines, and Northolt airport, some 6 m. to the N.E. A third airport at Bovingdon, Hertfordshire, is used chiefly for freight, and a fourth at Blackbushe, near Cumberley, is a relief airport for use in thick weather. Still another alternative to L. is available at Hurn, near Christchurch, nearly 100 m. away. Croydon, once the prin. airport, is unsuitable for modern aircraft and, as it cannot be enlarged, is gradually falling into disuse. The L. airport handles chiefly intercontinental traffic. Seventeen operating companies, serving all five continents, were working to and from the L. airport in 1949. The average daily aircraft movements numbered seventy, the daily passenger total was about 900, and the freight handled was about 25 tons a day. Northolt airport deals almost exclusively with home and European traffic. It is smaller than the L. airport and is used mainly by smaller aircraft. All the operators in W. Europe were using it in 1949 and its daily traffic average was about eighty aircraft movements, 1200 passengers, and 12 tons of freight.

The flow of freight into and out of Bovingdon represented an average of about 8 tons a day. Development of the L. airport, planned for completion in 1955, is intended to increase its capacity threefold. Northolt is regarded as a temporary terminal for European traffic and will probably be replaced in 1956 by an airport on the E. side of L. The estimate is that by then 6000 passengers a day will pass through the continental airport. Aircraft movements in the L. area at that time will be not less than 400 a day and a wider separation of the two airports will be desirable for control reasons. A control area extends for a distance of about 25 m. around L. Within that area aircraft are required to follow instructions as to course and height given to their captains by the L. control. A smaller area with a radius of about 7 m. from L. airport is the control zone which no aircraft may enter without permission. In times of widespread fog aircraft can be sent to Blackbushe, where a F.I.D.O. system for dispersing fog along the runway by jets of petrol flame is installed. This is infrequently used because it is expensive and because an alternative fog-free airport is usually available. The proportion of G.C.A. landings is high. The average of such landings up to 1949 at the L. airport was 1500 out of a total of about 12,000 landings in the course of a year. Improvements are still being made in aircraft control and in approach aids in the L. area. Avoidance of delay in landing is becoming more urgent with the development of jet air liners, which consume fuel at an extremely high rate at low levels while waiting their turn to land.

Private flying continues from flying clubs at Panshanger near Hertford, Fairbairns near Woking, White Waltham near Maidenhead, Broxbourne, Essex, and Redhill, Surrey. Gliding clubs are on the Dunstable Downs and at Redhill.

Commerce and Industry.—L., in proportion to its vast size, is not an industrial city in the sense of the manufacturing of goods. There are, of course, large engineering works and shipbuilding yards at the E. end, on the riv. There are leather works in Bermondsey, and clock-makers in Clerkenwell, and furniture workshops in Bethnal Green, and there is still silk-weaving in Spitalfields. Breweries are famous and numerous, and by some strange luck smoky L. has been chosen as a suitable place to manufacture biscuits in large quantities. But in the great mass of L. all these trades are of comparatively small account. A great many new businesses, however, such as those connected with wireless, gramophones, moving pictures, television, electric light, and electric appliances tend to collect in the area. L. is essentially the city of the distributors and middlemen. It is a place of import and export; of bankers and financiers; of clerks and book-keepers. It is the European centre for gold distribution, although two wars have concentrated the chief gold reserves in other lands. The L. bankers are the heart of commercial L., with the Bank of

England at their head. Lombard Street is the classic place for great banks. Then there is the Stock Exchange, near the Bank of England. On the other side of the bank the Royal Exchange, the Corn Exchange, the Coal Exchange, the Wool Exchange, the Shipping Exchange, Lloyd's, and the Baltic transact the business of their respective trades. But perhaps the most pregnant summary of the trades of L. is to be found in the statistics of the tonnage of shipping which arrives and departs from the docks, and the ann. value of the overseas trade. An official summary gives the following statistics (which are, of course, valid only for the period before the Second World War): Shipping traffic—arrivals and departures (approximately), vessels, 62,000 (63,000,000 net registered tons); goods handled (approximately), 11,000,000 tons; overseas trade (exclusive of coastwise trade), ann. value, £543,000,000 (or over one-third of the overseas trade of the United Kingdom).

The chief markets have been mentioned above in reference to the City Corporation, under whose control and whose property they are. The chief market of L., beyond the possession of the city, is the vegetable market of Covent Garden, which is the property of the dukes of Bedford.

Jorn H. Stone

REGENT'S PARK

The rock-garden and lily pool

Parks.—In the mass of bricks and mortar which make up L. there are mercifully a few open spaces, some of considerable size. The most central and most famous is Hyde Park, of 363 ac., with the adjacent Kensington Gardens, of 274 ac. Practically touching Hyde Park begins Green Park, of 62 ac., and adjoining the latter is St. James's Park, of 193 ac.

Further N. from the above group is Regent's Park, which, with the adjoining Primrose Hill, has a total area of 472 ac. All these are owned by the gov., as is likewise the case with the magnificent Richmond Park, of 2358 ac., which is, however, just over the co. of L. boundary, but within the greater L. area. Woolwich Common, of 159 ac., is also in the same control. The L.C.C. maintains a large number of parks and open spaces having a total area of 5065 ac. The largest is Hainault Forest (1805 ac.), and the others most important are Hampstead Heath (320 ac.), Hackney Marsh (339 ac.), Parliament Hill (267 ac.), Ken Wood (195 ac.), Victoria Park (Bethnal Green) (217 ac.), Battersea Park (199 ac.), Wormwood Scrubbs (Hammersmith) (193 ac.), and Finsbury Park (115 ac.).

History.—The hist. of L. is inevitably bound up with the story of the nation of which it is the cap. city. Nevertheless there is a more local sense in which that hist. can be considered, and it is that which must be treated here. L., as we now speak of it, is the intermingling of many places which had once a distinct individuality of their own. L., as it was known to the A.-Ss., the Normans, and even in the days of the Stuarts and Hanoverians, was a city on the E. side of the little streamlet, the Fleet, which ran along the foot of Ludgate Hill. On the E. side of the fn. its boundary was drawn from the Thames bank, from about the spot where the Tower of L. now stands, which has been the military key through almost the whole hist. of the city. From the days of the Romans a wall ran from this S.E. corner, making a curve just short of the Moorgate marshes, until it came along the Fleet stream side and reached the Thames again at the end where now stands Blackfriars bridge. This small walled space, a mere spot on the map of modern L., was the city of hist. It certainly extended during the Middle Ages into small suburbs which grew up at its various gates, chiefly at Ludgate, Bishopsgate, and Cripplegate, the more important of these suburbs being made into wards of the city. But they reached a very little way from the gates when all is said. All the rest of the L. we know to-day was, until the end of the seventeen-hundreds, in actual fact, and even until the Local Government Act, 1888 (constituting the L.C.C.), in theory, a group of independent vills, and hamlets. First and foremost, there was the city of Westminster (and for some purposes it still exists independently), the place of the royal palace and the abbey which the royal house had founded and especially favoured. For long centuries Westminster was almost as important as the city of L. It was the king's city as against the city of the merchants. Even to-day the distinction still holds good in many ways. The depas. of the royal gov. mainly cluster round the Houses of Parliament and Whitehall. Other independent manors or vills, were Kensington, Chelsea, Paddington, and Marylebone on the W.; Islington, Stoke Newington, Hampstead, and Hackney on the N.; Stepney, Whitechapel,

Bow, and Bromley on the E.; the bor. of Southwark, and the vils. of Lambeth, Kensington, Battersea, and many others on the S.; all these names would now be considered as part of L. They have been swamped and encircled by the ruthless endeavours of the builder.

It is with the doings of the city and Westminster that the historian must be mainly concerned. They were, and are, the two dominant partners in the group. The first L. was probably a Celtic hamlet near the bank of the Wulbrook, a stream now built over, and scarcely more than a large drain. But small though it was, it seems to have given the place the name which lasts to this day. In Celtic *Llyn-din* means a stronghold by the marsh. Another theory traces the name from *Lud*, a Celtic water-god. The first historical reference to the place is in Tacitus, who wrote of it as 'Londinium, a place which is not indeed dignified with the name of a Colonia, but which is greatly celebrated for the number of its merchants and the abundance of its supplies.' His reference is to the time when it was sacked by Boadicea's army which had risen against the Romans. The Romans had adopted this place for much the same reason that it had attracted the Britons: it was the first convenient place where there was both a small hill which could be defended from attack, and also an easily available ford at Westminster close by. The Romans, with their higher engineering skill, were able to build a bridge: at least that is the inference from the fact that the Rom. roads concentrate on the position where it still crosses the riv. On the other hand, the ford gave a good reason for the selection of Westminster as an important place. In the middle of the ford was the little is. of Thorney. The buildings perhaps began as a halting-place, or the abode of the guides who conducted travellers over the riv. King Sebert of the E. Saxons seems to have built a church there as early as 616. But it was Edward the Confessor's abbey which made the place really famous; and he added a royal palace that gave Westminster the two main keynotes which it has retained throughout its hist. This adoption by the kings left the city of L. more completely in the hands of the merchants, who asserted their privilege of freedom from the direct control of the Crown. To this day when a king of England enters the city he must be met by the lord mayor, who hands him the keys of admission at Temple Bar, the W. limit of L. proper. Almost the whole of what we now call the W. end was built on land which was part of the abbey's manor of Westminster; and the chief landowner of that dist. is now the duke of Westminster, who has taken the historical place of the abbot and his monks. Southwark, the bor. which lies at the S. end of L. bridge on the Surrey side of the riv., was an independent place in its early hist. It was inhabited by the Romans, who left many remains there. Later on it became mainly a Dan. settlement during the periods of the Dan. raids and rule, and its name, *Suthgeworke*, is the Dan. for 'the

south fortified place.' It was not until 1327 that Edward III. put it under the jurisdiction of the city of L., whose tn. council complained that it had become a refuge for criminals who escaped there in order to get beyond the reach of its magistrates. But Southwark still retained many privileges, and it was not until the time of Edward VI. (1550) that it was made a ward of the city, with an alderman.

There we have the origin of the three chief units which now form the nucleus of the modern L. For many years the chief point at issue between L. and Westminster was to settle how much of the wealth of the city merchants should go into the treasury of the Westminster king. The city was the wealthiest place in the kingdom. The kings had other great palaces besides the one at Westminster: in early days Winchester, for example, ranked as the first place in the land. When William the Conqueror arrived he saw the importance of commanding L., and one of his first acts was to build the Tower, partly inside the walls and partly without, so that he could dominate the city and yet not be surrounded by his unruly subjects. At first the Tower was a royal residence as well as a fortress. But as time went on the kings lived more and more at Westminster, and by the time of Henry VIII. the Tower was mainly a prison and a fort. Charles II. was the last monarch to sleep within its walls. Since the early Parliaments were practically taxing assemblies called to vote money to the Crown, it was natural that they should meet at the king's palace, so Westminster became the seat of the Parliament, which at first sat in the chapter house of the abbey (from 1295 until 1547); then in St. Stephen's Chapel (now the rebuilt entrance hall of the present house) until 1834, when the whole of Westminster Palace (except the hall) was destroyed by fire. Somewhat paradoxically the Parliament Houses (rebuilt 1840-67) have remained till this day on the site of the king's palace, while the palace itself has moved sev. times. Thus, after the fire of 1512, Henry moved his court to Whitehall, which had been formerly the tn. house of Hubert de Burgh, the great justiciar of Henry III.'s reign; then it had passed into the possession of the archbishop of York, by which it came into the occupation of Cardinal Wolsey, on whose fall Henry VIII. seized it, and made it the chief royal palace in L. The Stuarts lived there, and Charles I. died there on the block outside the window of the banquetting hall, which still stands in the main street of Whitehall. When Whitehall palace was almost destroyed by fire in the reign of William III., the court moved to St. James's and Kensington, which stand to-day much as they were in the times of the early Hanoverians. Buckingham Palace, built in the nineteenth century, is now the actual residence of the Court in L., though St. James's remains the official seat.

To return to the hist. of the city of L. proper. After the Norman Conquest the city was busy securing its rights against the encroachments of the autocratic kings.

Henry I. granted a new charter about 1101, which put the co. of Middlesex under the control of a sheriff, who was to be chosen by the city council. In the language of that day, the *ferm* of Middlesex was sold to the city for a rent of £300 yearly, which was about the value at which the king estimated the revenue he had previously drawn from that co. The citizens were also given the power to choose their own chief justice, or justiciar. But, backed up by the threat of their Tower and its soldiers, the kings were not always ready to keep all the promises they made in their charters. The theory of the municipal constitution by no means always corresponds closely with the facts. During the civil wars of Stephen's reign the Londoners were chiefly on the side of the *de facto* king, though they received Matilda within their walls when she was too strong to be kept outside. There was a widespread fire about this time (1136), which swept from St. Paul's Cathedral to L. bridge and Aldgate. The city was then almost entirely built of wood, except probably a few great nobles' houses. But in 1189, in the reign of Richard Cœur de Lion, a law was passed commanding at least all the ground floors to be built of stone, while the roofs were to be tiles or slates. When Richard went crusading his minister in charge, Longchamp, made the Tower his headquarters, and tried to play the despot. The citizens, one day, were summoned by the assembly bell in the churchyard of St. Paul's (the place of popular meetings), and heard John and the nobles of his party depose the tyrant, and graciously grant the city the right to be governed as a commune, that is, an independent city. But, as a matter of fact, L. already claimed, and to some extent possessed, the right of self-government. In any case, it was about this time that the gov. took the form of a mayor and aldermen. The first mayor on record was Henry Fitz-Kylwin of London-stone, who held office from 1188 until his death twenty-five years later. In the year 1200 we first hear of 'five and twenty of the most discreet men of the city,' who were 'sworn to take counsel on behalf of the city, together with the mayor.' Perhaps this was the beginning of the Court of Aldermen, though, of course, aldermen had existed, with their wards, long before, probably from the Saxon days. There is a list of the wards still in existence dated 1130. But another theory holds that the twenty-five men may have been early common councillors. The agitation for Magna Carta was mainly a matter of L. hist.; for it was in St. Paul's Cathedral that the barons assembled on Aug. 25, 1215, when Langton, the archbishop of Canterbury, addressed them by an appeal to maintain the liberties of the realm. It was just outside the city, at the Temple, that John met the barons to discuss the matter for the first time, and when he would not give way the barons chose Robert Fitz-Walter, the chief constable of the city, to act as their leader, and when they had won their charter it was signed, amongst others, by the lord mayor of L., the only name on the

list that was not that of a peer. It is of this period that we have the first detailed description of the city, in an account written by Fitz-Stephen, the friend of Thomas à Becket; it was written indeed as an introduction to a life of St. Thomas, who was one of L.'s special saints. He described the great wall, with its seven double gates and its towers on the N. side. There was practically no L. at all beyond the walls, except a few straggling houses along some of the main roads of approach, and a few religious buildings whose holiness protected them without a wall of defence. Fitz-Stephen writes of the 'thirteen greater conventual churches,' besides the 126 lesser par. churches which were situated in L. and its immediate suburbs. Of Westminster he says: 'To the west the royal palace is seen rising above the river, an incomparable building with ramparts and bulwarks, two miles from the city, joined to it by a populous suburb'—the only real suburb L. then possessed. The 'greater conventual churches' he means are worthy of name, for they give a good illustration of the main features of the city and its surroundings at this time. They are Westminster Abbey, the Hospital of St. Giles, the Temple, the Priory of the Knights of St. John at Clerkenwell and the nunnery next door, St. Bartholomew's Priory, St. Katherine's Hospital near the E. wall, St. Mary Overy and Brompton Priory over the riv. at Southwark, while inside the walls were St. Martin-le-Grand near St. Paul's and the Priory of Holy Trinity at Aldgate. The other great religious houses to which Fitz-Stephen refers are a little doubtful. Another prominent feature of Fitz-Stephen's L. was the group of wells just outside the walls; of these the names of Clerkenwell and Holywell remain to this day. Indeed a very large proportion of the important names in L., whether of streets or districts, or some other local matter, can be traced back to the early days of the hist. of the city. There are to-day many names which would have been familiar to the men of the Norman period; in some cases they carry the mind back to the days of the Saxons and Danes, even to the Britons. Thus, for example, as we have seen, the name L. is Brit.; the church of St. Martin Poinroy, in the heart of the city, probably is (as Sir Lawrence Gomme surmised) the place of the Rom. *pomerium*, the open ground which lay just outside the first and smaller Roman; Adile Street is the survival of Adel or Atheling Street, the Saxon for Prince's Street; St. Clement Danes still recalls the period when it was the peculiar settlement of the Dan people, who never found themselves quite at home within the city walls, and the names of the Middle Ages period are numerous.

Fitz-Stephen mentions the existence of special districts given over to the use and habitation of the members of individual guilds or trade unions. To this day there is Bread Street, where the bakers baked, and Friday Street, where the fishmongers sold the fish for the day of abstinence. Other trade names are Milk Street, Iron-

monger Lane, and Honey Lane. During the years between the Norman Conquest and the Tudors perhaps the most important factor in L., after the Church, was the development of the trade guilds. The gov. of L. was, during this period, almost entirely in their hands. Their control of trade and industry was almost a monopoly, and their halls or council houses were an imposing part of the architectural display along the streets. In the Middle Ages L. was a city of churches and guilds, of priests and craftsmen, and its hist. is

the control of a merchant class. Fitz-Thomas, who was elected mayor in 1261, may be taken as the first representative of the newer men. He played the part of a popular demagogue; what happened can best be described in contemporary language: 'He so pampered the city population that they called themselves "the commons of the people." In all he did he acted and determined through them, saying, "Is it your will that so it should be?" and if they answered, "Ya, ya," so it was done. He had all the populace of

largely the story of these various trades and professions. In still earlier times the government of L. was probably mainly in the hands of a class of men drawn from the 'country gentleman' type, perhaps mainly the chief landowners of the city. These, as time went on and trade developed, were gradually supplanted by the newer merchant and craft classes, who became the moneyed classes. The country and tn. magnates were not divided by any hard and fast line. A good reminder of this fact is that Richard Whittington, the story-book hero of L., and also an historical personage, was the son of a Gloucestershire knight. The broad distinction holds good, however, that during the Middle Ages L. was under

the city summoned, telling them that the men of each craft must make such provision as should be to their own advantage, and he himself would have the same proclaimed throughout the city and strictly observed.' When the king, Henry III., refused to acknowledge such a revolutionary lord mayor, the Londoners threw themselves on the side of the barons and fought with them at the great battle of Lewes, 1264. It was the indiscretion of Prince Edward in ordering these Londoners too far from the field which lost his father the battle, for when Edward turned back to his father's assistance it was too late, for the king was a prisoner. The reason for young Edward's keen desire to strike at the Londoners gives us an interesting

insight into the medieval hist. of their town. A year or so before, Henry being short of money, Prince Edward raided the treasury of the Templars living in the Temple, where it still stands to this day off Fleet Street. The Londoners, like all well-to-do persons, feared that this lawless raiding might attack their possessions next. So to show their anger they took the first opportunity of throwing mud at the queen as she passed along the Thames under L. bridge on her way from the Tower to Windsor Castle. The chase at Lewes is generally held to have been incited by Edward's desire to avenge his mother. There is a dramatic sequel to the story. When Henry was rid of Simon de Montfort he turned savagely on L. and seized control of its government. He demanded that Fitz-Thomas and the chief men of the city should attend before him at Windsor and submit themselves to the royal mercy. They arrived. What happened is a mystery to this day: some of them were released very quickly, but Fitz-Thomas was never seen again.

In the charter of 1319 there is a clause declaring that every freeman of L. must belong to a 'mystery' or guild company, unless he could persuade the commonalty to elect him by popular vote. This made the control of L. almost a close monopoly of the craftsmen or guildsmen. In the reign of Edward III. it became a common custom to recognise these guilds or livery companies by a grant of letters patent from the Crown. By 1328 twenty-five guilds were thus legally recognised as possessing power to draw up rules for the regulation of their respective trades. By 1377, when Edward III. d., thirty-five had been added to the list. In 1351 the guilds elected the Common Council. It was during the fifteenth century that the splendid guild houses of the city companies were mainly built. Before 1100 we can only be certain that two of them were already in existence, the halls of the Merchant Taylors and of the Goldsmiths, though the Fishmongers probably had built their hall also. By the year 1485, the beginning of the Tudor period, twenty-eight other halls had been built, and others were in process of building. This century may be taken as the high-water mark of the power of the great city companies. In Tudor days the power of the Crown increased at the expense of the medieval power of the Church and guilds, and the evolution of industry had burst its medieval bonds. The day of the more unrestrained individual capitalist was coming fast. The transition from the master of a guild to a millionaire was well on its way, and it deeply influenced the hist. of L.

Edward IV. has, in some respects, a special claim to consideration in the hist. of the city. He was a great favourite with the traders of L. He made love to their wives, and generously scattered charters of privileges among the smaller guilds. He became a wool trader himself, and carried on a flourishing trade with Flanders. He also paid his debts punctually. In return for all these favours the

citizens gave him a free hand. They allowed him to murder Henry, and to grant the famous Hansatic League of foreign merchants almost complete independence within their guild house, the Steelyard, which stood where Cannon Street station now stands. But it was the Great Rebellion of the seventeenth century which finally demonstrated the great power of L. One might almost say that the merchants of L. were the motive power in the revolt against Charles I. They were now almost supreme within the walls. Their rival, the Church, had been swept away by Henry VIII. When Charles attempted to raise money by forced loans and hampered trade by patent monopolies, he found the city merchants too strong for him. All the right was by no means on the city's side, but there was no fact on the side of the king, and when strength meets blind autocracy there must follow war. L. was the stronghold of the Parli. party. When the king used armed force in the House of Commons the threatened members fled to the city, where they were safe. It shows the strength of the Londoners when we read that all the satisfaction that the pursuing Charles could get when he entered the city to demand the surrender of his opponents was a loud angry shout of 'Privilege! Privilege!' When Charles levied ship-money there was only one man in all L. who would pay. Strafford is said to have counselled Charles to bring the city innuents to reason by beheading a few of them, but instead it was Strafford's head that was cut off, and it is said that 200,000 people assembled on Tower Hill to see it done. The Commons sat in the city while their friends were arming themselves. When Charles heard the news that the train-bands of L. were arming, he left Whitehall and took up his residence out of harm's way, at Hampton Court. The 'train-bands' played a noble part in the hist. of L. This form of military service was introduced in Elizabeth's reign, the train-bands being regiments raised for home defence, and the predecessors of the citizen soldiers who have played such an important part in later wars. Though better trained in the metropolis than elsewhere they were not, of course, peculiar to London. Following the departure of Charles for Hampton Court, the Commons were escorted back to their house at Westminster by the citizens, in tumultuously joyful mood at their victory. During the Civil war which followed L. was the continuous centre and support of the Parli. cause.

From earliest times L. has always been ready to assume the role of a 'city in arms.' It was as a city in arms that it 'attacked Hengist and Æse, that it met the attacks of the Danes, took its share in the struggle at Hastings under its own sheriff, Ansgar; again it was under this influence that King Stephen mustered the men of L. and that a section of the army of the barons in 1264 was composed of Londoners; that the gathering under Wat Tyler took place at Mile End; that the organised forces of the city under Henry VIII. were gathered

there according to "ancient custom"; that the city in arms marched to Newbury led to battle by the city chiefs' (Gomme). Indeed the strategical importance of the city, from the fateful events of A.D. 61 to the days of the Civil war, was always recognised by the Rom. military system, by the A.-S. kings, by the Danes, by William I., by the military commanders during the Wars of the Roses, and during the Civil war.

L. had scarcely recovered from the strain of civil war when she had to face two terrible disasters. Four years after the Restoration the Great Plague decimated the city, and on its heels came the Great Fire. On Sept. 2, 1666, a baker's shop in Pudding Lane caught fire, and from this centre the conflagration spread rapidly. For five days the flames raged, and when at last they died down there was very little of L. left. St. Paul's Cathedral, eighty-nine churches, and most of the livery halls, together with 13,000 homes, lay in ruins (see also GREAT FIRE OF LONDON).

At the revolution of 1688 the councillors of L. did not take quit. An official part as they did in the Civil war, though it was within the city that the lords and bishops met (at the Guildhall) to arrange the plot to call William from Holland. When he arrived he invited the lord mayor, the aldermen, and fifty councillors to sit in the Convention Parliament which offered him the crown. In other words, he treated L. as an estate of the realm. That was perhaps L.'s last appearance as a constitutional factor. Henceforth it is merely the largest and wealthiest of the towns of the nation. By this time the swelling of the L. suburbs had begun. When the nobles and gentlemen returned to L. at the Restoration they did not take their old place in the city. They built themselves houses round Covent Garden and St. James's, continuing the process which had already begun round Lincoln's Inn Fields in the days of Charles I., when the friction between crown and merchant had already begun. These early suburbs linked up L. with Westminster. It was during the Hanoverian period that the rest of the W. end spread, drawing, one by one, the surrounding vills. within the whirlpool of L. as we know it to-day. Even in 1725, when the traveller De Saussure described it, he could still write that 'Chelsea is one of the finest and largest villages outside London . . . about two miles from Chelsea you reach Kensington, a large and fine village situated on a slight elevation. Marylebone is a fine large village about one mile from London. . . . Paddington is a small village further north, and two miles distant from London.' And he writes of Islington as a 'small market town,' and the vills. of Hackney, Hampstead, and Highgate, while Lambeth, on the S., is another 'small market town.' Of course Hammersmith, Fulham, and Putney were quite rural places in his eyes. It is therefore only since this date that L. has become anything like the place as we now know it. A statistical statement may help to focus its size. In the beginning of

Elizabeth's reign there were about 50,000 inhab. within the walls, and perhaps another 20,000 in the suburbs proper. Then came the moment of its first rapid growth. By the end of Elizabeth's reign it had almost doubled its pop. By the Restoration the total pop. was about 450,000. Now it has, in its widest sense, over 8,000,000.

Topographical and Architectural Features.—The above sketch of the historical growth of L. will have given a hint as to the distribution of its architectural features, which must now be summed up in a more systematic form. But first a word as to the topography. As said above, L. was at first a settlement on a little hill by the riv. bank. The city proper is on higher ground. The original hill can best be realised by looking up Ludgate Hill from the E. end of Fleet Street, and also by noticing how the streets to the S. fall away to the riv. Then continuing through the city eastwards, the ground descends until the old bed of the Walbrook is reached in Cannon Street, and the more rapid rise of the other bank can be noted just in front of Cannon Street station. The N. side of the city is flat where it reaches the ground which was in earlier days the Moor or Fen, still commemorated in the names Finsbury and Moorfields. Beyond that the tn. rises to the high ground of Islington and Hampstead and Highgate. Returning to the foot of Ludgate Hill the S. side of Fleet Street slopes more and more steeply down to the riv., until the comparatively steep streets are seen on the S. side of the Strand with the ground still rising on the N. side. Then comes the city of Westminster, built on the old marshes along the Thames, continuing along the riv. bank towards Putney. The ground rises slowly to the N. until it reaches the fairly uniform plateau along which Oxford Street runs, falling down rapidly at its E. end to the valley of Holborn (the stream in the hollow), now, of course, easily overlooked because of the viaduct. The chief historical and architectural features of present L., prior to the destruction wrought by Ger. bombing raids (see *Bomb-damaged London*, which follows), could be listed as: The city wall (best seen at St. Alphage Church, in L. Wall, in Cripplegate Churchyard, in the basement of the General Post Office building, and near the Tower). Chief palaces and fortresses, etc.: The Tower, Westminster Hall, St. James's Palace, Whitehall, Kensington Palace, Hampton Court (outside L.C.C. area), Buckingham Palace, the Horse Guards, Whitehall, Domestic and guild houses: The Guildhall, Merchant Taylors' Hall, Apothecaries' Hall, the Middle Temple Dining Hall, Lincoln's Inn Gate-way, Bernard's Inn, Staple Inn, Gray's Inn Hall, Chelsea Hospital (by Wren), Newcastle House and Lindsay House (Lincoln's Inn Fields), the houses in the Temple, Featherstone Buildings, the Adelphi, Berkeley Square, Grosvenor Square, Inigo Jones's house on S. side of Queen Street. The best known of the larger private houses included

Holland House, Lansdowne House, Marlborough House (belonging to the Crown), Bridgewater House, Apsley House (given to the nation in 1947), Chesterfield House, Lancaster House (formerly Stafford House and now used for the L. Museum), Montagu House (Whitehall). Churches: Westminster Abbey, St. Paul's, St. Bartholomew's, Southwark Cathedral, All Hallows, Barking, St. Stephen's, Walbrook (said to be Christopher Wren's best par. church), St. Olave's, Hart Street, St. Andrew Undershaft, St. Helen's, Bishopsgate, St. Ethelburga (best example of a small par. church of the Middle Ages now left in London), the Temple Church, Chelsea Old Church, and Westminster Cathedral (the sumptuous interior decoration of which should be specially noted). Other famous Rom. Catholic places of worship are Brompton Oratory, St. James's, Sp. Place, Our Lady of Victories, Kensington. There are many of Wren's par. churches scattered over the city. The most completely uniform dists. and streets were Regent Street (designed by John Nash, 1813-20), Queen Anne's Gate, Westminster (built about 1706), a very beautiful square of the period. Bloomsbury is still largely early Victorian, with many houses still older. The Great Ormond Street dist. has many examples of Queen Anne houses. The Adelphi is the work of the Adam brothers. Whitehall, with the Admiralty and Horse Guards, etc., is still very Hanoverian in tone. Belgrave Square and its dist. is fairly uniformly in the style of the period, 1830-50. Fitzroy Square is again the work of the Adams. Some of the other 'sights of London' can only be briefly mentioned here; these include the following: The Albert memorial, one of L.'s most controversial monuments, which took twenty years to build, and which was the work of Sir Gilbert Scott; Broadcasting House, erected in 1931 on modern lines, with a sculpture executed by Eric Gill; the Cenotaph in Whitehall, designed by Sir Edwin Lutyens, and first erected to preserve the memory of those who died in the First World War, and afterwards newly inscribed so that it may also remain a monument to those who fell in the Second World War; Cleopatra's Needle, standing on the Victoria Embankment, blackened by L. smoke and soot for many years (this was cleaned during 1949 in an effort to restore the original pink colour of the granite); Downing Street, Whitehall—No. 10 is the address of the Prime Minister of England; the Inns of Court; the Marble Arch, which was designed by John Nash; the Royal Mint, where all the coins used in the United Kingdom are struck; L. and Tower bridges, and the site of Tyburn tree at Marble Arch, which is marked with a plaque.

Bomb-damaged London.—The damage wrought by Ger. air raids in the First World War was a mere bagatelle to the widespread havoc caused by the much larger bombs and highly developed bomber planes used during the Second World War, and one of the major prob-

lems facing the gov. after the war was the rebuilding of the damaged and devastated areas. The heaviest damage in L., so far as area alone was concerned, was that in the Thames estuary, in the ill-fated riverside bors., and around the dock areas. In the last-named large fires were caused on Sept. 7, 1940, when more than 350 Ger. bombers attacked L. Heavy damage was done to shopping centres, particularly in the W. end and in Queen Victoria Street and the vicinity. Hardly a well-known city street escaped some damage, and, in anticipation of further raids, numerous firms and individuals transferred their offices to tns. in the W. of England, or elsewhere in the provs. Damage in the residential suburbs of L. was not heavy, but the area of outer L. is so great that the damage done was apt to be underrated, until the introduction of the flying bomb, when severe damage was sustained by many outer suburbs. A great number of L.'s historic buildings were hit, and some almost entirely destroyed. Both on Dec. 29, 1940, and again in April and May 1941, the Ger. Air Force made strenuous efforts to set the whole of L.'s chief business centres aflame, as had been done at Coventry, and, in a lesser degree, at Southampton, Bristol, Portsmouth, and elsewhere. On April 16, 1941, L. experienced one of the most wanton and savagely indiscriminate raids of the war and there was scarcely a dist. that did not suffer damage from high explosive and incendiary bombs, which rained down in thousands throughout the night from a force estimated at over 500 machines. It was in the raid of May 10 that Westminster Abbey and the Houses of Parliament were seriously damaged, the Commons' debating chamber being destroyed. The famous oak roof of Westminster Hall was pierced by bombs; Big Ben was scarred and damaged, but its mechanism remained intact, so that, throughout this nightmare period, its welcome chimes radiated over the Brit. broadcasting system symbolising the proud resistance of L. as the heart of the empire. Parliament agreed to a reconstruction scheme on Jan. 25, 1945. The deanery (except the Jerusalem Chamber and Jericho Parlour) of Westminster, one of the finest examples of medieval architecture in England, was destroyed; in Westminster Abbey the roof of the lantern in the centre of the building fell in. Structurally the abbey sustained no damage beyond this, but the Chancel window in Poets' Corner was destroyed.

Elsewhere in the cap., on the same night, sev. churches were destroyed, and five hospitals were hit, one being a hospital for children. In the cloister court of the House of Commons, which was originally built by Dr. John Chambers, physician to Henry VIII., the public bill office, the votes and proceedings office, and the old members' staircase leading to the inner lobby were all destroyed. Windows in the House of Lords were blasted, and Richard Cœur de Lion's sword was bent by a bomb in Old Palace Yard. One bomb dropped in the

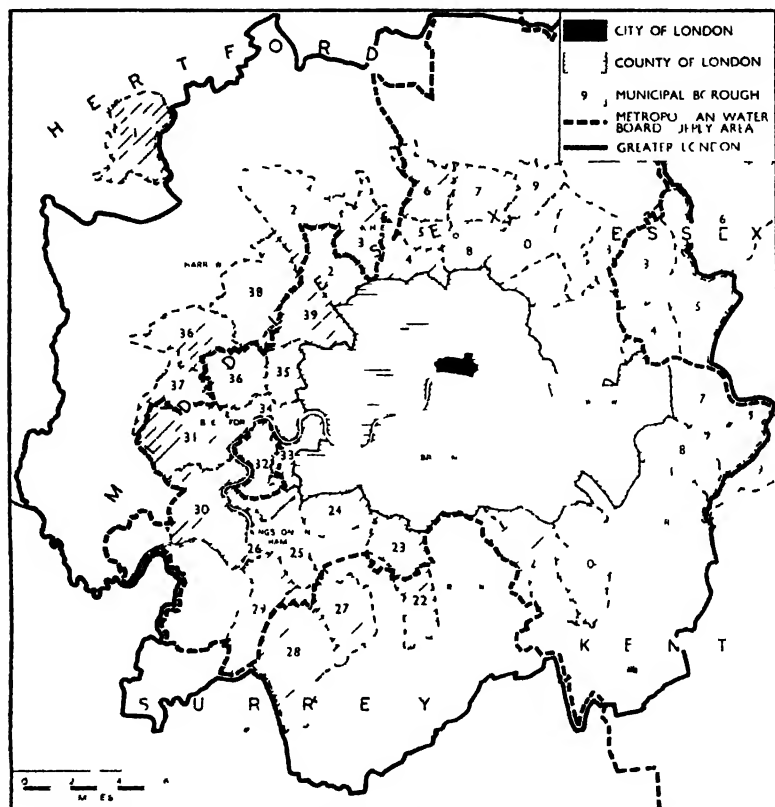

choir of St. Paul's Cathedral, obliterated the high altar, and damaged the reredos; another fell through the roof of the N. transept and into the crypt, destroying spandrels of the ceiling and the marble gallery near the N. door; the two bombs blasted out all the windows with the exception of a few fragments.

Buckingham Palace was attacked three times, but on each occasion only the precincts were hit. The private chapel, which was fitted up for worship by Queen Victoria, and used for daily prayers, was damaged. On the first occasion (Sept. 10, 1940) a time bomb shattered the swimming pool and damaged the Chinese Chippendale room. The great hall of the city Guildhall was burnt out in the fire raid of Dec. 29, 1940, and the library of the Guildhall was also damaged, but less seriously. The Guildhall Art Gallery has since been reopened. The N. bastion of the Tower of L. received a direct hit in Nov. 1940. The Tower was reopened to the general public at the beginning of 1946. The side of Trinity House was burnt out on Dec. 29, but plans have been prepared for repair and reconstruction of the interior. One end of the Temple Hall was blown out (Oct. 1940), but the ancient stained glass had been removed; restoration is now complete. The Inns of Court were particularly heavy sufferers: the Inner Temple Library and Hall were ruined; the riverward end of the Middle Temple Library was seriously damaged, and later the roof was destroyed. Pump and Brick Courts were also seriously damaged. The chapel, hall, and library of Gray's Inn were destroyed. Girdler-Hall court room was destroyed, together with its Wren-period panelling and Grinling Gibbons' carving. Other historic buildings damaged were Holland House, St. James's Palace, Kensington Palace, and Lambeth Palace. The chief L. churches which were left in ruins were St. Clement Danes (the statue of Dr. Johnson remained); the Chapel of the Ascension, Baywater Road; Bow Church (the spire and crypt remaining intact); St. Mary, Aldermanbury (the Shakespeare monument remains); St. Lawrence, Jewry; All Hallows, Barking (the tower remains); St. Olave's, Mark Lane; St. Bride, Fleet Street (the spire remains); Christ Church, Newgate (the tower and Lamb memorial were untouched); Greenwich Church (the Wolfe memorial was untouched); St. Giles's Cripplegate; St. Ann's, Soho (the tablets to Theodore and Hazlitt were untouched); Chelsea Old Church (part of Lawrence and Moro chapels remain); Austin Friars' Church, Old Broad Street; St. Augustine and St. Faith, Watling Street, of which R. H. Barham ('Thomas Ingoldsby') was rector in his day (the tower is almost all that survived); St. Vedast, Foster Lane (burnt out); St. Nicholas Cole Abbey (a mere shell, but one of the few remaining buildings between Queen Victoria Street and Cheapside); St. Andrew-by-the-Wardrobe (burnt out); St. Alban, Wood Street (wrecked); St. Michael's (Dick Whittington's church), of which the in-

terior was wrecked, but the seventeenth-century fittings had been removed.

Among churches damaged were St. Swithun's, Cannon Street; St. Margaret's, Westminster (the Caxton window being destroyed); the Temple Church; St. Stephen, Coleman Street; Our Lady of Victories, Kensington; St. Mildred, Bread Street; St. James's, Piccadilly; St. John, Smith Square; St. Stephen Walbrook (since restored and reopened, 1944); Christ Church, Westminster Bridge Road; St. Dunstan-in-the-E.; St. John's, Clerkenwell; and St. Sepulchre's, near the Old Bailey (the Watch House being destroyed). In Southwark Cathedral the windows to Shakespeare, Beaumont, Fletcher, Massinger, Allyn, and Chaucer were destroyed. The Bishop of L.'s commission on the city churches, in 1946, pub. its proposals regarding the future of the twenty churches that were seriously damaged. The commission recommended that eleven be restored, or rebuilt, that four be converted into parishes or institutes, and that the sites of the remaining five be sold. The five thus affected are those which are considered to be beyond restoration: St. Mildred, Bread Street; St. Swithun, Cannon Street; St. Mary, Aldermanbury; St. Alban, Wood Street; and St. Andrew-by-the-Wardrobe. The four churches recommended for conversion, all badly damaged, but not so severely as the five foregoing, are Christ Church, Newgate; St. Stephen, Coleman Street; St. Dunstan-in-the-E., and St. Augustine, Watling Street. The eleven churches recommended for restoration are All-Hallows, Barking, notable for the world-wide extent of its activities associated with Toc H, and partly rebuilt in 1949; St. Stephen, Walbrook, the rebuilding of which has (1949) also been begun; St. Lawrence, Jewry; St. Michael Royal; St. Vedast, Foster Lane; St. Mary-le-Bow, Cheapside; St. Bride, Fleet Street; St. Andrew, Holborn; St. Nicholas, the Abbey; St. Giles's, Cripplegate, and St. Olave, Hart Street. In the case of all the churches which are to be rebuilt, it was stated in 1949 that the work of rebuilding could not be completed until at least ten or twelve years from that date.

Other notable buildings which were hit included the Brit. Museum, the library of which was reopened in 1946 (see BRITISH MUSEUM), Law Courts, Tate Gallery (reopened 1946) and Wallace Collection (generally, all paintings had been removed), Old Bailey, Somerset House, Stationers' Hall, Royal Hospital, Chelsea, Hogarth House, and the Theatre Royal, Drury Lane. Queen's Hall was completely burnt out. The Arts Club, Dover Street, was almost demolished. Australia House, the Royal Empire Society's building in Northumberland Avenue, Co. Hall, the headquarters of the L.C.C., the Public Records House, Madame Tussaud's, Univ. College Library, the headquarters of the B.B.C., the headquarters of the Y.M.C.A., Spurgeon's Tabernacle (burnt out), and the whole of the old buildings of the Charterhouse (excepting the sixteenth-century entrance

ADMINISTRATIVE AREAS OF LONDON

gatehouse and the chapel). The Sessions House, Toynbee Hall, and Clerkenwell Co. Court were among the other prominent buildings which sustained more or less severe damage. The great hall of Westminster School, which will be restored, the Bushy Library, and the college were gutted, but the outer wall and facade, built from Wren's designs, remained. Especially heavy damage was suffered by the publishers in Paternoster Row in the fire raid of Dec 29, 1940, millions of books being destroyed. On the same night huge gaps were torn in the buildings at the back of Fleet Street, these, mostly, being

the offices of newspapers. Some blocks of St Thomas's Hospital were completely destroyed, and other hospitals hit were Queen Mary's, St Bartholomew's Medical School, Great Ormond Street Hospital, St Dunstan's (headquarters), and the Charterhouse Clinic. The V2 rocket was responsible for much damage between Sept 1944 and March 1945. Forty-five churches and chapels were destroyed or damaged, and thirty-five hospitals were hit. Whitefields Tabernacle, Tottenham Court Road, was destroyed after catching fire, in March. Among the worst incidents were those at

New Cross, Deptford, in Nov. 1944, when 160 persons died and 108 were seriously injured during the lunch hour, a rocket making a direct hit on a multiple store at a time when both the store and the pavement outside were crowded, mostly with women and children; at Stepney in March 1945, where a block of flats was reduced to rubble, and 133 persons killed and 49 seriously injured; and at Farringdon market, in March 1945, a rocket falling at a moment when the stalls were crowded with shoppers, casualties being 110 killed and 123 seriously injured.

Greater London Replanning.—Before the Second World War almost a quarter of the pop. of England and Wales, over 10,300,000 people, lived in the 2720 sq. m. of the greater L. region. This vast concentration of people was badly distributed, and pop. and industry moved from place to place within the region at a very high rate. People and industry were steadily withdrawing from the centre, while there was an influx from other parts of Britain into the outer suburbs. The outer ring of the L. area was expanding at an alarming rate and engulfing the green belt around the metropolis in a jumble of new building. The desirable objective for the development of L. was first sketched in the outline plan prepared by Sir Patrick Abercrombie (1945). This plan, abjuring piecemeal methods, advised a realistic middle course between a doctrinaire policy of decentralisation at all costs and the timidity which resists any idea of a broad plan as visionary. The challenge of this and the Barlow report (see TOWN AND COUNTRY PLANNING) had to be met, and the 143 local planning authorities of the region were grouped into twenty-three executive joint planning committees, which in turn set up, together with the L.C.C. and the city corporation, an advisory committee for L. regional planning. In July 1946 this committee submitted its report on the Abercrombie scheme to the minister of town and country planning, and in May 1947 the minister pub. the gov.'s decisions on many of the issues in dispute. In his memorandum the minister provided for the eventual removal of at least 300,000 people, principally to the tns. not far beyond the boundaries of the region. The gov. accepted the proposal that the overall growth of L. must be restrained and agreed with the preservation of the green belt round L. It was decided not to build new tns. at Stapleford, Ongar, Margaretting, Croxhurst, Holmwood, and White Waltham, as Sir Patrick Abercrombie recommended. Mainly it was decided that the proposed site was too near an existing tn., or that the land was too valuable for agric. purposes. Four new tns. were approved in principle, and steps taken to develop them; these are Stevenage, Hemel Hempstead, Harlow, and Crawley (Three Bridges). Other new tns. will be needed in the course of the decentralisation. The basis of the plan is that the pop. of the region will not materially increase above the 1938 pop. of about 10,000,000, and

that about 1,250,000 will be decentralised from the congested centre.

The Great Exhibition, 1951.—The festival of Britain, planned to take place in 1951, 100 years after the great exhibition planned by the prince consort, envisages the changing of part of the face of London, for the plans include the development of the S. bank of the Thames, where a great concert hall is to be built, together with a small hall for entertainments, and a restaurant. These buildings are to be a permanent feature of the S. bank, and will not be removed after the exhibition (indeed it is hardly thought possible that they will be fully completed until after the close of the exhibition). The S. bank is to be cleared between Co. Hall, Waterloo Bridge, the riv., and York Road, and work began in 1949. Only the Shot Tower will remain of the buildings already in this area.

Bibliography.—There is a multitude of books on L.; the most convenient for general reference are: HISTORICAL: J. Cussel, *Old and New London*, 1873; W. J. Loftie, *The History of London*, 1883; H. B. Wheatley, *London Past and Present* (3 vols.), 1891; R. R. Sharpe, *London and the Kingdom*, 1891; C. Welch, *Modern History of the City of London*, 1896; W. R. Lethaby, *London Before the Conquest*, 1902; Sir W. Bessant, *London in the Time of the Stuarts*, 1903, and *London in the Time of the Tudors*, 1904; G. R. Stirling Taylor, *An Historical Guide to London*, 1911; TOPOGRAPHICAL: P. Cunningham, *Handbook of London*, 1850 (new ed. by H. B. Wheatley, 1911); E. Walford, *Greater London* (2 vols.), 1893-95; Sir L. Gomme, *London*, 1914; C. G. Harper, *Londoners' Own London*, 1927; G. H. Cunningham, *London*, 1930; H. P. Clump, *The Face of London*, 1932; W. Kent, *The London Encyclopedia*, 1937, and *London for Everyman*, 1938, 1948; and H. Williams, *South London*, 1949. ADMINISTRATIVE: H. Morrison, *How London is Governed*, v.1, 1936, 1949; Sir G. Gibbon and R. W. Bell, *History of the London County Council, 1889-1939*, 1939; see also the London Government Act, 1939, which consolidates certain previous enactments and makes some amendments. GENERAL: J. Timbs, *Curiosities of London*, 1885; W. Harrison, *Memorable London Houses*, 1880; P. H. Ditchfield, *Memorials of Old London*, 1908; C. Mullins, *London's Story*, 1920; G. Bell, *More about Unknown London*, 1921; A. K. Bruce, *Memories and Monuments in the Streets of the City of London*, 1931; R. J. Blackham, *London forever the Sovereign City*, 1932; and A. J. Woolf, *The Battle of South London*, 1945. London, cap. of Middlesex co., Ontario, Canada. Situated 115 m. S.W. of Toronto and 125 m. W. of Niagara Falls. It is on the Can.-U.S. National and Canadian Pacific Railways' main lines; there is an airport near by, and it owns the civic lake port and park at Port Stanley on Lake Erie, 35 m. S. Founded originally in 1826 by Governor Simcoe as military headquarters at the forks of R. Thames. Eng. L.'s names were given not only to Ontario L.'s streets, parks, bridges, and

churches, but also to adjoining vills. and townships. Here is the univ. of W. Ontario; there is also a fine technical and commercial high school, sev. collegiate institutes or senior high schools, many separate Rom. Catholic schools, a music college, and a teachers' college. L. has two cathedrals, nearly eighty other churches, and a splendid public library. There are six hospitals and six large parks. There are very fine residential streets, and L. is called 'Forest city' from the great number of trees in its shaded streets. It is the second wholesale distributing centre of Ontario, fourth banking centre, and the dominion's seventh industrial city. Its chief industrial plants are concerned with the manuf. of refrigerators, agric. implements, stores, clothing, shoes, small steel wares, and cereals. The surrounding S.W. Ontario region is rich in agriculture. Pop. 91,000 (greater L. 115,000).

London Airport, see LONDON, Aviation.
London and North-Eastern Railway Company, The, came into being as such on Jan. 1, 1923, as a result of the Railways Act, 1921. Under this title there was a grouping of the old independent lines, viz. Great Central, Great E., Great N., N.E. (including Hull and Barnsley), N. Brit. and N. of Scotland Railways. The London termini were Marylebone, Liverpool Street, and King's Cross stations, from which latter the *Flying Scotsman* left daily (except Sunday) at 10 a.m. accomplishing the run to Edinburgh, a distance of 392 m., in 8½ hrs. In the season this journey was performed without an intermediate stop. The route mileage of the L.N.E.R. (including lines partly owned, leased, or worked by the company or jointly with other companies) was 6401 m. The L.N.E.R. was merged into Brit. Railways as from Jan. 1, 1948.

London Clay. Two triangular regions of this, the lower stratum of the Eocene formation, occur in England, the lower basin of the Thames and the Hampshire basin. The apexes of the triangles are near Hungerford and Salisbury respectively, while the bases are clearly marked by the extent of broken and low coast with muddy estuaries. It is a stiff clay, grey, red, brown, and bluish, with little trace of bedding and no large number of fossils. The fossils are indicative of an old estuary with warmer seas than now, and indicate the presence of palms, turtles, crocodiles, and other tropical life. Layers of septaria occur, worked on the E. coast and N. Kent into cement. The outcrops are largely marked by the presence of brickfields, with their characteristic yellow bricks. The beds are based on sand and gravel, below which lies the chalk; they have a maximum thickness of over 700 ft. The impervious bed imprisons large stores of subterranean water supplied from the Chilterns and N. Downs, and renders possible the artesian wells which supply the fountains of Trafalgar Square and an increasing number of factories and business houses. See Sir G. Lyell, *Principles of Geology*, 1840; J. S. Bowerbank, *Fossils of the London*

Clay, 1840; C. E. N. Bromehead, *Geology of North London*, 1925; and H. L. Sherlock, *London and the Thames Valley*, 1935.

Londonderry, Charles Stewart Henry Vane-Tempest-Stewart, seventh Marquess of (1878-1949), Brit. statesman, oldest son of the sixth marquess of L. Educated at Eton and Sandhurst. Served in the First World War, being second in command of the Royal Horse Guards. From 1906 to 1915, when he succeeded to the title, he was Conservative member for Maidstone. In the Coalition Gov. he was finance member of the Air Council in 1919, and then under-secretary for air and vice-president of the Air Council from 1920 to 1921. He gave up the post to join the gov. of N. Ireland, being appointed minister of education and leader of the senate. After the settlement of the boundary question he returned to England and was appointed first commissioner of works, a post he continued to hold in the National Gov. of 1931, later becoming secretary of state for air with a seat in the Cabinet. In 1932-33 he made an air tour of 16,000 m. to visit R.A.F. units in the Middle E. and India, gaining his 'A' certificate for flying on his return. It was in 1934 that he told the League of Nations that Great Britain would not give up the right to use the bomber against troublesome tribes on the N.W. frontier and similar regions—a reservation which raised a storm among the advocates of disarmament. L., however, radically disbelieved in the possibility of getting general disarmament and believed that no concessions would have any effect on the outcome of the Disarmament Conference. When Baldwin became Prime Minister in 1935 he removed L. from the Air Ministry and made him lord privy seal, but on reconstructing the gov., after the general election in Nov. 1935, he dropped L. altogether. After 1939 L. maintained his interest in all matters pertaining to the R.A.F., and he also took a leading part in the House of Lords in rousing the gov. to prepare plans for the expansion of civil aviation after the war. An air accident in 1945 ended his public career. He suffered a spinal injury from which he never fully recovered. Mr. Winston Churchill, in his memoirs, has paid tribute to L. as secretary of state for air. The great achievement of his period of office, states Mr. Churchill, was the designing and promotion of the Hurricane and Spitfire fighters.

Londonderry, Robert Stewart, second Marquess of, see CASTLEREAGH.

Londonderry: 1. N. co. of Ireland in the prov. of Ulster, bounded N. by the Atlantic. The surface varies, being composed of riv. valleys, rising to tablelands and mts., of which the highest elevation is Mt. Sawell (2236 ft.). The most important riv. is the Roe, which cuts the co. in two and flows into Lough Foyle, others also flowing into Lough Foyle are the Faughan and the Foyle, while further S. are the Moyola and the Bann. Lough Finn is the only lake, but Lough Neagh forms part of the E. boundary. The climate is not good for agriculture, but cattle and sheep

are reared, and oats, turnips, barley, potatoes, and flax are grown. The prin. manuf. is linen, and there are also potteries, breweries, and distilleries. The Bann affords fine salmon and eel fisheries, and the deep-sea fishing is carried on extensively. It is divided into six baronies and two parl. divs., each returning one member.

In 1609 the estates of the O'Nells, who owned most of the co., were confiscated and made over to the citizens of London; the common council of London then inaugurated the Irish Society, and they retained the tn. of L. and Coleraine, while twelve of the big livery companies divided the rest of the property between them. James I. cancelled their charter, but it was restored by Cromwell, and their rights are still retained. Area 816 sq. m. Pop. 950,000 (i.e. exclusive of L. co. bor.). 2. Or Derry, co. tn., situated about 21 m. from the mouth of Lough Foyle, on both banks of the R. Foyle and still partly surrounded by the old city walls, which extend for about a mile and include seven gates and sev. bastions. The two parts are connected by the Craigavon Bridge, which was opened in 1933, and carries a roadway 1200 ft. long. There are some fine old buildings, of which the Protestant cathedral of St. Columba (St. Columba founded monasteries at Derry—A.D. 546—and other places in Ireland before going to Iona—A.D. 563) is the finest, dating from 1633. Other old buildings date from the siege days of 1688. The original guildhall was destroyed by fire in 1908, only the outer walls and clock tower surviving. The building was reconstructed in 1912; the windows in the assembly hall and in the staircase contain fine examples of stained glass art, and the tower clock, erected in 1891, has dials 9½ ft. in diameter and weighs over 10 tons. The council chamber of the guildhall has a richly ornamented ceiling and contains a beautiful range of stained glass windows presented by the London livery companies. The cathedral was completed in 1633 at a cost of £1000. Lead from the old wooden spire was used for making bullets during the siege of 1688-89. The bells in the tower are the oldest peal in Ireland. In 1929 they were recast and increased from eight to thirteen. In the centre of the garden laid out in 1909 on the Diamond, on the site of the former Corporation Hall, is the war memorial. The monument to Governor Walker, a column surmounted by a colossal figure, stands in the Royal Bastion on the Mall Wall; round the pedestal are the names of other historic defenders: Mitchelburne, Baker, Murray, Cairnes, Leake, and Browning. Educational institutions are Magee Univ. College (in affiliation with Trinity College, Dublin), Foyle College for Protestants, St. Columb's College for Rom. Catholics, and the Municipal Technical College. Among the parks are Brooke Park, containing a museum and municipal library, St. Columb's Park, and Meenan Park. The staple industry, the making of shirts and collars, is a century old, having begun

as a handicraft in cottages and now being carried on in large factories in all dists. of the city. Subsidiary industries are motor and mechanical engineering, fancy-box making, snuff, mineral waters, and bacon curing. Surrounded by good agric. areas the port of L. has a large cattle shipping business and sheep and pig export trade.

'Derry' means an 'oak grove,' and its original appellation was Derry-Calgach, the 'oak wood of Calgach' (fierce warrior), and by that name it was known down to the tenth century. No such hero as Calgach is known to hist. or tradition, except in the pages of Tacitus. Thrice was the tn. pillaged by the Danes and indeed for centuries its hist. was mainly a record of fights and fires. In 1311 the tn. was granted to Richard de Burgo, earl of Ulster, and a more or less uneventful period followed. But in 1568, on the rebellion of Shane O'Neill, earl of Tyrone, there was a renewal of trouble; O'Neill suffered a great defeat at the hands of Edward Randolph, who commanded the Eng. forces, and was killed. Randolph's successor, Edward St. Low, abandoned the place in 1568, after an accidental explosion by which the tn. and fort were blown up, including the Teampall Mór or 'great church' built in 1161. With the plantation of Ulster under James I. a large tract of the prov. of Derry was distributed among the London companies or guilds. Subsequently, in order to avoid jealousy among the companies, the City of London Corporation retained the bors. of Derry and Coleraine in its own hands and appointed the Irish Society from among its own members to administer them. The Irish Society was founded by royal charter in 1613; its court consists of a governor and a deputy governor, and twenty-four assistants, in addition to the Recorder of London, and the society are trustees for the corporation of L. It was in connection with the association of Derry with the corporation of London that the name of the city was changed to L. It was one of the conditions of the original charter that the Irish Society was bound to fortify and enclose Derry with stone walls. These were laid out and built in 1617 at a cost of £2357. They consist of a thick rampart of earth, faced with stone and flanked with bastions, and range from 14 to 17 ft. in breadth and from 20 to 25 ft. in height. There are four old gates, Bishops, Butchers, Ferryquav, and Shipquay; in modern times three additional openings have been made for convenience. In arranging the tn. plan the Irish Society followed the principle of having in the centre a diamond, or tn. square, from four points of which main streets radiate.

Derry had its first siege during the rebellion of 1641, when it was successfully defended by seven companies of foot and fifteen guns sent by the London Corporation. In 1648 Sir Charles Coote, the parl. commander, took over the governorship and held it till the Restoration. In 1688 occurred the great siege, which it sustained against the forces of James II.

under Tyrconnell, and which has made the name of Derry famous. The story is one of stubborn endurance, unswerving loyalty to William of Orange, and remarkable courage in the midst of treachery, famine, and disease. Perseverance was at length rewarded by relief, when hope had almost gone, after a siege of 105 days. A boom had been stretched across the river to block the small squadron of ships laden with provisions from England that had laid for some weeks in the lough beyond Culmore Fort. This famous siege is commemorated by a column erected to perpetuate the memory of the Rev George Walker, while a bronze tablet on the wall opposite the guildhall commemorates the heroism of Capt Browning

dry inaccurate 'news'. In 1707 Richard Steele was appointed its gazetteer and editor. In 1845, when the 'railway mania' was at its height the *L G* assumed bulky dimensions because of the unprecedented rush of advertisements. On Nov 15 of that year it was swollen on this account to as many as 583 pages of printed matter. To-day it appears twice a week, on Tuesday and Friday. Its pages are filled with announcements of appointments, promotions, and retirements etc., in the army and navy, and with advertisements required by law.

London General Omnibus Company was formed in 1855 and its original title was *La Compagnie Générale des Omnibus de Londres*. This was of course in the days

London General Omnibus Co. Ltd. Dundee

LONDONDERRY CRAIGAVON BRIDGE

of the *Mountjoy* which by breaking the boom relieved the city. Browning falling at the moment of his triumph. The anniversary of the relief is still observed on Aug 12. In the Second World War *L* was the haven sought by thousands of Brit., Canadian and Amer. sailors returning from their Atlantic patrols. It was in fact the main base in the battle of the Atlantic. 11,000,000 tons of allied naval shipping used the port during the years 1940-4. It was fitting that the people of *L* should witness the eventual surrender of more than sixty U-boats. It is a color and returns one member to Parliament. Pop 47,800.

'Londonderry Air,' one of the best known Irish folk tunes often sung to words of *Danny Boy*.

'London Gazette,' first appeared in 1866 being in reality the twenty-fourth number of the *Oxford Gazette*. Charles Perrot, M.A., a fellow of Oriel College, Oxford, ed it till about 1871. Although it aimed at being the official recorder of news, its scanty columns contained little up-to-date information. After the revolution (1888) it appeared three times a week the reader paying a penny for two double-columned folio pages of happy gossip or

of the old horse buses but early in the twentieth century these had all been superseded by motor buses. The latest of these were of a very luxurious type for street service and fitted with the most modern equipment and appointments. The miles of roads over which the buses operated were 1200. Later the company started a Green Line of motor coaches to the provinces. On the formation of the London Passenger Transport Board in 1933 the *L G* was put under its control.

London Group, The, society of professional artists which was formed in 1913 by a number of painters associated with Walter Sickert (q.v.). The first president was Harold Gilman (1876-1919). The aim of the society was to break away from academic tradition and allow British painting to nourish itself freely from the influences of Post Impressionism. The *L G* holds exhibitions in various London galleries and under its auspices a number of modern painters who have since achieved fame were encouraged to develop in an individual and experimental style. Among them mention may be made of Paul Nash, Matthew Smith, Duncan Grant, Edward Wadsworth, Ivon Hitchens, and David Jones.

London Hippodrome, see HIPPODROME.
London Hospital, The, Whitechapel Road, London E.1, founded in 1740. Formerly one of the largest voluntary hospitals in London, it expanded and modernised its facilities and equipment during the present century, particularly during the chairmanship of Sydney Holland, Lord Knutsford. In 1912 it was further added by a bequest of over £100,000. Under the National Health Act of 1946 it is designated a medical teaching centre. Its medical college is one of the medical schools of London Univ., and possesses laboratories, a valuable library, and a museum of pathology. The L. H. is also approved as a training school for nurses and midwives. The hospital now provides over 900 beds, 700 in the London building and 200 in the hospital annex at Brontwood. Convalescent homes are run in conjunction with the hospital at Reigate, Felixstowe, and Hanstead. The work of the hospital is divided under fourteen specialised depts., and there are eighteen operating theatres.

London Irish Rifles, see LONDON REGIMENT.

London Library, The, founded 1841 by Thomas Carlyle and others mainly to enable scholars and students to borrow books which at that time could only be read in the Brit. Museum. It began with 3000 vols. It specialises in books on art, biography, hist., literature (Eng. and foreign), philosophy, religion, travel, and has nearly 500,000 vols. From two rooms in Pall Mall the library moved to its present site, 14 St. James's Square, in 1845. The old premises were rebuilt in 1897. Additions to the premises have been made from time to time, largely through the generosity of its members. The newest wing was hit by a bomb in 1944 but is being rebuilt. The library has always been under royal patronage and is governed by a president, vice-presidents and a committee of twenty-four of its members. A royal charter was granted in 1934. London members are allowed to borrow ten vols. and country members fifteen at a time, and there is a large reading room. The library is self-supporting, being dependent on members' subscriptions and gifts. There are few libraries, if any, from which a reader can borrow so many costly and valuable historical and artistic works, as e.g., Sir Thomas More's *English Works*, 1557; Lepsius's monumental *Denkmäler aus Ägypten* (12 vols.), 1819-59; Gould's book on *Birds of Great Britain* (5 vols.), 1873; Bouquet's *Recueil des historiens des Gaules et de la France*; Rymer's *Foedera*; Migne's *Patrologia Graeca et Latina*; Botticelli's *Drawings for Dante's Divine Commedia*; *Société des anciens textes français*; *Société de l'histoire de France*; *Acta Sanctorum*; *Mansi Sacrorum Conciliorum collection*; *Luther's Works* (Weimar ed.); Wilpert, *Römische Mosaiken* (4 vols.), 1917; Muratori's *Reverend Italicarum scriptores*; and the *Corpus inscriptionum latinarum*.

London, Midland and Scottish Railway Company (L.M.S.), The, emerged as such as a result of the various groupings of the

Brit. railways brought about by the Railways Act, 1921, which became operative as from Jan. 1, 1923. The L.M.S., the greatest of all Brit. railway companies, took over the following railway companies: London and N.W., Midland, Caledonian, Glasgow and S.W., Lancashire and Yorkshire, Highland, Furness, Wirral, Maryport and Carlisle, N. London and the Somerset and Dorset (1923). The total mileage of the company's lines was (1940) 6940; the company owned over 9300 locomotives, 26,600 coaching vehicles, and 292,500 merchandise and mineral vehicles. The prin. London termini of the company were Euston and St. Pancras stations. A famous train of the company was the *Royal Scot*, which did the journey of some 400 m. between Glasgow and London in 8½ hrs. The L.M.S. was merged into Brit. Railways as from Jan. 1, 1948.

London Military District was formed in 1905 by an army order of Jan. 6 which reorganised the various military dists., staffs, and commands of the United Kingdom. The London dist. covers the co. of London, the Guards' depot at Caterham, Purfleet, Rainham rifle range (for foot guards), Warley and Woburn for training, and (for regular troops) Windsor. Woolwich (exclusive of territorial troops quartered therein) is under the E. Command.

London Naval Conference (1930) was opened in the Royal Gallery of the House of Lords by H.M. The King to finish the work begun at Washington in 1921. Whereas the earlier treaty had regulated capital ships and aircraft carriers, the L. N. C. dealt with cruisers and submarines. The outcome of the conference was the treaty of April 22, 1930 signed by twenty-seven delegates of Great Britain, the dominions, U.S.A., Japan, France, and Italy, but never ratified by the last two countries, due chiefly to Fr. objection of Italy's insistence on parity with her. It provided that all construction on capital ships should be suspended for six years; that Great Britain, U.S.A., and Japan should reduce their capital ship quotas to 15, 15, 9; that the maximum tonnage of cruisers and destroyers should be 489,000 for Great Britain, 475,500 for the U.S.A., and 313,850 for Japan. Abolition of submarines, supported by Great Britain, U.S.A., and Italy, was opposed by France and Japan and the question shelved, but submarines were limited to 2000 tons and the three major powers agreed to a quota of 52,700 tons each. Under the later naval treaty of 1936 between the same powers, capital ship gun calibre was reduced to 11-in., the tonnage of aircraft carriers to 23,000 (from 27,000) and a naval holiday declared for the construction of cruisers. Italy was unable to associate herself with this agreement, Japan left the conference, and rising international tension soon stultified it. See further under NAVY AND NAVIES; SEA POWER.

London, New, see CONNECTICUT.

London, Pact of, concluded Sept. 1914, between Great Britain, France, and

Russia. The signatories mutually engaged not to conclude peace separately nor to demand terms of peace from the Central Empires without obtaining the previous agreement of each of the other signatories. In Sept. 1915 Italy came into the pact, and in the following Oct. Japan also joined it.

London Passenger Transport Board, or London Transport, body which, from July 1, 1933, to Jan. 1, 1948, was the sole owning and organising authority for the omnibus, train, and tube system of the metropolis and suburbs. Previous to 1933 the services, being under different owners and nominally at least in competition with each other, were unco-ordinated and, though mutual arrangements were made for obviating inconvenience, these did not solve a problem which became one of ever-increasing complexity. About 1928 the London traffic question became a matter of acute political controversy towards the settlement of which the inquiries held by the London and Home Cos. Traffic Advisory Committee, which had been set up under the London Traffic Act, 1924, had proved ineffective. In 1929, however, Bills were promoted in Parliament by the London Co. Council and the London Traffic Combine for the joint management of London transport facilities; but in that year a Labour Gov. was returned to office, with Mr. Herbert Morrison, leader of the opposition in the council, as minister of transport and the Bills were rejected in favour of a measure for setting up a board to take over the council's tramways and other public transport services. One of the most difficult questions was the terms of transfer to the new board: the London Co. Council wanted the board to take over the undertakings at their capital value, which the council assessed at £18,000,000; but the acquiring authority won the day and took them over at £8,300,000, this being the amount of the outstanding debt. The council were able to hand over a good tramway system covering 158 m., extending from Uxbridge to Dartford, and from Waltham Abbey to Purley. This transfer to the L. P. T. B. took place in 1934 and with it was transferred the council's former liability to pave such part of the street as lay between the tram rails and extended 18 in. on each side of them. Since the tramways were transferred to the board many of the lengths of tramway have been replaced by trolley vehicles, and during the Second World War the metals were pulled up for use in armaments factories. The nominal amount of the stock issued and outstanding as at June 30, 1934, was £109,368,000.

It is claimed that this merger was the most revolutionary change that had ever been made in the ownership and administration of the transport system of a great city; and when it is found that the board in normal times annually carried about 3,600,000 passengers over its diverse system, there is much to be said for the claim. Moreover it was the only urban transport system in the world which combined the ownership of omnibuses,

motor coaches, tramways, trolleybuses, and underground and surface railways, and also it was the only passenger transport body to combine undertakings previously under both company and municipal ownership. The concerns taken over by London Transport numbered 92 and comprised 5 railway, 17 tramway, 62 omnibus, 4 coach, and 4 subsidiary undertakings, the last including the Lots Road Power House at Chelsea (which supplies most of the railways and tramways with electric current). The board operated some 230 route m. of railway, 350 route m. of tramway and trolleybus route, and about 2400 m. of other bus and coach routes. The railways owned by the board were the Metropolitan, which runs out to Hertfordshire and Buckinghamshire; the Dist., City and S. London, Central London (once called the 'Twopenny Tube' and the first of its kind in England); and the London Electric (Bakerloo, Piccadilly, and Hampsstead Tubes). The omnibus and motor coach concerns taken over included Tilling, probably the oldest surviving concern in the London passenger transport business at the time of the board's formation; Green Line Coaches Ltd., and the Aldershot and Dist. Traction and other comparatively distant concerns. The merger of so many undertakings in one body resulted in greater efficiency of management, better training of personnel, and more up-to-date equipment, such as train-running indicators, pneumatic-operated car doors, improved signalling apparatus, etc. The first chairman of the board was Lord Ashfield (1874-1944). The L. P. T. B. became part of the nationalised system of transport, under the name of the London Transport Executive, on Jun. 1, 1948.

London Regiment, The. The L. R. embraces all the infantry territorial army regiments entitled City of London Regiment and L. R. Each regiment within the L. R. corresponds in all respects to a battalion of other infantry regiments. In 1859 there was a great revival of volunteers, due to a panic arising out of the supposed unfriendly attitude of Napoleon III. of France towards England. Public feeling practically compelled the gov. of the day to authorise the formation of volunteer rifle corps under an Act of 1864, and many such corps were formed in the city and co. of London, Middlesex, etc. These corps bore titles indicating their place of origin, e.g. Middlesex Volunteer Rifle Corps, until 1908, when they came into the new territorial force scheme as part of the L. R., a new regiment formed for the purpose. Each separate regiment is numbered in seniority throughout the regiment. The 9th L. R. (Queen Victoria Rifles) claims descent from a unit raised at the beginning of the nineteenth century. When the volunteers of that period were disbanded this corps maintained its existence as a rifle club, and was officially recognised and placed in the army list in Sept. 1853 under the title of The Middlesex (The Victoria) Volunteer Rifle Corps. Of the territorial battalions of the L. R.

the 5th is the London Rifle Brigade, the 13th the Kensingtons, the 14th the London Scottish, the 16th the Queen's Westminster, the 18th the London Irish Rifles, and the 28th the Artists' Rifles. The 7th City of London Regiment (Post Office Rifles) have the distinction of bearing honours for the earliest campaign in which volunteers participated, viz. Egypt, 1882. During the S. African war, 1899-1902, the volunteers of Middlesex and in and about London were permitted to participate either by providing service companies for regular regiments (see under LONDON SCOTTISH) or by individuals joining the City Imperial Volunteers. Thousands of volunteers thus served in the campaign, and sev. units of the L. R. bear the honour for the campaign. During the First World War each regiment raised from two to six battalions, which served with considerable distinction on every front, sev. individual members gaining the Victoria Cross. Many of the units have battle honours for some of the greatest battles of the campaign, e.g. Somme, Ypres, Arras, Neuve Chapelle, Festubert, Hindenburg line, Cambrai, Pursuit to Mons, Gallipoli, Jerusalem, Jordan, Dolran, and Egypt. Sev. units were in France in 1910 and in the subsequent evacuation from Dunkirk. The administrative offices of these regiments are at Finsbury Barracks, City Road, London, E.C.1.

London Rifle Brigade, see LONDON REGIMENT.

London School of Economics and Political Science, see ECONOMICS AND POLITICAL SCIENCE, THE LONDON SCHOOL OF.

London Scottish, The, London territorial army infantry regiment. The L. S. was formed in 1859 during the general Brit. volunteer movement. Its first commanding officer was Lord Elcho (later earl of Wemyss), who retained the appointment for twenty years. During the S. African war, 1899-1902, the regiment furnished a service company, which served with the Gordon Highlanders (its parent regular regiment) and a detachment for service with the City Imperial Volunteers. This service is commemorated on its colours. On April 1, 1908, it joined the newly formed territorial force (now territorial army), and took the title 14th (Co. of London) Battalion, The London Regiment, the L. S. In the First World War the L. S. was part of the original B.E.F. and was the first territorial infantry battalion to engage the enemy. It raised three battalions, which served in France, Flanders, Macedonia, and Palestine. In the Second World War there were three battalions, two of them infantry and the third a unit of heavy anti-aircraft artillery. The 1st and 3rd served overseas in many notable actions on the It. front. Its present headquarters, to which it moved in 1886, are at 50 Buckingham Gate, Westminster, London, S.W.

London Society, The, founded in 1912 by the earl of Plymouth, its first president. The aim of the society is to stimulate

interest in the historic buildings and amenities of London, to concern itself with their preservation, and to give consideration to schemes for the future development of London. The society arranges lectures and provides facilities for its members to visit places of interest. It publishes a *Journal* monthly or as occasion demands. The president is also chairman of the council, and in addition to the council there is an executive committee. The offices of the society are at 82 Pall Mall, London S.W.1. The ann. subscription is one guinea.

London Topographical Society was founded for the pub. of material illustrating the hist. and topography of the city and co. of London from the earliest times to the present day. It reproduces maps, views, and plans, publishes documents and data of every description, and gives a yearly record of demolition and topographical changes. Sev. maps and plans, the earliest dating from 1550, have already been produced. The society publishes the *London Topographical Record*.

London, Treaties of. A number of international conferences have been held in London since the eighteenth century and have resulted in international treaties, of which the following are the more important. (1) 1720: treaty under which the kingdom of Sardinia (q.r.) passed to the dukes of Savoy. (2) 1827: treaty between Great Britain, France, and Russia to secure the independence of Greece from Turkey; confirmed by a second treaty of London (1832), by which Greece became an independent kingdom (see GREECE, History). (3) 1839: treaty between the great powers in Europe to secure the creation of Belgium as an independent kingdom (see further under QUINTUPLE TREATY (1839)). (4) 1840: treaty between Great Britain, Russia, Prussia, and Austria agreeing to support Sultan Mahmoud II. against Mehemet Ali (q.r.). (5) 1867: treaty between two great powers in Europe to secure the independence of Luxemburg (q.r.). (6) 1871: treaty between Great Britain, France, Austria, Germany, Russia, Italy, and Turkey, abrogating the provisions of the Declaration of Paris (q.r.) in respect of preserving the neutrality of the Black Sea. It laid down the principle in international law that one of the contracting parties in an international treaty may not repudiate or modify any of the provisions of a treaty without the consent of the other contracting parties. (7) 1913: see BALKAN WAR. (8) 1915: secret treaty between Italy and the Entente Powers, designed to secure the adherence of Italy to the cause of the Allies in the First World War. Under it Italy was to obtain, eventually, i.e. Trentino, Trieste, S. Tyrol, Gorizia and Gradisca, Dalmatia, Istria, and the various Austrian is. in the Adriatic, thereby fulfilling its irredentist aspirations. Italy was also to keep and consolidate her hold on Libya, with rights of expansion in that region, concurrently with any extension of Brit. or Fr. interests in N. Africa. There was also an article in

the treaty binding the Allies to support Italy in her desire for the non-admittance of the Holy See to any diplomatic steps for the conclusion of peace or the regulation of questions arising out of the war. Most of these obligations were ultimately fulfilled. (9) 1925: treaty of non-aggression between Great Britain, France, and Belgium on the one hand and Germany on the other, concluded as part of the Locarno treaties (q.v.). See further under AUSTRIA-HUNGARY; ITALY; EUROPE; WORLD WAR, FIRST (vii), ALLIES AND THE NEAR EAST. *Italian Diplomacy*.

London University. London was one of the latest of the great caps. of Europe to provide itself with a univ., and there is no really adequate answer to the question why a project for the creation of a univ. was so long delayed. In the appendix to Stow's *Annals*, 1615, there is what purports to be, in three parts, an account of the 'three famous universities of Oxford, Cambridge, and London,' and Sir George Buck, author of the third of these treatises, enumerates the Gresham Foundation, the Divinity Schools at Westminster and St. Paul's, the Inns of Court and Chancery, the College of Heralds, the School of Civil Law at Doctor's Commons, and St. Paul's School, as forming collectively a complete academic system, and 'lacking nothing but a common government and chancellor' to give to it the unity and repute of a univ. Various projects for the creation of a univ. in London have been put forward from time to time, but the only one of these which even partially materialised is the college associated with the name of Sir Thomas Gresham (d. 1579). The Gresham College lectures are the sole surviving link with Gresham's original and far-sighted plan. The movement which was eventually responsible for the foundation of a univ. of London was unrelated to any of its predecessors. This movement, inspired by the teaching of Bentham, found expression in a letter to *The Times* of Feb. 9, 1825, in which the poet, Thomas Campbell, advocated the foundation of a great L. U., and the appeal initiated by him and his associates was so successful that two years later a sum of £160,000 was raised by subscribers who drew up a deed of settlement under which they became 'Proprietors of the University of London,' land being bought in Gower Street for the site of what became Univ. College. The same period saw the foundation of King's College, but the application for incorporation and degree-giving powers met with bitter opposition. The charter of incorporation was granted to Univ. College on Nov. 28, 1836, on which date also the charter of the new univ. was sealed.

From the beginning the gov. assumed responsibility for housing the univ. (as a non-resident institution) and at first premises were provided in Somerset House and, later, Marlborough House. In 1855 the univ. moved to Burlington House where, in 1870, a new building (now occupied by the Civil Service Commission) was opened by Queen Victoria, which was used until 1900, after which

portions of the Imperial Institute at S. Kensington were occupied as headquarters until 1936, and are still occupied for certain purposes by the univ. The administrative offices were removed to Bloomsbury in Aug. 1936 (but when the Second World War was imminent the new building was taken over by the Ministry of Information).

In 1558 an important change was made in the policy of the univ., for theretofore it admitted to its examinations only those students who had gone through a course of study at Univ. or King's Colleges or some other 'approved institution.' The list of these latter rapidly expanded until, in 1858, a supplemental charter provided that attendance at approved institutions should not be required for the examinations (other than in medicine) and thus formally recognised what was obvious, that the univ. could not accept responsibility for anything beyond the examination of its candidates. Its degrees were from that time thrown open to all who presented themselves for examination, not only from London and the Brit. Isles, but from all parts of the empire. The charter of 1858 is also important in another respect, since under it the graduates acquired the right to participate in the government of the univ. In 1878 the univ. extended its degrees to women, being the first univ. to do so in Great Britain. Soon after this Univ. College and King's College jointly petitioned for a charter for a new 'teaching university of London.' There were counter-proposals from the Royal College of Physicians and Surgeons and from others, and the gov. appointed a royal commission which, in 1889, reported that the general case for a teaching univ. in London had been proved. The commission did not approve of the proposal of the Royal College of Physicians and Surgeons to confer their own medical degrees. They considered it to be no part of the original conception of the univ. that it should be a mere examining body without direct connection with any teaching institution; and they did not think that the combination of the existing univ. with a new teaching univ. was impossible. But the senate of the univ. rejected the commission's scheme and a second commission was set up in 1892, and it was not until 1900 that the first University of London Act was passed. It was provided by the new statutes that the teaching work of the reconstituted univ. should be carried out in colleges which were designated as 'schools of the university,' and a number of institutions were admitted under the statutes for this purpose. Besides the constituent colleges (Univ. College, King's College, and Goldsmiths' College) the univ. also directly maintains the Francis Galton Laboratory for Natural Eugenics and the Brown Animal Sanitary Institution; while the Bartlett School of Architecture, the Univ. Commerce Degree Bureau and Appointments Board, the Institute of Historical Research, and the Univ. Observatory are all univ. depts. Besides all the foregoing the

following are 'schools of the university,' the teachers of which the univ. recognises as possessing only rank, and the students of which it recognises as 'internal' students: E. London College (Mile End Road, E.); Royal Holloway College (Eghfield Green); Bedford College for Women (Baker Street); Westfield College (Hampstead); London Day Training College (Southampton Row); Imperial College of Science and Technology (Imperial Institute, S. Kensington), comprising Royal College of Science, Royal School of Mines, and the City and Guilds (Engineering) College; S.E. Agric. College (Wye, Kent); London School of Economics (Clare Market, Kingsway); New College (Hampstead); Hackney College (Hampstead); Wesleyan College (Richmond); the medical schools of the following hospitals: St. Bartholomew's (Smithfield), Guy's (Rorough), St. Thomas's (Albert Embankment), London (Whitechapel Road), Middlesex (Mortimer Street, W.), St. George's (Hyde Park Corner), Charing Cross (Agar Street, Strand), St. Mary's (Prud Street, W.), Westminster (by the Abbey), King's (since removed to Denmark Hill) on Lincoln's Inn Fields), London (Royal Free Hospital) School of Medicine for Women (Brunswick Square, W.C.), London School of Tropical Medicine (Albert Dock, E.), Lister Institute of Preventive Medicine (Chelsea Bridge Road, S.W.), and the Royal Army Medical College (Grosvenor Road, S.W.), and some others, while there are a number of institutes with recognised teachers, such as the Royal Veterinary College and the Royal Academy of Music.

In 1926 another Act was passed, which appointed a body of commissioners to make statutes for the univ. These statutes came into operation in 1929. One of the most important changes made was the creation of a new body, the Court, to control the finances of the univ. The examinations for external and internal students are, in some cases, different, but the same degrees are awarded, except in medicine, mining, and architecture, where an internal course of study is required. Faculties of the U. of L. include arts, science, law, medicine, music, engineering, and economics, and the usual degrees and diplomas are awarded. The work done by the Univ. Extension and Tutorial Classes is considerable and includes a holiday course for foreigners. The number of internal students reading for degrees and diplomas in the session 1945-46 was close on 15,000. In addition there were over 19,000 registered external students. The number of appointed and recognised teachers in mid 1945 was 1300.

There are numerous hostels belonging to the various colleges, and the colleges are run on individual lines. The foundation stone of the new buildings in Bloomsbury was laid by King George V. (June 24, 1933). The cost of the scheme was about £3,000,000, and its purpose was to provide administrative buildings consonant with the dignity and importance of the univ.; but it did not involve the

removal of the existing colleges which are scattered about in various parts of London and even outside the metropolis. The Bloomsbury building comprises, besides offices, a library and a great hall, and a number of different univ. institutions, such as the Institute of Historical Research, the Schools of Oriental and Slavonic Studies, the Institute of Education, and the Courtauld Institute of Art.

The U. of L. is governed by a senate formed of a chancellor and 54 members, 4 of these being appointed by the Crown council, 16 by the convocation (the doctors and proctors) of the univ., 16 by the faculties of teachers, and the rest by various public institutions.

See the following publs. of the U. of L.: *The Historical Record, 1836-1926* (second issue), 1926; *The Senate House and Library, 1938: Calendar for the year 1943-49, 1948* (and earlier issues); *Regulations for Internal Students, Session 1948-49; Regulations for External Students, 1948-49*.

Lone Star State, see TEXAS.

Long, George Washington de, see DE LONG.

Long, Huey Pierce (1893-1935), Amer. lawyer and politician, b. at Winnfield, Louisiana. At sixteen he was an itinerant salesman. Admitted to the Bar (1915) he practised in Winnfield for a few years in cases against public utility companies. In 1928 he was elected governor of Louisiana, and he was U.S. senator 1931-35. His methods as a governor were those of an unbridled and unprincipled dictator who, having gained control of the state machinery of government, proceeded to abuse its functions. In 1934, for example, the state legislature passed more than forty of his Bills through all stages in a little over two hours. The most evil of his agencies or tools was the State Bureau of Criminal Investigation which he used, Nazi fashion, for political espionage and the suppression of opposition. He also controlled the state bar, police, fire dept., and in fact any other administrative unit that showed any tendency to resist him. He built 5000 m. of roads, excellent schools, and a new univ., with the result that the public debt of the state reached \$145,000,000; but as 70 per cent of the pop. were relieved of all indirect taxation there was no effective opposition to this expenditure. He was shot dead in the State House at Baton Rouge. His brother Earl Kemp (b. 1895) was lieutenant-governor from 1936 to 1938 and became governor on the resignation of Governor Richard Leche (1939), but he was defeated at the election for governor in 1940 and then returned by a great majority in 1948.

Long of Wraxall, Walter Hume Long, first Viscount (1854-1924), Eng. statesman, eldest son of Richard Penruddocke L. of Roud Ashton, Wiltshire. He was educated at Harrow and Christ Church, Oxford. In the Commons he represented various divs. as a Conservative from 1880 to 1921 continuously, including the Strand (London), 1910-18, and St. George's, Westminster, 1918-21. Held

successively the presidencies of the Board of Agriculture and the Local Gov. Board, each for a period of five years, 1895-1905. As president of the Local Gov. Board he made the dog-muzzling order, which stamped out rabies. In the Coalition during the First World War he again (1915) became president of the Local Gov. Board. In 1916 he became secretary for the colonies. After the armistice he was First Lord of the Admiralty, resigning in 1921. See his *Memories* (1923).

Long, Roger (1680-1770), Eng. astronomer, took his M.A. degree from Pembroke Hall, Cambridge, in 1704, and fourteen years later became a doctor of divinity. In 1729 he was chosen vice-chancellor of his univ. For three years (1749-51) he was the first Lowndes prof. of astronomy and geometry, after which he retired to a country vicarage. His text-book on astronomy (1742 and 1761) did much to popularise the science.

Long, Loch, sea loch of Scotland, being a branch of the frith of Clyde between Argyllshire and Dunbartonshire. It extends N. from Holy Loch to Arrochar for about 18 m., and its width is from 1 to 2 m.

Long Beach, city, watering-place, and summer resort of California, U.S.A., situated on San Pedro Bay, 4 m. E. of Wilmington. A harbour has been constructed with 10 sq. m. of anchorage; part of Los Angeles harbour, the system is the base of the U.S. Pacific Fleet. There is an airport. L. B. manufactures woollens, and steel ships. Fish and olive oil are tinned. An oil field was discovered in 1921, and natural gas is also utilised. Pop. (1940) 164,200, estimated (1946), 241,000.

Longbow, introduced into England from Wales, the L. was first used on a large scale by Edward I. Until the development of firearms it was the most effective weapon known. About 6 ft. in length, made of ash or yew, its arrows could penetrate 4 in. of oak. Its supremacy was shown, amongst other instances, at Agincourt, where a Fr. cavalry charge was reduced to complete confusion by a barrage of arrows.

Long Branch, city of New Jersey, U.S.A., in Monmouth co., about 30 m. S. of New York. It developed into a watering-place, and was chartered as a city in 1904. It possesses a noted drive, the Ocean Avenue, 5 m. long. It manufactures silk goods and raincoats, and has a fishing industry. Pop. 17,400.

Longchamps, William de (d. 1197), chancellor of England, was a Norman of humble origin, whom Richard I. made bishop of Ely in 1189, and afterwards, when he went on the crusade (1190), joint-justiciar with Hugh de Puiset, bishop of Durham. He manoeuvred de Puiset out of office, and by becoming papal legate in 1190 united supremacy in Church and State. Like Wolsey L. was unfailing in his devotion to his king, but his scorn of everything Eng., his burdensome taxation, his haughty bearing and his ungainly person roused such a storm of popular dislike that he was soon expelled from the kingdom. Richard

later made him chancellor, because he had helped to secure the king's ransom.

Longchamp, pleasure resort and race-course of Paris, France. The latter is situated at the end of the Bois de Boulogne, and the race for the Grand Prix is run here.

Long Chuyan, see **LONG XUYEN**.

Long Eaton, small tn. of Derbyshire, England, 10 m. E.S.E. of Derby, in the valley of the Trent. The prin. industry is the lace manuf., and there are manufs. of railway carriages, upholstery, metal tubing, etc. The urban dist. was extended in 1921. Pop. 28,100.

Longespée, William de, see **SALISBURY**, EARL OF.

Longevity, scientifically, refers to the length of life of any organism. In the case of lower forms of life very little has been determined, but the range is probably large; L. of a few hours is common. High plants are classed as annuals, biennials, perennials, etc., the range extending from a month to thousands of years. De Candolle gives figures as follows in years: elm, 335; ivy, 450; palms, 600-700; lime, 1076-1117; oak, 810-1500; yew, 2880; baobab, 5000. In the animal kingdom the range is considerably less, complexity of organism giving rise to greater chance of death. Certain infusoria live less than forty-eight hours. Cold-blooded animals live comparatively long: pike and carp, 100; tortoises, 100. Birds are long lived: eagles and crows, 100; peacocks, 20; but many smaller birds only 5 or 6. Among mammals the elephant ranks highest, over 100; camel, 50-60; horse, up to 40; deer, 30; ox, 15-20; dogs, pigs, 15-20. Although in cases some relation has been suggested between the period of gestation, or the age of maturity and the complete term of life, no laws have been formulated. Amongst the human race the biblical three score and ten still gives a healthy average, though it is not uncommon for the century to be passed. In 1915 there died at Serowe (Bechuanaland) a native named Ramonotswane Seran, who was claimed to be 130 years old; but some doubt has been cast on the validity of the claim, though according to the *Johannesburg Star* there could hardly be a shadow of doubt that he was 130 years old (see *The Times*, Aug. 31, 1945, and Sept. 5, 1915).

During the twentieth century attempts have been made to prolong the life of animals, and have been based on knowledge of the endocrine system. Voronoff has made most application of the process of grafting genital glands of apes into young men suffering from abnormalities of the endocrine organs, and into men approaching senescence. Partial rejuvenescence occurs for a time, but considerable doubt is thrown on the ability of such an operation to increase the span of life, especially since the various glands of the endocrine system work in conjunction, and the renewal of one type of gland could not rejuvenate the others. Moreover the gland of the ape atrophies in man. The life of sheep and rats has been pro-

longed by transplanting glands from young animals of the same species into animals approaching senescence.

See S. Voronoff, *Old Age and Refuvenescence*, 1920, and *The Conquest of Life*, 1920; B. Sokoloff, *The Battle for Youth*, 1922; R. T. Gould, *Enigmas*, 1929; and A. Guéniot, *Pour Vivre 100 ans*, 1931.

Longfellow, Henry Wadsworth (1807-1882), Amor, poet, the son of Stephen L., a lawyer and a member of the U.S. Congress. In 1822 he was entered at Bowdoin College in Brunswick, where Nathaniel Hawthorne was a fellow student. He graduated in 1825, and from 1829 to 1834

position were all reflected in his face, which Kingsley said was the most beautiful human face he had ever seen. Many are the generous tributes which friends have left to the nobility of his character.

L. was a facile and tireless writer, and the mass and variety of his output are amazing. Besides publishing linguistic text-books and contributing to reviews and magazines, he made sev. trans., the best of which is a rendering of the *Divina Commedia* (1867). Yet, though he is wonderfully faithful to his original, he has failed to suggest the Dantesque fire and glowing mysticism, and his version is monotonous by reason of the absence of rhyme and the frequency of feminine endings. One of his earliest books was *Hyperion, a Romance* (1839), a prose account of a foreign tour; from that date till his death the flow of his poetry was unceasing. *The Voices of the Night* (1839), containing the 'Psalm of Life'; the *Ballads* (1841), including 'Excelsior', 'The Wreck of the Hesperus', and 'The Village Blacksmith'; and *The Seaside and the Fireside* (1849), which included 'The Building of the Ship,' most of which have found their way into the popular anthologies. As a dramatic poet L. has established a small reputation. His extravagantly emotional play, *The Spanish Student* (1813), attracts few readers in this unsentimental age, and his ambitious trilogy, *Christus, a Mystery*, woefully lacks cohesion. This work was commenced early and was planned as his most considerable achievement, but the entire work did not appear till 1872. It is an attempt to illustrate Christianity at three different stages of the world's hist., but the illustrations chosen are wanting in balance. The first part, *The Divine Tragedy* (1871), is a noble paraphrase of the Gospels; the second, *The Golden Legend* (1871), is a delightful love story and lyric drama based on von Aue's *Der arme Heinrich*; and the third, entitled *New England Tragedies* (1863), exposes a cheerless and evanescent religious atmosphere. All these had previously appeared as separate works.

L. was endowed, like Wm. Morris, with a spontaneous gift for story-telling. In his *Courtship of Miles Standish* (1858) he reanimated the 'dry bones of Puritanism,' and in his *Tales of a Wayside Inn* (1863) he strung together, with just such an excuse as Boccaccio had in his *Decameron*, a number of graceful and pleasurable stories. But the finest exposition of this gift is undoubtedly his epic, *Evangelina* (1847). Here he tells of the wanderings of two Fr. lovers of Acadia, who are parted on their wedding-day, and who are only reunited when he is old and is dying in a hospital. This is one of the most popular of the longer poems, and deservedly so, for it is wonderfully rich in tender pathos, sweet romance, and a stirring humanity. *Hiawatha* (1851) is the best appreciated of all the poet's works. Its haunting, melodious metre, which affords such a contrast to the hexameters of *Evangelina*,

H. W. LONGFELLOW
The bust in Westminster Abbey.

held the professorship of modern languages at his own college, having spent over three years on the Continent, visiting France, Germany, England, Spain, Italy, and Holland in order to qualify himself for the post. He then accepted a similar chair at Harvard. In 1835, and again in 1842, he returned to Europe, which he visited for the last time in 1868. His home during the latter part of his life was a stately wooden residence in Cambridge, where Washington had stayed during the siege of Boston. He was twice married, first to Mary Potter (1831) and afterwards (1843) to Frances Appleton.

Like Wordsworth L. passed a singularly happy and uneventful life, darkened only by two tragic sorrows, one the loss of his second wife, who was burnt to death in 1861, the other the loss of Agassiz, to whom he refers with such moving and beautiful sentiment in the five sonnets entitled *Three Friends of Mine*. His joy in life, his geniality, and his lovable dis-

is admirably adapted to the weird and old-world legend of the Indian Prometheus, whilst the ennobling allegory is so lightly mirrored forth, and the delightful cameo-pictures of the native skies and woods and hills are so deftly inset in the narrative of Hiawatha's progress, that truly these 'legends of prairie-land belong to the world's great story-book.' It may safely be said that, though it is idle to look for great originality, profundity of thought, or anything of the modern analytical spirit in L., his poems will live for many years if they last 'until another shall sing the same songs better.' See lives by his brother Samuel, 1886 and 1891; E. S. Robertson, 1887; G. R. Carpenter, 1901; T. W. Higginson, 1902; H. S. Gorman, 1926; and H. Hawthorne, 1936. See also E. C. Stedman, *Poets of America*, 1885, and E. Goggio, *Longfellow and Dante*, 1924.

Longford: 1. Co. of Eire in the prov. of Leinster, bounded N.W. by Leitrim, N.E. by Cavan, E. and S. by Westmeath, and W. by Lough Ree and Rosecommon. The surface is generally hilly, and there is a good deal of marsh and bog. The chief rivers are the Camlin, flowing into the Shannon, and the Inny, flowing into Lough Ree. Marble has been found in the co., also iron and lead. The pasturage is good in places, and some cattle and sheep are reared; oats and potatoes are the chief crops. Linen and woollens are manufactured. Much butter is exported. The co. joins with Athlone to send three members to the Dail. Area 421 sq. m. Pop. 36,200. 2. Co. in of above, and the trade centre for grain, butter, and bacon. It has corn-mills and tanneries, and possesses one of the finest churches in Ireland, St. Mel's Rom. Catholic Cathedral for the diocese of Ardagh. Pop. 3000.

Long-Haired Dachshund, variety of dachshund (q.v.) with a coat similar to that of the Irish Setter (q.v.), being long and silky, but lying flat without curl or wave, and forming abundant feathering on the forelegs, on the ears, under the tail, and outside the thighs.

Longhorn Breed, see under CATTLE.

Longicorns, see CRAMNOCIDE.

Longinus, Dionysius Cassius (c. A.D. 213-73), Gk. philosopher, belongs to the group of men who gathered round Porphyry, his pupil, and is one of the last of the great pagan literati. The son of wealthy parents, he left his native Syria to study in Rome and Athens, and thus had every opportunity to absorb the culture of his day. But though he must have been taught the doctrines of Neoplatonism he never seceded from the old Platonic school. Like Socrates he took his own life, and thus escaped the sentence of death passed on him by the Emperor Aurelian, because he assisted his patron, Zenobia, queen of Palmyra, in her revolt against imperial sway. There are reasons for believing that he wrote the *Treatise on the Sublime* (τὸν ὑψηλόν), in which the highest critical acumen is united with a singularly pure and elevated style. See ed. by W. R. Roberts, 1899.

Long Island, i.e. lying off the coast of

Connecticut and New York state, U.S.A., and forming part of the latter. It is 118 m. long, from 12 to 23 m. wide, and is separated from the mainland by L. I. Sound, which varies in width from 2 to 25 m., and is over 100 m. in length. Except on the N. the coast is much indented, and there are numerous bays, headlands, and smaller is. In the Great S. Bay there are large oyster beds, the famous Blue Points growing there. Market gardens flourish in the W., and cabbages and cucumbers are grown for sauerkraut and pickles. Brooklyn and Queen's bors., which form part of New York city, lie at the W. end, Nassau and Suffolk forming the remaining cos. It is mainly a residential area. La Guardia airport is in Queen's co., and at Lake Success the United Nations general assembly took up in 1946 its temporary headquarters. There are sev. recreational areas including Coney Is. and Jones Beach. The earliest Eng. settlement was in 1640, and it was closely followed by the Dutch. The battle of L. I. was fought there in 1776; it was the first battle in the campaign and resulted in a victory for Lord Howe. The area is 1682 sq. m.

Long Island (Denmark), see LANGELAND.

Long Island City, formerly a city of Queen's co., New York, U.S.A. Since 1898 it has been part of the bor. of Queen's, New York city, at the W. end of Long Is. Over 1400 factories produce a variety of products. Pop. 125,000.

Longitude, see LATITUDE AND LONGITUDE.

Longleat, one of the great historic houses of England, seat of the marquess of Bath, situated in Wiltshire, midway between Warminster and Frome, near the Somerset border. L. was built for Sir John Thynne between 1558 and 1580 on the site of the monastery of St. Radegund. Since then the gardens and grounds have been replanned and a chain of lakes made by Lancelot Brown (q.v.) in the late eighteenth century. About 1800 Sir Jeffrey Wyntville made a number of alterations to the house and added a large quadrangle of stables, and, in the mid nineteenth century, heavy ornate ceilings and marble door surrounds were added by L. workmen in the prin. rooms. L. therefore shows the influence of many fluctuations of taste; yet in the lofty hall and in the second-floor library, in which latter from 1691 to 1711 Bishop Ken (q.v.) lived and worked, something of the original house remains, while the S. E., and W. facades are almost as they were in 1580. Much of the interest of L. lies in its contents, which are of many periods: a large ornate table which belonged to Talleyrand; a library rich in MSS. and printed books, including a beautiful twelfth-century psalter and the Book of Bath (1428, a miscellany of verse and prose originally belonging to the monastery of Bath), some MSS. of Matthew Prior, Caxton's *Histories of Troye* (c. 1475), and four folios of Shakespeare. Among the portraits at L. are examples of Lely and most of the other noted seven-

teenth-century portrait painters. Other portraits are those of Lord Thurlow by Reynolds, of the first Lord Bath by Sir Thomas Lawrence, and of the fourth Lady Bath by G. F. Watts; while paintings by foreign masters include a head by Raphael and a small Holy Family by Titian. There is also a series of huge sporting paintings by John Wootton (c. 1678-1765), the most important being a number of hunting scenes which reveal Wootton's decorative power when painting on a large scale. Open to the public, L. is a 'show-place' of wide appeal.

Longmans, London firm of publishers, estab. in 1724. In that year Thomas Longman (1699-1755) took over the business of Wm. Taylor (the publisher of *Robinson Crusoe*) at the signs of the 'Ship' and the 'Black Swan' in Paternoster Row. Until the fire of Dec. 1940 the present firm, Longmans, Green & Company Ltd., occupied premises on the original site; the address is now 6 and 7 Clifford Street, off Bond Street. Ever since the foundation members of the Longman family have exercised a major control, though others have been taken into partnership. In 1890 the firm bought up the business of Rivington (estab. 1711). Among L.'s pubs. are the works of Wordsworth, Scott, Coleridge, Southey, and Moore; Macaulay's *Lays of Ancient Rome* and *History of England*; books by John Stuart Mill, J. A. Froude, W. E. Lecky, Rider Haggard, Andrew Lang (who was literary adviser for many years), Richard Jefferies, R. L. Stevenson, Conan Doyle, Wm. Morris, and Thornton Wilder; and the works of G. M. Trevelyan. L. pub. the *Edinburgh Review* and *Longmans' Magazine* and continue to publish journals like *The English Historical Review*. The firm has associated companies in the U.S.A., Canada, and India, branches in S. Africa and Australia, and agents for its educational pubs. all over the world.

Long Measure, see under **WEIGHTS AND MEASURES**.

Longobards, **Longobardi**, or **Lombards**, name of a nation of ant. Germany, belonging to the Suevic tribe. Their original dwelling-place was on the E. side of the R. Elbe, but during the fourth or fifth century they dwelt on the banks of the Danube, and were successful in destroying the Heruli, while about the middle of the sixth century they lived in Pannonia, and here they were victorious over the Gepidae. In 568, after crossing the Julian Alps, they, under their king, Alboin, subjugated N. Italy, giving it the name of Lombardy (*g.v.*), after themselves. They finally settled here, and made this their kingdom, under the somewhat nominal sovereignty of various elected kings for about two centuries. These L. treated the It. whom they had conquered in quite a different way from their own people, allowing them none of their privileges, but at the same time they numbered among their kings some wise and able men. They were, however, a constant threat to the papacy, particularly under Liutprand (712-43) who estab. a definite control over the Longo-

bard dukes. After his death Pepin, son of Charles Martel, in answer to the appeal of Gregory III., began a conquest of the L., completed by his son Charlemagne in 774.

Long Parliament, name of two Parliaments in Eng. hist. (1640-53 and 1661-79) and of one (1886-1900) in the hist. of Spain. The title belongs *par excellence* to the first of these. Its first act was to compass the execution of the earl of Strafford by a Bill of Attainder (1641), and it then proceeded to abolish the Star Chamber. A constitutional Church and royalist party grew up under the leadership of Hyde and Falkland, when Pym and Hampden, the chief statesmen of the popular party, showed by the 'Root and Branch Bill' and the 'Grand Remonstrance' that they intended to abolish the existing system of eccles. government and get the reins of government into their own hands. In 1642 Charles I. made a futile attempt to seize Pym, Hampden, Holles, Hazlerigg, and Strode, his chief enemies in the House. From 1644 parl. power passed into the hands of the Independents. Laud was executed and the New Model Ordinance enforced, whereby a single parliamentary army was created, the officers of which had all to subscribe to the Covenant (1645). In 1648 Cromwell got rid of the Moderates and Presbyterians by the high-handed action immortalised as 'Pride's Purge'. The 'Rump,' as the remnant was called, was submissive to its master, and obediently voted the execution of Charles and the institution of the Commonwealth (1649). In 1653 it was dismissed, Cromwell having no further use for it. See further under **ENGLAND, History**. See J. H. Hexter. *The Reign of King Pym*, 1911.

Long Primer, name of an old size of type, equivalent to the modern ten point. In Germany it is known as *Korpus* or *Garmond*, in Holland, *Garmand*, and in Italy, *Garamone*, taking the name from Claude Garamond, Fr. type-founder, who d. in 1561. In France it is called *petit-romain*. See **GARAMOND; TYPOGRAPHY**.

Long Range Desert Group. This unit was estab. in the Second World War, in June 1940 in order to carry out very long-range reconnaissance behind the enemy lines in the vast interior of Libya. Its sphere of activities ranged over about 600 m. inland from the Mediterranean coast and about 1700 m. westwards from the Nile. The group was formed by Brig. Ralph Bagnold, O.B.E., F.R.S., who together with other enthusiastic officers had carried out numerous exploratory trips in the desert before the Second World War. The necessary equipment and the special desert technique were evolved by them during those expeditions. At the start the group was formed primarily of officers and men of the Second New Zealand expeditionary force. It was later expanded with officers and men of the United Kingdom and Rhodesian forces. All ranks were selected volunteers. Its role began as one of reconnaissance, but its mobility, training, and knowledge of the desert fitted it

admirably for harassing the enemy offensively. Among many successful raids in which the group participated were those against enemy outposts in the Fezzan (1200 m. from base across entirely unmapped country) in the autumn of 1940, and against the garrisons of Benghazi, Barce, and Tobruk in Sept. 1942. Operations in the Fezzan were made in co-operation with the Free Fr. from Chad and started a long period of friendship with Gen. Leclerc. They were also responsible for surveying the routes used by the Eighth Army in their out-flanking movements against the El Agheila and Mareth positions. One of the most valuable and difficult tasks which the group carried out was a continuous watch on enemy movement along the main coast road. This watch was maintained day and night for many months by a series of patrols, who sent daily reports by wireless to base. In this way the Eighth Army was served with a reliable intelligence on enemy reinforcement or withdrawal.

The basic unit of the group in the desert was the patrol, which normally consisted of five unarmoured vehicles and twenty men. Each patrol was commanded by an officer and contained an expert navigator, R.E.M.E. fitter, Royal Signals wireless operator, and a R.A.M.C. orderly. They carried food and water to last a month and petrol for an all-round trip of 1500 m. Contact with base was maintained by wireless. For most of the desert campaign the group was based either in the oasis of Siwa or Kufra, where its own two aircraft were maintained for the evacuation of casualties, communication, and dropping of minor necessities to patrols on operations. At the conclusion of the desert campaign in early 1943 the group returned to the Delta and later to the Lebanon. It was re-organised to operate in Italy and the Balkans on foot, on skis, with animal transport, and to reach its target by parachute or by sea. New types of equipment were devised and obtained in order to allow operations to be carried out in European country, where it was unlikely that mechanical transport would easily operate. In Sept. 1943 the unit was sent to the Dodecanese where it became involved in the ill-fated operations on the Is. of Cos and Leros. In these operations the group lost about 100 men killed, wounded, or captured out of a total of 400. In early 1944 the unit moved to Italy to operate under F.-M. Alexander. Its primary roles were to obtain information on enemy movements, to harass the enemy lines of communications, to support partisan movements, and to provide watches on the movement of enemy shipping in the Adriatic. Patrols operated continuously in Greece, Albania, Yugoslavia, and Italy, carrying out more than 100 successful operations. After the war a L. R. D. G. Association was formed.

Long Range Navigation (Loran), see under NAVIGATION.

Longridge, *ecclies. par. and tn. of Lancs.*

shire, England, 6 m. N.N.E. of Preston. There are large stone quarries in the neighbourhood, and the industries include cotton weaving, the manuf. of nails, and the production of rayon. The Preston water reservoirs are at L. Pop. 5000.

Long Service and Good Conduct Medal, award instituted in the Brit. Army and Navy by William IV. in 1830 and 1831 respectively. The military medal is awarded to warrant officers, non-commissioned officers, and other ranks after eighteen years' service, during which character and conduct have been irrep- roachable. The medal carries on the obverse a bust of the sovereign in military uniform and on the reverse the words 'For long service and good conduct.' The ribbon is crimson with white edges. The naval medal is awarded to petty officers and other ratings of the Royal Navy and to non-commissioned officers and men of the Royal Marines after fifteen years' service with 'very good' certificate of character continuously earned. Hung on a straight clasp, the medal has on the obverse a bust of the sovereign in naval uniform and on the reverse a design of a frigate-of-the-line with the appropriate words. A medal with similar qualifications as obtain in the army is awarded in the R.A.F. It has a bust of the sovereign on the obverse and eagle and crown on the reverse. The ribbon is dark blue and crimson with white edges. L. S. medals are also awarded in certain colonial regiments associated with the Brit. Army, and in the various naval reserve forces. The Board of Trade issues a L. S. M. to rocket apparatus volunteers.

Long's Island, see WRASSAIL ISLAND.
Longstreet, James (1821-1901), Amer. Confederate general, b. in S. Carolina. He was wounded in the Mexican war, and was made a brigadier-general at the outbreak of the civil war. He took part in the battles of Bull Run, Fredericksburg, Gettysburg, and Chickamauga (1863), being chiefly responsible for the victory at the last-named. His accidental wound by his own men at a turning point of the battle of the Wilderness (1869) was of the utmost importance, as it checked the Confederates' assault at a critical moment. At the close of the war he was attacked by the extreme irreconcilable party of the S. He was minister to Turkey under President Grant, and commissioner of railways to President McKinley and President Roosevelt. He pub. *From Manassas to Appomattox* (1896), and his defence of his action at Gettysburg appeared after his death.

Longsword, William, see SALISBURY, EARL OF.

Longton, dist. of Stoke-on-Trent, Staffordshire, England. From a small hamlet it has grown into a pottery dist. of considerable size, with blast furnaces, etc. There are coal-mines in the vicinity. Until 1910 it was a separate bor.

Longueuil, Barony of, see LE MOYNE.

Longus, Gk. writer who lived probably during the fourth or fifth century A.D. He is remembered as the author of a book called *Pastoral Matters concerning Daphnis*

and *Chloe*, which is noteworthy on account of its style and simplicity. Among the various eds. may be mentioned a trans. by M. L. P. Courier (later ed. by R. Gaschet, 1911), Amyot's trans. of 1781; and G. Moore's trans., 1924.

Longview: 1. Tn. of Texas, U.S.A., situated in Gregg co., 60 m. W. of Shreveport. The chief industry is the refining of oil from the E. Texas oilfield. It has foundries and plough works, saw mills, and office furniture factories, as well as a shipping trade in lumber, cotton, hides, fruit, etc. Pop. 13,700. 2. Co. seat of Cowlitz co., Washington, U.S.A. It is one of the world's largest timber centres, and its cantilever bridge across the Columbia is the largest of its type in America. Pop. 12,300.

Longwood, see under **ST. HELENA**.

Long-wooled Sheep, see **SHEEP**.

Longwy, fortified tn. in the dept. Meurthe-et-Moselle, France, 18 m. S.W. of Luxembourg. There are iron-mines in the vicinity. In a favourite invasion route it was captured by the Gers. in Aug. 1911. Pop. 12,100.

Long Xuyen, or **Long Chauyan**, tn. of Lower Cochun-China, on the Bassac, 32 m. S.E. of Chaudoc. Communication is maintained between the tn. and the Gulf of Siam by the Rachgia Canal. Pop. (dist.) 95,000.

Lonk Breed, see **SHEEP**.

Lonneker, tn. of the Netherlands in the prov. of Overijssel. Pop. 35,000.

Lönnrot, Elias (1802-84), Finnish scholar, b. at Shammatli in Nyland. He became a country doctor, but was greatly interested in Finnish philology and folklore, and he travelled widely in Finland and Russia, collecting songs and legends. *Kanteletar* (1829-31) was a collection of folk-songs. In 1835 he pub. a first ed. of the *Kalevala*, which was a collection of legendary poems and songs, from which L. evolved a reasonably connected epic of about 12,000 lines; it deals with the fortunes of three brothers, sons of Kalewa, whose origin dates from mythological times. An enlarged ed. was pub. by L. in 1849, and a still more complete text in 1887 by A. V. Forsman. Longfellow adopted the *Hiawatha* metre from it. L. was prof. of Finnish literature and languages at Helsingfors Univ. from 1854 to 1862. To establish a literary Finnish language, for use instead of Swedish, he compiled a notable Finnish-Swedish dictionary. He also ed. *Sanolas Kufja* (1842), *Arvoituksia* (1844), and pub., amongst other works, *Flora Fennica* (1860); *Suomen kansan muinaista laisurunoja* (1880); and *Faliskaisten Suomalainen Pöytäkirja* (1883). See A. E. Ahlgvist, *Elias Lönnrot*, 1886, and J. F. Perret, *La Littérature Finlandaise*, 1936.

Lonsdale, Earl of, Eng. title borne by the family of Lowther. In 1696 Sir John Lowther, a wealthy baronet of Cumberland, was given a viscountcy, but the title became extinct in 1750 and his estates descended to Sir James Lowther who, in 1784, was made earl of L. This title too became extinct when he d. in 1802. In 1807 Sir Wm. Lowther was made earl of

L. and from him the fifth earl, Hugh Cecil Lowther (1857-1944) was descended. The present earl has won a great reputation as a sportsman, notably in boxing (he founded the contest for the L. belt) and horse-racing. The seat is Lowther Castle, Penrith.

Lonsdale, Frederick (b. 1881), Eng. actor and playwright. His chief successes include *The King of Cadonia* (1908); *The Best People* (1908); *Maid of the Mountains* (1916); *The Last of Mrs. Cheyne* (1925); *The High Road* (1927); and *Canaries Sometimes Sing* (1929). L. began his career as a dramatist in rather melodramatic fashion with *The Fake* (1924), but soon turned to the writing of sophisticated comedy in such pieces as *Canaries Sometimes Sing* and *The Last of Mrs. Cheyne*. All his maturer plays show considerable wit, the plots are ingeniously manipulated, and the characters make up in brightness and charm what they lack in significance as human beings (N. Carolyn Wilson), though there is a more serious tone in *But For the Grace of God* (1947).

Lons-le-Saunier, cap. of the dept. of Jura, France, situated on the R. Vallière, 76 m. N.N.E. of Lyons by rail. Its name is derived from the Montmorat salt-mines, which are close to the tn. The manuf. of wine is the chief industry, and there is also a trade in horses and cattle, cheese, etc. Pop. 15,500.

Loos (formerly called **Lanterloo**), round game of cards played by any number of persons. Three cards are dealt to each player, and an extra hand called 'miss,' and the top of the undealt cards is turned up for trumps. The dealer puts a stake into the pool. If the leader holds the ace of trumps he must play it, or the king if the ace is already played, or if he has two trumps he must lead one. Subsequent players must follow suit, and must head the trick if able. If not able to follow suit, but can trump, they must do so. The winner of the first trick must lead a trump if able. When the hand has been played out, the winners of the tricks divide the pool, each receiving one-third of the amount for each trick. If each declared player wins at least one trick, it is a 'single,' and a fresh pool is made as before; but if any of the declared players fails to make a trick he is loosed by paying a stake into the next pool, adding to the contribution put in by the dealer.

Loos Castle, see **VELDPOORT**.

Loos Choo Islands, see **RYUKYU**.

Loos, seaport and urb. dist. of Cornwall, England, on L. Bay, 16 m. W. of Plymouth. The urban dist. comprises W. and E. L., joined by a bridge across the riv. L. is, was once a smuggler's resort. Fishing and shipping are carried on; the Ls. were once flourishing seaports. Pop. 3600. (See illustration, p. 564.)

Loofah, or **Vegetable Sponge**, fibrous skeleton of a gourd (*Luffa aegyptiaca*). After the pulp in which the seeds are embedded has been removed, the fibre is used as a bath sponge.

Lookout Mountain, ridge in N.W. Georgia and adjacent parts of Tennessee

and Alabama, U.S.A., rising to 1600 ft. above the Tennessee R. It was stormed by Gen. Hooker in 1863.

Loom, see under **CORROX**.

Loon, Hendrik Willem van (1882-1944), Dutch historian and writer, b. at Rotterdam. He went to America at the age of twenty, took a hist. degree at Cornell Univ., spent a year at Harvard, and became a journalist. He then studied hist. at Munich, and taught in sev. Amer. univs. In the First World War he was a reporter in Europe. His first book, *The Story of Mankind*, pub. in 1921, achieved great success as a popular, picturesque, universal hist. Other pub. include *The Fall of the Dutch Republic* (1913); *A Short History of Discovery* (1918); *The Story of the Bible* (1923); *Van Loon's Geography* (1932); *The Arts* (1937); and *The Story of the Pacific* (1940).

threatened with danger it either sinks the body low in the water or entirely disappears, seldom emerging before it has traversed a distance of 100 yds., or perhaps even 500, according to its idea of the extent of the danger.

Loos, Battle of, fought Sept. 25-Oct. 8, 1915. It was the Brit. counterpart to the simultaneous Fr. advance under D'Urbal, N. of Arras, following the close of Hindenburg's drive. The Brit. objective in this battle was the important mining centre, Lens, but only the outskirts were reached. L. vil. itself was occupied, together with the dominating position known as Hill 70, eastward and in advance of L. Brit. territorial battalions had a large share in the fighting. See further under FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGN—1915.

Loosestrife, perennial herbaceous plant

LOON, CORNWALL

British Railways

Loon, tn. on the is. of Bohol, Philippine Is. It possesses a sheltered harbour. Pop. 18,000.

Loon, or Great Northern Diver, *Colymbus glacialis*, bird, principally known as a winter visitor to Britain, when it is seen on most of the coasts, and occasionally on inland waters. It also breeds in Iceland and S. Greenland, and across the whole of N. America. The head, neck, and upper tail-coverts are glossed with deep purplish green on a black ground; short transverse bar on the throat collar or middle of the neck; upper plumage black, marked with white spots; under plumage white. Total length 28 in. On account of the extreme watchfulness of this bird, and its wonderful powers of diving, specimens are by no means easily obtained by a person who has not had considerable experience of its habits. In smooth water a boat and its moving shadow can be seen from beneath the surface of the water for a considerable distance, and hence the bird is most frequently dodged and shot during a breeze. The instant it perceives itself

of the family Lythraceae. The purple L. (*Lythrum Salicaria*) is common on riv. banks and in marshy dists. It grows to about 4 or 5 ft. in height and has branching stems, lanceolate leaves, and spikes of brilliant purple flowers. Another variety is *L. vulgaris* which bears clusters of yellow flowers.

Lope de Rueda, see **RUEDA**.

Lope (Felix) de Vega Carpio, see **VEGA CARPIO**.

Lopez de Ayala, Pedro, and **Perez de Ramon**, see **AYALA**.

Lopez de Ricalde, Inigo, see **LOYOLA**.

Lopez, Francisco Solano (1827-70), Paraguayan soldier and statesman, b. at Asunción. He was the son of Carlos L., by whose will he assumed the executive in 1862, and became president for ten years. His acts of cruelty and torture bordered on insanity; in these he was influenced by Mme Lynch, a talented Irish adventuress who became his mistress. Finally he was driven from Asunción, and he retreated into the interior, where he and his eldest son were

seized and killed by a Brazilian force near the Il. Aquidaban. See study by R. B. Cunningham-Grahamo, 1933.

Lopez y Portaña, Vicente, Sp. painter, b. at Valencia, follower of Goya, and a portraitist of the classical style. See life by M. González Martí, 1928.

Lophiades, Lophides, or Angler Fishes, family of fishes with a very large mouth and teeth hinged so as to bend over towards the throat. They have a depressed body, and live on the sea bottom, often at great depth. The angler fish (*Lophius piscatorius*) is a Brit. species (see ANGLERS). The first few dorsal fin rays are long and flexible and terminate in expansions over the snout which lure small fish within reach of the great mouth.

Lophiodon, genus of extinct perissodactyl or superilluon-loed Ungulates. Fossil remains of various species are found in the Eocene strata, varying in size from a horse to a rhinoceros.

Lophobranchii, see BONY FISHES.

Lop-Nor, see LOB NOR.

Lopkova, Lydia (Lady Keynes) (b. 1892), danseuse and actress b. in Russia, daughter of Vassili Lopkova and Constantia Douglas, married the first Baron Keynes (q.v.), 1925. Educated at the Imperial ballet school, St. Petersburg. Her first stage appearance was at the Mariinsky Theatre, St. Petersburg, 1901. She took solo parts in the Imperial Russian ballet. As an actress she played in New York from 1914 to 1916, and later joined Diaghileff's Russian ballet in New York and London. She was the Lilac Fairy in Diaghileff's revival of *The Sleeping Princess* (1921); created the role of Mariuccia in Massine's *Les Femmes de bonne humeur* (1917); was with Massine and the Can-Can dancers in *La Boutique fantasque* (1919); with the Camargo Society, 1930-32, in which Lord Keynes was interested; and the Vic-Wells ballet, 1932-33. Her stage roles include Lady Olivia in *Twelfth Night* (1933); Nora Helmer in *The Doll's House* (1934); Hilda Wangel in *The Master Builder* (1936); and Celine in *Le Misanthrope* (1937). She is a member of the Arts Council of Great Britain.

Lorain, city of Ohio, U.S.A., in L. co. on Lake Erie, 25 m. S.W. of Cleveland. There is a good harbour. Various steel goods are produced, and it has ship-building yards and a fishing industry. Pop. 44,100.

Loran, see under NAVIGATION.

Lorea, Federigo Garcia (1899-1936), sp. poet and playwright, b. at Puentevaqueros. A collection of poems in 1921 was followed by *Cancones* in 1927 and *Romancero* in 1928. In 1931 he founded La Barraca, a dramatic touring company. His plays include *El Maleficio de la Mariposa* (1920); *Donde de Sangre* (1933); and the poems *Doña Rómula la Soltera*; *Perma*; and *La Casa de Hernando*. Among his best poems is his lament for the torador Sanchez Molinas. He was killed by the Falangists. See life by E. Montg. 1944.

Lorea, city of Spain, in the prov. of Murcia, 33 m. S.W. of Murcia. There are Rom. antiquities, Moorish walls and

towers, and a twelfth-century cathedral. There are lead- and silver-mines in the dist., and manufs. include textiles, chemicals, gunpowder, and porcelain. Pop. 73,300.

Lord, John (1810-94), Amer. historian, b. at Portsmouth, New Hampshire. He was a Congregational pastor and lectured at Dartmouth College. Among his works are *Modern History* (1850), *The Old Roman World* (1867), *Ancient States and Empires* (1869), *Ancient History* (1876); and *Beacon Lights of History* (1883-84).

Lord, word derived from the A.-S. *hlaford*, provider of food (*hlaf*, loaf, *ord*, beginning), has a variety of usages. The L. is a term applied to the Jehovah of the O.T. and to the Saviour of the N.T. All bishops and archbishops are Ls. spiritual, whilst members of the House of Ls. assume the title of Ls. temporal. It is a title given to persons of the peerage and to those who have been created peers. All eldest sons of dukes, marquesses, and earls, whilst assuming an inferior title of the peerage, have the word 'L.' by courtesy prefixed to their entire name. Younger sons of the peerage have only the word 'L.' prefixed to their Christian name and surname. There is an official employment of the word L. as in the case of the titles: L. chamberlain, L. advocate, L. high chancellor, L. chief justice, L. high constable, L. high steward, L. high treasurer, L. keeper of the great seal, L. justice general, L. president of the council, Ls. of the bedchamber, Ls. justices, etc. All judges are addressed throughout the Brit. Isles as 'My L.' when acting in their official capacity. In some cases the members of boards which represent state legislation are called Ls., as in the case of Ls. of the Treasury, Ls. of the Admiralty, etc.

Lord Chamberlain, see CENSORSHIP OF THE DRAMA; CHAMBERLAIN.

Lord Chief Justice, name given to the judge who presides over the king's bench, div. of the high court of justice. He ranks in the legal hierarchy, next to the lord chancellor and usually he is created a peer on appointment. (See also CRIMINAL APPEAL COURT OR.) The former court of common pleas of from four to nine judges was presided over in the time of Edward I. by a *capitalis iudiciarius*; later, from the earlier half of the seventeenth century, the four judges of the court were presided over by a L. C. J. The third co-ordinate court of common law, the old court of exchequer, was presided over by a chief baron of the exchequer first appointed in 1312. See also COMMON PLEAS, COURT OF; KING'S BENCH DIVISION; EXCHEQUER COURT.

Lord High Chancellor, see CHANCELLOR. **Lord High Steward**, see HIGH STEWARD OF ENGLAND.

Lord Howe Island, situated in the Pacific Ocean midway between Norfolk Is. and Sydney, about 520 m. E.N.E. of Sydney. It is a dependency of New S. Wales, some 3200 ac. in area, and is of great natural beauty, rich in bird life and rare plants. The is. is of volcanic formation and has coral reefs. Discovered in 1788, it was

first settled in 1853 by a party of Maoris from New Zealand, and other settlers from Sydney followed them. None but the descendants of these early settlers may now establish themselves permanently in the Is. It is the home of the handsome and hardy Kentia palm, the export of the seed of the plant being the staple industry, in which all persons b. on the Is. (they number about 150) are entitled to share. L. H. is also the name given to Mopha Is. of the Society Group, and to Ongtong, Java, of the Brit. Solomon Is., the latter being an atoll. The Santa Cruz or La Pérouse Is. in the Pacific are also known as the L. H. Is.

Lord-Lieutenant of Ireland, see IRELAND.

Lord-Lieutenant, The (of a co.), is nominated by the sovereign by patent under the great seal. He stands as the permanent local representative of the Crown, and is responsible for the maintenance of public order. This title was first created in the reign of Henry VIII., and entailed many responsibilities. The L.-L. had to maintain the efficiency of the militia of the co., and had the right of appointing his own officers. These rights were withdrawn in 1871 and vested in the Crown. The chief duties imposed on the L.-L. in present times consist in the appointment of magistrates for the co. bench, the appointment of deputy lieutenants, and the raising of the militia, if need be, in times of riot or invasion. He is, as a rule, a peer or baronet, a large landowner, and is often appointed *custos rotulorum*.

Lord Mayor of London, see LONDON.

Lord of Misrule was the 'master of mirth and fun' appointed in the king's court for the feast of Christmas. His nomination took place on All Hallows' Eve, and he remained in office till the feast of Purification. According to Stubbs these mock dignities had from twenty to sixty officers under them, and were furnished with hobby-horses, dragons, and musicians. In Scotland they received the title of 'Abbot of Unreason.'

Lord of the Isles, see ISLES, LORD OF THE.
Lord President of the Council, see PRESIDENT OF THE COUNCIL, LORD.

Lord Privy Seal, see SEAL, LORD PRIVY.

Lord Provost, see under PROVOST.

Lords-and-Ladies (botany), see ARUM.

Lords Appellant, see APPELLANTS.

Lord's Day, see SABBATH.

Lord's Day Observance Society was founded in 1831. Its aim is to promote the religious observance of the Christian Sunday, and 'to resist all sports and amusements which would tend to assimilate the traditional quiet British Sunday to the continental Sunday.' Its methods consist of sermons in churches, talks in schools, youth meetings, and circulation of scriptural pubs. The society's watchword is 'For our Lord and His Day.' Headquarters: Lord's Day House, 55 Fleet Street, London, E.C.4.

Lords, House of, see PARLIAMENT.

Lord's Seat, commanding viewpoint, over 2000 ft. high, of Edale, Cumberland, England, in the possession of the National Trust.

Lord's Supper, see EUCHARIST.

Lord Steward, see HIGH STEWARD OF ENGLAND.

Loreburn, Sir Robert Threshold Reid, first Earl of (1846-1923), Brit. lawyer, second son of Sir James John Reid. Educated at Cheltenham College and Balliol College, Oxford, where he took a first class in moderations and in Literae Humaniores, he was called to the Bar in 1871. Solicitor-general and then attorney-general in 1895, he was M.P. for Dumfries, 1886-1905, and received a decoration for his services in the Boundary Arbitration Commission. He was knighted in 1894 and created Baron L. in 1906. Lord chancellor, 1905-12, he became an earl in 1911. Wrote *Capture at Sea* (1913) and *How the War Came* (1919). The title became extinct on his death.

Lorelei, or Lurlei, name given to a rock rising steeply on the r. b. of the Rhine near St. Goar, in the Rhineland, Germany. There are many legends associated with the L., which possesses a wonderful echo. One legend runs that a maiden sits upon this rock combing her glorious hair and tempting fishermen to death by the surpassing sweetness of her song, which makes them approach the rock too closely. Another legend makes this rock the hiding-place of the Nibelungen treasure. Mechen-dorf, Loeben, Heine, and others have used the legends in poems, stories, and songs. Heine's *Ich weiss nicht, was soll es bedeuten* was set to music by Schlegel.

Lorentz, Hendrik Antoon (1853-1928), Dutch physicist, b. at Arnhem. He was educated at Leyden Univ., where he was subsequently prof. of physics. His researches in electro-dynamics won for him and his pupil, Zeeman, the Nobel prize for physics in 1902. It was L. who propounded the theory that magnetism and light result from the interaction of electric charges forming the ultimate connection between ponderable matter and ether. His researches paved the way for the famous theory of relativity of his other pupil, Einstein. He also advanced research work in the theory of gases, radiation, and thermo-dynamics. Among his numerous honours were the award of the Rumford and Copley medals of the Royal Society of Great Britain, the position of a foreign associate of the National Academy of Sciences of the U.S.A., and the degree of D.Sc. of Cambridge Univ. In 1919 he was chairman of the Committee of Intellectual Co-operation of the League of Nations. Pubs.: *Text-book of Differential and Integral Calculus* (1882); *Text-book of Physics* (1888-90); *Clerk-Maxwell's Electro-magnetic Theory* (1892); *Theory of Electrical and Optical Phenomena in Moving Bodies* (1895); *Treatise on Theoretical Physics* (1907); *Les Théories statistiques et thermodynamiques* (1916); *Theory of Electrons and its Applications to the Phenomena of Light and Radiant Heat* (2nd ed., 1916); and numerous contributions to the periodicals of various learned and scientific societies.

Lorenzetto, Pietro, It. painter, b. at Siena towards the end of the thirteenth century, some of his pictures being dated

earlier than 1305. His best works are 'The Nativity of the Virgin'; 'The Invention of the Cross' (1338); and a group of figures in the Siena Museum. His brother, called *Ambrogio L.* or *Ambrogio di Lorenzo* (c. 1266-1348?), was also a painter. In 1337-39 he executed in the Palazzo del Pubblico some frescoes representing the saints worshipping at the feet of God the Father, which have suffered much from the passage of time.

Lorenzo di Medici, *see* MEDICI.

Lorenzo Marques, *see* LOURENÇO MARQUES.

Casa, though no allied troops were quartered in the building. The roof of the dome and that of the nave were burned but, considering the violence of the attack, the damage was miraculously small, though the frescoes by Signorelli and Melozzo da Forlì were damaged. Pop. 9000.

Loretto, Scottish public school at Musselburgh, Midlothian, founded in 1827.

Loria, Isaac Ben Solomon, *see* LURIA.

Lorient, before the Second World War a fortified seaport, which ranked as the

THE LORELLI AND THE RHINE, NEAR ST. GOAR

Loreto: 1. Dept. of Peru, situated in the valley of the Amazon. The dist. is densely wooded and consequently difficult of approach. It is watered by the R. Ucayali and Huallaga, between which lies a large plain, the Pampas del Sacramento. Salt, rubber, tobacco, cinchona, and gold are produced. Area 119,270 sq. m. Pop. 108,000. 2. Or Loretto, city of the Marche, Italy, 15 m. S.S.E. of Ancona. It is a famous resort for pilgrims because of the Santa Casa, or Holy House, of the Virgin, which is reputed to have been brought over from Nazareth by angels in the thirteenth century. A magnificent church holds the sacred shrine which is adorned with most costly treasures. The Rom. Catholic Litany of L. in honour of the Blessed Virgin takes its name from this shrine. The tn. was bombed on the night of July 5-6, 1944, by the Gers. who concentrated many waves of bombers in an attack on the sanctuary of the Santa

most important centre in France for the building of men-of-war. It lies on the S. coast of Brittany in the dept. of Morbihan. The port was divided into a commercial and naval harbour. The naval port is situated at the mouth of the R. Scorff and possesses quays upon which were built (1939) enormous workshops, foundries, and estabs. of all kinds for the construction and equipment of men-of-war. Long-boats and canoes were built at Pré aux Vases, whilst the heavy battleships were built at Caudan. The port was well protected by forts, the most prominent one being St. Michel.

In the Second World War the port was frequently bombed by the R.A.F. and, later, by the Amers, after it had fallen into Ger. hands. It was an important Ger. submarine base during the war and the destruction of its facilities (as well as those of St. Nazaire) was vital to the allied cause. Amer. Fortresses attacked L.

constantly in the autumn and winter of 1942. During Jan.-Feb. 1943 L. and its submarine pens, capable of berthing thirty U-boats, was a frequent target for allied aircraft. It was attacked in eight major night raids in addition to a heavy daylight raid on Jan. 23. The raids reached a climax on the night of Feb. 13 when 1000 tons of bombs were dropped on the port and there were almost equally heavy raids later, especially on the electric power station on March 6. By that time the port had been for the most part razed to the ground and the civilian pop. had to leave. It was one of the last places in Brittany to be yielded up by the Gers. after the allied break-through in Normandy. After the war the streets of L. consisted of two parallel lines of piled rubble. The Cours de la Bève could be identified only by the chestnut-trees under which fashionable L. used to foregather in the evenings before the war. It would be impossible for the stranger to imagine what manner of tn. this was, because there remained of the tn. proper not even a wall on which a street name might be found to remind the returned traveller of the one-time jostling crowds, cafés, and uniforms. Pop. (1939) 43,000.

Loris, name given to certain types of lemurs, of which the two best known are the Grey Slow L. and the Slender L. They are nocturnal in habits and are found in W. Africa, India, and China.

Lorraach, tn. of Baden, Germany, 4½ m. N.E. of Basle. It has manufs. of cloth, calico, etc. Pop. 20,300.

Lorraine, Claude of, see **CLAUDE**.

Lorraine, Mary of, see **MARY OF GUISE**.

Lorraine (Ger. Lothringen), anct. prov. of the N.E. of France which was originally that portion of the empire of Charlemagne which fell to Lothair by the treaty of Verdun in 843, and was called Lotharingia. Later it consisted of the depts. of Meurthe-Moselle, Meuse, and Vosges. The name was originally given to two ters. between the Saône and the Rhine, the N. portion between the Moselle and the Rhine bearing the name Upper L. and the S. portion Lower L. The latter soon became known as Brabant, and the name L. became confined to the Moselle country. It was an area of constant dispute between France and Germany. In 1736 the Fr. obtained the duchy for the ex-

king of Poland, Stanislas, whose daughter had been married to Louis XV. In 1766 the death of Stanislas was followed by the incorporation of L. with France, until 1871, when it was annexed by Germany, forming one of the three dists. of Alsace-Lothringen. For its subsequent hist. see **ALSACE-LORRAINE**.

Lorraine, Cross of, red cross, with two horizontal cross-pieces, on a blue ground. It was the irredentist emblem carried by Joan of Arc, Lorraine still being, in her time, in the possession of vassals of the

CROSS OF
LORRAINE

ground. It was the irredentist emblem carried by Joan of Arc, Lorraine still being, in her time, in the possession of vassals of the

Ger. king. The cross was adopted by the Free Fr. Forces of Gen. de Gaulle in 1940 as an emblem of resistance to the Ger. occupation.

Lorris, Guillaume de (c. 1215-c.1240), Fr. poet, b. at Lorris. Little is known of his life, except that he was the author of the famous medieval poem, *Roman de la rose*, which was finished by Jean de Meung about 1277.

Lory (*Lorius* or *Electus*), genus of brilliantly coloured parrots. They are honey eaters, and the bill is but slightly curved, and the tongue long and protrusible. Also a S. African name (Louri is the native name) for the white-crested plantain eater (*Corythaix muscophaga*). It is about 10 in. long, its general colour is green, and the feathers of its beautiful crest are tipped with white; the wing feathers are brilliant carmine.

Los Alamos, settlement in the New Mexican desert, U.S.A., N.W. of Santa Fé, one of the three dists. of the atomic bomb project. It covers 70 sq. m. and in 1948 had a pop. of 8000, principally of scientists and staff.

Los Andes: 1. Or Santa Rosa de los Andes, tn. in Chile, 65 m. E.N.E. of Valparaiso, at the foot of the Uspallata Pass. Mining and stock-raising are carried on. Pop. 6000. 2. Former ter. of Argentina, with an area of 28,000 sq. m., taken over by Argentina in 1899. In 1943 it was abolished and divided between the provs. of Jujuy, Salta, and Catamarca.

Los Angeles: 1. City of California, U.S.A., co. seat of L. A. co., 350 m. S.E. of San Francisco. The Spaniards settled it in 1781. Alternately with Monterey, it was the cap. of Mexican California. Taken by U.S.A. in 1846, when it was already a thriving place, it is now the largest city in area (248,334 ac.) in the U.S.A. In size and pop. it has now outstripped the rival city of San Francisco, and is one of the chief commercial ports of California. Exports in normal years are valued at \$140,000,000 and imports at \$80,000,000. Its industrial area has been increased by a large automobile assembly plant, and also the works of the Fokker Aeroplane Company. L. A. is one of the largest manufacturing tns. of the U.S.A. Its chief industries are petroleum refining, printing and publishing, meat packing, foundry and machine shop products, clothing, lumber and planing mill products, while Hollywood, the suburb of L. A., is the centre of the Amer. motion picture-making industry. The L. A. city hall, a white stone structure, was completed in 1928. The univ. of S. California at L. A. has some 16,000 students (1938-39). It is the base of the Pacific fleet, and there is an airport. The climate is ideal, with long, dry summer, clear air, mild winter, and it has made L. A. a favourite resort and place of residences. The pop. is 1,845,700. See H. Carr, *Los Angeles, City of Dreams*, 1935; C. Landery, *Hollywood is the Place*, 1940; and Amer. Guide Series, *Los Angeles: a Guide to the City and its Environs*, 1941. 2. Cap. of the prov. of Biobío, Chile, stands at an altitude of 550 ft. Pop. 12,000.

Losinoostrovsk, tn. in the R.S.F.S.R. Pop. 70,400.

Los Islands, small group lying off the W. coast of Africa, are of volcanic origin, and belong to the Brit. colony of Sierra Leone; their names are Factory, Tamara, and Ruma.

Los Rios, prov. of Ecuador, on the W. slope of the Andes, with Guayas prov. to the W. and Bolívar prov. to the E. The prin. occupations are stock-raising and agriculture. Cap. Babahoyo. Area 2295 sq. m. Pop. 150,800.

Löss, see **LOESS**.

Lossiemouth, seaport of Elginshire, Scotland, stands at the mouth of the R. Lossie on the Moray Firth, and has a very fine harbour. Bp. of James Ramsay MacDonald, the first Labour Prime Minister of Great Britain. Pop. 4400.

Lossin, see **LUS-AN**.

Lost Property. If anything is lost the owner can claim it at any time from any one he sees in possession of it; the one who finds the article is entitled to it next after the owner provided he comes upon it in a public place. But should the finder keep the property when he finds the owner he is guilty of theft. So too is the man who discovers a valuable brooch while digging in another man's garden and fails to give it up; for the owner of private land is entitled to all found on it. But the mere keeping of a lost article, in hope of getting a reward for giving it up, though the owner be known, does not amount to theft, and there is no obligation on the finder of L. P. to incur expense in advertising for the owner.

Lost Tribes. In 721 B.C. a large number of the Israelites of the N. Kingdom, the ten tribes, were carried into captivity by the Assyrians under Sargon. These people subsequently disappeared from hist., thus gaining the title of the L. T. Other deportations occurred, notably that under Nebuchadnezzar, of a large portion of the prin. inhab. of Judah, after the fall of Jerusalem (586 B.C.), but these are reported to have returned when Cyrus overthrew the Babylonian empire (538 B.C.), whereas no authentic account of the N. tribes is forthcoming. A very improbable theory, originated by John Sadler in 1649, and still held by some people, is that the Eng. are descended from these L. T. These people assert that the Israelites were carried into Media, and they identify them with the Saces or Scythians, who appeared as a conquering horde there about the same time. And they further claim that those Saces spread over N. Europe, and so became the progenitors of the Saxon invaders of England.

Lostwithiel, municipal bor. and mkt. tn. of Cornwall, on the Fowey, 21 m. N.E. of Truro; it contains the ruins of Restormel Castle, built in the time of Henry III. Pop. 2000.

Lot, spoken of in Gen. xi. 27 as the son of Haran, the brother of Abraham, accompanied his uncle in the journey from their fatherland. He was allowed by Abraham to choose for himself the prosperous country in the Jordan valley near Sodom and Gomorrah. On the approaching

destruction of these two cities, he and his family were led from Sodom by two angels, and an addition to the story is made, telling the fate of L.'s wife. He took refuge in the mts. near Loar, and here he became the father of Moab and Ammon by his two daughters. This incident is possibly an insertion from another story.

Lot, dept. of S.W. France, formed in 1790 from the dist. of Quercy. It has three arrons., Cahors, Figeac, and Gourdon. The surface, which is varied, is crossed from E. to W. by the L. and is highest in the N.E. Wheat is the chief cereal, but maize, oats, and barley are cultivated to a large extent. Wine is the prin. product, the most valued being that of Cahors, grown in the valley of the L. Large quantities of chestnuts come from the N.E., and the dept. also produces potatoes, tobacco, and hemp. The chief minerals are coal, iron, and zinc; cloth-making, tanning, brewing, and the making of agric. instruments are among the industries. Cap. Cahors. Area 2018 sq. m. Pop. 154,800.

Lot, riv. of S. France, the anct. Oltis, which rises in the Lozère Mts., flows through the depts. of Lozère, Aveyron, L., and Lot-et-Garonne, passing Mende, Espalion, Entraygues, Cahors, Penne, Villeneuve d'Agen, and joins the Garonne near Alguillon. It has a length of 300 m., and the area of its basin is 4350 sq. m.

Lotario de' Conti, see **INNOCENT** (popes), *Innocent III.*

Lot-et-Garonne, dept. of S.W. France formed from parts of Guienne and Gascony. Its surface, which consists mainly of wide plains, is traversed by the Garonne from S.E. to N.W., and by the Lot from E. to W. The valleys of these rivers are exceedingly fertile, and the slopes of the low hills are covered with orchards and vineyards; coal forests occur. The soil is highly cultivated, wheat being the chief cereal, then maize and barley. Hemp and mulberry leaves are also products of the prov., and the vine covers about 9 per cent of the surface. Minerals are few, although large quantities of iron are found. The chief tn. is Agen, which is also the seat of a bishopric and of the court of appeal for the dept. Area 2079 sq. m. Pop. 265,100.

Lothaire I. (790-855), Rom. emperor, was the eldest son of the Emperor Louis I., who divided the empire among his sons in 817. He undertook the government of Italy in 822, and was crowned emperor at Rome in 823. He was alternately master of the empire, and banished and confined to Italy. He claimed the whole of the empire on his father's death, but was defeated by his brothers at Fontenoy (841), and by the treaty of Verdun (843) received Italy and 'the imperial title, together with some land in the valleys of the Rhine and Rhone. He renounced the throne in 855 just before his death.

Lothaire II. (d. 1070-1137), called 'The Saxon,' a Rom. emperor, succeeded to his father's lands around Helmstadt in Saxony in 1075, and became duke of Saxony in 1106 on the death of Magnus.

He was elected king of Germany in 1125, succeeding Henry V., and was crowned emperor at Rome by Pope Innocent II. in 1133.

Lotharingen, or Lothringen, *see* LORRAINE.

Lothian, Philip Henry Kerr, eleventh Marquess of (1883-1941), Eng. statesman and ambas., son of Maj.-Gen. Lord Ralph Kerr. After leaving New College, Oxford, he went to S. Africa, becoming one of 'Milner's young men.' In S. Africa he ed. the *State*, a paper founded to promote S. African union, and on returning to England became editor of the *Round Table*. In 1916 he became secretary to the Premier, Lloyd George, and played an important part in the peace conference at Versailles. Later he was appointed secretary of the Rhodes trust. On accession to the peerage in 1930 he sat in the House of Lords as a Liberal and, in 1931, became chancellor of the duchy of Lancaster in Ramsay MacDonald's National Gov. Later he was under-secretary of state for India and chairman of the Indian Franchise Committee. In 1939 he became ambas. to the U.S.A. in succession to Sir Ronald Lindsay. His knowledge of and sympathy with Amer. problems made his appointment outstandingly successful and he became a popular figure with the Amer. people. His unceasing efforts in the cause of Anglo-Amer. friendship received tribute from President Roosevelt and Mr. Cordell Hull. He collaborated with Mr. Lionel Curtis in writing *The Prevention of War* (1923), which, based on the lessons of Amer. hist., upheld the thesis that war could only be prevented by the estab. of a commonwealth to include all humanity.

Lothian Regiment, *see* SCOTS, ROYAL.

Lothians, The, dist. on the S. side of the firth of Forth, which includes the co. of Haddington, Edinburgh, and Linlithgow, which are called respectively E. Lothian, Mid-Lothian, and W. Lothian. It formerly embraced the E. part of the Lowlands from the Forth to the Cheviots, i.e. all the Eng. part of Scotland in the eleventh century.

Loti, Pierre (Louis Marie Julien Viaud) (1850-1923), captain in the Fr. Navy and novelist, b. at Rochefort. His real name was Julien Viaud. He served throughout the Tongking campaign with distinction, but retired from active service in 1883. He was elected a member of the Fr. Academy in 1891, succeeding the celebrated romanticist, Octave Feuillet. As an author he was the very antithesis of Zola, and his works marked a revival of the spirit of romanticism in Fr. literature. Pubs. include *Le Mariage de Loti* (1880); *Mon Frère Yves* (1883), describing the life of a Fr. bluejacket; *Pêcheur d'Islande* (1886), describing life among the Breton fisherfolk, the most popular of all his writings; *Propos d'exil* (1887); *Ramuntcho* (1897); *L'Inde sans les anglais* (1903); *Disenchanted* (1906); *Pelléas d'Angkor* (1912); *L'Horreur allemande* (1918); and *Figures et choses qui passent* (1920). An Eng. trans. of his early recollections, *Notes of My Youth*, appeared in 1924. A

monument in Tahiti was unveiled to his memory in 1934. *See* lives by N. Serban, 1924; E. d'Auvergne, 1926; R. Lefèvre, 1934; and P. Flottes, *Le Drame intérieur de Loti*, 1937.

Lotions, liquid washes used as remedies for bruises, sores, and enlarged joints. They are usually solutions of various salts, and differ from embrocations or ointments in that oils or fats are absent. The chlorides of ammonia, soda, and lime are common washes. Sal ammoniac with vinegar or spirit is used for application when there is no open wound; chloride of lime or soda for ulcerated mouth and throat or tumours. Calomel in lime water, known as *black wash*, is a more efficient lotion for obstinate ulcers.

Lotophagi (Λωτοφάγοι, lotus-eaters), a people mentioned by Homer, who lived on the fruit of the lotus, the taste of which was so delicious that any one who ate it lost all desire to return to his native country. In historical times the Gks. came across people who used the fruit of the lotus as an article of food on the N. coast of Africa, and called them L. But it has also been said that they inhabited the large is. of Moninx or Lotophagitis, adjacent to this coast. They carried on a commercial intercourse with Egypt and with the interior of Africa, using the caravan routes that are in existence to-day.

Lots, Casting, system of divination common among primitive and civilised peoples alike. The most common method is by pieces of wood or straw, which are marked and covered up, one or more being then drawn out at random. Tacitus speaks of this method being used by the ant. Teutons. The Romans also made use of the famous *Sortes Virgilianae*, which were performed by opening a copy of Virgil and drawing deductions from the first lines that caught the eye. Other books were also made use of, and the custom passed into the Christian Church. We find many canons and penitentials condemning the practice of using the gospels, psalters, etc., in this way. *See* also DIVINATION.

Lotschberg, or Lötsebenpass, pass in the Swiss Alps, linking Kandersteg with the Lötschental, a side valley of the Rhone in the canton of Valais.

Lottery, in Eng. law, is a statutory public nuisance, though on the Continent such form of competition is both authorised and carried on by the state. The essence of a L. is the award of prizes by lot or mere chance, the commonest form taking the shape of money prizes for drawing a winning number. Theoretically a competition is not a L. if some degree of skill, however slight, is requisite to securing a prize, but the adverse decisions of the high court to the continuance of the 'Limerick craze' and 'progressive whist drives' (*see* GAMBLING) are against the old theory, and indicate that if the court is either not satisfied that a particular form of competition of mixed skill and chance is conducted fairly, or thinks that the element of chance altogether predominates over that of skill, it will construe the com-

petition as a L. Formerly state Ls. were authorised by various Acts of Parliament in England, but they were dropped in 1824, and any one who allows a L. to be carried on upon his premises may be liable to a fine not exceeding £100, while any one who sells tickets for a L. is liable to a fine not exceeding £50, and in each case the offender may be dealt with under the Vagrancy Act, 1821, as a rogue and vagabond.

The only kind of Ls. allowed by the law are art union Ls., conducted by societies (incorporated by royal charter) with the express object of distributing works of art; this being a special and exclusive privilege in the interests of art. Selling packets of tea or any other commodity with coupons attached entitling the purchaser to some prize of problematical value constitutes a L., but not so 'football pools.' It is to be noted, however, that competitions for guessing the results of football matches or forecasting any other uncertain event may come within the Betting Act. A L. is essentially a betting transaction, although a greater or less degree of skill may be employed, and if the proprietor of a newspaper or any other concern habitually conducts so-called 'skill' competitions at his offices and takes ready-money in the shape of a preliminary deposit, he will probably find that his activities will become the subject of criminal proceedings.

The popularity in Britain of the Irish Hospitals Sweepstake led to the passing in 1934 of a new Act prohibiting the printing of news regarding foreign Ls. in Brit. newspapers and strengthening the law in other ways, despite the fact that a commission had reported, in 1933, in favour of the legislation of private Ls. under stringent supervision. See also CALCIUTA SWEEPSTAKE; GAMING. See G. ARCY, *Jeux de hasard*, 1923; C. F. Schoolbred, *Lotteries and the Law*, 1928-31; C. Ewen, *Lotteries and Sweepstakes in the British Isles*, 1932; and G. Martin, *Gambling and the Citizen*, 1919.

Lotto, Lorenzo (c. 1480-1555). It. religious painter. b. at Venice. His most celebrated altar-pieces are to be seen in the churches of the Carmine and SS. Giovanni e Paolo, Venice, the cathedral of Asolo, and at Monte San Giusto, near Ancona, where the church contains a Crucifixion containing twenty-three life-size figures. See life by B. Borsonson, 1895.

Lotus, large genus of leguminous perennials. Some of them are low and prostrate and others of shrubby habit. *L. Bertholletii* (synonym *peliorhynchus*), a valuable plant for hanging-baskets in the greenhouse, bears large red pea-shaped blooms and silvery foliage. A number of species are Brit.; the bird's-foot trefoil (*L. corniculatus*) is abundant in pastures, and is sometimes grown in the rock garden. Two small species occur rarely on the S. coast. The sacred *L. (Nelumbium speciosum)* is believed to have been the Egyptian *L.* of ant. hist., though it does not now occur in Egypt (see NELUMBIVUM).

Lotus Eaters, see LOTOPHAGI.

Lotze, Rudolf Hermann (1817-81), Ger. philosopher and physiologist, b. at Bautzen. His first essay was *De futurae biologiae principibus philosophicis*, with which he gained his M.D. in 1838. But he laid the foundation of his philosophical system in *Metaphysik* (1841) and his *Logik* (1843). These books, however, remained unnoticed by the reading public, and he first became known as a physiologist combating the then accepted doctrine of vitalism, his physiological works being *Allgemeine Pathologie und Therapie als mechanische Naturwissenschaften* (1842 and 1848), *Allgemeine Physiologie des Körperlichen Lebens* (1851), and *Medizinische Psychologie oder Psychologie der Seele* (1852). His great work, however, was his *Mikrokosmos* (1856-64), and this gives a comprehensive statement of his opinions on nature and man, and shows him to be essentially the philosopher of the transition from the exaggerated idealism of the first half of the century to the most recent modifications of materialism. This book has run through four eds., and has been trans. into Eng. (1890). Other notable works of his are *Geschichte der Ästhetik in Deutschland* (1868); *System der Philosophie* (1874-79); *Logik* (1874, 1880, trans. 1884); and *Metaphysik* (1879, trans. 1884). L. was prof. of philosophy at Leipzig in 1842, and in 1845 was appointed to the chair of speculative philosophy at Göttingen, where he remained until 1880. See studies by H. Jones, 1895; E. Becher, 1917; and H. Johansen, 1927.

Loubet, Émile François (1838-1929), president of the Fr. republic from 1899 to 1906, b. at Marianne, Drome. He studied law, and became mayor of Montélimar in 1870. He entered political life in 1876, and showed himself to be the enemy of the Monarchist coalition. He fought the clerical system estab. by the Loi Falloux, and worked hard for free elementary education. He supported the Gambetta and Ferry ministries, and voted for Tongking and Tunis credits. In 1885 he became senator, and two years later was appointed minister of public works. In 1892 he became minister of the interior, and in 1895 president of the Senate. He was a warm friend of President Faure, and on the latter's sudden death was called upon to fill his place. During his presidency the Dreyfus case was settled, and the Fr. ambas. was recalled from the Vatican, the separation of Church and State being voted in the Chamber of Deputies.

Loudon, or Laudon, Gideon Ernst Freiherr von (1717-90), celebrated field marshal of the Austrian Army, b. at Tootzen, Livonia. He entered service of Maria Theresa in 1743, having previously been ten years in the Russian service and gained distinction in sev. exploits. During the Seven Years war he contributed greatly to the victory of Hochkirch, as also to that of Kunersdorf, where Frederick the Great commanded in person. L. also commanded during the War of the Bavarian Succession (1778) and the Turkish war (1788-89), when he gained sev.

victories and captured Belgrade. See lives by W. von Janko, 1869, 1903, and G. B. Mallison, 1894.

Loudon, John Claudius (1783-1843), Scottish horticultural writer and landscape gardener, b. at Cambuslang, Lanarkshire. He was apprenticed at fourteen to a nurseryman and landscape gardener but continued to attend classes in Edinburgh in general subjects. L. found employment in London where, in 1803, he pub. his first essay, *Observations on Laying out Public Squares*. But his greater interest lay in rural rather than in urban development, as shown by his next pamphlet, *An Immediate and Effective Mode of Raising the Rental of the Landed Property in England*, prompted by his conviction of the superiority of Scottish over Eng. farming. In 1809 he rented the large farm of Tew Park in Oxfordshire, where he took pupils in agriculture; by 1812 he had made a fortune of £12,000, which enabled him to leave his pupils and study farming and gardening methods on the Continent. Through injudicious investing he soon lost his fortune and thereafter wrote encyclopedic works on agriculture and the like, and ed. magazines on the same topics. His *Encyclopaedia of Gardening* (1822) shows no trace of his foreign visits. His *Encyclopaedia of Agriculture* and *Encyclopaedia of Plants* were pub. in 1825 and 1829 respectively. In 1826 he had begun publishing the monthly *Gardener's Magazine*, which he ed. until his death, and in 1828 he began the pub. of the *Magazine of Natural History*. About this time he superintended the laying out of the Birmingham Botanical Garden. In 1832 he began the compilation of the *Encyclopaedia of Cottage, Farm, and Villa Architecture*. Its success led to the pub. of *Arboretum et Fruticetum Britannicum* in monthly parts, his most valuable but, financially, his most disastrous work. His remaining years were spent in a desperate effort to repay his indebtedness on this account. He did much for the development of Great Tew vil. (q.v.). L. is commemorated by a genus *Loudonia* described by Lindley, and an oil painting of him by Linnell was presented by subscription to the Linnaean Society.

Loudspeaker, instrument for the conversion of electrical energy into sound at a level which can be heard by one or more persons. It is in general use in connection with most types of communications equipment, domestic wireless receivers, and public address systems. In its early form the L. was derived from the simple telephone receiver earpieces which was fitted with a horn to give a concentration of sound. This sound was produced by a thin metal diaphragm which was caused to vibrate by an electro-magnet placed close to it, and whose coils carried the audio-frequency current from an amplifier. The efficiency of such an arrangement was very low, and the response to notes of different frequencies most uneven. There were marked resonances which rendered the reproduced speech or music unpleasant to the ear, and unlike the

original in many of its characteristics. As time went on, however, many of these drawbacks were overcome, and the diaphragm was replaced by a steel reed joined to a paper or parchment cone which had the vibrations imparted to it axially. This arrangement was then known as the 'moving-iron' L., and was widely used in domestic wireless receivers. As the demand grew for more faithful reproduction of sound sev. other principles were applied to L. design, e.g. the condenser and crystal Ls. made their appearance. The first of these depended for its action on the electrostatic forces brought into play between a diaphragm and a fixed surface when an audio voltage was applied between them, while the second relied on the piezoelectric effect present when an electric voltage is applied to a crystal of Rochelle salt or similar substance. Their success was, however, limited as they were soon superseded by the moving-coil L., which in its various forms fulfils almost all requirements. In essentials it consists of a small coil of wire suspended in an annular gap between the poles of either a permanent or electro magnet. This coil is joined to the apex of a light paper, parchment, or metal-foil cone, and the assembly is free to move within limits along its axis so that any movement of the coil is imparted to the cone, and thence to the air in front and behind it. The audio-frequency current is passed to the coil whose movement, induced electromagnetically, faithfully follows its variations. As the impedance of the coil is low it is usually coupled to the output valve by means of a step-down transformer, the latter often being incorporated with the L. The recent advances in high flux density permanent magnets have resulted in a L. which is both compact and efficient, and which is employed in all modern domestic wireless receivers. When in a suitable cabinet or on a baffle board this type is capable of a high degree of fidelity with few of the shortcomings of the earlier varieties.

A field of application in which L. design has become largely specialised is that of public address where it is required to project sound at a high power level in given directions so that it may be heard by large crowds, often over a wide area. The cone of such a L. unit is relatively small, being only 3 or 4 in. in diameter, and made of spun aluminium foil to withstand stresses at which the weaker parchment cone would collapse. The speaker unit feeds into a large horn which provides the requisite air loading and directivity. Such Ls. are usually employed in groups, often in conjunction with a number of the more ordinary cone type, which give a shorter range, but wider coverage. The high power units can handle power of the order of ten watts and upwards, and can project sound over considerable distances. A public address installation may employ very large numbers of Ls. with horns designed to give the directivity and sound distribution required. Speakers are usually divided into groups so that the sound level may be adjusted for each one

independently to obtain an even distribution of sound over the area. Such an installation may require sev. hundred watts of electrical audio power, and considerable skill is required in the placing and choice of Ls. to obtain optimum results.

Loudun, Ernst Gideon, Baron von (1717-1790), Austrian soldier, b. in Livonia, of Scottish extraction. He left the Russian Army to enter Austrian service and twice defeated Frederick the Great during the Seven Years war. See life by G. B. Mulleson, 1894.

Loughborough, Baron, see WEDDERBURN, ALEXANDER.

Loughborough, mkt. tn. and municipal bor. of Leicestershire, on the L. Canal. The prin. industry is hosiery-making, but engineering is also carried on, and there are iron and dye works and bell foundries. It has a grammar school, founded in 1495, and a technical and scientific college. Pop. 33,200.

Loughrea, mkt. tn. of co. Galway, Eire, 10 m. S.E. of Athenry. It is the seat of the Rom. Catholic bishop of Clonfert, and has a cathedral, built 1900-. Pop. 2800.

Loughton, urban dist. and tn. in Essex, 5 m. from Epping. There is an anct. camp at L. Pop. 6000.

Louis, or Ludwig (Lewis), name of a number of Ger. emperors from the eighth century onwards:

Louis I. ('le Débonnaire' or 'the Pious') (A.D. 778-840), son of Charlemagne, succeeded him as Rom. emperor and king of the Franks (814). See B. von Simson, *Jahrbucher des Fränkischen Reichs unter Ludwig der Franzose*, 1874-76, and O. Schnürer, *Die Anfänge der Abendlandischen Volksgemeinschaft*, 1932.

Louis II. (822-75), son of Lothaire I, associated in the gov. from 849, sole emperor from 855. See Gregorovius, *History of Rome in the Middle Ages* (Hamilton trans.), 1894-1900.

Louis III. (880-924 or 928), grandson of above, succeeded his father under his mother's regency (887), and was nominal emperor from 901 to 905, being deposed and blinded by Berengar I. of Italy.

Louis IV., or III. ('l'Enfant') (893-911), last of the Carolingians, king of Germany from 900.

Louis V., or IV. ('the Bavarian') (1282-1347), elected Holy Rom. emperor with the help of Ghibelines (1314). He was excommunicated (c. 1324) by Pope John XXII., and later opposed by Clement VI. See lives by J. Fischer, 1882, and A. Steinberger, 1901; also R. Moeller, *Ludwig der Bayer und die Kurie im Kampf um das Reich*, 1911.

Louis, or Ludwig (Karl August) (1786-1868), king of Bavaria. He married in 1810 the Princess Theresia of Saxe-Hildburghausen. He succeeded in 1825, and the early part of his reign was very successful. He initiated many reforms, and ruled on the whole for the good of his people. But during the later period he adopted a more or less reactionary policy. His subjects, stimulated by the revolution of 1848, forced him to abdicate.

Louis I.-V., see FRANCE, History.

Louis II. (Otto Frederick Wilhelm), (1845-86), king of Bavaria, grandson of Louis I. of Bavaria, and son of Maximilian II. He succeeded his father in 1864. During the Austro-Prussian war he fought with the Austrians, but went ultimately over to the side of Prussia. He was the proposer of the formation of the Ger. empire in which Bavaria itself was merged. See lives by G. de Pourtales, 1929; W. Richter, 1939; R. Wagner, 1941.

Louis VI. (surnamed 'le Gros') (1078-1137), son of Philip I., with whom he was associated in the gov. from 1100, succeeding him as king of France (1105). He made Sugar, abbot of St. Denis, his chief minister, and did much for the defence of the Church. He also tried to check the power of the feudal lords of the Isle de France, and continually sought to add lands to the royal domains. His wars with Henry I. of England for the possession of Normandy were unsuccessful. See A. Luchaire, *Louis VI. le Gros*, 1889; *Les communes françaises*, 1890; and *Histoire des institutions monarchiques de la France sous les premiers Capétiens*, 1891.

Louis VII., VIII., see FRANCE, History.
Louis IX. (1214-70), king of France, commonly called St. Louis, b. at Poissy. He succeeded his father, Louis VIII., at the age of eleven, and the days of the regency

LOUIS IX. (SAINT LOUIS)

of his mother, Blanche of Castile, were the scene of feudal reaction on the part of the nobility. Having taken over the gov. himself, he defeated an Eng. army of invasion, forcing H. y III. to acknowledge the overlordships of France in Guienne. In 1249 he embarked on his first crusade, but his army was overwhelmed and defeated in Egypt. He had already captured Damietta, but he was himself captured and held to ransom. He proceeded on his release to Acre, and remained in Palestine until 1252, returning

to France on the death of his mother. His internal reforms in France were many; he founded the Sorbonne, and estab. a definite relationship between Rome and France by the Pragmatic Sanction; he set up the Parlement de Paris, and issued also a new code of laws. In 1270 he entered on his second crusade, which was, however, owing to the influence of Charles of Naples, his brother, diverted to N. Africa, and in this same year L. d. at Tunis. He was canonised in 1297. A contemporary, Joinville, gives a good detailed account of many of his actions in *La Vie de St. Louis* (new ed. by M. Roques and L. Halphen, 1932); other lives are by J. Faure, 1865; H. Wallon, 1893; F. Perry, 1901; and M. R. Toynebee, 1930. See also E. J. Davies, *The Invasion of Egypt by Louis IX.*, 1898.

Louis X., see FRANCE, History.

Louis XI. (1123-33), king of France, the eldest son of Charles VIII., b. at Bourges. Owing to his attempts on his father's throne, he was forced into exile in Burgundy, and remained there until his accession in 1461. His attempts to increase the power of the Crown led to a revolt of his feudal vassals. His greatest opponent was Charles the Bold of Burgundy, who compelled him to help put down the revolt in the bn. of Liège; in turn he stirred up the Flemish and Swiss tns. against Charles. Charles was twice defeated, and finally killed in battle against the Swiss. L. claimed Burgundy, but failed to maintain his claim until 1482, when by treaty Burgundy and Artois were ceded to France. He succeeded in consolidating France, and, in addition to the cessions already mentioned, he annexed Provence. His chief advisers were taken from the lower classes, his virtual Prime Minister being the barber Olivier. See P. de Commynes, *Mémoires*, 1649; *Letters*, ed. by J. Vascen and E. Charavay, 1883-1909; and lives by C. Hare, 1907, and P. Champion, 1927.

Louis XII. (1462-1515), son of Charles of Orléans and successor of Charles VIII., b. at Blois. His kindness and lack of severity gained for him the title of the 'father' of his people. Much of his time was spent in campaigns in Italy, where he was successful in overrunning Milan and in helping in the conquest of Naples. In 1513, however, he was finally driven out of Italy, and in the same year suffered defeat at the hands of the emperor and Henry VIII. at the battle of the Spurs. By his marriage to Anne of Brittany he added the last remaining dependent feudal fief to the kingdom of France. See P. Lacroix, *Louis XII. et Anne de Bretagne*, 1882; A. R. de Maulde, *Histoire de Louis XII.*, 1889-93; and J. S. Bridge, *History of France* (vols. III. and IV.), 1929.

Louis XIII. (1601-43), b. at Fontainebleau, son of Henry IV., on whose assassination he succeeded to the throne of France at the age of nine. His mother, Marie de' Medici, acted as regent, and pursued a policy of alliance with the Catholic powers, which led to a revolt of the Huguenots. This was, however, speedily put down. The king, on being

declared of age, continued the Edict of Nantes, and called the last States-General before the eve of the Fr. Revolution. In 1624 Cardinal Richelieu became the virtual Prime Minister and ruler of France. By the capture of La Rochelle in 1628 he finally crushed the Huguenots, although the Edict of Nantes was not revoked. Under the guidance of the cardinal France took an active part in the Thirty Years war, supporting the Protestants against Spain and Austria. See M. Topin *Louis XIII. et Richelieu*, 1876; G. Hanotaux, *Histoire de Richelieu*, 1893-1903; R. de Beauchamp, *Louis XIII. d'après sa correspondance avec Richelieu*, 1902; K. A. Patmore, *Court of Louis XIII.*, 1909; and L. Balas, *Scènes et tableaux du règne de Louis XIII.*, 1935.

Louis XIV. (1638-1715), b. at St. Germain-en-Laye, the son of Louis XIII., whom he succeeded in 1643. His mother, Anne of Austria, became regent, but the chief power lay in the hands of her minister, Mazarin. The policy of the exclusion of the nobility from the chief posts in the gov. led to the rising known as the Fronde, which was brought to an end in 1659. In the following year L. married the Infanta Maria Theresa, and in 1661, on the death of Mazarin, L. began his long period of personal government. The keynote of the whole of his reign was despotism, and his motto, 'L'Etat, c'est moi', typifies the whole of his policy. Under the great minister, Colbert, the finances of the kingdom were reformed, trade was increased, and a strong colonial policy pursued. Under his war minister, Louvois, the armies were reformed, and under his generals, Turenne and Condé, the Fr. Army became the finest fighting machine in Europe. The war of Devolution began on the death of Philip IV. of Spain, L.'s father-in-law. In right of his wife, L. claimed part of the Netherlands. He made himself master of Flanders and the Franche-Comté. The alliance of England, Holland, and Sweden prevented his power from expanding, and in 1668 the treaty of Aix-la-Chapelle led to the surrender of the Franche-Comté. He again entered the Netherlands in 1672, his armies being led by Turenne and Condé. He overran many of the cities of Alsace, and also continued the conquest of the Netherlands. In 1678 the treaty of Nimwegen left him in possession of the Franche-Comté and of many of the fortresses of the Sp. Netherlands. By means of the law courts he succeeded in obtaining many cities on the borders of Germany, amongst them being Strasbourg and Metz. The courts were entirely under his control, and the *lettres de cachet* were a weapon of great efficacy. In 1685 L. married his mistress, Mme de Maintenon, who was entirely under the control of the Jesuits, and who, in turn, influenced L. to such an extent that he revoked the Edict of Nantes. This in reality marked the beginning of the fall of L.'s greatness. In 1688 a Fr. Army invaded the Palatinate, and left William of Orange free to invade England. The war of the League of Augsburg which

followed was terminated by the treaty of Ryswick, which was in reality merely a truce, and caused L. to give up all conquests which he had made since 1678. In 1700 Charles II. of Spain d., leaving the crown of Spain to Philip of Anjou, the second grandson of L. I., in spite of the Second Partition Treaty, accepted the will of the Sp. king. This led to the War of the Sp. Succession, Eng. participation in which being caused also by L.'s recognition of the Old Pretender as James III. The war terminated in the treaty of Utrecht in 1713, and gave Spain to L.'s grandson, but the victories of Marlborough (q.v.) had left France a ruined country.

L.'s reign is supreme in the age of Fr. literature, and was productive of such men as Corneille, Racine, Molière, and Boileau, whilst religion was represented by men of the type of Bossuet and Fénelon. See Voltaire, *Siècle de Louis Quatorze*, 1751; A. Hassall, *Life of Louis XIV.*, 1895; St. Simon, *Mémoires* (Eng. trans.), 1899; E. Lavisse (ed.), *Histoire de France* (vols. vii-viii), 1901; Lord Acton, *The Age of Louis XIV.*, 1902; Sir C. Petrie, *Louis XIV.*, 1940; and I. M. Auloy, *Louis XIV. and the Greatness of France*, 1916.

Louis XV. (1710-74), b. at Versailles, king of France, sometimes, and with little justification, called the 'Bien Aimé'; he was the great-grandson of Louis XIV.,

Austrian Succession the Fr. supported the claim of the elector of Bavaria to the throne of Austria in lieu of Maria Theresa. They were repeatedly successful on land, but their trade and navy were ruined by the Eng. The great duel in India and America between England and France may be said to begin here. The financial state of France, however, was chaotic, and all the money which could be obtained was lavished by L. on his mistresses, especially on Mme du Pompadour and later on Mme du Barry. The country was overtaxed, and was further humiliated by the practical conquest of all the Fr. possessions in India and America during the Seven Years war. The peace of Paris (1763) definitely deprived France of the nucleus of her colonial empire. On L.'s death France was bankrupt and ready for revolution; 'Après moi, la délugé.' See A. de Toqueville, *Histoire philosophique du règne de Louis XV.*, 1847; P. Gaxotte, *Louis XV. and his Times*, 1931; and A. Leroy, *Louis XV.*, 1938 (Eng. trans., 1939).

Louis XVI. (1754-93), king of France, the grandson of Louis XV., b. at Versailles. During the reign of Louis XV. a diplomatic movement, usually known as the Diplomatic Revolution, had taken place; by this Austria and France, hitherto violent enemies, became allies, and in order to strengthen the bands of the alliance, in 1770 L. married the daughter of Maria Theresa, Marie Antoinette. L. succeeded to a bankrupt kingdom (see LOUIS XV.). The state had a national debt of over 4,000,000,000 of livres, and the people paid altogether well over 50 per cent of their income in taxes. The king agreed to many minor reforms, but was prevented by the Church and the nobility from accepting greater reforms urged on by Turgot. Necker succeeded in reforming the finances of the country to a certain extent, but again a proposal to tax the classes who were excluded by privilege led to such violent opposition that Necker resigned. Finally it became apparent that the States-General, which had not met since 1614, would have to be called. The state had by this time stopped all money payments, and Necker had again attempted to put an end to the financial embarrassments. In May 1789 the States-General met, the Third Estate having been called in doubled numbers to obtain equal voting power against the alliance of Church and nobility. The Third Estate speedily took upon themselves the rectifying of grievances and formed themselves into a National Assembly. Proclaiming a new constitution they gained for themselves the title of the Constituent Assembly and the revolution had begun. The king refused to accede to their demands for *liberté, égalité, fraternité*, and retallated by dismissing Necker and calling out the troops, but to little effect. In Oct. Versailles was attacked, and L. and his family were forced to take up residence in Paris. The next two years were spent by the assembly in experimenting with constitutions, and the king and his family, in 1791, got away

LOUIS XV.

Hackitt

whose eldest son and grandson both d. in 1711. L. was just over five years of age when he succeeded, and the country was administered by the king's uncle, Orleans. The age of Orleans was noted for its vice and its profligacy. In 1725 L. married the daughter of Stanislas, the deposed king of Poland. After the death of Orleans his chief minister was Cardinal Fleury. In the War of the Polish Succession France succeeded in establishing the claims of L.'s father-in-law to the Polish throne. During the War of the

to Varennes, only to be brought back as prisoners to Paris.

In 1792 the king's hand was forced, and he was compelled to declare war against Austria. Hostility in Europe was aroused by the republican fervour of the left-wing of the assembly: in Sept. 1792 the republic was proclaimed as a reply to Prussian invasion. In Dec. 1792 the king was brought to trial for treason against the republic, was sentenced to death, and executed on Jan. 21. He was guillotined in 'La Place de la Révolution.' Marie Antoinette soon shared the same fate. See A. de Tocqueville, *L'Ancien Régime*, 1856; J. M. Thompson, *The French Revolution*, 1929; and L. Madelin, *Louis et Marie Antoinette*, 1936; also life by M. de la Faye, 1943.

Louis XVII. (1785-95), b. at Versailles, titular king of France, the second son of Louis XVI., became dauphin on the death of his elder brother in 1789. He was at first imprisoned with his mother, but was later removed to the Temple and placed under the charge of an infamous Jacobin bootmaker named Simon. Many stories are related of the revolting cruelty of his keeper, and also of his alleged escape. It seems now definitely fixed that he d. in 1795. He has been personified most notably by a Prussian named Karl Wilhelm Naundorf, whose resemblance to the Bourbons was striking. This pretender made his way to France in 1833, but was later expelled. See A. Beauchesne, *Louis XVII., sa vie, son agonie, sa mort*, 1884, and D. Jacommet (ed.), *Louis XVII., 48 documents originaux et iconographiques*, 1937.

Louis XVIII. (Stanislas Xavier) (1755-1824), b. at Versailles, king of France, the younger brother of Louis XVI. He claimed the title of king of France after the death of Louis XVII. in 1795. He continued in exile, living in Buckinghamshire in England until Napoleon's first abdication (1814), when he crossed to Calais and assumed the throne of France. L. and his family fled to Ghent during the Hundred Days, and remained there until after Waterloo. For a time he attempted a liberal form of gov., under the influence of Derazes, but Royalist extremism gained the upper hand after the murder of the duc de Berry in 1820. See M. G. Pallain (ed.), *Correspondance inédite de Talleyrand et du roi Louis XVIII. pendant le Congrès de Vienne*, 1881; J. Lucus-Dubreton, *The Restoration and the July Monarchy* (trans.), 1925; and J. François-Primo, *La Vie privée de Louis XVIII.*, 1938. He was succeeded by his brother Charles X.

Louisa Augusta Wilhelmina Amalie (1776-1810), queen of Prussia, a daughter of Karl, duke of Mecklenburg-Strelitz, b. at Hanover, in 1793 married the prince-royal of Prussia, later Frederick William III., and became the mother of Frederick William IV. and William III., afterwards emperor. She endeared herself to her people by her spirit and energy, and particularly distinguished herself during the Napoleonic campaign by her self-denying efforts to obtain concessions at

Tilsit from Napoleon. The Prussian order of Louise was instituted in her honour, and also the Louise foundation for the education of girls. A statue of Queen Louisa was erected in the Tiergarten at Berlin in 1880. See E. Hudson, *Life and Times of Louisa, Queen of Prussia*, 1874; E. Engel, *Königin Luise*, 1876; and lives by Mary Moffat, 1906, and G. Aretz, 1927; also novel by W. von Molo, 1924.

Louis Bonaparte, king of Holland, see BONAPARTE.

Louisburg, tn. in Cape Breton Is., Canada, off the Atlantic coast, commanding the entrance to the gulf of St. Lawrence, 27 m. S.E. of Sydney. It is now little more than a fishing vil., but under the Fr. had a large export trade in cod, and was the strongest fortress in N. America. Taken in 1745 by the troops of Massachusetts under Pepperell and a Brit. squadron under Warren. L. was restored to France in 1748 by the treaty of Aix-la-Chapelle. It was again taken by Amherst in 1758. It possesses a very fine harbour, employed for the winter export of coal. Pop. 1100. See J. G. Bourinot, *Memorials of the Island of Cape Breton*, 1892.

Louis de la Trinité, Father, see D'ARGENT-LIET, THIERRY.

Louis-d'Or, Fr. gold coin first issued by Louis XIII. in 1640, and discontinued in 1795. Its value varied at different times from 10 to 20 francs.

Louise Caroline Alberta, Duchess of Argyll, Princess (1848-1939), b. at Windsor, March 18, fourth daughter of Queen Victoria, and named after her godmother, Louise, queen of the Belgians. She married Lord Lorne, heir to the duke of Argyll, on March 21, 1871. Her sympathies were with all good works; and hospitals, nursing societies, and all agencies of that nature had her patronage. The hospital for limbless sailors and soldiers at Erskine, on the Clyde, bears her name. She was in Canada during part of the term of the marquess of Lorne's governorship; but the over-strict etiquette that hedged the governor-general's court provoked critical and outspoken comment in Canada, the more so as the marquess was a man of simple friendliness and genial ways and the princess's manner was charming and entirely without stiffness. The winter, however, proved too severe for her and she returned to Britain in 1880. As a sculptor she is best known by her statue of Queen Victoria in the gardens opposite Kensington Palace. By far the handsomest of the queen's daughters, the years passed lightly over her, though her health, by no means robust, had suffered in Canada.

Louisiane Archipelago, group of is. at the S.E. extremity of Brit. New Guinea, St. Aignan and South-east being the largest. They are all of a mountainous nature and covered with vegetation, the inhab. being very wild, and partaking of both Malayan and Papuan characteristics. The is. were discovered in 1666, and taken by the Brit. in 1888. Alluvial gold has been found.

Louisiana, known as the Pelican state,

one of the S. central states of U.S.A., bordering the gulf of Mexico, bounded on the N. by Arkansas and Mississippi, on the E. by Mississippi and gulf of Mexico, gulf of Mexico on the S., and Texas on the W., covering an area of 48,523 sq. m., including 3346 sq. m. of inland water. It was admitted to the Amer. Union in 1812. The surface of the state, generally, is not very much above sea level, but there are extensive tracts of undulating ground in the N.W. About a third of the area of the state is occupied by the Mississippi delta. In many places, notably at New Orleans, the riv. is at a considerably higher level than the surrounding land (see MISSISSIPPI). Marsh lands form a large portion of the great delta of the Mississippi and extend W. all along the coast. These marsh lands are the home of muskrat, opossum, skunk, fox, and other fur-bearing animals. Timber is also produced on these marshes, L. being U.S.A.'s third lumber producer. The state has a large number of rivs., creeks, bayous, and lakes, giving it over 4000 m. of navigable waterways. The prin. riv., after the Mississippi, is its great trib., the Red R.; the Sabine forms its W. boundary, the Pearl bounds it on the S.E. The geological formations belong to the Tertiary and Quaternary periods. The climate is semi-tropical and unhealthily in the lowlands, and the soil is exceedingly fertile, except in the extreme N. The chief manufacturing industries of the state are those of petroleum, lumber, rice, cottonseed, sugar, and molasses. Sugar is the most important agric. product; others are rice, cotton, corn, fruit, especially strawberries, and tobacco. There are valuable fisheries. The chief mineral products are rock-salt (the state has three of the largest salt-mines in the world), sulphur, clay beds, petroleum, and natural gas. The cap. is Baton Rouge (pop. 31,700), and other important tns. are New Orleans (494,500), the largest city and one of the chief Amer. seaports; Shreveport (98,100); and Monroe (28,300). There is a state univ. at Baton Rouge and a univ. for coloured students at New Orleans. L. sends two senators and eight representatives to Congress. The four years' (1931-35) governorship of Huey P. Long (q.v.) was a landmark in L. politics. After his assassination (1935) there followed a reactionary period of twelve years in which L. political life reverted to something more normal—the conflict between New Orleans, predominantly Catholic, and the poor and largely Protestant countryside; and the parsimony which replaced Huey Long's enormous expenditure on roads, hospitals, and education. But in the 1948 election, by a huge majority, L. chose Earl Long (for the second time since 1939), brother of Huey, as governor. His programme, if less flamboyantly presented than his brother's doctrine of 'share the wealth,' rests on the same assumptions. In 1949, however, there was much uneasiness over the vast taxation scheme needed to raise the funds for the social welfare projects to which the governor was pledged, but it

appeared that he had complete control over an obedient legislature. Pop. (1940) 2,368,800, of whom 700,000 are coloured.

The old Fr. prov. of L., named by La Salle in honour of Louis XIV., stretched from Manitoba and the Great Lakes to the gulf of Mexico, and from the Brit. colonies in the E., to the Sp. colonies in the W. When France lost Canada L. passed to England and Spain, the Mississippi being the boundary. In 1800 it passed again into Fr. possession, to be sold to the U.S.A. three years later for £3,000,000. See also LOUISIANA PURCHASE; U.S.A.; History. See Johnson, *Highways and Byways of the Mississippi Valley*, 1906; L. Saxon, *Old Louisiana*, 1929; and Federal Writers' Project, *Louisiana: a Guide to the Pelican State*, 1941.

Louis, Joe (real name Joseph Louis Barrow) (b. 1914), Amer. Negro boxer, b. near Lafayette, Alabama, son of a sharecropper and one of eight children. When the father d. from the strain of trying to keep his family on the vegetables of his cotton-patch, the mother married a widower with five children and the combined families moved to Detroit, where the stepfather worked in a car factory and L. went to a trade school and worked in the evenings delivering ice from an ice wagon. He took up boxing for a living at the age of eighteen. Last amateur fight was against Joe Bauer, in Detroit, June 12, 1934. As a professional his first fights were against Hans Birke and Lee Ramage, whom he beat. After beating Ramage for the second time the papers nicknamed him 'Brown Bomber.' A New York promoter then fixed up a fight with ex-heavyweight champion Primo Carnera, whom he defeated in the seventh round, and for which he received \$60,000 (June 1935). After the Carnera fight he knocked out (1935) Max Baer, who had just lost the heavyweight title to Jimmy Braddock. In June 1936 he was defeated by Max Schmeling in the twelfth round—the worst night he ever had. In Aug. he knocked out Jack Sharkey in the third round, and in Sept. Al Ettore in the fifth round. On June 22, 1937, he knocked out Jimmy Braddock (eleventh round), thereby winning the world's heavyweight championship. Then came the return match with Schmeling whom he knocked out in the opening round. He held the title until 1948, retiring undefeated from the ring in the same year. He served in the U.S. Army 1942-45.

Louis Philippe (1773-1850), king of the Fr., b. in Paris. The eldest son of the duke of Orleans, together with whom, at the time of the Fr. revolution, he gave up his title and assumed the name of Egalité. During the early Revolutionary campaigns he fought for the republic, but finally fell under suspicion and was threatened with arrest. He fled to Austria, and did not again enter France until the Restoration. He was a teacher in Switzerland, visited the U.S.A., and finally, about the beginning of the nineteenth century, settled at Twickenham. He married, in 1809, the daughter of Ferdinand, king of the Two Sicilies, and returned to France in 1815.

He became exceedingly popular in Paris, and after the revolution of 1830 was elected king, having first taken the title of lieutenant-governor. The power of the king was great, but nevertheless the reforming party gradually increased, and the Bonapartists protested that the national honour was being degraded by a pacific foreign policy. Twice Louis Napoleon entered France as a pretender, but with no success. Attempts were finally made to stamp out the reforming party, which precipitated the revolution of 1848. The Paris mob rose, and, aided by the complicity of the army and the police, were successful in compelling the king to abdicate, although he for his part promised redress, and dismissed his Prime Minister, Calrot. He fled to England, where two years later he d. at Claremont,

LOUIS PHILIPPE

Surrex. His *Discours, allocutions, réponses* were pub. in 17 vols (1833-17), and *Mon Journal événement de 1815* in 1845. See lives by P. de la Gorce, 1931, and J. Lucas-Dubreton, 1939.

Louisville, city in Jefferson co., Kentucky, U.S.A., on the l. b. of the Ohio, 130 m. S.W. of Cincinnati. It is connected with New Albany and Jeffersonville by three fine bridges, and is an important riv. port. It is one of the greatest manufacturing cities of the S., and as a leaf-tobacco market leads the world. It has manufs. of plumbing supplies, meat packing, flour mills, grain products, and lumber. Its chief buildings are the custom-house, court-house, city hall, and univ. Pop. 319,100.

Loulé, fortified tn. of Algarve, Portugal, 6 m. N. of Faro. It has copper and silver mines, and the prin. industries are basket-making, leather goods, and porcelain. Pop. 23,700.

Louping ill, or **Sheep Stagers**, common disease of sheep in Scotland and Northumberland, appearing in spring. The symptoms are a staggering jerky gait, staring eyes, followed by convulsions, paralysis, and death. The application of

half a ton of crushed salt per acre to pastures has greatly reduced the losses by the disease.

Lourdes, tn. in dept. of Hautes-Pyrénées, S.W. France, at the foot of the Pyrenees, on the r. b. of the Gave de Pau, 80 m. S.E. of Bayonne. It is divided into an old and a new tn., united by a bridge, leading to the church of the Rosary and the Grotto, with its spring of healing water with which the present fame of L. is associated. Here in 1858 the Blessed Virgin is believed to have appeared to a peasant girl, Bernadette Soubirou, prophesying the future fame of L. The celebrated spring is credited with miraculous powers of healing, a permanent medical bureau examining alleged cures, comparatively few of which are certified as completely miraculous. Nevertheless many remarkable cases have occurred where a cure has been declared inexplicable on any natural reasoning, and in 1889 a church was built for the accommodation of pilgrims, about 500,000 of whom visit the place every year. The chief of the pilgrimages, known as the national pilgrimage, takes place in Aug. L. has marble and slate quarries. Pop. 8790. See D. Barbé, *Lourdes Yesterday, To-day, To-morrow*, 1893 (Eng. trans. by Alice Meynell); T. Oxenham, *The Wonder of Lourdes*, 1924; and novels by E. Zola, 1894, and F. Werfel, 1941.

Lourenço, or **Lorenzo Marques**: 1. Dist. in the S. of Portuguese E. Africa. It is traversed by the Rs. Lunde and Limpopo, and is divided into five sub dists., the gold-bearing ter. of Manica being one. 2. Cap. of the L. dist. Portuguese E. Africa, in the N.W. of Delagoa Bay. It is the terminus of the Delagoa Bay railway penetrating to Pretoria. The total length of railroad from Lobito to L. is 329½ m. L. was founded as a factory by the Portuguese in 1541. As late as 1875 what little there was of the tn. was built on a narrow spit of sand 1 m. long and ¼ m. wide and surrounded by marshes. It was the construction of the line to the Transvaal that made the harbour known and did so much to bring prosperity to L. Besides its good harbour the tn. has many fine buildings, and a goldfield was proclaimed in the dist. in 1890. It is Johannesburg's nearest outlet to the sea and has many visitors. Its pavements are laid in elaborate mosaic patterns; the Praça Sete de Março ('Band Square'), the market square, has a bandstand and casinos, there is bathing at the Polana beach near the Polana Hotel which cost nearly £500,000. In the city close to the Avenida Aguilar are the Vazco da Gama Gardens and on the Polana side of the gardens is the National Museum, the exhibits of which exemplify the hist. and wild life of Portuguese E. Africa. About 25 m. out of the city is Marracuene, a riv. resort, where hippopotami may be seen at play, and 25 m. further inland is the upland resort of Namacha, a place of medicinal springs called 'the sanatorium of L.'; it is situated at the junction of the Portuguese E. African, Swaziland, and Transvaal borders. Pop. 38,000.

Lousewort, see PFDICULARIS.

Louth: 1. Tn in the Lindsey div. of Lincolnshire, England, on the R. Lud, 16 m. S.E. of Grimsby. There are fine buildings and the ruins of a Cistercian abbey at L. Park. Agric. implements are manufactured, and there are also iron foundries, breweries, brick-fields, etc. It communicates with the Humber by means of the L. Canal (1763). Pop. 17,100. 2. maritime co. of Eire in the prov. of Leinster, bounded E. by the Irish Sea. The surface generally is low and undulating, with a high mt. range in the N.E., bordering Carlingford Lough. On the

Liège the prin. line of the Belgian defence was centred at L. and after L. fell the Belgians were driven back on Antwerp and Malines. The greater part of the city of L., including the church of St. Peter, the law court, the theatre, the Academy for Fine Arts and the anc. halls, with the famous univ. library, was then raved by the Gers on the pretext that the civilian pop. had joined in an attack on the Ger. occupying troops. This vandalism, however, reacted severely on Ger. prestige, and by the treaty of Versailles Germany undertook to deliver MSS. and prints equivalent in value to those destroyed at

D. McLeish

THE (10170) AT LOUTH

coast are the watering places of Carlingford and Greencore with Dundalk forming the bay of that name. The chief towns are the Fane, Lagan, Glide and L., with the Boyne forming part of the S. boundary. Agriculture is the chief occupation, but there are also linen factories and deep-sea and salmon fisheries. It is rich in anc. buildings and remains. The tn. of L. from which it takes its name has now passed into decay, and contains some fine ruins. Area 317 sq. m. Pop. 66,100.

Louvain (Flem. Leuven; Ger. Löwen), city in the prov. of Brabant, Belgium, 16 m. E. by N. of Brussels, on the Dyle. Among its numerous historical buildings are the tn. hall (1448-99), one of the finest examples of the Gothic style in N.W. Europe. The univ. of L. was founded in 1425 and was designated as the Cathol. Univ. in 1835. The beginning of the First World War was the most tragical episode in L.'s hist. It was sacked by the Gers. on Aug. 25, 1914. After the fall of

L. in 1910 the library, rebuilt with the help of the Amer. people in 1928, and containing over 900,000 vols., was again destroyed by the Gers. L. suffered much from bombing before its liberation by a Brit. armoured column in Sept. 1945. It is an important market place, and road and railway junction. There is agriculture and floriculture, and breweries, iron foundries, and manufs. of machinery, radio sets, chemicals, and tinned vegetables. Pop. 36,000. See L. van der Ksaen, *L'Université de Louvain*, 1927, and H. van der Linden, *Geschiedenis van Leuven*, 1936.

L'Ouverture, Pierre Dominique Toussaint, see TOUSSAINT.

Louvière, L., see LA LOUVIÈRE.

Louviers, tn. in dept. of Eure, France, 17 m. S. of Rouen, one of the prin. centres of Fr. woollen mfgs. Pop. 10,300.

Louvois, François Michel Le Tellier, Marquis de (1641-91), Fr. statesman and war minister under Louis XIV., b. in Paris. Turenne perceived his talents in

the war of Devolution, and after the peace of Aix-la-Chapelle he was set to reorganise the Fr. Army. He founded the military orders of merit, the *Hôtel des Invalides*, and the Fr. standing army. The efficiency of his instrument was demonstrated in the war of 1672. Until 1690 L. was a chief statesman of France. See C. Rousset, *Histoire de Louvois*, 1872; and L. André, *Michel Le Tellier et Louvois*, 1942.

Louvre, The, greatest of the modern palaces of Paris, forming a square of 576 ft. by 538 ft., was connected with the palace of the Tuilleries by a great picture gallery overlooking the Seine and 1156 ft. long. Between the two palaces lay the *Place du Carrousel*, and Napoleon III. further connected the two palaces on the N. side, making them into one vast palace. The L. is erected on the site of an old thirteenth-century chateau; the first part of the modern structure, the S.W. wing, was built, after the designs of Pierre Lescaut, in 1511, while the main portion of the square was built by Louis XIV. after the design of Claude Perrault. After the building of the Tuilleries the L. proper became a series of great galleries filled with pictures, sculpture, Egyptian, Greek, and Roman antiquities. The fire originated by the Communards in 1871, which destroyed the Tuilleries, only burnt the corner of the L. which contained the library.

The 'Grande Galerie' of the L., re-decorated and rehung, was officially opened again on Oct. 6, 1947. It had been closed and empty since the outbreak of war. The 'Grande Galerie' contains the Renaissance painters and their successors down to the eighteenth-century Venetians: Leonardo da Vinci, Raphael, Andrea del Sarto, Titian, Tintoretto, Mantegna, Canaletto, and Guardi. Near the end of the gallery are the paintings of the Sp. school: Velasquez, Murillo, and Goya. As before the war the centre of the gallery is reserved for the special masterpieces, 'Joan of Aragon' and 'Baltasar Castiglione' by Raphael, 'Francis I.' by Titian and Leonardo's 'Mona Lisa.' Cimabue's 'Virgin with the Angels' first meets the visitor at the top of the stairs. In the 'Seven Metres Hall' are the L. primitives and the artists of the early Renaissance, including Botticelli and Ghirlandajo. See also *Paint.*

Lovat, Simon Fraser, twelfth Lord (c. 1667-1717), Scottish Jacobite. Though professing loyalty to the Stuarts, one of his first acts on leaving college was to raise 300 men from his clan to form part of a regiment in the service of William and Mary. In 1690 he was declared guilty of treason and fled to France. In 1702 he was at the court of St. Germain, and one of his first steps towards gaining influence in France was to announce his conversion to the Catholic faith. In 1713, at the request of his clan, he returned home, and though arrested in London (1714) he was liberated, and, by siding with the gov., obtained a full pardon. In the rebellion of 1745 he made false profession of fidelity to the gov., and after the battle of Culloden was forced to retreat to the High-

lands. He was finally arrested on an is. in Loch Morar, and was tried and executed in his eightieth year, on Tower Hill, March 1717. One of his greatest private outrages was the rape and forced marriage of the widow of the tenth Lord L., with the view of securing his own succession to the estates. See *Memoirs of Lord Lovat*, 1716 and 1767; J. H. Burton, *Life of Simon, Lord Lovat*, 1847; Katherine Thomson, *Memoirs of the Jacobites*, 1845-46; and A. Mackenzie, *History of the Frasers of Lovat*, 1896.

Lovat, Simon Joseph Fraser (1871-1933), sixteenth Baron, succeeded to the barony in 1887. He served in S. Africa in the early stages of the Boer war, and raised a corps, designated 'L.'s Scouts,' with himself in command. On returning from Africa he raised two yeomanry regiments, which formed part of the Highland Mounted Brigade. L.'s Scouts were incorporated in the Scottish Horse. L. served in France and Gallipoli during the First World War.

Love. In its most common use the term denotes a concentration of tender feeling upon one particular person, most commonly the affection existing between parent and child, and that affection between two persons of opposite sex which forms the normal basis of marriage. It manifests itself in a desire for the welfare of the beloved object, in a longing for his presence and delight in his approval, and sorrow at parting. The term is less often used for the animal instinct between the sexes and its gratification, with its analogues in the lower animal world. No word has so little preciseness of meaning and so great an elasticity of definition. Leibniz's definition that to L. is 'to be carried away to take pleasure in the well-being or happiness of the loved being,' restricts the emotion to protecting L. Socrates distinguishes between heavenly and vulgar L., and utterly condemns the latter, and Plato follows in his steps. Platonic L. is the affection between two persons of opposite sex that is free from all sexual desire, that is a striving after the infinite and a lowly adoration of perfect beauty. Aristotle, searching after the psychological basis of the emotions, found in L. not a metaphysical principle, an aspiration after perfect beauty, but a natural physical bond between the sexes designed for the procreation of children. The Christian ideal makes L. to man, or charity, the unvarying method of manifesting L. to God. In the supreme synthesis of the beloved disciple (God is L. (1. John iv. 8). See J. Michelet, *L'Affranchissement moral par le véritable amour*, 1858; A. Bain, *The Emotions and the Will*, 1859; C. Darwin, *Descent of Man*, 1871; H. Drummond, *The Greatest Thing in the World*, 1890; H. Krafft-Ebing, *Psychopathia Sexualis* (Eng. trans., 1899); O. Pfister, *Love in Children*, 1924; A. Nyrgen, *Agape and Eros: Christian Idea of Love*, 1932; I. D. Suttie, *Origin of Love and Hate*, 1935; and E. Brunner, *Eros und Liebe*, 1937.

Love Apple, see *APPLE*, *LOVE*.

Love Bird, popular name of various

small parrots of the genus *Agapornis* (separated from *Psittacula* by Jardine and others) of the family *Psittacidae*. They are so named from the affection the male displays towards the female whether caged or wild. The African short-tailed rosy-faced L. B., which is about 6½ in. long, is a favourite cage-bird and among the hardiest of the genus. Other varieties are the Melanesian pygmy parrots and *Micropsittacus undulatus*, a long-tailed grass-parrot once much used for fortune-telling, and known as the Australian budgerigar (*g.v.*).

Lovedale, educational institution and mission station in Cape Prov., 30 m. N.W. of King William's Town. Founded in 1841 by Scottish missionaries for the training of teachers for native schools.

Love-in-a-Mist, popular name of a genus (*Nigella*) of flowering plants of the natural order Ranunculaceae, bearing blue or white blossoms surrounded by feathery leafy bracts. The most popular species are *N. damascena*, bearing dark blue flowers, *N. d. Miss Jekyll* (pale blue or white flowers), and *N. hispanica* (dark blue).

Love-in-Idleness, see **PANSY**.

Lovelace, Richard (1618-58), Eng. lyrical poet, b. at Woolw. in Kent. He spent his fortune in support of the royal cause, and though he could have shone at court, preferred warfare. In 1645 he took up arms on the king's behalf, fought for France against Spain, and on returning to England in 1648 was imprisoned till the king's death, thus obtaining leisure for verse-making. During his imprisonment he wrote the song by which he is best remembered, *To Althea in Prison*, and collected and revised for the press a vol. of occasional poems. In 1649 they were pub. under the title of *Lucasta*. He also wrote, when quite a young man, a comedy and a tragedy, entitled respectively *The Scholar* and *The Soldier*. The last ten years of his life were passed in obscurity. A vol. of his *Posthumous Poems* was pub. in 1659 by his brother, and the best complete modern text appears in Everyman's Library in *Minor Poets of the XVIIth Century*. See C. H. Hartmann, *The Cavalier Spirit, and its Influence on the Life and Work of Richard Lovelace*, 1925.

Love-Lies-Bleeding, see **AMARANT**.

Lover, Samuel (1797-1868), Irish novelist and poet, achieved fame in 1826 with the well-known ballad of *Rory O'More*, which was, and is still, very popular. His best novel is the farcical *Handy Andy* (1842) which achieved a great success, and this almost alone of his works of fiction is still read, but now principally by boys. *Rory O'More*, *A National Romance* (1837), and *Treasure Trove* (1844) being almost entirely forgotten. He wrote many songs and sev. plays, and one of the worst vols. of parodies ever issued, *Rival Rhymes in Honour of Burns* (1859). See lives by W. B. Bernard, 1874, and A. J. Synnington, 1880.

Lovosice (Ger. Lobositz), tn. in Bohemia, Czechoslovakia, on the Elbe, 40 m. N.W. of Prague. It is the site of the defeat of the Austrians by Frederick the

Great in 1756. It has an important fruit trade. Pop. 5000.

Low, Archibald Montgomery (b. 1888), Brit. physicist, educated at St. Paul's School, Skerry's College, Glasgow; Central Technical College, S. Kensington; and the Imperial College of Science and Technology, London. He was honorary assistant prof. of physics at the R.A. college, 1919-1922. His numerous inventions include system of radio signalling, a television system (1914), electrical rocket control (1917), a coal fuel engine, radio torpedo control gear, vibrometer and audiometer. President of the British Institute of Engineering Technology and of the Institute of Patentees, his numerous scientific pubs. include works on inventions and experimentation.

Low, David (b. 1891), Brit. caricaturist, b. at Dunedin, New Zealand; third son of David Brown L. Educated at the Boys' High School, Christchurch, New Zealand, his first drawing was pub. in the *Christchurch Spectator*, 1902. He worked for various New Zealand papers till 1911, when he joined the staff of *Bulletin*, Sydney, New S. Wales. He came to London, 1919, at the invitation of the *Star*, on the suggestion, it is said, of the late Arnold Bennett, and became as celebrated for his portraits of Lloyd George as was Sir F. C. Gould for his pictures of Joseph Chamberlain. He left the *Star* for the *Evening Standard* in 1927, in which newspaper his cartoons have since appeared, as well as being syndicated in the *Manchester Guardian* and other prov. papers. L.'s work is remarkably free from the conventional devices of the professional cartoonist. Thus, in the 300 cartoons included in his *Years of Wrath* there are, no doubt, sev. personified statues of Liberty, and, as the war progressed an increasing number of skeletons, but his pictorial invention is so great that he avoids the smaller suggestion of staleness. In the world of L. 'creation' his most noted stock character Col. Blimp appears far oftener than does John Bull; and furthermore L. is no jingo, his appeals to national sentiment being founded unerringly on an understanding of the popular mind. As an artist he is superior to most cartoonists, with an unrivalled gift for lifting off a comic and unmistakable likeness, and the prin. political figures of 1932-45, from Churchill, Baldwin, and Chamberlain to Mussolini, Hitler, and Goering, are portrayed with rare genius. He has pub. collections of his cartoons as *The New Rake's Progress* (1931); *Political Parade* (1936); *Cartoon History of Our Times* (1939); *Bristol Cartoonists* (1942); and *Years of Wrath* (1949).

Low, Sir Sidney James Mark (1857-1932), Eng. historical writer and journalist; b. at Blackheath and educated at King's College School and Balliol College, Oxford. Editor, *St James's Gazette*, 1888-97, he was elected to Bar, Inner Temple, 1892. Joint editor, *Dictionary of English History* (1896, revised 1929), he was formerly lecturer on constitutional hist. at King's College, London. Pubs. include *The Governance of England* (1904,

revised 1914); *Political History of the Reign of Queen Victoria* (1907); *De Quincey* (1911); *Egypt in Transition* (1914); *The British Constitution* (1928); and *Indian States and Princes* (1929).

Low Church, movement developed, in the eighteenth-century evangelical revival, within the Anglican Church and occasioned by John Wesley's contemporary Methodist movement. See also EVANGELICAL.

Low Countries, region of N. Europe, comprising Belgium and the Netherlands.

Lowe, Sir Hudson (1769-1844), Brit. general, b. at Galway. He entered the army in 1787, and in 1793, after the outbreak of the war with France, saw active service in Corsica, Gibraltar, Minorca, and Egypt. In 1812 he returned to England, and three years later was appointed custodian of Napoleon and governor of St. Helena, a post which he retained till Napoleon's death in 1821. From 1825 to 1830 he commanded the forces in Ceylon. See W. Forsyth, *History of the Captivity of Napoleon at St. Helena*, 1853; Lord Rosebery, *Napoleon, the Last Phase*, 1900; R. C. Seston, *Napoleon's Captivity in Relation to Sir Hudson Lowe*, 1903; and Dornier Creston, *In Search of Two Characters*, 1945.

Lowe, Robert, see SHERBROOKE, VISCOUNT.

Lowell, Abbott Lawrence (1857-1943), Amer. historian, b. in Boston. From 1880 to 1897 he practised as a barrister. In 1896 his *Government and Parties in Continental Europe* attracted wide notice. In 1897 he was appointed lecturer, and in 1900 prof. of the science of gov., at Harvard; in 1909 he became president. His influence was strongly felt in the educational world of America, and more modern methods of education were pursued at Harvard. Other pub. include *The Government of England* (1908); *Public Opinion and Popular Government* (1913); *Public Opinion in War and Peace* (1923); *Conflicts of Principle* (1932); *At War with Academic Traditions* (1934); and *What a College President has Learned* (1938).

Lowell, Amy (1874-1925), Amer. authoress, b. at Brookline, Massachusetts. Daughter of a well-to-do New England family, she studied in private schools and then travelled abroad. An intense student of Fr. poetry, after 1902 she devoted herself almost continuously to the writing of verse. She was the real leader of the Imagist school of poetry, and was one of those who fought in America the battle for free verse. Her best book of poetry is probably *Sword Blades and Poppy Seeds*, which appeared in 1914. She also wrote an illuminating series of essays on some of the Fr. poets, illustrated by her own versions of their verse, a book on the life and work of John Keats, and *Tendencies in Modern American Poetry* (1917). *Selected Poems*, ed. J. L. Lowes, was pub. in 1923.

Lowell, James Russell (1819-91), Amer. poet, essayist, and diplomat, b. at Cambridge, Massachusetts, son of the Rev. Charles L. He was admitted to the Bar, but took little interest in his profession,

and frequently contributed poems and prose articles to various magazines. He was attracted to the steady pursuit of literature largely through the influence of Maria White, a poetess of delicate power, to whom he became betrothed in 1840. The outcome of this was a vol. of poems entitled *A Year's Life*. Three years later he pub. a collection of his poems and *Conversations on some of the Old Poets*. He married in 1845, and went to Philadelphia for a time, where he became editor of the *Pennsylvania Freeman*, a fortnightly jour. devoted to the anti-slavery cause. In 1848 he pub. a further ed. of his poems with some new ones added, including 'To the Dandelion,' 'The Changeling,' 'A Fable for Critics,' 'The Vision of Sir Launfal,' a romantic story suggested by the Arthurian legends and one of his best known poems, and 'The Biglow Papers,' a reprint of dialect poems furnished to the newspapers of the day, satires of an effective nature, which attracted a great deal of attention.

In 1851 L. sailed for Europe, with his wife, whose health was failing, and spent a year, chiefly in Italy, in study and travel. Mrs. L. d. in 1853. Two years later L. became prof. of modern languages and literature at Harvard, and spent a couple of years in Europe to prepare himself more fully, being appointed to the chair at Harvard in 1857. In this year he married Miss Frances Dunlap. From this time till 1862 he was editor of the *Atlantic Monthly*. He was Amer. minister in London from 1880 to 1885.

His essays are marked by great literary refinement. *Presidential Travels*, *My Study Windows*, *Among My Books*, etc., all have descriptive and critical articles of permanent value and charm. *Latest Literary Essays* appeared in 1862. See lives by H. E. Soudier, 1901; F. Greenwood, 1905; and L. S. Livingston (with bibliography), 1914. See also W. H. Hudson, *Lowell and his Poetry*, 1912; J. J. Reilly, *Lowell as a Critic*, 1915; and *New Letters*, ed. by M. A. de W. Howe, 1934.

Lowell, city of Massachusetts, U.S.A., on the Merrimack R., 26 m. N.N.W. of Boston. The riv. falls afford great hydraulic power. There are a number of cotton and woollen factories and manufs. of leather, paper, and iron goods. It has large machine shops, munition factories, and carpet factories. The chief institutions are a public library, textile school, state normal school, and Roger Hall school. Pop. 101,300.

Lowen, see LOUVAIN.

Löwenheid, see LÖWENHOLD.

Lowensjærn, Johann Kunkel von, see KUNKEL.

Lower Austria, prov. of Austria, lying in the W. of the country. Area 7100 sq. m. Pop. 1,253,600.

Lower Horton, see GRAND PRÉ.

Lower Hutt, fifth largest city in New Zealand. It is situated in Hutt valley, 9 m. N.E. of the cap. city of Wellington in N. Is. Pop. 42,000.

Lower Merion, tw. in Montgomery co., Pennsylvania, U.S.A., close to Philadelphia. Pop. 39,600.

Lower Saxony, see **SAXONY, LOWER**.

Lowestoft, seaport, holiday resort, and municipal bor. of Suffolk, England, 118 m. N.W. of London. It is situated at the mouth of the R. Waveney, which here debouches into Oulton Broad, and the salt lake and inner harbour of Lake Lothing. A lock at Oulton Broad prevents the salt water of the sea from contaminating the fresh water of the broad, which is the southernmost of the Norfolk broad system of inland waters. The name *l.* appears in Domesday Book as *Lothwistloft*, but the derivation of the name has occasioned much speculation, especially as the alternatives *Leyloft*, *Leatloft*, and *Lowistloft* are found; but it is generally assumed that the name derives from *loth*, a slow-moving riv., and *loft*, a cluster of houses. Some, however, infer a connection with Dan. *Lothbrog* or *Lodbrog*, a legendary Dane who was said to have been driven ashore in E. Anglia and subsequently put to death by Edmund, king of E. Anglia, in retaliation for which outrage the Danes invaded the country, slew Edmund, and settled in 'Lothingland.' The older part of *l.* is built on a hill overlooking the sea, the more modern part being further S., where are to be found fine esplanades, two piers, and hotels. The *tn.* has some good modern schools, a large general hospital, and many industrial undertakings connected with shipbuilding, engineering, railway maintenance, food-canning, and electrical work. In the First World War the *tn.* was bombarded by Ger. warships, April 25, 1916. It suffered most severely during the Second World War, immense damage to shopping and housing areas, being occasioned by the 'hit-and-run' raids of the earlier years of the war. As a large naval base and headquarters of the mine-sweeping service *l.* was almost entirely controlled by service personnel during the Second World War. As a fishing port *l.* is among the first three or four in the country, and is especially noted for sole, cod, turbot, and plaice, and, in the autumn season, for herring. As a holiday resort *l.* is famous for its bracing air, which is particularly suitable for convalescents. The estimated pop. in 1918 was 13,666.

Loweswater, one of the Eng. lakes, 1 m. long, $\frac{1}{2}$ m. broad, 429 ft. above sea level, and 60 ft. deep, with trout, pike, and perch. The vil. of the same name is in the Park Beck, which drains the lake into Grummock Water. St. Riman's (Ninian's) Well is in Fang's Brow. The lake is owned by the National Trust.

Lowicz, *tn.* in Poland, 48 m. W.S.W. of Warsaw. Pop. (1939) 15,000.

Lowland, general term in physical geography for any broad expanse of land with a low level not rising more than 600 to 1000 ft. above the sea. The term is applied to a region of depression in the interior of a mountainous region, or in fact to any region that presents a contrast to a highland, such as the *ls.* of Scotland. The area of *ls.* is about 15,600,000 sq. m., or nearly three-tenths of the total land surface, and they prob-

ably support at least six-tenths of the inhab. of the world. They present every variety of vegetation, and where climate and drainage permit are easy to exploit and traverse. There is 55 per cent of *l.* in Europe, 36 per cent in Australia, and only about 15 per cent in Africa, mainly in the N. and W. of the Sahara.

Low Latin, properly the Lat. of the Middle Ages, but more often used in a general sense for the Lat. spoken and written after the fall of the Rom. Empire as well. Deterioration in the form of the language had begun even in Cicero's time, but it rapidly grew from bad to worse until the different divs. of the empire formed distinct varieties, finally developing into the modern Romance tongues.

Lowndes, Mrs. Marie Adelaide Belloc, see **BELLOC LOWNDSES**.

Lowndes, William Thomas (c. 1798-1843), Eng. bibliographer, to whom we owe *The Bibliographer's Manual of English Literature*, the first systematic work of the kind (2nd ed. 1857-64), and *The British Librarian* (1839), designed to supplement his early manual, but uncompleted.

Low Sunday, first Sunday after Easter, so called because it ends the octave of the Easter festival, some parts of the solemnity of which in great part were repeated on this day, thus celebrating it as a festival itself, though of a lesser order than that of Easter-tide. Probably 'Low' is a corruption of 'Laudes,' the first words of the sequence of the day being 'Laudes Salvatori,' thus naturally 'Laudes Sunday' corrupted into 'L.S.'

Low Temperature Carbonisation, see **CARBONISATION (Low Temp.)**.

Lowth, Robert (1710-87), Eng. divine and orientalist, *b.* at Winchester. In 1741 he became prof. of poetry at Oxford and in 1750 was appointed to the archdeaconry of Winchester. He pub. his *Life of William Wycham* in 1758 and *A Short Introduction to English Grammar* in 1762. He was consecrated bishop of St. Davids in 1766, soon afterwards being transferred to Oxford, and in 1777 becoming bishop of London. *l.* was one of the first to treat the Bible poetry as literature, and in 1778 wrote *Isaiah*, a new Translation, with a Preliminary Dissertation, and Notes, Critical, Philological, and Explanatory. See *Life and Writings of Bishop Lowth* (1787) and an ed. of his *Popular Works* (1843).

Lowther, James William, see **ULLSWATER, VISCOUNT**.

Loxa (Spain), see **LOJA**.

Loxia, see **CROSS-BILL**.

Loyalists, United Empire, name applied to those who remained loyal to the Brit. Gov. at the time of the revolutionary war in America. They migrated to Canada after the U.S.A. had secured independence, and formed the greater part of the pop. of Ontario and New Brunswick, which they founded. See C. Van Tyne, *The Loyalists in the American Revolution*, 1902.

Loyal Regiment (North Lancashire), The, formerly 47th and 81st Regiments, linked in 1881 to form the present

regiment. The 47th was raised in 1740, and its first service was in Scotland in the 1745 rebellion. It then took part in Wolfe's campaign against Quebec and later served in America under Gen Burgoyne. In 1783 it received the title 'The Lancashire Regiment'. In 1813 it joined Wellington's army in the Peninsula, later serving in the Burmese war (1824-26) and the Crimea. The 81st was raised in 1793 as the Royal Lincoln Volunteers. It served in the 1800 Kaffir war, then at Malda (1806). A battalion was with Moore during the retreat to Corunna, and with Wellington in the Peninsula and at Waterloo. It was in India and Afghanistan in 1878-79. The linked regiment gained further honours at the defence of Kimberley during the S. African war, 1899-1902. During the First World War it raised twenty-one battalions, which served in France, Flanders, Macedonia, Gallipoli, Egypt, Palestine, Mesopotamia, and E. Africa. In the Second World War the Loyals were part of the Eighth Army (1941) and fought in many of the battles on the front. Other units of the regiment fought against the Jap invaders of Brit. Malaya in 1941 and were conspicuous in the battle of Gemas (1942).

Loyalty Islands, group of is. in the Pacific, 60 m E of New Caledonia, consisting of three large is., viz. Lifu, Maré and Uea, and sev. smaller is., having a total area of about 800 sq. m. They are an administrative dependency of New Caledonia and have belonged to France since 1864. The chief product is coconuts and the chief export copra. The climate is healthy. Pop. about 18,000.

Lloyd, Samuel Jones, see **OVERSTON BARON**.

Loyola, Ignatius de (Inigo Lopez de Ricalde) (1491-1556) founder of the Society of Jesus was the thirteenth and youngest son of a Spanish nobleman and was born at the castle of Loyola in the Basque prov. of Guipuzcoa. After serving as a page at the court of Ferdinand and Isabella, he embraced a soldier's career, which, however, he was obliged to renounce in 1521, owing to a wound received at the siege of Pampluna. The accident made him lame for life. It was during the wearisome convalescence that his nature underwent one of those curious metamorphoses which affected Francis of Assisi and to a certain extent Tolstoy. In the army he had been distinguished for his courage and force of character, but on the other hand he had freely gambled and amused himself with women. When his sickness left him the ardour of his nature was unimpaired only by the highest religious aspirations, and after a period of mental unrest, during which he practised fasting, scourging, and other austerities and was a victim to a host of morbid sentiments, he eventually found his way as a pilgrim to Jerusalem (1523). This journey was followed by years of patient study at Alcalá, Salamanca, and from 1528 at Paris. In 1534 a band of seven students among them Francis Xavier, Pierre Lejeune (Faber), Diego Laynez and Simon Rodriguez, gathered together under the

leadership of L., in the church of St. Mary on Montmartre and having taken the vows of chastity and poverty, swore either to prosecute a ministry in the Holy Land or to serve the pope where he directed. In 1537 Ignatius was ordained priest at Venice, in 1540 he obtained the sanction of Pope Paul III. for his Society of Jesus and the following year he was chosen its first general, an office he held till his death although again and again he expressed his longing for a life of solitude and prayer. His face is a key to his character, the lofty forehead suggests that intellectual grip which enabled him to frame his *Constitutiones* and those *Constitutions* which

IGNATIUS DE LOYOLA

Painting after a picture by Rubens

in the third day the basis of the organisation of his society (see **JESUIT**). He was canonised in 1622, and his day is July 31. See **ALIX** (ed.), *Ignatius Testament* (1900) and **J. Brodick**, *The Origin of the Jesuits* (1910).

Lovson, Charles, see **HYACINTHE PIRE LOZERS**, dept of France formerly part of the old prov. of Linguado. The surface is exceedingly mountainous and is traversed by the Cevennes and other ranges. A peak of the former attains an elevation of 7600 ft. On the mt. slopes, looking towards the Rhone valley, cattle and sheep are reared and the olive, vine, and mulberry are cultivated. The rearing of silkworms and the manu. of cheese are important industries, and chestnuts are one of the leading products. The mineral wealth consists of lead, silver, copper, and antimony. Marble, granite, and slate are quarried. It has two arrons., Mende and Florac, and Mende is the cap. of the dept. Area 1986 sq. m. Pop. 90,500.

Luang-Prabang, cap. of the kingdom of Laos, Indo-China, on the l. b. of the

Mekong, situated in the midst of a forest of palm-trees, and surrounded by mts. Pop. 10,000.

Luban (Ger. *Lauban*), tn. in Silesia, Poland, 15 m. E. of Zgorzelec (Gorlitz). It is a centre for the linen industry, and has ceramic works and railway shops. Pop. 18,400.

Lubao, pueblo of Luzon, Philippine Is., 5 m. S.W. of Bacolor, situated in a rice and sugar dist. Pop. 21,000.

Lübben, tn. of Brandenburg, Germany, 47 m. S.E. of Potsdam, on the Spree. Pop. 7,000.

Lubbock, Sir John, see *AVLBURY*, BARON.

Lübeck, former Ger. republic, now in Schleswig-Holstein. The prov. of L. lying to the N. was part of the grand duchy or republic of Oldenburg. The state lay in the lowlands of the Baltic, watered by the Trave and its tribs. The soil of the area is fertile, except the forest lands (14 per cent of area), and produces rye, wheat, potatoes, hay, and much fruit. The supreme power under the 1925 constitution was vested in the people, who elect a *Bürgerschaft* of eighty members and this House elected a senate of eleven, which was the highest executive authority.

The free city of L. was one of the Hanseatic tns., formerly head of the Hanseatic League, 40 m. by rail from Hamburg. Prior to the Brit. air attack on March 28, 1912, L. was a grand anct. city, containing five Gothic churches, full of medieval works of art: the Rathaus, the Schifferhaus, medieval gates (Hoktentor, Burgtor), the hospital of the Holy Ghost, and a valuable museum. The Brit. bombers left the whole port area ablaze and the fires reached uncontrollable dimensions. A great number of historical buildings, including the dome of the church of St. Mary, the tn. hall, the museum, and many old burgher houses dating from Hanseatic times were destroyed. The military value of this first raid was that L. (together with Rostock (q.v.) and Warnemünde (q.v.)) was a vital port for handling troops and supplies for the N. Russian front. Nearly half of the old inner L., with its port facilities and industrial plants, was wiped out, largely through incendiary bombs. L. was taken by Brit. forces on May 2, 1915.

L. was founded in 1140 and quickly gained commercial importance. It was ceded to Saxony in 1158, obtaining its first charter from Duke Henry; conquered by Denmark, 1201; regained its liberty and was made a free city by Frederick II.; sacked by the Fr., 1806, and annexed, 1810, but became once more a free city, 1813, and joined N. Ger. confederation in 1866. L. was a rival of Hamburg and Bremen as a Ger. emporium, having a good harbour and quays, and ice-breakers to keep the riv. open. It traded chiefly with Denmark, Russia, Sweden, and Finland in machinery, chemicals, brushes, and other manufactured goods. Pop. 223,000. See F. Endres, *Geschichte der freien u. Hansestadt, Lübeck*, 1926.

Lüber, Thomas, see *ERASTUS*.

Lublin, tn. of Poland, cap. of L. prov.,

bounded N. by Siedlce, E. by the R. Bug, S. by Galicia, and W. by the R. Vistula. About one-third of its surface is oak, beech, and lime forest, less than one-twelfth pasture land, and the rest arable. In some parts the soil is fertile, black earth, but other parts are sandy. Rye, oats, wheat, barley, and potatoes are the chief crops; flax, peas, millet, and beet-root are also cultivated, and horses are bred. A univ. was founded in 1919. The chief industries are distilling and sugar-making. Chief exports: grain, wool, and wood.

After the First World War L. was one of the Polish military dists. Heavy destruction was wrought by Ger. bombers. In the invasion of Poland, on Sept. 15, 1939. In the Russo-Ger. partition of Poland on Sept. 28, 1939, L. fell within the Ger. sphere. It remained in Ger. occupation until it was taken by the Russians on July 24, 1941. Area, 6500 sq. m. Pop. (tn.) 122,000; (prov.) 2,460,000.

Lubricants and Lubricators. Lubricants are substances interposed between moving surfaces to reduce the friction between them and prevent them becoming hot. There are two types of lubrication: hydrodynamic or fluid lubrication and boundary lubrication. The former is the condition in which bearing surfaces are separated by a relatively thick film of lubricant, the latter when the surfaces are separated by a film of lubricant only a few molecules thick. The co-efficient of friction in the second case is higher than is the case with fluid lubrication and special properties are required in a lubricant which has to function under boundary conditions. Lubricants may be of the solid, semi-solid, or liquid type. The first variety, such as graphite or plum-bago, seems to act as rollers or serve to fill roughnesses in the surfaces in contact, thus coating them with a soft slippery material. They are used chiefly for wood, rough iron bearings, and all very hard materials. Semi-solid and liquid lubricants are much more important and consist of various animal, vegetable, and mineral oils often mixed and thickened or solidified with soaps. Where possible oil is used as the lubricant, but in many cases grease lubrication is desirable. Grease does not leak out of bearings to the same extent as does oil, and moreover will form a protective seal against the entry of dirt and moisture. Semi-solid greases are used for railway wagon axles and the bearings of slow-moving machinery, being generally introduced by a syringe fitted with a spring piston or else by a screw plug. Fluid lubrication occurs when there is a copious supply of lubricant between two surfaces which are moving relative to one another at moderately high speeds. The film between the surfaces is maintained by the lubricant being dragged in between the surfaces due to the movement between the surfaces and depends solely on the viscosity of the lubricant and the relative speed of the surfaces; it is independent of the type of lubricant. Thus it is possible to lubricate high-speed spindles by means of air or any other

gas at high pressure. A lubricant should have sufficient viscosity and must not be volatile or be decomposed by heat or congealed by cold. It should not be oxidised by exposure to the air or acid so as to affect the metal of bearings, nor must it be easily inflammable but ought to be able to carry off the heat generated by the inevitable amount of friction. A mineral oil, therefore, has a number of advantages over other fluids, e.g. high viscosity and relatively high resistance to chemical change. An example of fluid lubrication is in a journal bearing where the rotation of the journal drags the oil between it and the bearing so that the journal is separated from it by a film of oil. The thickness of the film varies with operating conditions of the bearing, but it will be very thin by ordinary standards, probably something of the order of a thousandth of an inch. This is very thick, however, compared with the dimensions of the molecules of which the oil is composed. About 100,000 or more of these molecules, placed end to end, would be required to form the thickness of this film.

Lubricators are mechanical contrivances for introducing the lubricant to the rubbing surfaces. For applying solid lubricants (tallow, lard, etc.) a simple box is used above the part to be lubricated with a hole in it of a size adjusted to the viscosity of the material and the freedom with which it is to run. For the animal or vegetable oils the usual form is a brass or glass vessel of varying capacity fastened to the journal box and having a hole at the bottom through which a vertical tube rises nearly or quite to the top of the oil cup. A channel leads from the cup to the bearing to be oiled and a leader of lamp-wick often twisted round a wire-shaped Γ is inserted partly into the tube, the rest falling into the oil so that the wick acts as a siphon. Oil lubrication systems may be divided into three broad categories: (1) total loss systems (non-circulating), (2) circulating systems, (3) bath and splash systems. With the total loss method a comparatively small quantity of oil is delivered either intermittently or continuously to the bearing surfaces. The used oil from these working surfaces runs to waste and is not re-circulated. The fresh oil may be applied in a number of ways, using methods ranging from hand oiling to complicated centralised pressure systems. Typical examples of this system are drip-feed lubricators and mechanical lubricators. The first type consists of an oil cup with an adjustable outlet from which the oil falls drop by drop on to the bearing. A window is provided so that the oil drops can be seen and the flow can be regulated. A disadvantage with this type of lubricator is that it must be turned off and on by hand each time the machine is started and stopped. In the case of mechanical lubricators the engine or machine normally operates a number of pumps, each of which delivers a given amount of oil through a series of pipes to the various lubricating points. This method is widely

used in group lubrication systems, e.g. large Diesel engine cylinders, air compressors, steam engines, etc. In the case of circulating systems a relatively large supply of oil is kept in circulation and is delivered under pressure to the bearings. From a reservoir oil is fed by pump or gravity through pipes or passages to the working surfaces. Excess lubricant may be returned to the reservoir by gravity or by means of a scavenge pump. Typical examples of such systems are to be found in the case of automotive engines, aero engines, and steam turbines. With this method the oil also functions as a coolant. A typical example of the bath and splash system is the ordinary gearbox where the pinions dip into the oil and splash it freely around all bearings and moving parts. Variations of this method are chain or ring oilers where a ring or endless chain, rotating loosely on the journal or shaft, dips into a bath of oil and carries the oil up to the bearing surfaces. In other cases a shaft or spindle may rub against a felt pad impregnated with oil. An important development in the lubrication of marine and other engines was the invention of the Michell Thrust Block, and the ball and roller bearings made by such firms as SKF and Ball Bearing Company Ltd. and Hoffmann Manufacturing Company Ltd., and the Timken Company have simplified the mounting and lubrication of machinery. See J. H. Hyde, *Lubrication and Lubricants*; E. N. de C. Andrade, *Engines*; A. W. Nash and A. R. Bowen, *The Principles and Practice of Lubrication*, 1937; Institution of Mechanical Engineers, *General Discussion on Lubrication*, 1937; and A. W. Judge, *Modern Petrol Engines*, 1946.

Luc, Jean André de (1727-1817), geologist and meteorologist, who invented a new form of hygrometer, and pub. the first correct rules for measuring heights by the barometer. His *Recherches sur les modifications de l'atmosphère* (1772) contains many important facts relating to heat and moisture.

Luca della Robbia, see ROBRIA.

Lucan, Marcus Annæus (Lucanus) (c. A.D. 39-68), Rom. epic poet, b. at Cordova, Spain, nephew of the philosopher Seneca. Educated at Rome, he at first won the favour of Nero, who later grew jealous of him, and forbade him to recite in public. L. immediately joined Piso's conspiracy, but was betrayed and induced to turn informer by promises of pardon. Having revealed his accomplices, even including his own mother, he was condemned to death, but forestalled a traitor's death by suicide. His only extant work is the famous epic *Pharsalia*, dealing with the struggle between Caesar and Pompey, after the crossing of the Rubicon. There are eds. by H. Grotius, 1614; Weber, 1821-31; C. Haskins, 1889; E. Ridley, 1919; and A. E. Housman, 1928. Fr., Ger., and Eng. versions have appeared. See Palmer, *Apologia pro Lucano*, 1704; F. M. Voltaire, *Essai sur la poésie épique*, 1760; J. Meusel, *Dissertationes* (vol. II.), 1767; C. Welser, *Vita*, 1835; and Obermeyer, *Sprachgebrauch des Lucanus*, 1886; also study

by E. Malcovati, 1940, and W. Fischl, *Studien zum Fortleben der Pharsalia*, 1945.

Lucania, anat. div. of S. Italy, between the Tyrrhenian Sea and the gulf of Tarentum, separated from Campania by the R. Silarus (N.) and from Bruttium by the R. Lous (S.). The original inhab. were subdued by the Samnites (c. 300 B.C.), in turn subjected by the Romans. (272). Sybaris, Hieracles, Thuril, and Paestum were among the chief cities. In modern times the compartimento of Basilicata (prov. of Potenza and Salerno) represents L.

Lucaris, Cyril (c. 1572-1637), Gk. theologian and prelate of the Orthodox Church, native of Candia (Crete). He became patriarch of Alexandria (1602), of Constantinople (1621), and attempted to reform the Gk. Church on Calvinistic lines. For this he was deposed and exiled to Rhodes. He was recalled, but again expelled by his orthodox opponents and the Jesuits. His *Confessio* appeared in 1692. He gave to England the *Code Alexandrinus* MS., now in the Brit. Museum. He was probably slain by the sultan's janissaries. See J. Asmon, *Lettres anecdotes de Cyrille-Lucaris*, 1718; A. Pöhlner, *Geschichte der kirchlichen Trennung zwischen Orient und Occident* (vol. I), 1864; and study by G. Hofmann, 1929.

Lucarne, see DORMER.

Lucas, Edward Verrall (1868-1938), Eng. author and editor. In 1902 he joined the staff of *Punch*, and achieved success with skits written in collaboration with C. L. Graves, the best remembered being *Wisdom While You Wait* (1903) and *Huddled History* (1904). He also wrote many travel books, and became chairman of the publishing house of Methuen. His other works include a biography (1905, 1921) and *The Letters of Charles Lamb* (1935); *A Book of Verses for Children* (1897, 1907); *The Open Road* (1899); *Highways and Byways in Sussex* (1904); *A Wanderer in Holland* (1905); *Fireside and Sunshine* (1906); *Listener's Lure* (1906); *A Wanderer in Florence* (1912); and *Vermeer the Magical* (1929). His memoirs, *Reading, Writing, and Remembering*, appeared in 1932, in which year he was made a companion of honour.

Lucas, John Seymour (1849-1923), Eng. historical and portrait painter, b. in London. He received his training at St. Martin's School of Art, and entered the Royal Academy in 1871. In 1880 he became an associate, and in 1898 an R.A. His first picture, the 'Apothecary' from *Romeo and Juliet*, was exhibited in 1872. His best works include 'The Burgomaster' (1877); 'Armada in Sight' (1880) (representing Drake finishing his game of bowls on Plymouth Hoe); 'Spy in Camp' (1882); 'Whip for Van Tromp' (1883); 'After Culloden' (purchased by the Royal Academy); 'Eloped', 'The Smoker', and 'Peter the Great at Deptford'. He was commissioned by King Edward to paint the reception of the Moorish embassy in 1901.

Lucas van Leyden (1494-1533), Dutch painter, b. at Leyden, contemporary and rival of Albrecht Dürer. He studied under Cornelis Egelbrechtsen, and was a

celebrated engraver early in life. In 1514 he settled in Antwerp, and was elected a member of the guild of St. Luke. His best known paintings include 'The Last Judgment', 'St. Peter, Martyr', 'Christ Healing the Blind Man of Jericho', 'A Card Party', 'Virgin with Saints', etc. He is eminent as an engraver for his skill in grouping figures. See W. Ewald, *Lucas de Leyde et Albert Dürer*, 1883; studies by R. Kahn, 1918, and L. Baldass, 1923; M. J. Friedländer, *Meister der Graphik*, 1924; and R. H. Wilenski, *Introduction to Dutch Art*, 1927.

Lucas, Vrain, see under CHARLES, MICHELL.

Lucayos Islands, see BAHAMAS.

Lucca: 1. Prov. of Tuscany, Italy, bordering on the gulf of Genoa. Silk, oil, wine, and chestnuts are produced. Area 558 sq. m. Pop. 350,000. 2. Cap. of above, on the Serchio, 10 m. N.E. of Pisa. It contains the famous eleventh-century cathedral of San Martino, with valuable paintings and antiquities, sev. churches of Carrara marble, the Palazzo Provinciale, and two academies. There are remains of a Roman amphitheatre, and to the S. of the town an aqueduct with 459 arches. L. manufactures velvets, silks, and other textiles, glass, paper, linoleum work, and cigars. In the 1914 battle the town escaped very lightly, and only slight damage was sustained by the cathedral. Santa Maria Formosata, and the Palazzo Governativo.

There have been bishops since A.D. 347, and L. was made an archbishopric without suffragans (1726). The ant. Lucca is mentioned by 218 B.C. In 177 the Romans founded a Lat. colony there, and it was a municipium by 90 B.C. L. was annexed to the kingdom of Italy in 1860. The Bagni di L. (Bagno a Corsena) are in the Lucca valley. Pop. 83,000. See Del Carlo, *Storia popolare di Lucca*, 1877; J. Russ and N. Krichson, *The Story of Lucca*, 1912; and E. Lazzarochi, *Lucca*, 1931.

Luce, Clare Booth (b. 1903), Amer. playwright and journalist, b. in New York city, married Henry L. (a.g.) in 1935. On the editorial staff of *Vogue* (1930); *Vanity Fair* (1931-34). She was a member of the U.S. House of Representatives from 1943 to 1947. Her plays *The Women* (1937) and *Kiss the Boys Good-bye* (1938) are maliciously witty satires on the follies and deceptions of women. *Stuffed Shirts* (1933); *Margin for Error* (plays, 1939); and *Europe in the Spring* (1940) are among her other plays, the last-named being a description of the Ger. invasion of France and the Low Countries in 1940. She has also written articles on travel.

Luce, Henry Robinson (b. 1898), Amer. publisher and editor, b. in Shanghai, China. He studied in England and on his return from Oxford Univ. L. and some Yale friends, in 1923, founded and pub. *Time*, the great success of which magazine encouraged the foundation in 1930 of *Fortune*, which 'sold' the romance and glamour of Amer. business far more effectively than the conventional and uncritical business magazines had done. It was intended for readers with incomes

of \$10,000 a year and over. In 1936 L. bought the title of the dorelet comic monthly periodical, *Life*, and estab. a new and lavish pictorial weekly, which was as successful as his previous ventures. The smart streamlined, irreverent style of *Time* and *Life*, and the thoroughness and frankness of *Fortune*, made those papers especially representative of the disillusioned generation which had lived through the First World War, the boom, and the slump, yet lacked the simple faith to seek a return to 'normalcy' as a solution for present discontents. See D. Brogan. *U.S.A.*, 1941.

Lucena: 1. Tn. of Cordova prov., Spain, on the Cascajar. Woollen and linen fabrics, pottery, watches, and metallic wares are manufactured. There is a well-known local breed of horses. Pop. 25,000. 2. Small tn. of Castellón de la Plana, Spain, 45 m. from Valencia. Pop. 5000.

Lucera, Duke of, see GALLAS, MATTHIAS VON.

Lucera, or **Luceria**, tn. of Foggia prov., S. Italy, 11 m. W.N.W. of Foggia. It has a thirteenth-century castle, a medieval cathedral (once a Saracenic mosque), and a fine episcopal palace. The silk trade cathedral (once a Saracenic mosque), and a fine episcopal palace. The silk trade thrives. Pop. 20,000.

Lucernal Microscope, optical instrument invented by George Adams, and so called because the image of the object observed is thrown on a screen by the rays of light from a lamp (Lat. *lucerna*), reflected from the object. An Argand lamp is used to give the required light; it is placed beyond the object, and the light, after passing through a hemisphere of glass, falls on a small concave mirror, which reflects the light on to the object. By the refraction of the light in passing through the lenses, a highly magnified image of the object is formed on the screen.

John H. Stone

THE LION OF LUCERNE

Lucerne: 1. Canton of N. Central Switzerland, next in importance to Zürich and Bern. The surface in the N. is mountainous, but the soil is generally fertile. Its area is about 580 sq. m., and about four-fifths consists of pastureland. Grain,

flax, hemp, and potatoes are produced, and the manuf. of cheese and condensed milk is important. It is generally French-speaking. Nine representatives are sent to the Nationalrat. Pop. 206,000. 2. Cap. of the canton, and one of the most popular tourist centres in Switzerland. It is situated picturesquely on the banks of the Reuss as it issues from the lake, and is 24 m. S.S.W. of Zürich. To the S. of the city towers Mt. Pilatus (7000 ft. above sea level), while on the E. rises the famous Rigi. Amongst the numerous features of interest are the celebrated rock, the 'Lion of L.' carved by Thorwaldsen as a memorial to the Swiss Guards who fell in Paris (1792), the Hofkirche of Leodegar, glacier garden, and the tn. hall, dating from the seventeenth century. L. has only a small trade, and manufs. some silk and ironware, the accommodation of tourists being the chief business of the inhab. Pop. 60,000.

Lucerne, Lake of (Vierwaldstättersee, lake of the Four Forest Cantons), one of the most lovely and celebrated of European lakes, situated in the N. central part of Switzerland. Its greatest length is 23 m., and its average breadth is about 2 m.; greatest depth, 700 ft. Its altitude is 1435 ft., and it is in the shape of an irregular cross.

Lucerne, see ALFALFA.

Luchu Islands, see RYUKYU ISLANDS.

Lucian (ΛΟΥΚΙΑΝΟΣ) (c. A.D. 120–after 180). Gk. writer of the 'silver age' and free-thinker of the Christian era, a native of Samosata. He travelled in Greece, Italy, and Gaul, settled at Antioch (160), and then moved to Athens. Many of his best works were written between 160 and 180, in the reign of Marcus Aurelius. He is chiefly noted as a satirist and one of the world's greatest wits. Among his numerous productions may be mentioned *Dialogues of the Gods*; *Dialogues of the Dead*; *Zeus Confounded*; *Zeus Tragedian*; *Sale of Lives*; *The Incredulous*; *Symposium*; *Charon*; *Menippus*; *Democritus*; *Twice Accused*; *The Fisherman*; *Timon*. His *True History* inspired Rabelais's *Voyage of Pantagruel*, Swift's *Gulliver's Travels*, and Cyrano de Bergerac's *Journey to the Moon*; his works influenced Voltaire also. See eds. of his works by T. Hemsterhuis and H. Reitz, 1743–46; J. T. Lehmann, 1822–31; L. Dindorf, 1858; C. Jacobitz, 1874, 1886–88; Sommerbrodt, 1886–93; M. Weber, 1910–13 (Eng. trans. by T. Franklin, 1741); A. M. Davidson, 1902; and H. Fowler, 1905. See also Jacob, *Charakteristik Luciana*, 1832; F. Passow, *Lucian und die Geschichte*, 1854; W. Collin, *Lucian*, 1873; H. Bernay, *Lucian und die Kyniker*, 1879; M. Gröbet, *Essai sur Lucian*, 1882; P. M. Bultmann, *Studia Luciana*, 1893; H. W. Heine, *Lucian the Syrian Satirist*, 1900; B. Gildersleeve, *Essays and Studies*, 1900; Sir R. Jebb, *Greek Literature: Essays and Addresses*, 1907; and studies by R. Helm and L. Menipp, 1906.

Lucian, Saint (c. A.D. 240–312), Christian martyr of Samosata, prophyet of Antioch. He was celebrated as a biblical scholar, and prepared a revised ed. of the

Scriptures. He was tortured to death by Maximian's orders in Diocletian's reign. See Jerome, *De Viris Illustribus sive de Scripturibus Ecclesiasticis*; C. G. Harnack, *History of Dogma*, iv., 1891; C. J. Helele, *History of the Councils*, i., 1871.

Lucientes, Goya y, Francisco José de, see GOYA Y LUCIENTES.

Lucifer: 1. (Lat., light-bearer), morning star, and the Lat. name for the planet Venus, corresponding to the Gk. *phosphoros*. When the identity of the morning and evening star was recognised, Phosphorus and Hesperus were made brothers. 2. Hesiod makes L. the son of Eos, the Dawn, and Astræus; others call his father Cephalus. He had charge of the temple of Aphrodite, and was much in favour with the goddess. 3. In the A.V. of Isaiah the word is used with reference to the glory of the king of Babylon, but the Church fathers attached the name to Satan, thinking that the passage, 'How art thou fallen from heaven, O Lucifer, son of the morning,' contained a reference to the Prince of Darkness. Thus the word L. has come to be used to denote the fallen angel. See A. Müller, *Die Gestalt Lucifers in der Dichtung vom Barock bis zur Romantik*, 1940.

Lucifer (d. 371), bishop of Calaris (Cagliari) in Sardinia, an ardent supporter of Athanasius, noted for his intolerance and zeal against Arianism; in consequence he was banished by Constantius in 355. His exile ended on Julian's edict (362). He refused to recognise as orthodox bishops who had signed the Rimini formula (359), and finally caused a schism in the church of Antioch. His followers were called Luciferians, but the sect soon disappeared. See ed. of his works (including *Defence of Athanasius*) by Tilus, 1568; J. P. Migne, *Patrologia Latina*, xlii.; and life by Krüger, 1886.

Luogen Lamp, very powerful artificial lamp, first used in 1885. The light is produced by burning creosote oil, held in a strong iron tank in the form of a circular drum. With the more general use of electricity for lighting purposes the L. L. has now become obsolete.

Lucilius, Calus (c. 148-103 B.C.), Rom. satirist, b. at Suessa of the Aurunci. He is regarded as the founder of Rom. satire, for although his verse is rough it is fluent, and was the model on which Horace and Juvenal based their polished and elegant poetry. He was a personal friend of Scipio, whom he accompanied on the expedition against Numantia, and of Lucius. L. wrote thirty satires, but only fragments remain. The best eds. are those of L. Müller, 1872; C. Lachmann, 1876; and F. Marx, 1904. See L. Müller, *Leben und Werke des Lucilius*, 1876; J. Mackail, *Latin Literature*, 1895; and G. C. Fisher, *Lucilius and Horace*, 1920.

Lucina (Lat. *lux*, light), in Rom. mythology, the goddess of light, corresponding to the Gk. goddess, Ilithyia. When invoked she attended women in labour and brought children to light. It was used as a surname of both Juno and Diana, who presided over the labours of women.

Lücke, Gottfried Christian Friedrich (1791-1855), Ger. Protestant theologian, b. at Egein, near Magdeburg. He became prof. of theology at Bonn (1818-29) and at Göttingen (1827-35). He was one of the founders of the *Theologische Studien und Kritiken*, the chief organ of the 'mediation' school of evangelical theologians. His prin. works are *Grundriss der Neuhebraeischen Hermeneutik* (1817); *Kommentar über die Schriften des Evangelisten Johannes* (4 vols.) (1820-32); and, in collaboration with W. de Wette, *Synopsis Evangeliorum* (1818). See life by F. Sander, 1890.

Luckenwalde, tn. in Brandenburg, Germany, 22 m. S.E. of Potsdam, on the R. Nuthe. There are textile manufs. Pop. 28,800.

Lucknow, chief city of the dist. of the same name, India, cap. of the United Provs. of Agra and Oudh. The city stands on the r. b. of the Gumbi, 43 m. N.E. of Cawnpore by rail. It is of great interest to Englishmen on account of the glorious defence of the Residency by a handful of Brit. soldiers (May to Nov. 1857). The most notable buildings are the Imambara, the mausoleum of Asaf-ud-Daula, the palaces of Chhatrar Manzil, the Residency, the Lawrence Memorial, and the great mosque, Jama Masjid. The inhab. are engaged in gold and silver brooding, brass, copper, and clay work, and in the manuf. of shawls, paper, muslins, etc. The Canning College, founded in 1864, the univ. (1920), and La Martinière College for soldiers' sons, are the prin. educational establs. Pop. 387,100. The dist. of L. now has an area of 970 sq. m. Pop. 950,000. The div. of L., comprising six dists., has an area of 12,051 sq. m. Pop. 6,531,000. See J. J. McLeod Innes, *Lucknow and Oude in the Mutiny*, 1895.

Luçon, tn. in the dept. of Vendée, France, 21 m. N. of La Rochelle, and is connected with the sea by a canal 8 m. long. It is the seat of a bishopric, and has a cathedral dating from the eleventh century. There are iron and copper industries, and manufs. of liqueurs and cloths. Pop. 6600.

Lucretia, celebrated Rom. matron, the wife of Lucius Tarquinius Collatinus, and the daughter of Lucretius. According to the story a number of Rom. soldiers in camp quarrelled as to the respective virtue of their wives, and, in order to test the truth of their assertions, returned unexpectedly to Rome to see how their wives were occupied. L. alone was found loyal to her husband, busily occupied on household matters. Her beauty and innocence roused the passion of Sextus Tarquinius, who visited her at night and ravished her. In the morning she told her father and her husband of her shame and then stabbed herself. Her rape roused the Romans to shake off the hated rule of the Tarquins. See Shakespeare's *Rape of Lucretia* and Thomas Heywood's play of the same name.

Lucretius, or Titus Lucretius Carus (c. 99-55 B.C.), Rom. poet, concerning whose life authentic information is entirely lacking. His *De rerum natura*

is a didactic poem on Epicurean philosophy in six books, and is addressed to C. Memmius Gemellus, who was praetor in 58 B.C. The chief aim of the poem is to free men from superstition, to accustom them to the idea of complete annihilation at death, and to rid them of the idea of divine interference. Gods there are, beings a little higher than mortals, but to them, too, death and corruption come, bringing total eclipse. Regarding mortal concerns they live in supreme contempt. Throughout the whole universe the atom alone is eternal and incorruptible. These theories are expounded by L. with a passionate eloquence, fervour, and power that are quite unparalleled in Lat. literature. See H. A. J. Munro's trans. and commentary (1886); study by O. Regenbogen, 1932; and definitive ed. with trans., commentary, *apparatus criticus*, and prolegomena by C. Bailey, 1948.

Lucronius, see LOGROND.

Lucullus, Lucius Licinius (c. 110-57 B.C.), celebrated Rom. general of plebeian stock. He first distinguished himself in the Marian war, and afterwards fought in the Social war on the side of Sulla, and became praetor in 77 and consul in 74. In the latter year he was entrusted with the care of the Mithridatic war, and remained in Asia for eight years. During the campaigns of 74, 73, and 72 he relieved Cotta, who had been besieged in Chalcidonia, destroyed the enemy's fleet off Lemnos, conquered Bithynia, and forced Mithridates to take refuge at the court of his father-in-law, Tigranes, king of Armenia. L. pursued him across the Euphrates, and took Tigranocerta, cap. of Armenia. His haughty temper, however, displeased the senate, who sent out Aedius Glabrio to take his place (67). He did not yield the command to his rival, but was obliged to resign to Pompey, who was sent out in the following year. On his return to Rome he retired from public life, and became notorious for his fondness of luxury. He had a famous villa on the promontory of Misenum, which afterwards became the property of Tiberius. He wrote a hist. of the Marian war in Gk. He was the first to introduce cherries into Italy, which he had brought with him from Cerasus in Pontus. See Plutarch's life and T. Mommsen, *History of Rome*, 1894.

Lucy, Saint (281-304), virgin and martyr, b. and d. at Syracuse. She was betrothed to a rich pagan who, irritated at her refusal to marry him, denounced her as a Christian to Paschasius, the governor, who beheaded her. She is the patron of the blind, and her day is Dec. 13.

Lucy, Sir Henry William (1845-1924), 'Toby, M.P.' of Punch, Eng. journalist, b. at Crosby, near Liverpool. After serving as a reporter on the *Shrewsbury Chronicle* he went to Paris, and afterwards joined the staff of the *Pall Mall Gazette* (1870). In 1873 he became parl. writer for the *Daily News*, of which he was editor in 1886-87. In 1881 he succeeded Shirley Brooks on *Punch* as the writer of 'The Essence of Parliament,' for which he

created the characters of 'Toby, M.P.' and the 'Member for Sark.' He wrote *Men and Manners in Parliament* (1875); *Faces and Places* (1895); *Mr. Gladstone, a Study from Life* (1896); *Memories of Eight Parliaments* (1908); *Sixty Years in the Wilderness* (1909, second series, 1912); *Nearing Jordan* (1918); *The Diary of a Journalist* (1920-23); and *Lords and Commons* (1921).

Ludd, see NUDD.

Ludd, El, see LYDDA.

Luddite Rioters, or Luddites, were organised bands of workmen who gave voice to the popular distress caused by the introduction of machinery and the consequent scarcity in the demand for manual labour. From 1811 to 1812 the Luddites destroyed stocking frames, steam power looms, and shearing machines throughout Nottinghamshire, Derbyshire, Leicester-shire, and Yorkshire. They derived their name from Ned Ludd, an idiot boy of Leicester-shire, who, unable to catch someone who had been tormenting him, destroyed some stocking frames in a fit of temper (1779). See the *Annual Register*, 1811, 1812, and 1816; G. Pellet, *Life of Lord Sidmouth*, 1847; and F. Peel, *Risings of the Luddites, Chartists, and Plug-drawers* (2nd ed.), 1888. Charlotte Brontë's *Shirley* includes an account of the attack on Hawththorpe Mill at Liversedge.

Ludendorff, Erich von (1865-1938), Ger. soldier, b. at Kruszwina, near Posen, entered the Cadet Corps in 1877 and the 37th Infantry Regiment in 1882; he gained accelerated promotion into the Marine Regiment in 1887. In 1890 he studied at Kriegsakademie, and was transferred to 8th Body Grenadiers in 1893, becoming captain in 1896, colonel in 1911, and commander 39th Fusilier Regiment 1913. At the beginning of the First World War L. was a brigade commander at Strassburg. He joined Gen. von Emmich's (q.v.) staff for the siege of Liège. In these operations he showed much initiative in organising and leading a Ger. brigade which penetrated the outer line of forts, for which service he received the order *L'our le Mérite*. On Aug. 22, 1914, he was appointed chief of staff of the Eighth Army in E. Prussia, the command of which was given to Gen. von Hindenburg (q.v.). Here L. was instrumental in winning one of the most brilliant battles in the hist. of warfare (see TANNENBERG, BATTLE OF). Following this he was appointed chief of staff to the S. army, in E. Prussia, but shortly afterwards went further S. to work in conjunction with the Austro-Hungarian Army in its operations against Przemyśl (q.v.).

The summer campaign of 1915 against the Russians brought his views into conflict with his superiors, but he loyally carried out the orders of his general headquarters. On Aug. 28, 1916, L. was appointed 'first quartermaster-general' to von Hindenburg and in that capacity was largely responsible for the subsequent military action of the central powers during the war. He staked practically his last throw on victory in March 1918, when peace with Bolshevik Russia enabled

him to withdraw vast numbers of trained troops from the E. front and put them into action in the W. before the Amers. could give the Allies anything approaching numerical superiority. When the Brit. and Fr. troops withstood his onslaughts he lost heart, and in the last period of the war insisted that an armistice should be sought.

He resigned his post on Oct. 26, 1918, and fled in disguise to Sweden. Later he returned to Germany, settling in Munich. He played an inglorious part in one of the 'putsches,' whose object was to overthrow the Ger. republic, but after the success of the Nazi revolution emerged again, and gained prominence for his violently nationalist and anti-Christian utterances.

Ger. historians have claimed that L., as much as anybody, lost the war for their country. It has furthermore been claimed that all the brilliant victories on the E. front, including Tannenberg, were planned by Gen. Max von Hoffmann. His *War Memoirs* were pub. in 1919, and he also wrote *The General Staff and its Problems* (1920) and *Warfare and Politics* (1922). See life by L. Bnat, 1920, and Col. G. von Horsteuau, *Collapse of Austria-Hungary*, 1930.

Ludenscheld, tn. in W. tpshala, Germany, 19 m. S.E. of Barmen. Pop. 10,000.

Luderitzland (S.W. Africa), see ANGRA PROPEL. In the First World War, Luderitz Bay was occupied by S. African forces in Sept. 1914. See AFRICA, SOUTHWEST, *First World War Campaign*.

Ludger, Saint (d. 809), Frisian by birth, educated under Gregory and Alcuin. He became a missionary in Westphalia, and played a great part in converting the Saxons to Christianity. He founded Münster and was its first bishop.

Ludhiana, tn. of the Jullundur div., E. Punjab, India, 73 m. S.E. of Amritsar. It manufs. famous Cashmere shawls, ornaments, and carriages. Pop. 111,700. The L. dist. has an area of 1452 sq. m. and a pop. of 819,000. Wheat and grain are grown.

Ludington, co. seat of Mason co., Michigan, U.S.A., on Lake Michigan, at the mouth of Marquette R. It is a health resort. It has a fine harbour, exports lumber, and has saw mills and canning factories. Pop. 8700.

Ludlow, Edmund (1617-93), Eng. parliamentarian and regicide, b. at Maiden Bradley, Wiltshire. On the outbreak of the Civil war he joined Lord Essex's Life Guards and fought at Worcester and Edgehill (1642). Elected to Parliament in 1645 he was one of the promoters of Pride's Purge (1648), and signed the death warrant of King Charles I. (1649). In 1651 L. was sent to Ireland as lieutenant-general of horse, and on the death of Ireton in Nov. held the chief command. When Cromwell was declared Protector he refused to acknowledge his authority, and retired from public affairs until 1659, when he was returned to Parliament as member for Hindon. At the Restoration (1660) he fled to Vevey, where he d. His memoirs were pub. in 1698-99, ed. by

Firth, 1894; see also F. P. Guizot, *Monk's Contemporaries* (Eng. trans., 1851).

Ludlow, tn. of Shropshire, England, 26 m. S. of Shrewsbury, at the junction of the Corve and the Teme. It was an old Rom. settlement, and contains a castle of the eleventh century. The grammar school was founded in 1382. The industries are tanning and brewing, and there are cabinet works and corn mills. Pop. 15,600.

Ludolfus, Job (the Latinized name of Hlob Leutholf) (1624-1704), Ger. orientalist, b. at Erfurt. He studied philology at Erfurt and Leyden, where, and on his travels, he is said to have acquired a knowledge of twenty-five languages. For many years (1652-78) he served the duke of Saxe-Gotha, and in 1690 was appointed president of the Collegium Imperiale Historicum at Frankfurt. His works include *Historia aethiopica* (1681); *Grammatica linguae amharicae* (1698); and *Grammatica der äthiopischen Sprache* (1857). See C. Juncker, *Commentarius de vita et scriptis Jobi Ludolfi*, 1710.

Ludovisi, Alessandro, see GREGORY (poet) - Gregory XV.

Ludwig (Ger. emperors), see LOUIS.

Ludwig, Emil (1881-1948), Ger. author, b. at Breslau (now Wrocław), son of Hermann Ludwig Cohn, a celebrated prof. of ophthalmology of Jewish race. Anti-Semitism in Prussian official circles compelled his father to adopt the surname of L. for his children but in 1922 Emil returned to the Jewish faith. He was educated at various Ger. univs. and at Lausanne. He wrote two verse dramas at the age of twenty-one. Eloping with Elga Wolf, whom he called Diana, daughter of a Scots mother and Ger. father, he went to Locarno, where he wrote a play on Napoleon. L. also lived in Italy and Vienna, often in financial straits, and wrote, but without success, two semi-autobiographical novels, *Iduna* and *Manfred* and *Helena* (1910, 1911). During the First World War he was a gov. journalist in various European camps. His next literary effort was a 'psychological' study of Bismarck, his first attempt in that method of biography which was soon to achieve such an enormous vogue with the reading public, particularly in England, the U.S.A., and France and, at the same time, to cause much bitterness among the anti-Semitic Ger. Nationalists. In 1920 he produced his first full-length biography, the two-vol. work (*Goethe: Geschichte eines Menschen*). A trans. of Shakespeare's sonnets appeared in 1923. In 1925 he wrote a drama on Bismarck and his biography, *Bismarck: Geschichte eines Kämpfers* in 1926, both highly successful. L. was a prolific and facile writer and among his next works were a life of Wilhelm II. (1926) (whose faults of character he attributed to the psychological inheritance of a withered arm); a life of Christ, *Der Mensch Christus* (1928); *July 1914* (1929), a narrative of events preceding the outbreak of war; a life of Lincoln (1930); *The Gifts of Life: a Retrospect* (1931) (autobiographical); *Talks with Mussolini* (1932); *Hindenburg* (1935);

Masaryk speaks (1936); *The Nile in Egypt* (1937); *Cleopatra* (1937); and *Roosvelt* (1938). L. adopted Swiss nationality in 1932 but went to California where he lived until 1945. The fashion of romanticising biography, which he so effectively developed, led him, in depicting historical personages or events, to subordinate intellectual power to dramatic interest. His last works, written while living in America and in Switzerland, were *Stalin* (1942); *The Germans* (1942); *The Mediterranean* (1943); *Beethoven: Life of a Conqueror* (1945); *History of Cuba* (1946); and *Othello* (1947). See critical biography by N. Hansen, 1930.

Ludwig, Karl Friedrich Wilhelm (1816-1895), Ger. physiologist, b. at Wiltzenhausen, near Kassel. In 1849 he was appointed prof. in anatomy and physiology at Zurich, and held the same post at Vienna (1853-65) and at Leipzig (1865-1895). His *Lehrbuch der Physiologie des Menschen* appeared (1852-56). He was one of the founders of the Leipzig Physiological Institute for original scientific research.

Ludwig, Otto (1813-65), Ger. dramatist and novelist, b. at Eislein in Thuringia. He studied music under Mendelssohn at Leipzig, but later adopted a literary career, and made his first success with a drama, *Der Erbforster* (1850), which was followed by *Die Makkabaer* (1852). His extraordinary power of psychological analysis is seen in his pictures of Thuringian life, *Die Heiterkeit und ihr Widerspiel* (1851) and *Zwischen Himmel und Erde* (1855). His *Shakespearestudien*, pub. posthumously by A. Stern 1891, show a fine discriminating taste. His *Gesammelte Schriften* were pub. in 1891-92 and in 1900. See studies by A. Stern, 1891; A. Sauer, 1893; E. Jentsch, 1913; and E. Tyrhoffer, 1931.

Ludwigsburg, tn. of Württemberg-Baden, Germany, 8 m. N. of Stuttgart. It was formerly the second royal residence and a military centre. The chief manuf. before the second World War were chemicals, cloth, linen, and organs. In the second World War the Amer. Seventh Army in the first half of April 1945 advanced speedily to a line through L., Crailsheim, and Nuremberg in order to link up with Patton's Third Army at Baireuth. Pop. 43,500.

Ludwigshafen, tn. on the Rhine in Bavaria, Germany, opposite Mannheim. It had a free harbour and before the second World War a combined pop., with that of the twin tn. Mannheim, of not much less than 430,000. L.'s individual pop. was about 150,000, and it is noted for its manufs. of aniline dyes, chemicals, and wool. It was frequently bombed by the Allies in the second World War: there was a heavy assault on Nov. 18, 1943, but the raids of 1944 were heavier. There were repeated assaults in the period April-June, 1944, notably on May 6, but the heaviest raids were those of Sept. 5, 1944, when 1200 Amer. bombers and 650 fighters attacked the chemical works, and on Dec. 15, when Brit. Lancasters also attacked those works. In the advance of

the Allies on the W. front the Amer. Third Army entered L. on March 21, 1945. L. and Mannheim were an impressive object lesson. Both of these tns., modern, solidly built, with blocks of magnificent flats, with great factories along the Rhine and wharves which made them together the largest port on the riv., rich and important, were completely annihilated. Not a house, bank, shop, or cinema was distinguishable among the piles of stone and twisted girders.

Ludwigs Kanal, see under MAIN.

Ludwigslust, tn. in Mecklenburg, Germany, 21 m. S. of Schwerin. The grand-dukes of Mecklenburg-Schwerin lived here until 1918. Pop. 6000.

Lufia, see LOOFIA.

Lufiji, see RUFII.

Luftwaffe, Ger. Air Force, was created in contravention of the treaty of Versailles before Hitler's advent to power and had its roots in the gliding and flying clubs of Germany and in the air transport genius of Deutsche Lufthansa. The building up of the L., according to well-informed opinion, was a work of intrigue and deceit dating almost from the armistice of 1918. But most of those who wanted to take up flying after the First World War had no thought of re-creating a fighting force; they believed in aviation as a sport and recreation, and as a means of transport. Unwittingly perhaps they laid the foundations for a new type of air force, which Hitler, Goering, and others could use as a major weapon in a new war of aggression. Some believe that the L., as a secret force was created to fight Russia, but that as late as 1938 it was nothing like as large a force as people in Britain supposed. Among the chief aircraft designers and constructors were Junkers, Focke, Klemm, Messerschmitt, Dornier, and Heinkel. It is asserted by some that of these Junkers, Klemm, and Focke were either not interested in, or even actually opposed to, Ger. rearmament in the air, but some of them, particularly Messerschmitt and Heinkel, took part in the development of aviation almost entirely on account of its war value. The treaty of Versailles, by prohibiting the building of military aircraft, helped the L., because it gave it entirely new types of machines created after the Allied Control Commission had departed from Germany in 1926. While the Allies were still flying obsolete biplanes of wood and fabric Germany was already producing all-metal monoplanes. The two men most responsible for Ger. air rearmament were Gen. Wilberg, head of the secret aviation div. (Fliegerzentrale) in the Ger. Ministry of Defence, and Ernst Brandenburg, who was in charge of civil aviation. When the Nazis came to power in 1933 Germany already possessed a well-balanced aviation industry. Hitler's decision to use the L. as a political weapon influenced its development. The L. was intended to produce quick results and therefore became a purely tactical force, and heavy bombers were ignored.

The Nazis prepared for a series of 'lightning' campaigns, and from the

moment they failed to bring complete victory the L. was doomed. The combined achievements of the L. and *Panzer* divs. in Poland, the Low Countries, and France suggested that Goering and his coadjutors had created a war-winning machine, but when the R.A.F. first checked the L. at Dunkirk, and then smashed it in the battle of Britain, doubts arose. Subsequent events proved that Germany was in no way invincible in the air, and the initial successes of the L. were due mainly to the element of surprise and the unpreparedness of other nations. Some reliable experts maintain that the L. was created as a tactical weapon to co-operate with the *Panzer* or armoured divs. in a series of *Blitzkrieg* operations, and, since it was not to have a strategical role, it was not provided with heavy bombers. Hence its weakness was exposed during the battle of Britain, and, after the conflict had settled down into a long war of attrition, it achieved no further spectacular successes. See also *World War, Second, Air Warfare: British Policy of Strategic Bombing; Bomber Command; Britain, Battle of*. See C. G. Grey, *The Luftwaffe*, 1944; H. Hermann, *The Rise and Fall of the Luftwaffe*, 1944; and A. J. F. The German Air Force, 1946.

Lugano, tn. in the canton of Ticino, Switzerland, on Lake L., 40 m. N.W. of Milan. It is a much frequented health resort. A famous cattle fair is held in Oct., dating from 1513. The chief manufs. are silk, leather, and iron goods, and it is a trade and banking centre. Pop. 17,000.

Lugano, Lake, in Switzerland and N. Italy, between Lakes Maggiore and Como, covers an area of 19 sq. m., and is noted for its beautiful scenery. Its altitude is 890 ft., and depth 945 ft.

Lugansk, Lugañ, or Luganskiya Zóavod, see VOROSHILOVGRAD.

Lugard, Sir Frederick John Dealtry, Baron (1858-1945), Brit. soldier and colonial administrator, b. at Madras, son of Rev. F. G. L., and educated at Rossall and Sandhurst. He joined the Norfolk Regiment in 1878 and served in the Afghan war, 1879-80, in the Sudan campaign for the relief of Gordon, 1884-1885, and in the operations in Burma after the fall of King Thebaw, in 1886-87. His later campaigns were directed mainly against the slave trade and native mis-rule in Africa. The three outstanding achievements in his career were his success in winning and in securing the retention of Uganda for the empire in 1893; the latter in the face of the whole of the Liberal Gov. except Rosebery, his initiation of the policy of 'indirect rule' (rule through native chiefs and bodies) during his governorship of Nigeria, and the pub. of his great book, *The Dual Mandate in British Tropical Africa* (1922). The African native has rarely if ever had a more zealous or effective pioneer, and, as such, he was recognised equally by other African administrators, by missionaries, and by leading anthropologists whose work lay in Africa.

His earliest efforts against the slave trade were in Nyasaland, where in 1888 he commanded an expedition from Blantyre against Arab slave-raiders, which though heavily outnumbered, defeated the slavers, L. being badly wounded. This work attracted the attention of Sir Wm. Mackinnon (q.v.) and L. took service with the Imperial Brit. E. Africa Company, founded by Mackinnon. L.'s immediate task was to open a new route from Mombasa to the hinterland and to explore the Sabakhi. This was followed by his expedition to Uganda, on whose chief ruler, the *kabaka* of Buganda, the notorious Carl Peters had imposed a Ger. treaty. But the Anglo-Ger. agreement of 1890 assigned Uganda to Great Britain, and L. and his small band of soldiers marched with remarkable rapidity to the cap. of Buganda where he eventually obtained the treaty he sought and brought order to the country. But the next year L., to his chagrin, was ordered by the Brit. E. Africa Company to abandon Uganda, the company being without funds for its administration. L. returned to England to advocate, in season and out of season, the desirability of retaining the country and he lived to see it become eventually one of the most prosperous and progressive of Brit. protectorates in Africa. The Brit. Gov.'s reluctance to hold the protectorate was the subject of a famous *Punch* cartoon entitled 'The Black Baby,' in the issue of April 21, 1894. In 1894 L. was sent by the Royal Niger Company to Borgu, where he forestalled the Fr. and Gers. in obtaining treaties with the chiefs, by which they acknowledged the sovereignty of the Brit. company, and where he made a lasting friend of King Kiama, in whose hands he put his life notwithstanding his realisation that Kiama was plotting to kill him. The Brit. Gov. then ordered L. to raise a native force to protect Brit. interests against Fr. aggression in the hinterland of Lagos and Nigeria. After a settlement had been reached with Fr. co., and the Royal Niger Company had surrendered its charter, L. was appointed high commissioner of N. Nigeria. Only a small part of this immense ter. was under effective control. The sultan of Sokoto and other sultans or emirs refused to fulfil their treaty obligations. But L. undertook a campaign against the doughty Fulani warriors which brought the whole protectorate under Brit. rule; and, by 1906 when he resigned his post, Nigeria was being peacefully administered under the supervision of Brit. residents. In 1906 L., who had retired from the army with the rank of colonel, resigned his commissionership to take up the governorship of Hong Kong, where his tenure of office was marked by the great impetus he gave to educational efforts; it was also during this period that the univ. of Hong Kong was founded. But this governorship in Asia was only an interlude in his African work and in 1912 he was sent back to the protectorate of Nigeria which now included S. as well as N. Nigeria, and also the colony of Lagos. In 1914 he

amalgamated the two Nigerias into one administration known as the colony and protectorate of Nigeria, the largest protectorate of the Brit. Empire, which, with the personal title of governor-general, he administered with conspicuous ability, bringing to its multiple peoples a great advance in civilisation and contentment. K.C.M.G., 1901, and G.C.M.G. 1911. Retiring from the colonial service in 1919, he became P.C. in 1920, and was raised to the peerage in 1928. Member of the Permanent Mandates Commission of the League of Nations, 1922-36. It was in 1922 that he pub. his classic work *The Dual Mandate in British Tropical Africa*, the thesis of which is the doctrine 'that Europe is in Africa for the mutual benefit of her own industrial classes and of the native races in their progress to a higher plane; that the benefit can be made reciprocal, and that it is the aim and desire of civilised administration to fulfil this dual mandate'; or, more shortly, the dual mandate is that development of indigenous resources, for the benefit of the world must go hand-in-hand with native well-being. Earlier in his career he wrote *The Rise of our East African Empire* (1893), which is partly autobiographical; *British East Africa and Uganda* (1892); and *Story of the Uganda Protectorate* (1901).

Lugdunum, see LYONS.

Lugger, small two- or three-masted vessel with a running bowsprit and lug-sails, i.e. sails hanging obliquely to the mast, and having generally two or three masts.

Lugo: 1. Maritime prov. of N.W. Spain. It is watered by the Miño and its trib., the Sil, and is a fertile region. Iron, granite, arsenic, and marble are found. Area 3815 sq. m. Pop. 513,700. 2. (Lucense or Lucus Augusti of the Romans.) The cap. of the prov. of L., situated on the l. b. of the Miño, 51 m. E. by N. of Santiago. It is enclosed by four massive Rom. walls, and has a beautiful Gothic cathedral, dating from the twelfth century. To the Romans it was noted for its hot sulphur springs. Pop. 52,700. 3. Tn. of central Italy, in the prov. of, and 14 m. W. of the city of, Ravenna. In the battles of 1444 the church of St. Dominic was almost totally destroyed and that of St. Lawrence completely demolished. Wine and hemp are produced. Pop. 28,000.

Lugos, cap. of the prov. of Krassó, Rumania, 35 m. E. of Temesvár. It is the seat of two bishoprics, Gik. and Lat. It trades chiefly in wine and fruit, and is a main railway junction for the Danube-Budapest route. Pop. 23,700.

Lug-worm, Fishing-worm, or Lob-worm (*Arenicola piscatorum*), marine worm of the sub-order *Tubicolae* or tube-makers, common on the Brit. coast, burrowing in the sand and mud, and indicating its whereabouts by spiral rolls of excrement. The worms are sought after by ground-feeding fish, and are therefore used in considerable quantities as bait by fishermen. Ls. grow up to 10 in. long, and are formed of numerous segments, thirteen of which have branchial tufts which appear to assist burrowing.

Luigi Amadeo Giuseppe Maria Ferdinando Francesco di Savoia-Aosta, see ABRUZZI, DUCA DI.

Luigi, Andrea di (commonly called Andrea d'Assisi and nicknamed 'L'Ingegno') (c. 1470-c. 1556), It. painter, b. at Assisi. He studied under Pietro Perugino, and in his youth was regarded as the rival of Raphael. Later he painted excellent figure studies in conjunction with his master in the hall of Canbio, and afterwards in the Sistine Chapel at Rome. When L. became blind at an early age Pope Sixtus IV. allowed him a pension. His 'Holy Family' is in the Louvre.

Luik, see LIEKE.

Luines, Charles d'Albert, see LUYNES, DUC DE.

Luini, Bernardino (c. 1470-c. 1535), It. painter of the Lombard school. He was b. at Luino, on Lake Maggiore, and was a follower, some think also a pupil, of da Vinci. His finest frescoes are in the church of the Madonna at Saronno, and he is represented by an oil painting, 'Christ disputing with the Doctors,' in the National Gallery, London.

Luis de Granada, see GRANADA.

Luisse, Auguste Wilhelmine Amalie, queen of Prussia, see LOTHA.

Lukaris, Cyrillus, see LUCARIS, CYRIL.

Lukas, or Leokas, see LUTYADIA.

Luke, The Gospel according to, has been ascribed by a continuous tradition, since the second century, to the writer whose name it bears. The question has been much canvassed, and many modern critics have denied that Luke had any share in the authorship either of the Gospel or of the Acts, which two are universally ascribed to one compiler. Others are willing to ascribe to him only the *vv.* sections in the latter work. But the majority of critics accept the traditional view, which has the support of the late Prof. Harnack, who places the date of St. Luke's Gospel before A.D. 80. Zahn places it about 75, while of more advanced critics who deny the Lucan authorship Julius places it about 105 and Lohs from 90 to 100. The author does not claim to be an eye-witness narrating from his own recollections but a compiler intending to give a more accurate compilation than those already in circulation. One of his sources was our St. Mark or a treatise very similar to this work. Another source which he had in common with the compiler of St. Matthew's Gospel, and which contained full accounts of the sayings of Our Lord, is generally known as Q (from the Ger. *Quelle*, a source). See A. Harnack, *Neue Untersuchungen zur Apostelgeschichte und zur Abfassungszeit der Synoptischen Evangelien*, 1911. See also commentaries by L. Ragg, 1922; J. M. Creed, 1930; H. Balmforth, 1930; and J. Chapman, 1937.

Lukuga, or Lukuja, see TANGANYIKA, LAKE.

Lulea: 1. Seaport and the cap. of the Lan of Norrbotten, Sweden, is at the mouth of L. R., on the N.W. coast of the gulf of Bothnia. It exports ore from the iron mines of Gellivara, and since 1943 pig-iron has been produced by electrical methods near by. Fish, skins, and forest products

are also exported. The harbour, which was improved in 1901, is closed by ice from Nov. to June. There is an airport. Pop. 15,200. 2. Riv. in the N. of Sweden, flows through the *lan* of Norrhoten into the gulf of Bothnia, entering the sea at L. after a course of 255 m.

Lull, Raimon, or Lully, Raymond (c. 1235-1315), Sp. mystic, known as the 'enlightened doctor.' He was b. at Palma in Majorca, and led a wild, dissolute life till 1286, when he was converted. After sev. years spent in solitude and meditation, he began a great missionary enterprise, carrying out his projects by preaching throughout Italy and in France, Armenia, and Africa. In 1314 he sailed on a crusade against Mohammedanism to Bugia (modern *Bougie*) in Africa, where he was stoned and died of his wounds. L.'s philosophy, as set forth in *Libri XII. Principiorum Philosophorum contra Averroistas*, was condemned by a papal Bull (1376), and is now of interest only for its breaking away from the scholastic system. His *Blanqueria* (1283) in some ways anticipates More's *Utopia*. His poems *El Desconort* (1295) and *Lo Cant de Raimon* (1299) are of great beauty. He estab. chairs in oriental languages at Oxford, Paris, and Salamanca. See A. Hefferich, *Raymond Lull*, 1858; Canalejas, *Las Doctrinas de R. Lull*, 1870; W. T. A. Barber, *Raymond Lully*, 1903; H. Ellis, article in *Contemporary Review*, May 1906; and E. A. Peers, *Fool of Love*, 1946.

Lully, Giovanni Battista (1633-97), It. composer, b. in Florence. He went to Paris, where he joined the band of Louis XIV., who made him director of the Académie Royale de Musique (1672). He introduced lively ballets into the Fr. opera, and in conjunction with the poet Quinault composed twenty operas, the chief of which are *Alceste* (1674); *Thésée* (1675); *Alys* (1676); *Phaeton* (1683); and *Armide* (1686). His *Miserere* was written for the funeral of Sequier. See lives by E. Radet, 1891, and J. Chancel, 1938.

Lulworth Cove, see WEST and EAST LULWORTH.

Lumbago, medical term applied to a painful affection of the muscles in the small of the back. It usually seizes the patient suddenly on some extra, but not unusual, movement calling on the lumbar muscles. In a severe attack the slightest movement gives rise to excruciating pain, necessitating complete rest in bed. It is probably of rheumatic origin, and may be seated in the cartilages and ligaments rather than the muscles. It appears to follow exposure to damp or cold, and leaves the patient open to future attacks, particularly with chill after perspiration, or muscular strain. The most efficient treatment is by hot or Turkish baths to promote perspiration, and the use of an aperient. Alkalies, belladonna, aconite, opium, etc., are beneficial. The severe pains may be allayed by hot fomentations with turpentine or laudanum; the common bread poultice is efficacious. The old-fashioned remedy, the application of a hot iron with brown paper interposed, is also good. Those subject to the complaint

should follow the rules for rheumatism: woollen clothing, good food with careful dieting, the avoidance of chill and damp.

Lumbar Puncture, minor surgical operation, the object of which is to remove some of the cerebro-spinal fluid which surrounds the spinal cord. The examination of the fluid is of great value for correct diagnosis of disease of the cord, while the reduction of pressure following the operation is of immediate therapeutic benefit. The patient is placed on his side in such a posture as to facilitate the insertion of the needle between the processes of the spine; the puncture is made at the lower termination of the spinal cord, below the second lumbar vertebra at the highest point of the iliac crests slightly to one side of the middle line; in this way damage to the spinal cord itself is avoided. The needle is pushed upwards and backwards through the ligaments of the spine, and the fluid will issue drop by drop from the canula if pressure is normal and healthy. It is carefully collected in a sterilised tube for complete subsequent examination. The operation has been performed in cases of epidemic and tuberculous cerebro-spinal meningitis and uræmia, to relieve intra-cranial pressure. The fluid should be perfectly clear, and microscopic examination should show the presence of few cells. If there is excess of cells the fluid will be more or less turbid. It must be tested for the amount of albumin and undergo careful bacteriological examination. In tuberculous and syphilitic diseases of the cord, mono-nucleated leucocytes will be found in excess, multi-nucleated cells in other forms of meningitis. The Wassermann test for syphilis can also be performed on the spinal fluid. The operation of L. P. has been proved of the greatest value in the study of the various forms of meningitis, bringing them within the realm of scientific treatment and control. The same operation affords a means of inducing spinal anaesthesia by the introduction of anaesthetics.

Lumber and Lumbering (cf. Swedish *lomra*, to roar, a frequentative of *luma*, to make a noise). Formerly the word *lumber* was applied to a pawnbroker's shop, being a variant of 'Lombard,' which was equivalent in meaning to pawnbroker, someone who accumulated discarded furniture, etc. The word, with its twofold meaning of rubbish and timber is probably associated with both these sources. The lumbering of wood for shipbuilding, building, and the manuf. of furniture, etc., is an important industry of N. America. It includes the felling of trees and cutting into logs, and the sawmilling of rough timber into beams, and the planing of these. Lumbering has long been an important industry in the U.S.A., and forests have been cut down so rapidly that at the present rate of consumption the whole supply may become exhausted in forty years' time. Lumbering is also a valuable primary industry in Canada, Newfoundland, Sweden, Finland, and other countries which possess large forest resources. See also CANADA, *Forestry and Lumbering*; FORESTRY. (See illustration, p. 596.)

Lumbricus, *see* EARTHWORMS.

Lumbumbashi, *see under* ELISABETHVILLE

Lumière, Louis (1862-1948), Fr pioneer of cinematography. He improved upon Edison's kinesiograph so as to obtain a hitherto unknown steadiness of his pictures when projected on a screen. Owing, however, to defective mechanism used in his apparatus for drawing the film through the projector, no more than 50 ft could be used at one showing, and L.'s method had soon to be abandoned. With his brother Auguste L. gave the first demonstration in London of 'living photographs' on February 20, 1896. Among these early films which were the prototypes of many

others. Some crystals exhibit L. on being warmed slightly, *e.g.* diamond, or as a result of friction due to rubbing or crushing, *e.g.* sugar.

Luminosity, state of emitting light. Intrinsic L. or brightness is the comparative light-emitting power of a shining body per unit area. Bodies may be self-luminous or luminous by reflected light, in the former case *incandescence* is usually due to a state of heat. The whole question concerns the effect of light rays on the retina of the eye, and a rough classification may be made into glowing or dull red, bright red, yellow, and white but the eye fails completely to make any approximation to scientific comparison.

(Canadian National Railways)

UNLOADING LOGS INTO A RIVER

others of their kind were 'Workers leaving the Lumière Factory,' 'The Gardener and the Horse,' and 'Arrival of a Train.'

Luminal, *see* PHENOBARBITONE.

Luminescence, property of emitting light without the simultaneous manifestation of heat. The most familiar instances are those of phosphorescence in decaying fish, the glow-worm, and fire-flies, and the 'phosphorescence' of the sea. Chemical action accounts for it in the case of phosphorus itself, oxidation taking place in air at ordinary temps. In the case of radium and electric discharges, disintegration of substances largely accounts for it (*see* X-RAYS), this occurring probably in the *aura*. In the case of quinine sulphate solutions fluorescence is due to emission of previously absorbed light; other substances exhibiting L. are the sulphides of calcium, barium, and strontium, used in the manuf. of luminous paints. These possess the power of storing up light rays of higher refrangibility.

judging, *e.g.* a surface to be only five times as bright as another ascertained by photometry to be 100 times as bright. The eye, unable to estimate difference of L., can recognise equal L. It can be shown that the intensity of illumination at any point of a surface held normally to the light from a point source varies inversely as the square of the distance. By so adjusting distances of two luminous objects that they give equal illumination on a surface, we arrive at their comparative Ls. There are, however, many attendant difficulties, *e.g.* colour and standard (but *see* PHOTOMETRY).

As a rule Ls. of gases or vapours are low, even with intense heat, high L. being due to incandescent solids. Bright flames owe their intensity to small particles of solid in an incandescent state, *e.g.* coal gas owes its luminous powers to carbon particles liberated chemically; if air be mixed as in the bunsen flame, though the heat is more intense, the brightness is altogether lost; the solid incandescent

mantle, however, becomes intensely luminous in the flame.

Luminous Paint. Substances with the power of luminescence have been incorporated in paint. Such paints do not give off enough light to illuminate their surroundings, but serve to render the object coated with them visible in the dark by the phosphorescent glow. The substances used are the sulphides of calcium, barium, and strontium, prepared by reduction of the sulphate with carbon. The earliest L. P. was 'Bologna phosphorus,' the sulphide of barium; Balmann's L. P. is another mixed sulphide preparation. The essential point about these substances is that they lose the property unless exposed periodically to sunlight or other strong actinic rays. The rays of light of higher refrangibility are stored and slowly emitted; an example of the dissipation of energy. By mixing an ordinary L. P. with a radioactive substance such as mesothorium, a L. P. is produced that does not need to be exposed to light. Such radioactive L. P. is largely used for illuminating watch and clock dials, etc.

Lumsden, Ernest (1851-1913), Scottish etcher and portrait painter and a Royal Scottish academician, b. in London. In his early years he worked with Frank Morley Fletcher and J. D. Batten on colour printing from blocks. Before the First World War his etchings were much in demand by both public and private collectors, and he exhibited portrait paintings regularly at the Edinburgh academy.

Lunacy in this article is used in its legal sense as representing all those aberrations from mental soundness which involve as a consequence certain disabilities in civil relations. (For the pathological side of the subject see under **INSANITY** and **MEDICAL JURISPRUDENCE**, especially as to the medical tests of L.) The term lunatic is derived from *luna*, the moon (from the supposed influence of the moon in causing mental disorder). It is notoriously difficult to state the legal conception of L. from the fact that different text writers adopt different classifications, sometimes opposing it to *idiot* or other forms of insanity, and sometimes including under the connotation practically all cases of lost memory. In general the Eng. law overrides pathological difficulties by defining lunatic as meaning and including 'every person of unsound mind, and every person being an idiot' (Lunatic Asylums Act, 1853, and Lunacy Act, 1890). This leaves the term idiot undefined, but for the most part *idiot* has been used to denote *dementia naturalis*, or a *naturalis*, i.e. congenital infirmity of mind, though some, e.g. Luff (*Forensic Medicine and Toxicology*), state that all grades of mental deficiency are comprised in the term *idiot*, from persons whose mental condition resembles a mild form of imbecility to those whose intelligence is so low that they lead but an automatic existence. No less confusing is the legal use of the term *unsound mind* which in many Acts is used indis-

criminately to mean *non compos mentis* (i.e. not master of one's senses), congenital L. in all its variations of signification, and permanent 'adventitious' insanity, *idiot*, at all events, is a term of less shifting import than all the others; it is derived from the Gk. *idiōs*, a private person, or one who has no public office, and *idiōs*, an ignorant or illiterate person, and necessarily implied and still implies incapacity; whereas the term 'L.' is by no means a synonym for incapacity, and does not consistently imply a permanent state. Another type of mental disability is that called *imbecility*, which is legally defined as a weakness of mind between the limits of absolute *idiot* on the one hand, and of perfect capacity on the other. The phrase *moral insanity* is noticed in **CRIMINOLOGY**.

For all practical purposes of civil relationship it is unnecessary to attempt a further differentiation or a more scientific classification of these mutable terms, because the law avoids definitions for the most part, and merely applies various tests to determine responsibility and capacity, and then, according to the result of its inquiry, attaches or removes disabilities, as, for example, disability to make a will or enter into a binding contract.

Formerly the legal tests of *idiot*, or *insanity* generally, were of the crudest kind. One test was the capacity of the alleged idiot to count twenty pence, tell his age, or who were his father and mother. This old test of *idiot* is grotesque enough when judged by the light of modern mental science; for it is a commonplace among alienists that there are to be found among idiots (generally congenital) special instances of extraordinary memory, and great powers of calculation (*idiots savants*). Then later the law acted on Hume's view that the question whether a person was master of his senses was one of fact for a jury. At the present day commissions in L. do not venture to declare a person a lunatic unless he is unable to appreciate the nature and to pass a rational judgment upon the results of the particular act which is the subject of judicial consideration. In one direction law goes further than medicine, because it consistently infers irresponsibility on the ground of insanity from mere ignorance of the nature and quality of a particular act, while medicine recognises that in certain cases a person may, from disordered feelings, over which his rational faculty has no control, be unable to refrain from a particular act, although he understands perfectly its moral nature. (For the test of criminal responsibility and the relation of L. to crime generally in Eng. law see under **CRIMINAL LAW**, and also **CRIMINOLOGY**.)

The Lunacy Acts, 1890-1930, may be said to make provision, firstly for the care, housing, and custody of persons of unsound mind, and secondly for the administration of their estate. It should be noted that in practice and statutory form the terms *lunatic*, *asylum*, *pauper*, and *workhouse* have been replaced by the terms *person of unsound mind*, *mental hospital*, *state-aided patient*, and *poor*

law institution. So far as the question of care, housing, and custody are dealt with under these Acts, duties devolve (*inter alia*) upon the Court of Protection (previously Board of Control); the Lord Chancellor's Visitors or Chancery Visitors (being three medical and one legal); and visiting committees of co. and bor. mental hospitals (who are appointed by the local authorities); visitors of those licensed houses which are not within the immediate jurisdiction of the Court of Protection (they are appointed by the justices of every co. and quarter sessions bor.); and the justices of the peace, some of whom are for the purposes of the Acts constituted as judicial authorities.

Visitation and Inspection.—On the occasion of these visits patients may be personally examined as to their mental condition and general welfare. Such personal visitation is compulsory upon the visitors at the time of some of their statutory visits. The inspection of the sev. institutions in all their depts., including questions as to diet and the various forms of medical treatment, are included in the duties of the visitors. The Chancery Visitors' duties mainly rest with the visitation of all lunatics *so found*, and of such other persons of unsound mind for whom receivers have been appointed, and who have been placed on the list for such visitation by the master in L. In addition to the above instances of statutory visitation there are also provisions for the visitation of rate-aided patients by the public local authority and their medical officer.

Housing.—As to the housing of the insane, there are three distinct types of mental hospitals; co. and bor. asylums, registered hospitals, and the metropolitan and prov. licensed houses. The Acts contain extensive legislation for the regulation and management of these institutions.

Custody and Detention.—Elaborate measures are incorporated in the Acts to ensure, as far as possible, that no person, whose mental state does not warrant reception or detention in a mental hospital, either for his own good or the good of the public, can have his rights of liberty infringed.

Certification.—As to private patients (excepting in the cases of lunatics *so found*, who may be detained by the order of the committee of the person, or in cases of extreme urgency demanding immediate supervision) the prin. Act (*i.e.* the Act of 1890) requires the intervention of a judicial authority, whose order for detention is obtained on petition supported by two medical certificates. The petition is, however, dispensed with in the case of a person 'not a pauper' and 'not under proper care and control.' The cases of urgency referred to may be dealt with by an urgency order signed by a relative or friend or other person, accompanied by a medical certificate containing a statement of the reasons for the employment of such methods. This order, however, only covers seven days' detention, and before or at the end of that period has to be super-

seded by the order of a judicial authority if further detention is deemed to be necessary. The rate-aided patients cannot be received or detained, other than in poor law (now national assistance) institutions, except upon the order of a justice of the peace. This latter is called a summary reception order and must be supported by one medical certificate, differentiating as between the private and rate-aided classes in two respects, *i.e.* omitting the necessity for a petition and accepting one medical certificate in place of two. The Acts also make provision for sending reports at various fixed periods relating to the mental and physical conditions of patients after their admission into institutions. Reports and certificates in one form or another are obligatory, whether the patients belong to the private or the rate-aided class, and extend also to persons who are lunatics *so found*.

Discharge.—Discharge may be brought about in the case of private patients by the order of the petitioner, *i.e.* the person upon whose petition the reception order was granted. In the absence, for any cause, of such petitioner, other persons may be substituted to exercise the power. Rate-aided patients in the co. and bor. mental hospitals may be discharged on the authority of the visitors of such institutions, whilst power resides with the Court of Protection to order discharge of patients, under various conditions laid down in the prin. Act. The Acts nowhere give direct authority to the medical superintendent of a mental hospital, registered hospital, or a licensed house to order the discharge of any patient detained there. In the cases, however, of recovery of a patient in a registered hospital or licensed house, after seven days' notice thereof to the person on whose petition the reception order was granted, the patient shall forthwith be discharged, unless in the meantime the petitioner or other responsible person shall have effected the removal. In cases where the petitioner or other substituted person orders the discharge of a patient who is deemed by the medical officer of the institution to be dangerous and unfit to be out at large, and a medical certificate to that effect is given, together with the grounds thereof, such patient shall not be discharged unless the Court of Protection or Visitors grant their assent.

Voluntary Boarders.—Voluntary patients can be admitted for treatment in the registered hospitals and licensed houses, and there are statutory provisions with respect to their admission and detention under the prin. Act where they are referred to as boarders. Generally speaking there is no power to receive boarders into the co. or bor. mental hospitals. The application to be admitted as a boarder must be voluntary, and in the case of licensed houses admission must be sanctioned by the Court of Protection or, where such house is not within their immediate jurisdiction, by two of the visiting or licensing justices. For a period of twenty-four hours their detention may be compulsory, but at the end of that time, after the boarder's written notice to quit, further

detention is illegal unless steps are taken for certification. The admission of a voluntary boarder into a registered hospital does not require the consent of the Court of Protection, but it is necessary to send to that body a notice of admission of a boarder both into that class of institution as well as into a licensed house.

The Mental Treatment Act, 1930.—This Act provides for the treatment of mental illness in its preliminary stages by enabling patients to be received, either voluntarily or on the application of the husband or wife or a relative, for temporary treatment without certification either in a mental hospital or in any hospital, nursing home, or place approved by the Court of Protection or into the charge as a single patient of a person so approved. Before the passing of this Act the law was that the consent of two, later one, commissioners or justices had to be obtained in each case where a voluntary patient wished to be admitted to a licensed house. Now this consent is rendered unnecessary, though the Court of Protection must have approved the institution and there are stringent provisions as to notice of reception, death, and departure being sent forthwith to the court.

Criminal Lunatics.—Under the warrant of the home secretary criminal lunatics may be detained during the royal pleasure in criminal lunatic asylums.

Estates of Persons of Unsound Mind.—Under section 171 of the Law of Property Act, 1925, the court has power to settle the beneficial interest of a lunatic or defective. The Lunacy Act, 1922, provides for the cases where lunatics are trustees or are mortgagees jointly with other persons.

Contract and Torts, Marriage and Divorce of Lunatics.—Simple contracts (q.v.) of persons of unsound mind are voidable. They are binding upon such person or his representatives unless he or someone on his behalf can prove that the other party to the contract knew he was so insane as not to know what he was doing. In order to deprive the other party of his rights on the ground of notice of the person's state of mind, something more than general reputation or a casual intimation that the other is out of his mind is requisite. A person of unsound mind may make a valid contract during a lucid interval, but it is for the other contracting party to prove the existence of a lucid interval. But the property of a lunatic (whether he be found so or not) is bound to recoup the reasonable cost of necessities supplied to the lunatic, and it is immaterial whether the person supplying the necessities knew or did not know of the l. A lunatic or his estate is liable for necessities supplied to his wife by any one who was ignorant of his state of mind, and to whom the lunatic when of sound mind had held out his wife as his agent. As to the question of the voidability of specialty contracts, a person found by inquisition to be a lunatic cannot execute a valid deed disposing of his property, not even during a lucid interval, unless and until the inquisition is annulled.

Apart from statute unsoundness of

mind is no bar to a valid marriage if the alleged lunatic knew at the time of marriage that he was being married, and fully appreciated at the time the duties and responsibilities which the contract of marriage creates; and insanity supervening after marriage is not a ground for divorce or judicial separation unless it also amounts to cruelty, when it might be a ground for separation, or becomes incurable; and in the case of a petition for divorce on this ground the respondent must have been continuously under treatment and care for at least five years immediately preceding the petition (see *DIVORCE*). A lunatic husband or wife (insane when married) may, on recovering reason, petition for nullity. The sane spouse may also petition for nullity at any time, but the burden of proof of the insanity of the other spouse at the date of marriage is upon the petitioner. The court does not usually attempt to gauge the extent of the mental derangement, but confines itself to the broad issue of the health or disease of the mind at the time of the ceremony (W. Lakey and D. P. Kees, *Law and Practice in Divorce and Matrimonial Causes*, 13th ed., 1946). It seems that under a statute of George II. marriages of lunatics so found by inquisition are void without the necessity of nullity proceedings, though the point is not free from doubt. L. is no answer to a petition for restitution of conjugal rights. It is a good answer to a petition for divorce on the ground of adultery, or other matrimonial offence, if the respondent were of such unsound mind as not to be aware of the nature and consequences of his offence. The will of a person alleged to be of unsound mind at the time of making it cannot be attacked if the testator at the time of executing the will had a sufficiently good memory to recall the nature and amount of his property and the persons who might have moral claims upon it, and further, if his judgment and will-power were not so subject to the influence of morbid ideas or external control as to be inadequate to balancing the relative strength of those claims. *Moral insanity* (see *CRIMINOLOGY*) is not sufficient to invalidate a will.

The general principle in the law of torts (civil wrongs apart from breach of contract) is that a lunatic is liable to the same extent as any other person, for intention and state of mind are hardly germane to questions of tortious liability. But, as Sir Frederick Pollock points out, a lunatic would hardly be held liable in damages for 'incoherent words of vituperation.'

The control of the person and property of lunatics belongs of right to the Crown (q.v.), a right which was confirmed by the statute *De Prærogativa Regis* of 1324. Formerly the king took the profits of the estates of idiots for his own use, and acted as a trustee for the estates of lunatics (i.e. *non compos*). But for at least three centuries this royal jurisdiction has been delegated to various officials or bodies like the lord chancellor (q.v.), the old court of wards, and the court of chancery (q.v.), and is now vested in the

masters in L. Masters in L. are barristers of ten years' standing, who are empowered to hold inquisitions as to the state of mind of a person alleged by near relatives, executors, or certain other persons to be lunatic. A petition for an inquisition must be backed up by medical affidavits, stating the facts relied upon to prove the mental incapacity. The L. laws are administered by a Court of Protection, comprising a chairman, four senior commissioners, a number of other commissioners and inspectors. The masters have power also to make all necessary or consequential orders for dealing with the persons and estates of lunatics so found by inquisition. Under the Lunacy Act, 1890, they also have wide summary powers of management and administration over the property of lunatics not so found, such summary powers being exercisable exclusively for the benefit of the lunatic.

Statistics.—The following table gives the number of notified insane persons in England and Wales, Scotland, and N. Ireland, so far as such information is available:

Year	Institutions	Private Cure	Total	Per 10,000 of Pop.
<i>England and Wales</i>				
1914	132,201	5854	138,055	37
1936	149,549	4222	153,771	38
1937	151,526	3996	155,522	38
1938	153,471	3882	157,353	38
1939	154,888	3835	158,723	39
<i>Scotland</i>				
1914	15,801	2913	18,714	40
1936	18,440	1257	19,697	40
1937	19,395	1201	19,596	39
1938	18,508	1144	19,652	39
1939	18,554	1087	19,641	39
<i>Northern Ireland</i>				
1914	—	—	4939	40
1936	5327	20	5347	41
1937	5444	22	5466	43
1938	5541	24	5565	43
1939	5617	31	5648	44

(The above figures include persons in state criminal lunatic asylums, the average number per annum being about 800.)

The total number of mental patients in England and Wales (as at Jun. 1, 1948) was 145,772 (private patients, 13,206; rate-aided, 131,652; Broadmoor patients, 914). Of this total the numbers in the various hospitals, homes, etc., were as follows: co. and bor. mental hospitals, 128,817; in other types of premises run by local authorities, 138; registered hospitals, 2429; licensed houses in the metropolitan area, 754; prov. licensed houses, 1624; nursing homes, 54; naval and military hospitals, 206; Broadmoor, 830; public assistance institutions and general public health hostels, 8893; private single care, 91; and on outdoor relief, 2036. Of the Broadmoor patients given in the first figure above, some 84

were in co. mental hospitals. (After July 1, 1948, all mental patients came under the national health service. The above classification has therefore now disappeared.) See also MENTAL DEFICIENCY ACTS.

See G. E. Mills and A. H. R. W. Poyser, *Lunacy Practice* (1934); N. A. Heywood and A. S. Massey, *Lunacy Practice* (6th ed., by D. G. Hunt and J. F. Phillips), 1939.

Lunar Nutation, see under NUTATION.

Lunar Theory, see under MOON.

Lunawada, small state of Bombay prov., India. The rulers of L. belong to the historic Solanki clan of Rajputs, claiming descent from the famous Sidhraj Jaysinh of Anhilwad (Gujarat). Besides having fine stretches of good agric. land, L. contains a large forest area yielding rich timber. The cap., L., is a fortified tn., 65 m. E. of Ahmedabad. Area 388 sq. m. Pop. 105,400.

Lund, tn. in the lon and 12 m. N.E. of Malmö, Sweden, was the cap. of Denmark in the twelfth century, and reunited with Sweden, 1658. It contains a fine eleventh-century cathedral, observatory, zoological museum, botanical gardens, and a univ. founded in 1668. The industries are sugar refining, furniture making, woollen manufs., and tanning. Pop. 31,000.

Lunda, ter. in Central Africa, situated S. of the Belgian Congo, and politically belonging partly to Belgian Congo and partly to Portugal. It is watered by the Kasai, Lulua, and Lubilash, and inhabited by the Kalunda, a tribe of Bantus. The Bantu supreme chief is called Muata Yamvo, who shares his power with the Lukokeshia, both these rulers being elected by the nobility. The site of the cap., called Musumba, changes at the death of the Muata Yamvo. A Portuguese company was formed in 1917 to mine the diamond deposits located in the L. dist. in the N.E. corner of Angola. Pop. (estimated) 2,000,000.

Lundy, Benjamin (1789-1839), Amer. abolitionist, b. at Handwick, New Jersey, of Quaker parentage. He contributed to the *Philanthropist*, and was the first to establish anti-slavery periodicals.

Lundy Island, in the Bristol Channel, England, 12 m. N.W. of Hartland Point; has an area of 1051 ac., most of which is pasture land. It contains a lighthouse built in 1820, and remains of an anc. castle and round towers, and is a Royal Naval signal station with telephone connection with Barnstaple. It was a stronghold of smugglers. Pop. about 50. See monograph by J. R. Chanter, 1877, and P. T. Eliottson and V. Barlow, *Tempestuous Isle*, 1949.

Lüneburg, tn. of Hanover, Germany. 31 m. S.E. of Hamburg, on the Ilmenau. There is a fine old tn. hall, the fourteenth-century church of St. John, and that of St. Michael, fifteenth century. L. was a member of the Hanseatic League. The chief manufs. before the Second World War were textiles, carpets, chemicals, and it has iron works and gypsum quarries.

It was at F.-M. Montgomery's headquarters on L. Heath that Doenitz (*q.v.*) and others came to surrender unconditionally all the Ger. forces in Holland, N.W. Germany, and Denmark. Pop. about 30,000. See WESTERN FRONT IN SECOND WORLD WAR. *German Collapse in Northern Germany.—Himmler's offer of surrender.*

Lünen, industrial tn. of Westphalia, Germany, 8 m. N. of Dortmund. Pop. 23,000.

Lunenburg, seaport tn., cap. of L. co., Nova Scotia, Canada, 45 m. S.W. of Halifax. The fishing fleets start from here for Labrador. It has a large trade with the W. Indies, and has shipyards,

China, near the borders of Tongking. It is on one of the main trade routes, but its trade is of no great importance to-day owing to the absence of railroad communications. Pop. 14,000.

Lungkow, port of China, in the Laitchow Bight on the coast immediately opposite the mouth of the Hwang-Ho. Pop. 11,000.

Lungs. The L. are the greyish, spongy, irregularly pyramidal or conical elastic organs of respiration, occupying the greater portion of the thorax, the remaining central portion of this cavity being termed the *mediastinum*, and containing the heart, great vessels, roots of L., etc. Each organ has an apex extending into the root of the neck just above the first rib, and a

LUNENBURG, NOVA SCOTIA

iron foundries, etc. Pop. 35,000.

Lunette: 1. In fortification, a redan with lateral wings and gorge generally open, built for the protection of roads and bridges. 2. (Fr. *lune*, moon), in architecture a crescent-shaped or semicircular aperture, made so as to admit the light or the sound of bells. The word is also applied to a semicircular pane, filled in with decorative carving.

Lunéville, tn. in the dept. of Meurthe-et-Moselle, France 15 m. E S.E. of Nancy. It is a military depot. The peace of L. was signed here in 1801 between Germany and Napoleon I. The industries are woollen and cotton spinning and tanning and manufs. of gloves, porcelain, and linen; there are large motor and railway engineering works. The tn. was a centre of severe fighting during the Fr. invasion of Lorraine under Castelnau in 1914. L. was captured by Amer. forces on Sept. 19, 1944. Pop. 20,300.

Lungchau, tn. in the prov. of Kwangsi,

concave base resting on the diaphragm. The outer surface is smooth and convex, and the inner is concave and in part adapted to the pericardium. The posterior border fitting into the deep concavity on either side of the spinal column is broad and rounded, while the anterior edge is thin and overlaps the front of the pericardium. Each lung is enclosed in its serous membrane, the *pleura*, a double bag, the inner closely covering the lung and the outer forming a lining to the cavity of the chest. Between the two surfaces of the pleura there is a small amount of lubricatory fluid as in the case of the pericardium. The bronchus (*q.v.*) and the great vessels join the lung at its root, which is situated upon the inner surface, somewhat above the middle of the lung and towards its posterior border. Within the lung the arterial trunks run behind the bronchial branches, and the venous trunks are situated in front.

Dimensions, etc.—The right lung is a

little thicker and heavier than the left, but is almost an inch shorter owing to the curvature of the diaphragm in accommodation of the liver. The organs vary in weight and size according to the amount of blood they may happen to contain. In general the right lung weighs about 22 oz. in the adult male, and the left weighs about 20 oz. The totals are less in the case of the female, both absolutely and also relatively, for the lung weight is about $\frac{1}{10}$ of the body-weight in the male and about $\frac{1}{12}$ in the female.

Properties and Structure.—The mass of the organ is of a light, porous, spongy texture, and when healthy is buoyant in water, hence the popular name of 'lights' applied to the L. When fully distended the sp. gr. of the organ is only 0.126, but rises to 1.056 on being entirely deprived of air (Krause). The pulmonary tissue is endowed with great elasticity, in consequence of which the L. collapse to about one-third of their bulk when the thorax is opened. The right lung is divided into three lobes, one of which is less distinct; the left is divided into two lobes. The surface of each lung is marked out into polygonal spaces, which are the bases of the lobules, and the substance of the organs is made up of lobules united by connective tissue (*interlobular septa*), which is continuous with the sub-pleural and peribronchial connective tissues. Each lobule is a complete system in itself, consisting of (a) a small bronchial branch; (b) artery, capillaries, and vein; (c) nerves; (d) lymphatics.

Air Circulation.—The L. may be regarded as a many-chambered elastic bag placed in the air-tight thorax and having a communication with the exterior only by means of the trachea (windpipe). Atmospheric pressure acting down the trachea keeps the L. so far stretched that the two pleural layers are always in apposition, and together with the heart and great blood-vessels they completely fill the thorax. The air passes on into and through the bronchi, which somewhat resemble the trachea in structure; the current then continues through the various subdivisions of bronchia, bronchioles, and bronchial tubes, which, diverging in all directions, never anastomose, but terminate separately. After a certain stage of subdivision (diameter about 1 mm.) the walls of the bronchial tubes become beaded with blind, cup-shaped pouches termed *air-cells* or *alveoli*, the walls of which consist of a thin membrane of areolar and elastic tissue lined by thin, transparent, flat cells. The cells are about $\frac{1}{2}$ in. in diameter, and are said to number upwards of 700,000,000 and to present a very great surface to the air. It is from the air in these cells that the blood obtains a fresh supply of oxygen and gives up its carbon dioxide, for between adjacent alveoli there is a layer of thin-walled capillaries, the vessels twisting first to one side and then to the other of the septa between the alveoli.

Blood-vessels.—The branches of the pulmonary artery accompany the bronchial tubes, but in their remote ramifica-

tions they subdivide more frequently. They are independent of one another, though the corresponding veins frequently anastomose. The terminal arterial branches are about $\frac{1}{10}$ in. in diameter, and from them arise the capillaries $\frac{1}{100}$ in. in diameter, so closely meshed that their interspaces are even narrower than the vessels. The radicles of the pulmonary veins arise from the capillary network of the alveoli and from that of the smaller bronchial tubes; the fusion of these and other venous vessels gives rise to the pulmonary veins, which leave the roots of the L. and return the blood to the left auricle of the heart. The pulmonary

LUNGS: THE AIR PASSAGES
L, larynx; T, trachea; B, bronchi;
AC, air cells.

vessels differ from the systematic in regard to their contents; the arteries in the former circulation carry dark red deoxygenated blood, while the veins carry bright red oxygenated blood. The pulmonary veins have no valves, nor are they more capacious than their corresponding arteries. Apart from the circulation mentioned above, there are also smaller bronchial arteries springing from the aorta which nourish the bronchi, lymphatic glands, and connective tissue of the L., while bronchial veins return much of this blood to the systematic circulation, though some small amount of it is returned by the pulmonary veins.

Lymphatics.—Part of the numerous lymphatics of the L. takes origin from lymphatic capillaries in the interlobular septa, others near the surface of the L. come into connection with the subpleural lymphatic plexus. Both sets emerge at the roots of the L., where they enter the bronchial glands, passing thence from the left lung into the thoracic duct, and from

the right lung into the right lymphatic trunk. Foreign particles caught by the mucus in the bronchial passages often find their way through the epithelium into the lymphatics, and may finally reach the bronchial glands. Particles of carbon are frequently found embedded in the lymphatic glands of those engaged in coal-mining.

Nerves.—The nerves of the L. come from the anterior and posterior plexuses, which are formed chiefly by branches from the pneumogastric or vagus nerve, joined by others from the sympathetic system. They enter the L. and follow the distribution of the vessels and bronchi, small ganglia being situated in the walls of the latter. In the lower vertebrates (frog, newt) the nerves are chiefly distributed to a layer of plain muscular tissue, which is everywhere found taking part in the composition of the relatively simple pulmonary wall (Stirling), but in mammals their exact mode of termination is not clear. Impulses pass from the L. along the pneumogastric and along other nerves to a respiratory centre in the medulla, and from this centre efferent impulses proceed along various nerves, and so bring about respiratory movements.

Condition in the Fetus and Change after Birth.—In the fetus the L. contain no air, and consequently sink in water. After birth they undergo rapid and remarkable changes consequent on the commencement of respiration. The chief changes are given below. In a still-born child or in a full-period fetus the L. lie packed at the back of the thorax; subsequent respiration in the latter case causes the L. to fill the pleural portions of the thoracic cavity. The introduction of air and of an increased quantity of blood converts their tissue from a compact, heavy, yellow-pink substance into a loose, light, rosy-pink, spongy material, resembling blood froth. These changes occur first at the anterior borders, and in the right lung rather earlier than in the left. The absolute weight, which has been increasing gradually during the intra-uterine period, undergoes a marked increase at birth, amounting to more than one-third of its previous weight owing to the increased amount of blood. The relative weight usually increases from about $\frac{1}{4}$ of the previous body-weight to $\frac{1}{2}$, a proportion which suffers no material change during later life. The sp. gr. is, as might be expected, materially reduced on the commencement of breathing.

Diseases, etc.—The L. are particularly subject to disease. Pneumonia, which may attack one lung or both, frequently arises as a secondary complication in association with other diseases. It is due to inflammation of the lung tissue, and is generally accompanied by pleurisy or inflammation of the pleura. Wounds of the thorax caused by piercing implements, or even by the fractured ends of broken ribs, may allow air to enter between the pleura. This is termed *pneumothorax*. The natural elasticity of the L., coupled with the atmospheric pressure acting on its exterior, leads to its contraction and to a consequent difficulty of inspiration.

Artificial pneumothorax is now much used as a method of collapsing the L. in the treatment of pulmonary tuberculosis (phthisis). *Empyema* is the presence of an abscess in the pleural space between the L. and the chest, and is usually caused by the micro-organisms of pneumonia, typhoid fever, etc. An opening of the chest space and draining away of the contained fluid is the usual surgical treatment. Other disorders may require the removal of portions of the lung tissue itself. *Bronchiectasis* is a condition following chronic bronchitis or pneumonia; the bronchioles become expanded here and there into large cavities filled with infected mucus. Treatment follows the same lines as for bronchitis and phthisis.

See ALSO ARTIFICIAL RESPIRATION; BREATHING.

Lungworm, see under ROUNDWORM.
Lungwort, lichen growing on tree trunks in damp sub-alpine regions. Sometimes prescribed in pulmonary diseases, like Iceland moss. Also the name of a boraginaceous perennial herb, the narrow-leaved L. or Jerusalem crowslip (*Pulmonaria officinalis*), with lance-shaped leaves and pink funnel-shaped flowers.

Lupercalia, yearly festival of purification, held at Rome on Feb. 15, in honour of Lyncæus Pan (or Faunus) whose worship was introduced by Evander, the Arcadian, or, as some think, of the wolf that gave suck to Romulus and Remus. It was held at the foot of the Palatine Hill, near the cave of Lupercus in which was preserved a bronze statue of a wolf. The officiating priests, called *Luperci*, sacrificed goats and dogs with the blood of which they touched the foreheads of two youths. The blood was then wiped away with wool dipped in milk, and the youths were obliged to smile during the whole process. The skins of the sacrificial victims were then cut into long lashes, called *februa* (cf. Lat. *februare*, to purify); with these the priests ran along the walls of the city, slashing any one they met as an act of purification. Women were particularly eager to receive a cut, which was believed to remove barrenness. The rite was discontinued in A.D. 494 when Gelasius I. replaced it by the festival of purification of the Blessed Virgin Mary on Feb. 2.

Lupescu, Magda (b. ? 1901), Rumanian adventuress, third wife of ex-king Charles (Carol) II. of Rumania; b. at Iasi (Jassy), daughter of a poor Jewish watchmaker and of an Austrian Catholic mother. Her original name is said to have been Wolff. Educated at a convent, she married an army officer, whom she divorced in 1921 when she first met Carol, who, in the same year, married Helen, daughter of King Constantine of Greece. In 1925 Carol renounced the succession and left Bucharest for Paris, accompanied by his mistress, L. From 1925 to 1930 the couple lived in Neuilly. In 1930 the peasant leader, Maniu, effected a *coup d'état* which deprived Michael, Carol's son by Queen Helen) of the throne and brought Carol himself back as Rumania's dictator king. L. then returned to Rumania or was smuggled back and kept in a mt. cottage

for some time before her presence was admitted. When Maulu discovered the truth he broke with Carol for ever. But although L. lived outside the palace, either at the mt. cottage near Jannissa or in her luxury flat in Alea Vulpaoh, she exercised strong political influence, putting her friends in key positions in the civil service and the army and is even said to have had her own secret service. Yet all the time she kept discreetly in the background. The opposition party pub. pamphlets against her, denounced her, and attributed the troubles of their country to her, the more so as her Jewish blood made her a target for anti-Semitism. But in 1940, when Antonescu's Iron Guard brought the country under the Ger. wing, Carol had to flee and Mme L. escaped with him, first to Spain, then Portugal, then Cuba (1941), finally settling in Brazil (1945). On July 8, 1947, it was reported that Carol had just then married Mme L.—who was stated to be dying of anemia—and that she had received the official title of Helena, princess of Rumania. See also CHARLES (CAROL) II.

Lupiae, see LECCE.

Lupino, name of a family of actors, including George (1853–1932), Brit. comedian of It. descent; his son Stanley (1895–1942), b. in London; actor, playwright, and producer of stage and screen plays; Ida (b. 1916), daughter of Stanley L., actress on Brit. stage, excelling in clear-cut characterisations as in *The Hard Way*, and in motion pictures at Hollywood; Barry (b. 1884), actor, pantomimist, and dancer, son of George L., studied dancing under Espinosa and trained in pantomime by his father; Wallace (b. 1897), son of Henry Charles L., dancer, actor, and screen artist; one of his chief parts was *Percheater in Me and My Girl*.

Lupinus, or Lupin (from *lupus*, wolf), fanciful name to indicate the destructive nature of this plant in overrunning land. Almost any soil suits. The following are the best varieties: *Arborea*, the tree lupin, a species of hardy evergreen with purple and yellow flowers (5 to 6 ft. high); *Snow Queen*, a white variety; *Hartwegi*, blue and white (2 ft.); *Hybridus Altracoccineus*, scarlet with white tips; others are *Myabilis*, *Nanus*, *Polyphyllus* (the common lupin, native to N. America), *albus*, *Purple King*, and *Somerset*. It belongs to the pea family, Leguminosae, and is closely related to the *Genista* and *Laburnum*.

Lupus, tubercular disease of the skin. The ordinary form is a slowly progressive and destructive affection of the skin, usually commencing in childhood, and has a predilection for the face, when it is most possibly due to transference from a consumptive by kissing. It is very disfiguring and hence the name L. (wolf). The modern treatment is by X-rays, radium, or ultra-violet light (Finsen's lamp). *L. Erythema* is a different disease, and probably not tubercular. It attacks old people, and consists of raised red spots and patches on the face, giving rise finally to the 'butterfly patch'. This disease is more easily cured than ordinary L.

Luray Cavern, in Page co., Virginia, U.S.A., near Luray vil., has one of the finest displays of stalactites and stalagmites in the world. It is divided into sev. chambers covered with formations of various colours, and fantastic shapes. It is lighted by electricity and much frequented by tourists.

Lurcher, cross between a collie and a greyhound, used by poachers on account of its speed and sagacity. It has very keen scent, a watchful ear, and a stealthy tread; when roused it can be very dangerous, and can run as fast as a hare.

Lurgan, tn. in co. Armagh, N. Ireland, 20 m. S.W. of Belfast. It is the centre of an agric. dist. and carries on important manufs. of lawn, cambric, and damask. Pop. 13,800.

Luria, or Loria, Isaac Ben Solomon (1534–72), Jewish mystic, one of the 'Five Sages' of the sixteenth century, b. in Jerusalem. He began life as a spice merchant in Alexandria, but was so much influenced by the *Zohar* of Moses de Leon, that he became a visionary, and propagated his mystic doctrines among a large company of disciples. His teaching, as recorded by his biographer, Hayim Vital, had a lasting influence on Talmud dogma.

Luristan, mountainous prov. on the W. frontier of Persia, crossed by part of the plateau of Iran, inhabited by numerous tribes, chiefly Lurio. Area 15,000 sq. m. Pop. 350,000. Between 1929 and 1932 important archeological finds were made in L. These included vessels and ornaments covering the period 2600 B.C. to A.D. 800.

Luriet, see LORLET.

Lusaka, tn. of N. Rhodesia. It is on the railway about 30 m. N. of the Kafue R., and replaced Livingstone, on May 28, 1935, as the cap. of N. Rhodesia.

Lusatia (Ger. *Lausitz*), dist. in Germany, comprising Upper and Lower L., taking its name from the Lusitzi, a Slavonic tribe. During the fourteenth century the country was possessed by the Emperor Charles IV., king of Bohemia, and in 1469 it fell into the hands of Matthias Corvinus, king of Hungary. In 1490 it was regained by Bohemia, which ceded it to Saxony by the treaty of Prague (1635). In 1815 most of L. was transferred to Prussia with the exception of Bautzen, and 900 sq. m. of Upper L. which were retained by Saxony.

Luscinus, see FABRICIUS CAIUS.

Lushale, warlike tribe of mountaineers, who inhabit the Lushal Hills of Asumu. This dist. was formerly occupied by Kukis. The L. number about 82,000.

Lu-Shun-Kau, see PORT ANTHUR.

Lusladas, or Lusladi, patriotic poem written by Luis de Camoens (q.v.).

Lusignan, tn. in the dept. of Vienne, on the Vonne, France, 15 m. S.W. of Poitiers. It has a fine eleventh-century church. One branch of the L. family were rulers of Jerusalem and Cyprus, and from the Fr. branch many distinguished families claim descent. Pop. 3000.

Lusitania, one of the three provs. into which Augustus divided Hispania, anot. Spain, the two others being Tarraconensis and Betica. L. was called after the tribe

Lusitani, and in extent corresponded very closely to modern Portugal. The Rom. seat of gov. was Augusta Emerita (Merida). See T. Mommsen, *Provinces of the Roman Empire* (Eng. trans.), 1886.

'Lusitania,' Cunard liner, sunk without warning by a Ger. submarine on May 7, 1915. The L. was launched at Clydebank in June 1906; was 785 ft. long, 88 ft. wide, and had a displacement of 40,000 tons. She had accommodation capacity for 3000 passengers, and during a crossing of the Atlantic, in March 1914, covered 618 knots in twenty-four hours. At the time she was sunk she was on a voyage from New York to Liverpool. Before she sailed the Gers. had inserted advertisements in Amer. papers warning people against sailing. This action was much resented by Amers., and no fewer than 218 sailed in the ship. The torpedo struck her when she was off the Old Head of Kinsale, and she sank within forty-five minutes. Of 1255 passengers and 651 crew, 1198, including 124 Amers., were drowned or killed. The action caused anti-Ger. riots in London's E. End, and the greatest indignation in America, but Germany, in a note to her embassy at Washington, dated May 10, 1915, gave various unsatisfactory explanations, and even struck a medal to commemorate the sinking incident. This elicited a strong reply from President Woodrow Wilson, who condemned the action in the most emphatic language. It is incontestable that the sinking of the L. had a great influence upon America's decision to enter the First World War on the side of the Allies.

Lussac, Joseph Louis Gay-, see GAY-LUSSAC.

Lussin, or Lossin, is. of Dalmatia, Yugoslavia, formerly of Austria, in the gulf of Quarnero, and separated by the channel of Ossero from Cherso. The chief tns. are L. Grande on the E., containing a Venetian palace, and L. Piccolo, the chief port of the Quarnero Is. and a popular pleasure resort. Pop. 12,000.

Lustré, characteristic appearance of many substances in ordinary light, due to the intricate interworking of transparency, translucency, reflection, refraction, and diffraction, chiefly at the surface of the substances. For example, the L. of pearl is largely due to the diffraction of light. Practically all metals have what is termed metallic l., probably due chiefly to reflection combined with refraction of light partially absorbed in surface crystalline layers and reflected back again. In the case of crystals and precious stones refraction plays a larger part. The whole phenomenon is due to interference with incident light rays by the surface and surface layers of the substance before finally reflecting them.

The term is used also for pottery covered with an iridescent glaze: silver and golden copper types are produced, and a mother-of-pearl glaze is a feature of Belleek (q.v.) ware.

Lustrum (Lat. *luere*, to purify), sacrifice for purification and expiation by the censors at the end of the quinquennial

census of the Rom. people; a five-year period thus became known as a L. The sacrificial victims (boar, sheep, and bull) were carried round the people assembled in the Campus Martius, hence it was also called the Ambulstrum. Before any expedition was undertaken, and after any disaster, the *lustratio* of the fleet or army was performed. See LUPERCALIA.

A SIXTEENTH-CENTURY LUTE

Lute (Arabic *al ud*), stringed instrument of music, widely used in the sixteenth and seventeenth centuries. The primitive type of L. is the two-stringed *tanbur* of Persia. It came into Europe through the Arabian *al ud*, which consists of a convex and pear-shaped sound-body stringed with silk and played upon by a shell or quill plectrum. The L. family includes the Neapolitan mandoline, but excludes the guitar and sitar, which are distinguished from it in shape and by possessing sides and ribs. The s. s. L. seems to have had four pairs of catgut strings: the mandoline still has four pairs, but the larger *mandola* or *mandore* has eight pairs. The *theorbo* or *archlute* is a double-necked L.; it has

extra brass strings, and the necessity of retuning these at an alteration of key led to the custom of using only one key for the movements of a suite; the *chitarra* has a very long neck. These two forms were superseded by the violoncello and the double-bass, and the mandoline, ukulele, etc., are descendants of the L. Mozart, Bach, and Handel wrote parts for the instruments of the L. family.

Lutecium. Symbol Lu, atomic number 71, atomic weight 175.0, an element discovered independently by A. von Welsbach (1905) and G. Urbain (1907). The former named it Cassiopeium, and the latter adopted L., which is now the accepted name. It was separated from ytterbium proper (called neo-ytterbium for a time) in the so-called 'ytterbium,' which was really a mixture of the two elements. This was achieved by fractionation of the nitrates. L. is a rare-earth element, with the typical valency of three. It forms colourless salts such as the chloride and sulphate. Pure lutecia, Lu₂O₃, was isolated in 1913.

Lutetia Parisiorum, anc. tn. corresponding to Paris, founded in 53 B.C. by Julius Caesar, who fortified it for strategic purposes.

Luteva, see LONÈVE.

Lutgendortmund, tn. in Westphalia, Germany, 5 m. S.W. of Dortmund. It has collieries and sawmills. Pop. 15,000.

Luther, Hans (b. 1879), Ger. statesman b. in Berlin, studied law and entered the public service, first at Charlottenburg and then in Magdeburg. During the First World War he was secretary to the association of Ger. and Prussian tns., and from 1918 to 1922 was burgomaster of Essen. In Dec. 1922 he returned to Berlin to take office as food minister; and nine months later was made finance minister of the republic under Brünnemann. In this office he negotiated the Dawes loan for Germany (1924) and was responsible for restoring the Ger. currency. In 1925 he became chancellor, in which capacity he headed the Ger. delegation to Locarno (see LOCARNO CONFERENCE AND TREATIES). He resigned in May 1926 and became connected with the management of the state railways. He had no definite party affiliations, but in 1927 he became a member of the People's party. In 1930 he succeeded Schacht as governor of the Reichsbank and left this post in 1933 to become Ger. ambassador in Washington (1933-37).

Luther, Martin (1483-1546), Ger. reformer and translator of the Bible, called the 'Founder of Protestant Civilization.' He was b. at Eisleben, in Saxony, of peasant parents. His father, Hans L., a slate-cutter, and his mother, Margaret, a very pious and industrious woman, moved after his birth to Mansfeld. The boy was sent to school at Magdeburg, and then in 1498 to Eisenach, where he lived with Frau Ursula Cotta. His means were very restricted, and to earn a few coins he and some of his school friends sang occasionally in the streets. At the age of eighteen L. entered the univ. of Erfurt, where he received his first degree in 1503 and his

doctorate in philosophy two years later. He then began lecturing on the physics and ethics of Aristotle, and within a year, contrary to the desire of his father, who had destined him for the legal profession, he entered an Augustinian monastery at Erfurt. During these years he passed through severe mental conflicts, and found much comfort in reading the works of St. Augustine. He was ordained priest in 1507, and in the following year entered upon his duties as prof. of philosophy to the new univ. of Wittenberg. He abandoned the methods of a decayed scholasticism and rejected the guidance of traditional authorities. He was much attracted by the works of Wm. of Occam, an Eng.

MARTIN LUTHER

Engraving after the original picture by Holbein the younger

Nominalist, who had preached ecclesiastical reform. In 1510 L. visited Rome on business connected with his monastic order, and was deeply moved at the irreligion and corruption of the papal court. On his return to Wittenberg in 1512 he was made doctor of theology. About the same time he began to preach at the desire of Staupitz, the vicar-general of his order, and attracted great crowds by his eloquence.

He first became prominent in the direction of ecclesiastical reform by his pub. in Lat. of ninety-five propositions directed against the sale of indulgences by the Dominican monk, Johann Tetzel. These he nailed to the church door at Wittenberg Castle on Oct. 31, 1517. A Ger. trans. spread through Germany like wildfire. The original propositions were burnt as heretical, but L. refused to recant, and even refused to obey a papal summons to Rome, though he asserted that at this time he did not contemplate severing his connection with the Church of Rome. In

the same year (1517) he pub. his first work, an *Exposition of the Seven Penitential Psalms*, which was soon followed by an *Exposition of the Ten Commandments* and of the *Lord's Prayer*. At a general meeting of his order in 1518 he attacked the outworn scholastic methods in theology, and in the same year had a controversy with Dr. Eck. He also pub. his *Resolutions*, which emphasised his objection to the sale of indulgences. Though refusing to go to Rome, he agreed to meet Cardinal Cajetan at Augsburg, but the interview had no satisfactory results as far as the pope was concerned. If anything L.'s position became more radical, and his disciples increased every year.

In 1520 L. pub. three of his most important works, namely, *On the Liberty of a Christian Man*, *An Address to the Nobility of the German Nation*, and *On the Babylonian Captivity of the Church of God*. In these he attacked the supremacy of the pope and the doctrines of the Church of Rome. He appealed for tolerance and showed the practical need of the individual to approach God by his own prayer, without the intervention of a priestly mediator. He now realised fully that his separation from the Church of Rome was inevitable. The pope replied to his attack by issuing a Bull of forty-one theses. This Bull L. burnt publicly at the Elster Gate of Wittenberg before a large crowd of students and sympathisers. In this same year Charles of Spain was crowned emperor at Aachen, and to his first Ger. diet, in Jan. 1521, L. was summoned. L. repaired to Worms and, called upon before the assembled powers of Germany to retract his writings, made his confession of faith. He was placed under the ban of the empire, but received practical help from his many admirers among the princes of the empire. The news spread that he had been assassinated by papal emissaries. Germany was in a ferment of excitement. The fact of the matter was, as became known later, the reformer had been safely conducted to the castle of the Wartburg at the instigation of his friend, the Elector of Saxony. There he was virtually kept a prisoner until the excitement should subside. He spent these hours of seclusion in hard study and in translating the Bible into Ger.

Meanwhile Lutheran opinions were spreading fast among the Ger. populace, restive under both social and eccles. grievances. Germany, in consequence, was threatened with disorders, and even with revolution. The trouble was worst at Wittenberg, where the populace had been excited by the teaching of the Zwickau prophets. L. left his retreat, and by reinstating order estab. his own position as leader. He did his utmost to prevent the Peasants' war of 1525, and though previously opposed to the tyranny of the ruling classes, he was no democrat, and urged them to suppress the insurgents in every way in order to procure peace. This lost him much popular sympathy and helped to mould the Protestant Church into an oligarchic and Erastian form. In this year too he be-

came estranged from Erasmus, to whose treatise *De Libero Arbitrio* he replied hotly in *De Servo Arbitrio*. About the same time he married Catherine von Bora, a Cistercian nun, who with eight companions had left her convent under the influence of his teaching.

At the diet of Speyer in 1526 it was resolved that both parties, Catholic and Protestant, should preach according to their conscience, but three years later the diet abolished this clause, and added another to the effect that no religious body might be deprived of its eccles. revenues, in other words, that the Church of Rome retained the revenues of the medieval church. The princes who, having changed their religion, had seized Church endowments protested against this edict and were therefore called Protestants. But the Protestants were divided among themselves on political questions as well as on the doctrine of the Lord's Supper. Zwingli and L. met at Marburg in this year to discuss their views on this question. To the diet of 1530 three separate Protestant confessions were sent, namely that of Zwingli, the *Confessio Tetrapolitana*, and the famous *Augsburg Confession*. L., being still in disgrace, did not appear in person, and his place as leader was taken by Melancthon. Charles V. was determined to suppress the Reformation. Finding compromise impossible he enforced the edict of Worms against L. and his followers. The Protestant princes joined together to oppose the decisions of the diet and formed the Schmalkald League. The Reformation now became more political in aspect, and L. gradually retired from the leadership. In fact, after the drawing up of the *Augsburg Confession*, he lived in comparative privacy, but continued to do a great deal of work in organising the eccles. polity of the new church and in suggesting its form of ritual. The Lutheran Church, differing from the Reformed Church, retained most of the medieval ceremonies and vestments. Its chief distinction from the medieval church was that the whole service (singing, reading of the Scriptures, and preaching of the sermon), was conducted in Ger. Ill health prevented L. from preaching as frequently as he would have liked. He d. at Eisenach.

L.'s writings were voluminous. The most interesting of those not already mentioned are the *Table Talk* and his *Letters*. He also wrote commentaries on the Bible, and many of his sermons are still read. The chief eds. of his works are those of Wittenberg (12 vols., 1539-58); Halle (24 vols., 1740-53); Erlangen and Frankfurt (67 vols., 1826-73); reissue Weimar (1883); people's ed. (1892); see also H. Wace, trans. of his primary works, 1896. His life was written by Melancthon, *Historia de vita et actis Lutheris* (1545). See also lives by J. Michelet (trans. by W. Hazlitt, 1846); A. Meurer, 1870; J. Kostlin, 1875; Koldo, 1884-93; A. Hausrath, 1904; A. P. Smith, 1911; H. Grisar (trans. 1913-17); J. Mackinnon, 1930; F. F. Brentano, 1936; and J. Martain (in *Three Reformers*), 1948. See

O. Beard, *Martin Luther and his Reformation in Germany until the Close of the Diet of Worms*, 1889; H. E. Jacobs, *The Lutheran Movement in England*, 1890; T. M. Lindsay, *Luther and the German Reformation*, 1900; J. W. Richard, *Confessional History of the Lutheran Church*, 1909; H. S. Denig, *Luther and Lutheranism*, 1910; H. Grisar, *Luther* (trans.), 1914; and J. W. Allen, *Political Conceptions of Luther*, 1924.

Luton, called by the Saxons Lygetune, and in the Domesday Book Loitoline, is an industrial and mkt. tn. of Bedfordshire, England, 19 m. S. of Bedford and 30 m. N. of London. The tn. was incorporated as a municipal bor. in 1876, and is the largest non-co. bor. outside the London area. It has a pop. of approximately 109,150, and an area of 8736 ac. It is an anct. tn., but until the founding of the straw-hat industry in the early nineteenth century it was of little importance. From then onward L. has progressed. The straw-hat trade was gradually replaced by ladies' felt-hat making, and to day it is still a centre of this trade. Other industries were attracted to the tn. by the offer of good sites, transport, and abundant skilled labour, and before 1914 offer of good sites and transport, and abundant skilled labour, and before 1914 such well-known firms as Vauxhall Motors, Skefko, Commer Cars, and Davis Gas Stoves were estab. in the tn. This process was continued during the post-war period, and the advent of the new industries meant for L. immunity from the economic crises of the 1930s. Other industries, including the manuf. of gelatine, cocoa, chemicals, electric cleaners, and refrigerators, have since been estab. in L. and with the creation of a municipal airport in 1936 a new industry of aeroplane manuf. was added to the tn.'s list.

L. has sev. fine buildings, the most modern of which is the tn. hall, opened by the duke of Kent in 1936. Its tall clock-tower contains a clock which was a bequest of a former mayor of the tn. The anct. par. church of St. Mary is, however, the chief building of traditional interest. Dating back to Norman times, traces of which may still be seen, it is a cruciform building in the Decorated and Perpendicular styles, and is among the largest of the par. churches of England. The interior of the church is full of interest, one of the most striking features being the unique canopied baptismal font of the Decorated period. See F. Davis, *History of Luton*, 1855, and *Luton Past and Present*, 1874; W. Austin, *History of Luton and its Hamlets*, 1928; J. G. Dony, *History of the Straw-hat Industry*, 1912; and F. Grundy and R. M. Titmas, *Report on Luton*, 1915.

Lutsk (Polish Lusk), tn. in the Volhynia Region of the Ukraine S.S.R., formerly Polish, 40 m. E. of Vladimir. It belonged to Russia from 1791 until the close of the First World War. Its fortress was captured by the Russians under Gen. Brusilov in June 1916. There were fierce tank battles in the L.-Kovno area between Ger. and Russian forces on June 29-30,

1941, L. being lost to the Russians. But it was evacuated by the Gers., together with Kovno, on Feb. 25, 1944, during the great battles for Kiev and Lwow. Pop. 20,000.

Lutterworth, mkt. tn. and dist. of Leicestershire, England, 6½ m. N.N.E. of Rugby. St. Mary's Church contains the pulpit and various relics of John Wycliffe, who held the living from 1374 till his death in 1384. There is considerable trade in agric. produce. Pop. (rural dist.), 10,400.

Lüttich, see Liège.

Luttrell Psalter, famous monumental vol. and one of the most outstanding illuminated MSS. of the fourteenth century; remarkable, too, for being one of the very few Eng. illuminated MSS. which remained in private hands until recently. Its date is about 1340. Its text, comprising the usual church offices, is embellished with exquisitely drawn illustrations of 'contemporary life, e.g. a picture of Geoffrey Luttrell (or Louterell) on a charger, with his wife and daughter in the same group. The MS. passed into the possession of the Weld family of Lutworth Castle, Dorset. Since 1929 it has belonged to the nation, having been purchased for £50,000.

Lüttringhausen, tn. in Rhineland, Germany, 5 m. E.E. of Elberfeld. There are iron and textile manufs. Pop. 13,600.

Lutyens, Sir Edwin Landseer (1869-1914), Eng. architect, b. in London, son of Charles L., who gave up the army for painting. Educated privately in art at St. Kensington, and in architects' offices, he was a practising architect at the age of nineteen, beginning by designing picturesque country houses, giving great attention to brickwork as ornament. In 1903 he began the restoration of Ludlow Castle, which was completed by 1912. A comprehensive example of his work in London is the central square of the Hampstead garden suburb, with its churches, St. Jude's-on-the-Hill and the Free Church, and the Institute. Other works he designed in London are Britannic House, Rushbury Circus; Midland Bank, Piccadilly; offices of *Country Life*; and 36 Smith Square. After 1912 he designed the restoration of Lambay and Howth Castles. In 1912 he was appointed to the committee advising the gov. of India as to the site of New Delhi, and subsequently he was one of the two architects (the other being Sir Herbert Baker) to plan and design the architectural scheme of the new Indian cap. Probably New Delhi, and the new Rom. Catholic cathedral, Liverpool, are his most important works in architecture. A.R.A., 1913, R.A. 1920, he was knighted in 1918, received the king's gold medal of the R.I.B.A. 1921, and in 1926 received the London street architecture medal of the R.I.B.A. for Britannic House. In 1924 he received the gold medal of the Amer. Institute of Architects. Other works by L. include the Manchester war memorial, Hampton Court bridge, Johannesburg picture gallery, and St. African war memorial; the tomb of George V. (in collaboration with Sir Wm. Reid Dick, the

sculptor) in St. George's Chapel, Windsor; the Australian national war memorial at Villers-Bretonneux; and the Cenotaph in Whitehall. He received the O.M. in 1942, being the first architect to be so honoured.

It is chiefly as a domestic architect that L. will be remembered, and his work on the design of modern Eng. country houses is a parallel to the work of Wren in adapting Renaissance ideas to building in brick. Of New Delhi it has been said that it suggests the setting rather for a Durbar than provision for gov. depts. and, illustrating as it does, the progress of L. from the picturesque to the monumental, serves to mark his limitations. That he had some sense of the monumental is shown by his cenotaph and Stone of Remembrance, but his natural bent might seem to have lain in the designing of façades and in the application of an intimate knowledge of fine craftsmanship in all that appertains to the art of building. In any case he was an architect in the tradition of Wren, probably the greatest since Wren, and probably he was the last of his line in an age when the grand manner of Renaissance building is yielding to a new age of glass, steel, and ferro-concrete, with the ideas in the manipulation of space which these materials have conducted to bring about. Whatever their inspiration, L.'s buildings were never mere revivals from a past age. His vice-regal palace at New Delhi is a genuine blending of E. and W., and worthy of a great artist, as may be seen by comparing it with nearby official buildings where features have been incorporated into structures without any modification. L. was president of the Royal Academy from 1938 to 1944 and a memorial tablet was unveiled in St. Paul's on May 9, 1946, in the crypt among the memorials to other royal Academicians.

Lützen, small tn. in Saxony, Germany, about 10 m. S.W. of Leipzig, with a pop. of 4900. It is famous for two battles: (1) The victory won, on Nov. 16, 1632, by the Swedes, numbering 18,000 under King Gustavus Adolphus (q.v.) over the imperialist army of 30,000 men under Wallenstein. The Swedish king, after being twice wounded, perished on the field, but this misfortune, far from discouraging the Swedes, now led by the redoubtable Bernhard of Saxe-Weimar, did but inflame their zeal for victory. (2) The victory of Napoleon with an army of some 115,000 men over the allied Russians and Prussians, who numbered 70,000, under Wittgenstein. Napoleon was, however, unable to follow up his victory. This battle is also known as the battle of Grossgörschen.

Lützow, Franz Heinrich Hieronymus (1849-1918), Bohemian historian, b. in Homburg, son of Franz, Count L. Eng. on his mother's side. He spent half his time in England. He was lecturer on Slavonic subjects at Oxford in 1904, and lectured in Amer. univ., 1912. His publs. include *Bohemia, an Historical Sketch* (1896); *History of Bohemia*

Literature (1899); a trans. of Comenius's

Hus (1909); and *The Hussite Wars* (1914).

Lützow, Ludwig Adolf Wilhelm, Freiherr von (1782-1834), Prussian soldier, b. at Berlin. He entered the army in 1795, and saw active service at the battle of Auerstadt and the siege of Colberg. At the outbreak of the war of Liberation (1813) he raised a volunteer corps of infantry and cavalry which was called the 'Black Rifles'. The corps was dissolved in 1814, becoming the 25th Regiment. L. led a gallant charge of the 6th Uhlans at Ligny (1815). He was promoted to the rank of lieutenant-general in 1830. See K. von Lützow, *Adolf Lützows Freikorps*, 1884, and F. von Jagwitz, *Geschichte des Lützowschen Freikorps*, 1892.

Luwian Language, see under INDO-EUROPEAN LANGUAGES.

Luxation, see DISLOCATION.

Luxembourg, François Henri de Montmorency-Bouteville, Duc de (1628-95), marshal of France, cousin of the great Condé, b. in Paris. He shared Condé's fortunes in the wars of the Fronde, was pardoned by Louis XIV. on his return to France (1659), and subsequently was created a peer of the realm (1661). He served in the Netherlands (1667), and defeated William of Orange at Woerden (1672). His retreat from Utrecht (1673), in the face of tremendous odds, was a masterly exploit that won for him a high reputation. In 1690 he defeated the allied troops at Fleurus, and put his old enemy, now William III. of England, to rout at Steinkirk (1692) and Neerwinden (1693). See J. de Beaurain, *Histoire militaire du Duc de Luxembourg*, 1756, and life by Comte de Ségur, 1907.

Luxembourg, prov. In the S.E. of Belgium, bounded on its E. side by the grand duchy of L. and to the S. by France. It is the region of the Ardennes and is watered by tribes of the Meuse and of the Moselle. There are large areas of forest and poor mt. pastures. Agriculture is mainly carried on in the fertile valleys. In its S. part, which forms an extension of the Lorraine ironfield of France, iron ore is found and worked. The prov. produces mainly pit props, timber, slate, iron, leather, and tobacco. The chief manufs. are boots and shoes, gloves, pottery, and hardware. The breeding of horses, cattle, and pigs is carried on. Chief tns. are Bastogne, Vielsalm, Marche St. Hubert, Virton, and La Roche. They all have fewer than 5000 inhab. Area 1706 sq. m. Pop. 213,400. The cap. is Arlon.

Luxembourg (Letzeburg), independent grand-duchy of Europe, bounded on the E. by Germany, S. by France, W. and N. by Belgium. Area 999 sq. m. The E. part belongs to the plateau of Lorraine, and the N. which is still higher, consists of the forest of Ardennes. The country is watered by the Sûre and affluents of the Moselle, which forms part of its E. border. Agriculture is carried on by about 160,000 of the pop., and some 210,000 ac. are under

cultivation, the chief crops being oats and potatoes. There are also about 150,000 ac. of meadow and pasture land. The mining and metallurgical industries are the most important and there are many blast furnaces; there is an ann. output of nearly 4,000,000 metric tons of iron ore and 2,500,000 metric tons of steel. From this output, as well as from its strategic position, L.'s importance derives. There are also manufs. of pottery, woollens, gloves, and leather.

The reigning grand-duchess is Charlotte (b. 1896), who succeeded on the abdication of her sister, Marie Adelaide, in 1919. The legislative power is vested in a Chamber of Deputies numbering fifty-one, who are elected for six years on a basis of universal suffrage. The sovereign nominates the ministers as well as an advisory council of state. Education is compulsory, and military service has been obligatory since 1914. There are good railway lines, 340 m. in length. The chief tns. are L., the cap., Esch-sur-l'Alzette, a mining centre, Differdange, Dudelange, and Petange. Pop. 291,000, nearly all Rom. Catholics.

The counts of L. took their name from the castle of Lucilin-burhuc, which was acquired by the first Count Sikefroid in 963. In 1308 Count Henry became Henry VII., emperor of Germany. Henry's grandson, Charles IV., raised L. to the rank of a duchy in 1354. In 1443 it was united with Burgundy, and in 1506 became Sp. By the treaty of Utrecht (1713) it was ceded to Austria, but was annexed to France at the peace of Campo-Formio (1797). At the congress of Vienna (1815) it was created a grand duchy and part of the Ger. confederation, and by the treaty of London (1867) it was declared a neutral independent state. In 1914 it was overrun by the Gers. and remained in their occupation until 1918. In 1919, by the treaty of Versailles, it was declared free of all Ger. ties. In 1921 a Bill was passed for the economic union of L. with Belgium and the use of Belgian currency. In 1948 a customs union (Benelux) of Belgium, the Netherlands, and L. came into being. In April and May 1948, constitutional changes were decided upon, the most important of which was the abandonment of unarm'd neutrality, imposed upon the Grand Duchy in 1867.

On May 10, 1940, L. was again invaded by Ger. troops and the grand duchess went to England. The Gers. appointed a gauleiter with the intention of absorbing L. in the Reich as Gau Moselland. Early in Sept. 1944 the Amer. First Army advanced rapidly across Belgium and L. on a 65-m. front and the city of L. was liberated on the 11th. The Allies then crossed the frontier N. of L. on Sept. 14. But on Dec. 16 Runstedt's army drove sev. m. into L. in the battle of the Ardennes. The Allies again advanced in N. L., Amer. forces launching N.-eastward from the Arlon-L. area and driving the Gers. out again. See further under WESTERN FRONT IN SECOND WORLD WAR, Marshal von Rundstedt's Counter-Offensive.

Language and Literature.—The L.

language, based upon old Teutonic roots, has borrowed extensively from the Celtic, Rom., and Fr. Throughout the centuries Ger. and Fr. roots have been phonetically altered and the language is still spoken in Ger., Belgian, and Fr. border regions which in the course of hist. were separated from the Grand Duchy proper. There is an extensive literature in the L. language. Amongst other classics are *Renart* by Michel Rodange, poems by Michel Lentz, plays by Dickx (Edmond de la Fontaine), and André Duchacher. In spite of the Luxembourgers' affection for his mother tongue, which is exclusively used by every class of the pop., Fr. has been for over 400 years the official legislative, administrative, and judicial language. The people are used to bilingualism, which, far from giving rise to any difficulties, provides a decided advantage in their dealings with neighbouring countries.

Luxembourg, cap. of the above, situated on the Alzette, 42 m. N. of Metz, is a dismantled fortress. It consists of two parts; the upper tn. stands on a rocky

Luxembourg Legion

LUXEMBOURG CITY

cliff and is connected with the lower tn., lying in a ravine, by flights of steps. The chief buildings are the Gothic cathedral of Notre Dame, the Grand Ducal Palais (1580), and the tn. hall. Steel and iron works, tanning and brewing comprise the main industries. L. was liberated by the Allies on Sept. 11, 1944. Pop. 62,000. See T. H. Passmore, *In Further Ardennes*, 1905; R. Putnam, *Luxembourg and her Neighbours*, 1918; Muirhead and Mon-

marché (editors), *Belgium and Luxembourg, 1929*; *The Luxembourg Grey Book* (preface by J. Bech), 1942; and J. Petit, *Luxembourg Yesterday and To-day, 1945-1947*.

Luxembourg Palace, in Paris, on the S. side of the Seine, was erected by Marie de Medici, and in 1879 became the meeting-place of the Senate. Attached to it is a gallery in which are exhibited the works of living artists. See PARIS.

Luxemburg, Rosa (1870-1919), Ger. revolutionary of Polish descent. She acquired Ger. nationality by marriage with a Ger. workman. Having devoted her energies to the Socialist papers *Arbeiterzeitung* and *Leipziger Volkszeitung*, she went to Russia, and there took part in the uprising of 1905. During the First World War she was held in preventive custody, but after the revolution she joined Liebknecht as co-editor of the Communist *Rote Fahne*. Together they were arrested (charged with complicity in the Berlin disturbances of Jan. 1919), but were attacked on their way to jail and murdered. L. was the author of *Die Akkumulation des Kapitals* (1913); *Briefe aus dem Gefängnis* (1920); and other works. See C. Liebknecht, *The Murder of Karl Liebknecht and Rosa Luxemburg*, 1924.

Luxeuil (anc. Luxovium), tn. in the dept. of Haute-Saône, France, 27 m. N.W. of Belfort, is famous for its mineral baths, known to the Romans. St. Columba founded a monastery here in 590, destroyed in the ninth century. Manus. are paper, cotton, and wines. Pop. 5000.

Luxor, see THEBES.

Luxullian, tn. in the co. of Cornwall, England, 6 m. S.W. of Bodmin. It has important granite quarries, and gives its name, Luxullianite, to a porphyritic rock found in the neighbourhood. Pop. 1000.

Luyne, or Luynes, Charles d'Albert, Duc de (1578-1621), courtier of Louis XIII., son of Honoré d'Albert (d. 1592), governor of Beauchamp. He instigated the assassination of Concini (1617); as governor of Picardy suppressed a rising of nobles (1620); and after being appointed constable of France (1621), headed an expedition against the Protestants. See *Recueil des pièces les plus curieuses qui ont été faites pendant le règne du connestable M. de Luyne* (2nd ed.), 1624.

Luz (Almond): 1. Old name of Bethel, tn. in Palestine, 9½ m. N. of Jerusalem. 2. Tn. in the land of the Hittites, Palestine, whose site has not been identified.

Luzán, Claramunt de Suelves y Gurrea, Ignacio (1702-54), Sp. poet and man of letters, b. at Saragossa. He was appointed secretary to the Sp. legation in Paris (1747-50) and treasurer of the Royal Library at Madrid (1751). His literary reputation was made and still remains on his criticism of poetry, *La Poesía, ó Reglas de la poesía en general y de sus principales especies* (1737).

Luzern, see LUZERNE.

Luzerne, tn. in the co. of L., Pennsylvania, U.S.A., 2 m. N. of Wilkesbarre. It has iron foundries, factories, and flour-mills. Pop. 8000.

Luxon, or Luçon, largest and most

northerly of the Philippine Is., with an area of 40,420 sq. m. L. was Sp. from the sixteenth century until it was ceded to America in 1898. It became part of the new Philippine Republic in 1946. The coast-line is much indented, the principal inlets being the gulf of Lingayén and Manila Bay on the W., Tayabas and Ragay Bays on the S., and the bays of Lagonoy, San Miguel, and Lamón on the E. The Is. is very mountainous. The highest peak is the volcano Mayón (7566 ft.) There are six chief rivers: Río Grande de Cagayán, Agno Grande, Abra, Río Grande de la Pampanga, Vicol, and Pasig, besides many streams and lakes. The vegetation is tropical and luxuriant. The chief manufs. are silk, tobacco, ivory carvings, and mats. Iron, copper, and coal are mined; a very large chrome deposit has been found; gold is produced in N. and E. L. The pop. of 3,800,000 is of mixed race, some 200,000 remain pagan.

Japan began hostilities against the U.S.A. on Dec. 7, 1941, and among other places raided the Clark airfield in N. L., killing 200 men. Soon afterwards their forces landed on the Is. Manila the cap. was raided by bombers on Dec. 13, and captured on Jan. 1, 1942. Though greatly outnumbered the Amers. and Filipinos under Gen. MacArthur put up a remarkable defence on the Bataan peninsula until April, the garrison at Corregidor holding out for nearly a month longer. The Amers. returned within three years when very large forces of troops landed on L. on Jan. 9, 1945. On the next day the Amers. controlled all beaches in Lingayán Gulf and captured the Lingayán airfield. The Jap. armies were split in two by the Amer. advance of Jan. 20, and on Jan. 25 the Jap. lost the main air base. The Amers. entered Manila on Feb. 3. Bataan and Corregidor were in their possession by Feb. 21. See PACIFIC CAMPAIGNS.

Lvoff, or Lvov, Prince Georgi Evgenievich (1861-1925), first prime minister of revolutionary Russia. Educated at Moscow Univ. he organized zemstvos or prov. and dist. councils in Manchuria during the war with Japan. He became a member of the Duma in 1905, as a constitutional democrat. On the abdication of the last tsar he was placed at the head of the state, March 14, 1917, giving place to Kerensky in July. Imprisoned when the Bolsheviks came to power, he escaped through Siberia to Japan, thence to France.

Lvov (Polish Lwów, Ger. Lemberg), city of the L. Region of the Ukraine S.S.R., 305 m. E.N.E. of Vienna, in a deep valley and picturesque dist. Before the First World War it was the seat of the Galician Diet under the control of the imperial gov. at Vienna. It was hotly contested in that war, the first great battle for it lasting from Aug. 31 to Sept. 2, 1914, when it fell to the Russians, who took over 100,000 prisoners and renamed it L. or Lwów. After this a Russian administration was estab. in 1915 during Mackensen's brilliant drive of 1915 the Austrians, under Gen. Boehm-Ermolli (q.v.), re-entered it in June of that year. In 1917, during Brusilov's spectacular Russian offensive, it

was only saved to the Austrians by revolutionary outbreaks in the Russian ranks. Frequent riots occurred in 1917 and 1918, fomented by separatist sympathisers. L. passed into Russian control until its cession to Poland in 1923; in 1945 it became part of the Ukraine. Before 1939 it was the seat of a Uk. Catholic and of an Armenian Catholic archbishop. The univ. was estab. in 1634, and L. was for long a centre of Polish culture. An academy of commerce was estab. in 1922. Up to 1939 it was one of the ten Polish military dists. Its many manufs. before the Second World War included machinery and textiles. (See further under AUSTRIA-HUNGARY; BRUSSELOV; WAR, THE FIRST WORLD—EASTERN FRONT IN 1914—German Invasion of Russian Poland; Russian Advance into Galicia.)

As a major base guarding the gap between the Carpathians and the Pripiet, L., which had been taken by the Gers. in 1941, became a vital objective during the great Russian offensive of 1943-44. In Jan. 1944 the Russians were still 50 m. from it. Beyond lay the oil fields of Galicia, the industrial triangle of Poland, and, further W., the great industrial area of Silesia. The Gers. were therefore bound to try to hold it at all costs. Following his success in the Tarnopol area Zhukov took Kamenets Podolsk and advanced some 40 m. But then came a long pause in the Russian offensive here, and the S. drive was not resumed till July 1944, when Marshal Konev launched an attack on a front of 125 m. between Lutsk and Tarnopol. The focus of the battle was the fortress of Brody guarding the approaches to L. Brody fell, together with 45,000 Ger. dead or captured. Konev then crossed the Bug and, advancing N. of L., cut its direct supply lines, and pressed down in a circling movement against the great base, while his left wing struck at Stanislaw which barred the way to the Carpathian passes. On July 25 Konev in a sweep to the rear of L., accompanied by a flank attack to the S., closed the 'pincers' at last around L. Once encircled and isolated L. collapsed with surprising speed. After a motorised force had broken through the defences covering the railway L. was directly attacked by the encircling troops, and on July 27 street fighting ended with the city in Russian hands. See also EASTERN FRONT IN SECOND WORLD WAR. Pop. (region) 3,130,000 (1935); (city) 320,000 (1935), a large proportion of which were Jews.

LXX (abbreviation for Septuaginta), Septuagint, the Gk. version of the O.T., said to have been made by seventy translators at Alexandria about 300 B.C.

Lyall, Sir Alfred Comyn (1835-1911), Eng. administrator, b. in Surrey, and educated at Eton and Haileybury. He became governor of the N.W. Provs. of India in 1882, and in 1883 was appointed a member of the council of India. His sympathy with the character and difficulties of the Indian people won for him a position of authority, and his *Asiatic Studies* (1882) is accepted as a standard

work. His other books include *Verres written in India* (1889); *Life of Warren Hastings* (1889); *The Rise and Expansion of the British Dominion in India* (1893); a criticism of Tennyson (1902); and *The Life of Lord Dufferin* (1905).

Lyall, Edna (1857-1903), pseudonym of Ada Ellen Bayly, Brit. novelist, the author of numerous works of fiction, which appeared between 1879 and 1901. Her best books were *Donovan* (1882) and its sequel, *We Two* (1884). See life by J. M. Escreet, 1901.

Lyautey, Louis Gonzalve Hubert (1854-1934), marshal of France, b. at Nancy; son of Just L., inspector-general of bridges and roads, and grandson of an artillery general of the Second Empire. Sent to Indo China in 1894, he later became chief of staff to Gallieni, whom he accompanied to Madagascar in 1897. L. brought order to the S. part of that is., theretofore unsubdued. Brigadier-general in 1903, in 1906 he became chief of the div. of Orlan.

Put by Poincaré at the head of the new Fr. protectorate of Morocco in 1912, L. revealed himself a veritable modern pro-consul as both builder and reformer; and fortunately for the Fr. he secured the loyal co-operation of Mulai Yusuf, who had succeeded his brother Mulai Hafid, the erstwhile Fr. protégé who had fallen under Ger. influence and was always ready to betray the Fr. When the First World War broke out L. had to send most of his troops home and to keep order and continue his reforms with weak effectives, while having to thwart constant attacks organised by Mulai Hafid. After the treaty of Versailles the Fr. had reduced their last opponents in Morocco, besides completing the network of roads made by L. This was the moment chosen by Abd-el-Krim (q.v.) to attempt a last uprising against the Fr. Ultimately, however, Morocco was completely pacified, and it was due to L.'s achievement that the protectorate remained loyal. One of his most notable reforms was the introduction of courts of appeal; he also laid the foundations of free public education: schools for the sons of notables, Moslem colleges, and practical primary schools. His success in so rapidly creating prosperity in the protectorate was due largely to emphasis on agric. colonisation and by carrying out an immense public works programme. Large tracts were purchased by the protectorate for settlers and for public works, in a country where Muslims sell reluctantly; but L. managed to carry out that part of his programme with great flexibility and without the slightest conflict. Contrary to the policy in Algeria and Tunisia of introducing Fr. legislation *en bloc*, in Morocco L. proceeded differently, Fr. legislation being adapted by him to the country and its people. But a method of directing the development of the country toward a Moroccan law and toward the Fr. language rather than the Arab language has not even to-day been completely evolved, though the difficult ethnic problem of the Berbers was partially resolved, by

defending them against absolute encroachment on the part of Islam. Yet in all his reforms L., like Faidherbe, Gallieni, and Gouraud, respected Moslem traditions and religion. In short, L. compelled world-wide admiration for his remarkable development of Morocco, its roads, ports, railways, first-class hotels, and tns.—modern city planning being more in evidence than in many European cities. L. was elected to the Academy in 1914; for a few months in 1916-17 he was minister for war; in 1921 he was made marshal. He resigned his position in Morocco in 1925. See life by A. Maurois (Eng. trans. 1931).

Lycanthropy (Gk. λύκος, wolf; ἀνθρωπος, man) was the power attributed to certain mortals of changing themselves into wolves. It was also used in a broader sense, and applied to the metamorphosis into any animal, i.e. tiger, dog, bear, fox, etc. Herodotus relates that the Neuri turned to wolves for a few days every year, and in Virgil's eighth Eclogue we read how Moeris makes himself a wolf by means of poisonous herbs. In the Scandinavian sagas, too, there are 'werewolf' warriors of peculiar ferocity, and the belief was long current in Denmark that a werewolf could be recognised by its howls meeting. The word is used in pathology to denote a mental disease in which the patient imagines he is an animal.

Lycæon, in Gk. mythology, the son of Pelæus, and king of Arcadia. Various stories are told of him; according to some he was a barbarian, who even defied the gods, while others describe him as the first civiliser of Arcadia, who built the tn. of Lycæura and introduced the worship of Zeus Lycæus. He was the father of fifty sons who were notorious for their impiety. They were visited by Zeus, and entertained the god by setting before him a dish of human flesh. Zeus pushed away the table which bore the horrible food, and either killed L. and his sons by a flash of lightning, or turned them into wolves.

Lycæonia, anct. prov. of Asia Minor bounded on the N. by Galatia. According to Strabo it was a bleak country, well adapted as pasture-land for sheep and wild asses; King Amyntas is said to have possessed over 300 flocks of sheep. It suffered from dearth of water, which was probably aggravated by the abundance of salt in the soil. The inhab. were a hardy and warlike race, which owned no subjection to the Persian monarchs, and lived by plunder and foray.

Lycæum, The (τὸ Λυκαῖον), name of an anct. gymnasium and garden with covered walks at Athens. It was situated S.E. of the city, outside the walls, just above the R. Ilissus, and received its name from the temple of Apollo Lycæus in the vicinity. Here it was that Aristotle and the Peripatetics taught, and it was also the place where the Polemarch administered justice.

Lycæum Theatre, in Wellington Street, Strand, London, was first built in 1795, and received its licence in 1809 when the Drury Lane Company took it over. Since then it has been rebuilt more than once,

and has been the scene of many remarkable performances, notably those by Mrs. Keeley and Edmund Kean, Planche's 'fairy extravaganzas,' and Beverley's transformation scenes. Irving first appeared at the L. in 1871 under Bateman's management, and played Mathias in *The Bells* with remarkable success, following this by Hamlet, Macbeth, Othello, and other roles. In 1878 he opened the theatre under his own management, and revived *Hamlet* and produced *The Merchant of Venice*, with Ellen Terry as Ophelia and Portia. The period that followed had a remarkable effect on the Eng. stage; the L. stage management and the brilliancy of its productions in scenery, dressing, and accessories, were revelations in the art of *mise-en-scène*. But in 1899 the theatre passed into the hands of a limited liability company. It soon deteriorated in the character of its performances, being devoted mainly to the production of popular plays and pantomimes. Bombed in 1910, it was reopened as a dance hall in 1915.

Lych-wake, see WAKE.

Lycia, mountainous country on the S.W. coast of Asia Minor, occupied an important place in the Homeric accounts of the Trojan war. It was originally peopled by two races, the Solymi and the Termilæ; afterwards it was conquered by the Persians and the Syrians, and then by the Romans. The prin. cities were Xanthus, Patara, Myra, Telmessus, and Phaselis, and during its independence it was ruled by a governor called the Lyciarch. Many interesting remains have been discovered in this region, the monuments and other antiquities showing a close relationship to the Gk. forms. See G. Grote, *History of Greece* (new ed. 12 vols.), 1869-70.

Lycian Language, see under INDO-EUROPEAN LANGUAGES.

Lycck, tn. of Poland (now Elk), stands on Lake L., 90 m. S.E. of Königsberg (now Chojna). Before the Second World War it had manufs. of machinery, mineral waters, etc. There is an old castle which belonged to the Teutonic knights situated on an is. in the middle of the lake. In 1915 it was occupied by the Russians and retaken by the Gers., and was taken by the Russians in early 1915. Pop. 18,000.

Lycomedes, king of the Dolopians in the is. of Scyros, a powerful people of Thessaly, who fought before Troy. Achilles was sent to L.'s court, disguised as a maiden, by his mother Thetis, who was anxious to prevent his going to the Trojan war. Here Achilles became, by Deidamia, the daughter of L., the father of Pyrrhus. L. treacherously killed Theseus by thrusting him down a rock.

Lycopene, red carotenoid pigment in tomatoes, rose hips, and many berries. It is the parent substance of all the natural carotenoids (so called from carotene, the pigment in carrots).

Lycoperdon, gen. of fungi, order Lycoperdaceæ. It has a double peridium, the outer wart breaking into warts, spines, scales, etc. *L. Bovista* is edible. The dry mass of threads and spores may be used as a styptic. *L. giganteum*, a large indehiscent

species, is also a styptic and has been used for tinder. *L. gemmatum* is the common puff-ball (q.v.). See also FUNGUS.

Lycophron (c. 260 B.C.), Alexandrian grammarian and poet, was a native of Chalcis in Eubœa. Ptolemy Philadelphus entrusted to him the arrangement of the Alexandrian library, and in the execution of this task L. drew up an extensive work on the Gk. comic poets. He is said to have been a skilful composer of anagrams, and also wrote sev. tragedies and an essay on comedy; but his *Cassandra* is the only poem which has come down to us.

Lycopodium, genus of plants known as Club Mosses. They form dense masses of verdure. *L. clavatum* is the Brit. Club Moss, and *selago* the Fir Club Moss.

Lyourgos (c. 825 B.C.), 'the legislator of Sparta,' was son of Eunomus, king of Sparta. Becoming guardian to his nephew, the infant king of Sparta, L. set out on extensive travels that he might not be suspected of ambitious designs. On his return he found the country in a state of anarchy and moral degeneracy. His countrymen welcomed him as their saviour, and besought him to put their state to rights. After fulfilling this task and giving Sparta the constitution and system of military training which laid the foundations of its greatness, he obtained an oath from the Spartans that they would change nothing before his return from further travels. That the constitution might remain permanently inviolate he departed into exile with the intention that it should be life-long. It is not known where or how he died. L. was honoured as a god and a temple was built in his honour.

Lyourgos (c. 390-329 B.C.), one of the ten Attic orators. He was of noble family, a disciple of Plato and Socrates, and one of the prin. supporters of Demosthenes as a patriot and an adversary of the Macedonian monarch Philip. He administered the finances of Athens for twelve years, and during this time he increased its revenue, beautified the city, and served the cause of literature by preserving in its archives copies of the plays of Æschylus, Sophocles, and Euripides. One only of his orations (that against Leocrates) is extant.

Lydd, bor. of Kent, 3 m. S.S.W. of New Romney. It is a corporate member of the Cinque Port of Romney. It has manufs. of the powerful explosive called lyddite (q.v.), and possesses a gov. artillery range and military camp. Pop. 2700.

Lydda, or El Ludd (Gk. Λύδδα, Heb. לוד), anct. city of Palestine, situated in the plain of Sharon, 11 m. S.E. of Joppa. It was renamed Diospolis in the second century A.D., and is referred to in both the O.T. and N.T. St. George is said to have been born and buried here, and in the fourth century a bishopric was instituted under his patronage. The church erected over his tomb has been repeatedly destroyed and rebuilt. It is the main junction of the gov. railways (the offices of which are at Haifa) and the chief Palestinian airport. After the inauguration of the Brit. mandatory regime in

Palestine, L. was the scene of frequent Arab outrages, particularly during the disturbances of 1929, 1933, and 1936-38. Pop. 17,700.

Lyddite, military high explosive, so called because it was manufactured at the munitions factory of Lydd in Kent. Chemically it is picric acid, $(C_6H_3(NO_2)_3-OH)$, and is prepared from phenol (carbolic acid) by the action of nitric and sulphuric acids. It is a bright yellow solid crystalline and bitter to the taste. Like cordite, it is difficult to detonate. It is poured into shells when molten, and on bursting gives pungent, suffocating fumes. Chemically it is related to T.N.T. or trinitrotoluene, $C_6H_2(NO_2)_3-CH_3$.

Lydenburg, or **Leydenburg**, one of the oldest tns. in the Transvaal, S. Africa, cap. of the L. dist. and situated on the trib. of Olifants R., 144 m. E.N.E. of Pretoria. The dist. is rich in gold deposits, chiefly alluvial. L. gets its name from the fact that the early *voortrekkers* from Potchefstroom to Ohrigstad were so stricken with fever that they moved 30 m. S. and called their next settlement 'L.' or 'the place of suffering.' Near L., which was for some years an independent republic until it became annexed to the S. African republic in the 1880's, the first gold-mining area of any size in the Transvaal was discovered and prospered until the Barberton field proved richer, though gold is still found in L. to-day. In the dist. of L. are two of the highest mts. in the Transvaal, Mt. Anderson and Mt. Maureberg, and the dist. is better provided with rivers than any other dist. in the prov. The tn. of L. does a thriving trade in agric. produce. There are Dutch and Eng. churches and a gov. school. The first Dutch Reformed church, built in 1861, is now a museum of *voortrekker* relics; the second, built in the eighties, is now a church hall, the third only does service as a church proper. Pop. (tn.) European, 5000; native 1600.

Lydford, par. in Devonshire, England, 11½ m. E. of Launceston. It was a walled tn. before the Conquest, and Judge Jeffreys held his Assizes at the castle. For many centuries it was the cap. of the Devonshire 'stannary,' owing to its important position on the edge of the great tin dist. of Dartmoor. Pop. 2000.

Lydgate, John (c. 1370-c. 1450), Eng. poet, was b. at Lydgate, Suffolk. After studying philosophy at Oxford, he travelled in France and Italy, where he became a master of continental poetry. L. was an admirer and imitator of Chaucer, his *Storie of Thebes* (1420-22) being represented as a new Canterbury tale; he produced many other poems, including *The Falls of Princes* (1494); *The Iystorie, Sege, and Destruction of Troye* (1513); *The Life of Saint Albon and the Life of Saint Amphibal* (1534); as well as works on a great variety of subjects, philosophical, scientific, and historical. See E. P. Hammond, *Chaucer and Lydgate*, 1912.

Lydia, in anct. geography, a country of Asia Minor, lying between the Ægean Sea and Mysia, its actual boundaries varying

considerably at different periods. The name *Ludd* is found among the inscriptions of an Assyrian king, Assur-bani-pal (c. 660 B.C.), who received tribute from Gyges, the first of the Mermaid dynasty of Lydian kings. Homer writes of the Meonians and their cap., Sardis; Herodotus states that the *Meiones* (Meonians) were called Lydians after Lydas, the son of the mythical Attila, whose dynasty preceded the Heraclidae. The last of the Heraclid dynasty, Candaules, was murdered by Gyges; the story in Herodotus of Candaules' wife is familiar. Gyges estab. the Mermaid dynasty (687 B.C.). He made war with Assyria, but was forced to pay tribute; he also sent troops to Psammeticus in Egypt. He was killed in an invasion of the Cimmerians in 652, and was succeeded by Alydes, and then by the latter's grandson, Alyattes, under whom L. became a great maritime power, gradually encroaching on the Gk.-Ionian Ius. of the W. coast, while an alliance between his daughter and Astyages brought peace with the Medes. The Cimmerians were finally subdued, and under his successor, Croesus, L. became an empire ruling all Asia Minor with the exception of Lydia. In 546 B.C., after fifteen years' rule, Cyr. captured Sardis and its king, and it became the W. cap. of the Persian Empire.

L.'s later hist. is, therefore, that of Persia and the Persian war with Greece. Under the Romans, it was part of the provincial prov. of Asia. At the period of its greatest prosperity L. was the industrial centre of the E.; possessing a healthy climate, wonderfully fertile, with the gold so long associated with the R. Pactolus, legend credited it with many inventions, and Lydian and luxury became synonymous. The earliest coinage was attributed to it, while dice and games of various kinds also were said to have first been played by the Lydians. Nature worship formed its religion, centring on the Great Mother, Cybele.

Lydian Language, see under INDO-EUROPEAN LANGUAGES.

Lydian Mode, the inhab. of anct. Lydia were noted for their effeminacy and voluptuousness. Hence the phrase L. M., meaning of effeminate, plaintive character. Cf. Milton, *L'Allegro*:

'Ever against eating cares,
Lap me in soft Lydian airs';

and Dryden, *Alexander's Feast*:

'Softly sweet, in Lydian measures,
Soon he sooth'd his soul to pleasures.'

Lydus, Joannes Laurentius (c. 490-565), Byzantine writer, b. at Philadelphia in anct. Lydia; at the age of twenty-one went to Constantinople and studied philosophy under Agapetus. None of his poetical works has been preserved; his prose compositions include *De Mensibus Liber*, a treatise on the Rom. calendar, and *De Magistratibus reipublice Romanae*.

Lye, Caustic is. are solutions of potash and soda; mild Ls., of their carbonates. Mother L. is the fluid remaining after crystallisation from solution.

Lye, The, par. in Worcestershire, England, 1½ m. E. of Stourbridge. There are coal-mines in the vicinity, and the manufs. of the dist. include fire-bricks, awls, and vices.

Lyell, Sir Charles, first Baronet (1797-1875), Brit. geologist, b. near Kilmuir in Forfarshire. He studied at Exeter College, Oxford, where he was attracted to geology by the lectures of Dr. Buckland, and in 1819 joined the Geological and the Linnean Societies of London, being elected secretary of the former in 1823. He was elected F.R.S. in 1826, and in 1830 pub. the first vol. of his *Principles of Geology*, the summary of which is given in the continuation of the title, 'being an attempt to explain the former changes of the earth's surface, by reference to causes now in action.' The second and third vols. appeared in 1832 and 1833 respectively, and the whole work was reprinted in four smaller vols. in 1834. The book was popular from the first, and by 1875 had run through twelve eds.; indeed it was one of the most important scientific productions of the nineteenth century. Besides this great work he pub. *Elements of Geology* as a supplement to the *Principles* (1838); *Travels in North America, with Geological Observations* (1845); *A Second Visit to the United States of North America* (1849); *The Antiquity of Man* (1863); and *The Student's Elements of Geology* (1871). He was prof. of geology at King's College, London, 1831-33, and president of the Geological Society, 1835-1836 and 1849-50. He was knighted in 1848, and created a baronet in 1864. His *Life, Letters, and Journals* appeared in 1881.

Lygetune, see LUTON.

Lykewake, or Lychwake, see WAKE.

Lyly, John (1553-1606), Eng. dramatist, b. in Kent. He took his degree of B.A. at Magdalen College, Oxford, in 1573, and his M.A. in 1575, but he also studied at Cambridge, and was incorporated M.A. at that univ. in 1579. The same year he first part of his *Euphues, the Anatomy of Wit* appeared, and he at once became famous. This was followed by *Euphues and his England* in 1580, which brought him under the notice of Lord Burghley, who gave him some employment. After this he wrote light plays to be performed at court by the children's acting companies of the Chapel Royal at St. Paul's, London, among which were *Campaspe* and *Sappho and Phao*, produced 1584. In 1589 he championed the cause of the bishops in the Martin Marprelate controversy (q.v.), and pub. a tract entitled *Pappe with an Halchit*. In 1589 he entered Parliament for Hinton, being subsequently elected for Aylesbury in 1593, for Appleby in 1597, and again for Aylesbury in 1601.

L.'s chief work was his *Euphues*, which, although a very tedious story, is remarkable for its prose style, which is chiefly characterised by a continuous straining after antithesis and a pigram. The novelty of this style was generally acknowledged in his own day, and received the name of 'euphuism.' L. also enjoyed some reputation as a writer of comedies, and is

described as 'eloquent and witty': but his plots are loosely fashioned, and his language artificial, the only attractive feature of his plays being the lyrics. Among his best comedies are *Alexander and Campaspe*, *Midas* and *Endymion*. See R. W. Bond (ed.), *Complete Works, with Life and Notes*, 1902; also C. G. Child, *John Lyly and Euripides*, 1894, and V. Jeffery, *John Lyly and the Italian Renaissance*, 1929.

Lyme Regis, seaport and watering-place of Dorset, England, stands on the Lyme near its entrance to the Eng. Channel. It was chartered by Edward I., and incorporated by Elizabeth; in 1685 it was the landing-place of Monmouth. Shipping, quarrying, and tourism are its chief occupations. The Lias rocks in the vicinity have yielded remains of the Ichthyosaurus and Plesiosaurus. Pop. 3400.

Lymington, seaport and watering-place of Hampshire, England, stands on the riv. of the same name, 12 m. S.W. of Southampton. Yacht-building forms the chief industry. Pop. of municipal bor. of L. 21,000.

Lymm, urban dist. of Cheshire, England, 5 m. E. of Warrington, Lancashire. Pop. 6800.

Lymph and Lymphatics. L. (lat. *lymphā*, water), slightly yellow, watery, somewhat salt, alkaline fluid pervading all the tissues of the body, and originating as an exudation of blood plasma from the capillaries. It is a medium acting between the cells and the blood, and performs a double function: conveying waste matter from the tissues to the blood and conveying new substance for the formation of blood. Chemically L. shows little difference from blood itself except in the red matter. It contains less protein, more chloride, and in it are corpuscles not distinguishable from the colourless blood corpuscles. Lymphatics are the vessels which carry the L. throughout the body. They absorb the waste products of tissues and collect the final products of digestion, the former then to be excreted by skin, lungs, and kidneys, the latter to renew the blood and tissue. The lymphatics of the small intestine are known as *lacteals*, and convey *chyle*. The structure of lymphatics resembles that of veins and arteries. The capillaries enter larger vessels, or the glands themselves, and form two sets; the superficial lymphatics lying immediately beneath the skin at the surface of the body, and the deep lymphatics in the interior of the body lying in the areolar tissue; the former communicate with the latter, which are larger. The final vessel of the lymphatic system is the *thoracic duct*, which enters the system of circulation at the junction of the subclavian and jugular veins on the left. Another much smaller duct, the right lymphatic, enters the right subclavian and conveys L. from the right side of the body from the chest upwards. The lymphatic glands are small, solid, kidney-shaped bodies, usually compared in size to variation from hempseed to the almond; there are again two sets, (1) in the thorax and abdomen, the deep set,

(2) the superficial set distributed in the groin, the ham, the armpits, and the neck. The lymphatics thus form a circulatory system regulated by valves, and, owing to direct connection with blood circulation, enforced by the heart.

Lymphangitis or inflammation of the lymphatics occurs with enlargement in the neck as an accompaniment to scrofula: *Rubo* is an affection in the groin. Lymphosarcoma may need surgical treatment. Since L. is so intimately concerned with the body cells and is in direct communication with the blood, the lymphatics are liable to bacterial infection and to poisoning.

LYMPHATIC GLAND

Showing lymph vessels entering and leaving

Lympe, vil. of Kent, England, 2½ m. W. of Hythe. An air station estab. here in 1915 was used for military purposes until the end of the first World War. It was then converted into a station on the route between the Continent and London. In 1919 it was being maintained as an airport by a charter company. L. was once a Rom. port, though not now on the sea. Pop. 700.

Lynceus: 1. In Gk. legend was the son of Argvptus and Argyphila, and married the Danaid, Hypermnestra. He became king of Argos, and was buried there near the altar of Zeus Phylxius. 2. In Gk. legend a son of Aphareus and Arene, was one of the Argonauts, and was famous for the keenness of his sight. He took part in the Calydonian hunt, and was slain by Pollux.

Lynchburg, city of Virginia, U.S.A., stands on the James R., 124 m. W. by S. of Richmond. It is the foremost Amer. tobacco market, and coal and iron are mined. Pop. 44,500.

Lynch Law, phrase denoting mob vengeance without form of law on a person suspected of having committed a crime.

At the present day it is heard of mainly in regard to the hanging of Negroes in the U.S.A. for assaults on white women, though actually sex offences account for less than one fourth of all the lynchings. The origin of the term is variously ascribed to the name of Col Lynch, who illegally whipped Tory conspirators in 1780 and to James Lynch Fitz-Stevens, mayor of Galway, who in 1493, acting on the classic precept of Brutus, tried his son for murder, and when prevented from publicly executing him, hanged him from the window of his own house. In Amer. law all present and consenting at a person's death by lynching are guilty of murder in the first degree unless the act were committed in sudden anger. Lynching was strongly condemned in the report of the S. Commission on the study of lynching issued in 1931. Ignorance, low economic status, and bigotry are assigned as factors responsible for lynching. Of all the lynchings in the previous forty years nearly 80 per cent were for non sexual offences, real or alleged, and sometimes men were lynched for political offences. The commission also found that L. L. was not necessary for the protection of white women. Mob leaders are rarely proceeded against owing to public indifference and the fact that the Negro has no vote where most lynchings occur. There were only three lynchings in 1939, the lowest since records were begun in 1882. Since that year there have been altogether 1659 recorded lynchings, the highest number in any year being 231 in 1892. Afterwards the number declined, there being 130 recorded in 1901, 83 in 1919 and 24 in 1933. During 1939 there were eighteen reported cases in which lynching was prevented by the transfer of suspects to secret jails or by the augmentation of guards. Two anti lynching Bills have been introduced in recent years, and the later was passed by the House of Representatives in 1940 and sent to the Senate.

Lynd, Robert (1879-1949), Brit. essayist and literary critic, b. in Belfast. He took his B.A. at Queen's College Belfast and from 1908 produced a series of books chiefly essays, among which may be mentioned *Home Life in Ireland* (1909), *The Art of Letters* (1921), *The Peal of bells* (1924), *It's a Fine World* (1930), *I Tremble in Think* (1936), and *Life's Little Oddities* (1941). L. was literary editor of the *New Chronicle*.

Lyndhurst, John Singleton Copley, first Baron (1772-1863), lord chancellor b. at Boston, Massachusetts. He was brought to England at an early age, and studied at Trinity College, Cambridge. In 1804 he was called to the Bar and joined the Midland circuit, and in 1812 became popular at Nottingham by defending a Luddite rioter, John Ingham. In 1819 he became chief justice of Chester, solicitor-general, and received the order of knighthood. He was attorney-general in 1824-26, and became master of the rolls in 1826. As Baron L. he was lord chancellor under three administrations. His first period of office was from 1827 to 1830, when he was made chief baron of

the exchequer. He was again lord chancellor, 1834-35, and took a leading part in the debates in the Lords, 1835-41. Chancellor for the third time, 1841-46. See life by Sir T. Martin, 1883.

Lyndhurst, vil. of Hampshire, England, is beautifully situated in the New Forest, 8 m. W.S.W. of Southampton. It contains the 'king's house,' or residence of the warden of the forest. Pop. 2500.

Lyndsay, Sir David, see LINDSAY, SIR DAVID.

Lyndsay of Pitcottie, see LINDSAY, ROBERT OF PITCOTTIE.

Lyne, Rev. Joseph Leycester, see IGNATIUS FATHER.

John H. Lyne

LYNMOUTH. THE RIVER LYN

Lynedoch, Thomas Graham, first Baron (1748-1843). Brit. general was the third and only surviving son of Thomas Graeme, laird of Balgowan, Perthshire. In 1793 he joined Lord Hood's fleet in the Mediterranean as a volunteer, and on returning home he raised a battalion known as the 'Perthshire Volunteers'. He became brevet colonel in 1798 and was appointed Brit. military commissioner with the Austrian Army in Italy, 1798. After the peace of Amiens he took up parl. duties until 1808, when he accompanied Sir John Moore to Sweden and Spain as aide-de-camp, being present in the Corunna retreat. His most memorable victory was the defeat of the Fr. at Barossa, March 1811, during the rest of the Peninsular war he acted as second in command to Wellington, and for his services was created Baron L. of Balgowan, 1814.

Lynmouth and Lynton, two picturesque vils. of N. Devon, stand on the Bristol

Channel, 12 m. E. of Hfracombe. Lynmouth is on the shore, at the base of a lofty cliff, and Lynton nestles on the hillside, 428 ft. above. A cliff railway has been built connecting the vils. Between 1934 and 1936 the National Trust acquired Watersmeet, comprising 366½ ac., mostly wooded, on both sides of the E. Lyn R. An additional 24 ac. of the S. and W. banks of the R. Lyn were purchased in 1946. Pop. 2000.

Lynn, seaport of Essex co., Massachusetts, U.S.A., stands on Massachusetts Bay, 10 m. N.E. of Boston. It has manufs. of machinery, car accessories, and metal garages; also foundries, wire goods factories, electrical machinery, and lamp factories, boot and shoe manufs., and large tanneries. Pop. 105,000.

Lynn Canal, inlet of the Pacific, off the coast of Alaska, is an important entrance to the Klondyke Region. It divides into the Chilkat and Chilkoot inlets, and at the head of the latter are Skagway and Dyea. Chilkat vil. stands at the junction of the two waterways.

Lynn Regis, see KING'S LYNN.

Lynx, name of a small N. constellation introduced by Hevelius in 1690; it lies between the great Bear and Auriga, N. of the Twins, and its ten brightest stars are of the fifth magnitude.

Lynx, general name for a widely distributed genus of fierce, bloodthirsty Felidae. Of the two European Ls., the N. L. ranges throughout Scandinavia and N.

LYNX

Russia, but is very scarce. The N. or small spotted L. is common in the less frequented parts of S. Europe. The African L., or Caracal (*q.v.*), occurs throughout the African continent, and there are four species in the New World. Ls. are larger than the true wild cats, and have long limbs, the tail is short, the ears are tipped with a tuft of hair, the cheeks are bearded. The soft, valuable fur is light brown or grey with darker spots varying according to species.

Lyon, Emma, see HAMILTON, EMMA.

Lyon Court, see LYON KING OF ARMS, THE LORD.

Lyonesse, scene of Arthurian romances, was a legendary country off the coast of Cornwall. It is described in early King chronicles as flourishing until its sudden disappearance beneath the sea. It was the scene of the 'last great battle of the West,' and of the final conflict between Arthur and Sir Modred. In an archaeological sense, L. is a submerged level off the coast of Essex, dating from the Early Bronze Age.

Lyon King of Arms, The Lord, permanent officer of state and prin. herald of Scotland. The origin of the office is lost in antiquity, and incorporates that of royal sennachie or bardic historian of the Celtic Scottish kings, of whom he was official inaugurator. The office and its duties are very ancl., for, according to Sir James Balfour Paul the L. K. of A. and his heralds and pursuivants attended at the coronation of Robert II. in 1371. Originally the functions of the office were mainly ministerial, *e.g.* they comprised the 'denouncing' war, proclaiming peace, and carrying public messages. His existing jurisdiction in regard to the inspection of arms and ensigns-armorial of the Scottish nobility and gentry was conferred by Acts passed in 1592 and 1672, and was expressly reserved by the treaty of Union. Formerly a Scots privy councillor, the lord L. is one of the king's lieutenants in Scotland; has management of all state and public ceremonial; is official advisor to the secretary of state for Scotland on these and heraldic matters, and has precedence of all knights. The title 'Lord L.' indicates a member of the Scots Gov., dates from the sixteenth century, and was ratified in Parliament. Like the similar titles, lord advocate, lord justice-clerk, etc., it is not used by the king of arms himself in addressing his servants. As comptroller of the messengers of arms, the lord L. is at the head of the whole executive branch of the law in Scotland; administers the law of name and change of name in Scotland; his certificates take the place of royal licence and deed-poll in England; is sole king of arms in Scotland, his armorial jurisdiction being both at common law and by statute; is president of the court of the lord L., dealing with matters of heraldry and genealogy, in which he has both civil and criminal jurisdiction. From this court appeal lies through the court of session to the House of Lords. The court of the lord L. is situated in H.M. Register House, Edinburgh.

Lyonnaise, anct. prov. of France, was bounded on the W. by Auvergne and on the S. by Languedoc, and the cap. was Lyons. It is now included in the depts of Rhône, Loire, Haute-Loire, and Puy-de-Dôme.

Lyons, Edmund, Lord (1700-1858), Eng. admiral. He was appointed flag-lieutenant on the *Minden* in 1810, and in the following year distinguished himself in an attack on the Dutch off the coast of Java. He received his commission as commander in 1812, and was advanced to post-rank in 1814; from 1828 to 1833 he was stationed

in the Mediterranean, and in 1835 he was appointed minister and plenipotentiary at the court of Athens. He took a prominent part in the attack on Sebastopol, and during the latter part of the Crimean war held the position of commander-in-chief of the fleet.

Lyons, Joseph Aloysius (1879-1939), Australian statesman, b. at Stanley, Tasmania, of Irish descent. A teacher by profession, he joined the Labour party in Tasmania, and in 1909 entered the Tasmanian Parliament, becoming Premier of

Press Portrait by means

JOSEPH A. LYONS

Tasmania in 1923. Returned as a Labour member to the Commonwealth Parliament in 1929, he joined the Scullin Gov. as postmaster general and minister for works and railways. In 1931 he resigned owing to disagreement with the gov.'s financial policy which he considered to be inflationist, and formed the United Australia party. In conference with the gov. he drew up, at the gov.'s request, the terms of a conversion loan which was accepted and which proved highly successful. When in the same year the gov. was defeated, L. became Prime Minister of a Coalition Gov. with the Country party. He was successful also in the elections of 1934 and 1937, being the only Australian Prime Minister to survive three successive appeals to the electorate. In 1935 he attended George V.'s jubilee celebrations in England, and in 1937 the coronation

ceremony, in which year he led the Australian delegation to the imperial conference. P.C. in 1932, he was made C.H., 1936. He was always insistent on the need for unity in the empire, especially in defence matters, and he made it plain only a month before his death that Australia would give full support to the mother country in the event of war.

Lyons, Richard Bickerton Pemell (1817-1887), Brit. diplomatist. In 1858 he was appointed Brit. minister at Washington, on the eve of the civil war. After three years of difficult negotiations his health broke down, and he was allowed to resign; he became ambas. at Constantinople in 1865 and at Paris in 1867. He was created Earl L. in 1887, but the title became extinct at his death.

Lyons (fr. Lyon, the anc. Lugdunum), city of France, cap. of the Rhône dept., at the confluence of the Rhone and Saône, 170 m. N.W. of Marseilles. It occupies an admirable position at the meeting-place of roads and railways, and is second only to Paris in commercial and military importance. It consists of a city proper on the peninsula between the rivs., and numerous suburbs on the l. b. of the Rhone and the r. b. of the Saône, surrounded by gardens and vineyards. Of the anc. buildings Notre-Dame de Fourvière is the most celebrated; but besides this there is the cathedral of St. Jean, begun in the twelfth century, one of the finest examples of Gothic architecture in France; the church of St. Martin d'Ainay, the oldest in L., dating from the sixth century; and the Hôtel Dieu, one of the chief charitable establs. in the city, said to have been founded in the sixth century. There are also Rom. remains, baths, tombs, and the relics of a theatre, and traces exist along the Rhone of a subterranean canal. It is the seat of a national court, of a univ. academy for the depts. Rhône, Loire, and Aix, and of an archbishop, bearing the title of 'Primate of All the Gauls.' There is also a school of medicine, a mint, a national observatory, a library of 110,000 vols., a museum, a botanic garden, a school of design, and a national veterinary school. It is a fortified tn., being the prin. fortress of the interior of France, and, like Paris, possesses a military governor. It has manufs. of all kinds, the most important being the silk industry in all its branches. There are also manufs. of machinery, copper, bronze, leather, starch, jewellery, iron goods, tobacco, hats, chocolate, and glass goods. Its trade consists in silk and silk goods, cloth, coal, and charcoal, metals and metal goods, wine and spirits, cheese, and chestnuts. L. was founded in 43 B.C., and became the cap. of Celtic Gaul, or the Lyonnais. It was rebuilt by Nero and also by Constantine, and was the residence of the Burgundian kings to the end of the fifth century. It was annexed to France in 1312.

There was fighting in the L. area in Aug. 1944, following the landing of the Allies in S. France (see WESTERN FRONT in SECOND WORLD WAR, Allied Landings in Southern France). Amer. and Fr.

forces entered L. on Sept. 3, 1944, on which date the Gers. had evacuated most of S. France between that city and the Atlantic. Ger. hopes of making a stand in the Rhone valley at L. were dissipated after troops of Gen. Patch's (q.v.) Seventh Army had crossed the riv. and its trib., the Ain (20 m. E. of L.). L. did not escape damage. The twelfth-century Pont de la Guillotière was destroyed, and the dome of the Hôtel Dieu by Soufflet was completely destroyed by fire. The dungeon and tower of the ruined Château-neuf-du-Pape were blown up by the Gers. Pop. 460,700.

Lyons, co. seat of Wayne co., New York, U.S.A., stands on the Erie Canal and the Clyde R., and has manufs. of silver ware and agric. implements. Pop. 3800.

Lyons, Gulf of, see LIONS, GULF OF.

Lyra (the Harp), one of the old constellations, representing the lyre of Mercury (Aratus), of Mercury or of Orpheus (Hyginus). It is surrounded by Cygnus, Aquila, Hercules, and the head of Draco. Its brightest star, a Lyrae, also called Vega, is of magnitude 0.1, being the third brightest star in the sky. Its proper motion is 35 in. per century. If a line be drawn through the middle of Cassiopeia, the pole star, and the middle of Ursa Major, this star may be seen nearly in the perpendicular to that line drawn through the pole star. When Aquila is known, a line drawn through its four neighbouring stars, α , β , γ , and δ , will pass through a Lyrae.

Lyrae, Alpha, see VEGA.

Lyre, most ancient of the stringed instruments of music. Though associated for us with the anct. Gks., who sang to its accompaniment the stories of the *Iliad*

of the Nile. The L. consists of a hollow sound-chest surmounted by two branching horns joined by a cross-bar to which the cords were attached. A plectrum of ivory or polished wood was used to touch the cords, which were of gut. The Gks. used tortoise-shells from India for their sound-chests, whence the name *chelys* (tortoise), the framework of the Egyptian L. was of wood. The troubadours accompanied their songs with the L. The *cithara* and the *phorminx* are often included in the term.

Lyre-birds, members of the passerine family Menuridae, which inhabit the forests and bush dists of Australia

LYRE BIRD

They are large birds with very stout beaks and short, rounded wings, the tail has sixteen rectrices, and in the males of some species the exterior pair of feathers are curved in the shape of a lyre, the tail of the female is long, broad, and normal in shape. L. live in the thick undergrowth or sandy gullies of forests, and feed upon insects, worms, and molluscs; they rarely fly, but run or strut with the tail spread horizontally. *Menura superba* is 33 in. long, and of a brownish colour, with bluish tinge. *M. victoria* has notch-like markings on the outer rectrices; and *M. alberti* is of a warmer, reddish colour. See A. O. CHISHOLM, *Birds and Green Places*, 1929.

Lyric (Grk. *lyra*, lyre, a musical instrument with seven strings). Lyric poetry among the ancients was so called because it was sung or recited to the accompaniment of music. L. poetry may perhaps be best described as that class of poetry which expresses emotion directly, and in this sense includes the ode, the sonnet, the elegy, the psalm, the hymn, and the song. 'In lyric poetry the poet gives vent to his personal emotions or experiences—his joy, sorrows, cares, complaints, aspirations, despair—or reproduces in words the impressions which nature or history has made upon him' (S. R. Driver, *Introduction to the Literature of the Old Testament*, 1891). Examples of L. poetry occur in the Vedantic hymns of India and in the Heb. psalms, but in Europe the art reached its zenith in Greece with the love

LYRE

and the *Odyssey*, the L. is probably of Asiatic origin. It was the instrument (*kinôr*) played by David and by the exiles in Babylon. The Gks. attributed its invention to their Hermes, who struck sounds from the dried cartilages of a tortoise-shell he picked up on the banks

songs of Alcæus and Sappho, the choral hymns of Pindar and Bacchylides, and the dramatic choruses of Æschylus, Sophocles, Euripides, and Aristophanes. If it be true that in succeeding ages the field of L. poetry widened in scope and variety of expression, it remains certain that no poets have surpassed the Gks. in sublimity of thought or passion of utterance. The most noteworthy of Lat. lyricists are Catullus, Horace, Tibullus, and Propertius, all of whom followed the models. The triumph of Christianity tended to dry up the sources of inspiration, though during the 'Dark Ages' a wealth of religious hymns was produced. During the Middle Ages the chivalric love L. was perfected by the troubadours and by the minnesinger of Germany. Chief among the latter is Walther von der Vogelweide (1170-1228), the author of *Frauenminne* and the glorious ode *Unter den Linden*. A century later Petrarch (1304-74) in Italy pub. his *Canzoni* which moulded the whole L. poetry of the Renaissance.

The poets of the Renaissance not only revived the external qualities of the classical tradition, but also returned to the ancient wells of inspiration. The odes of Ronsard (1550) follow closely the models of Pindar and Horace, while the sonnets of Shakespeare rank among the greatest of the world's literature. The seventeenth century witnessed a great outpouring of religious poetry, notably in England, where the chief names are John Milton, George Herbert, Henry Vaughan, and Richard Crashaw. In the eighteenth century the most famous lyricists are both Ger., Schiller (1759-1805), whose magnificent *Ode to Joy* was set to music by Beethoven, and Goethe (1749-1832), who wrote some fine Ls. during his stay at Strasbourg (c. 1770-1772). During the next century there was a wonderful flowering of L. poetry all over Europe. In England Keats's *Ode to the Nightingale*, Shelley's *Ode to the Western Wind*, and the love songs of Robert Burns are among the most splendid achievements of the human mind. Representative of the best Fr. work are V. Hugo's *Feuilles d'automne* (1831) and *Légende des siècles* (1856); the impressionist Verlaine's *Sagesse* (1881) and *Jadis et naguère* (1885); and Baudelaire's *Les Fleurs du mal* (1857). Of the Gers. in this period may be mentioned F. Rückert's *Frühling d'amour* and *Poésies lyriques*; E. Mörike's *Gedichte*; and the *Nachts* and *Waldegespräch* of J. von Eichendorff, the greatest lyricist of the Ger. romantics. There is a preference in modern poetry for the shorter L. presenting brief emphasised impressions, generally of everyday life. The effect is produced by clever and apt imagery, a whole technique in itself, which seems to give intuitive, if fleeting, visions of transient experiences, moods, or passions. Such are the Ls. of Robert Bridges, Gordon Bottomley, and Thomas Hardy. The popularity of the short L. to-day is partly due to a reaction from the literal interpretation of Wordsworth, who stated that 'poetry is the impassioned expression on the face of science.' Much learning

and scholarship are evident in the verse of the great Victorians, but it is now generally held that this attitude towards nature is not appropriate to the poet, and the fashion to-day is to discount scientific knowledge altogether as a necessary part of the poet's endowment.

At the end of the nineteenth century Ernest Dowson, Lionel Johnson, and A. E. Housman were leaders of a group of poets who strove to capture the spirit of the dying romanticism in Ls. which excluded the problems of morality and philosophy in favour of brief poignant lines imaging their own moods or moments of experience. But if they were often concerned largely with symbols they could express profound emotions with striking brevity. More open to criticism are the 'Georgian poets,' and particularly Rupert Brooke, whose poetry is often said to lack profundity and to subordinate the deepest emotions to pretty verses; but much of the revolt against the Georgians sprang from the belief that poetry in the modern world must discover a new manner, and even some writers who began with lyrical and melodious verse abandoned it for an expression nearer to the temper of modern life.

It is not without significance that the short L., in its implicit philosophy of life, often carries us far beyond the immediate subject into the 'music of the spheres,' as is exemplified in Siegfried Sassoon's *Everyone Sang*, or J. Elroy Flecker's *Tenebris interlucentem*; and this reaching out to the infinite is marked in the verse of Thomas Hardy. It is to be noted, too, that much of the best work of John Masefield is to be found, not in his long narrative poems, striking and powerful as these are, but rather in his fugitive Ls., in which latter he led the way for poets like Rupert Brooke, Siegfried Sassoon, Julian Grenfell, and Robert Graves. In the latter-day Irish literary movement, culminating in W. B. Yeats and 'A.E.' (George Russell), there are to be found a number of splendid Ls., albeit far from Irish in sentiment or theme. Among the best of these are Yeats's *The Song of Robin Goodfellow* and the well-known *Lake Isle of Innisfree*. Neither of these two poets has had much influence on the development of the main current of Eng. poetry; but it is otherwise with such poets as A. E. Housman, John Davidson, and Swinburne, though the last-named belongs rather to an earlier generation than that with which we are dealing. Housman's famous *A Shropshire Lad* is really a collection of some sixty-three short Ls., and it was chiefly through the influence of Housman that the brisker, brighter L. measures were restored to popularity and that the realisation grew that it was possible to express solemn emotion in forms other than the sonnet. John Davidson, though not of the ultra-moderns, was in advance of his time, and perhaps for that reason has sunk into a most unmerited oblivion; for with Housman, Bridges, and Hardy he had much to do with setting the minds of the young poets of the twentieth century exploiting new subjects and new methods

of treatment. Of Davidson's shorter poems may be mentioned *The Escaped Nun*, *Piper play*, and *The Runnable Slog*, all of which will be found to have had their influence on modern verse. Among other good modern Eng. Ls. may be mentioned Elroy Flecker's *Queen's Song*, W. H. Davies's *Where she is now*, Walter de la Mare's *Songs of Childhood*, and J. C. Squire's *The Ship*.

Among continental lyricists of to-day are Sophos Claussen, Ludvig Holstein, and Johannes Jorgensen, all of Denmark and generally of the Symbolist school; Verhaeren and Cammaerts of Belgium; Stefan George, Dehmel and Karl Broger of Germany; Jean Cocteau of France, an experimentalist; R. M. Rilke of Germany; the Russian A. Pushkin; and Campoamor of Spain; and of the work of Amer. poets some of the best Ls. are those of Wm. Wilfrid Campbell and Robert W. Service, both Canadian, and Ina Donna Coolbrith of the U.S.A. See also BALLAD; HYMNS; METRE; DRAMA; POETRY; also articles on the literature of the various nations. See G. Hegel, *Die Phanomenologie des Geistes*, 1807; F. T. Palgrave, *Golden Treasury*, 1861; G. Saintsbury, *Seventeenth-century Lyric*, 1892; J. and C. Massfield, *Lyrics of the Restoration*, 1906; E. K. Chambers, *Early English Lyric*, 1907; A. Gowers, *Lyric Masterpieces of Living Authors*, 1909; E. Ithys, *Lyric Poetry*, 1913; R. H. Strachan, *The Soul of Modern Poetry*, 1922; H. Brémond, *Précis et poésie*, 1926; Iola A. Williams, *Poetry of To-day*, 1927; H. J. Grierson, *Lyric Poetry from Blake to Hardy*, 1928; and A. Closs, *The Genius of German Lyric*, 1938.

Lyric Theatre, situated in Hammer-smith, London, and reopened soon after the First World War by Mr. (later Sir) Nigel Playfair, who, in collaboration with Arnold Bennett, revived a number of period plays and ballad operas. The most successful venture was Gay's *The Beggar's Opera*, which enjoyed a phenomenal run. Here too Sir Barry Jackson produced Drinkwater's *Abraham Lincoln* (1919). In 1945 control was assumed by the Company of Four, connected with the Arts Council; plays by European authors, including Sartre, Cocteau, and Molnar, have been presented.

Lys, or **Lez**, riv. of France and Belgium, rises in the Fr. dept. of Pas-de-Calais, and flows 130 m. N.E., joining the Scheldt at Ghent. It is navigable for about 100 m., and canalised for 44 m. Its water is famous for use in retting flax.

Battle of the Lys.—The second phase of the final Ger. offensive in the First World War (April 9–29, 1918), the first phase being the second battle of the Somme, begun on March 21. Both phases are called the battle of Picardy in Fr. official documents, the names L. and Somme being those adopted by the Battles Nomenclature Committee of the Brit. War Office. The L. battle, so far as the Brit. Armies were concerned, began with a gigantic Ger. effort between Arras and Ypres, with the object of separating the armies of Gens. Horne and Plumer, and the severest fighting took place near

Hazebrouck (q.v.), Kemmel Hill (q.v.), Passchendaele (q.v.), and Messines (q.v.). For details see FRANCE and FLANDERS; FIRST WORLD WAR, CAMPAIGNS IN, 1918.

Lysander (Λυσαιδης), Spartan soldier, was probably of servile origin, but his ability marked him out for great things, and in 407 B.C. he was chosen to command the fleet against the Athenians. Fixing his headquarters at Ephesus, he soon obtained great influence, not only with the Gk. cities but also with Cyrus, who supplied him with large sums of money. He was, however, superseded by Callicratides in 406, as the Spartan law did not permit the office of admiral to be held twice by the same man; but when Aracus was sent out in 405 as commander-in-chief, L. was made vice-admiral, being in reality invested with supreme command. It was in this year that he brought the Peloponnesian war to an end by the defeat and capture of the Athenian fleet off Egospotami, and followed this up by seizing Athens in 404, destroying her long walls and the fortifications of the Piræus, and establishing the oligarchy known as the Thirty Tyrants. He was by this time the most powerful man in Greece, and began to conceive the idea of bringing about a change in the Spartan constitution by abolishing hereditary royalty and making the throne elective, but his enterprise was cut short by his death. He perished at Halartus in 395, when commanding one of the Spartan armies in the Boeotian war.

Lysander. The Westland L. was designated to a 1934 R.A.F. specification for an army-co-operation two-seater, was

LYSANDER

Westland Lysander in its air sea rescue form. An inflatable rubber dinghy and supply containers are carried on the wings attached to the wheel spats, while smoke floats for giving wind direction are carried under the rear fuselage.

completed in 1936, and was in service at the beginning of the Second World War. Metal construction was used for the L., with fabric covering for parts of the wings and fuselage. The pilot sat in front of the wing and the observer behind, where he could operate the radio and a movable gun. For army-co-operation duties a

hook was fitted under the fuselage for picking up messages suspended between posts on the ground. Special slots and flaps (q.v.) on the wings allowed it to fly slowly and land in very small spaces, so that small advanced fields could be used. Used in France at the beginning of the Second World War, and also in the W. Desert, for artillery observation work, it was superseded by other types before the allied invasion of Europe. Because of its excellent slow-flying qualities, the L. was fitted with extra tanks to increase its range and used for espionage work. Not only were supplies dropped from it, but it was also landed in small fields at night to pick up Brit. agents. Another job was that of air-sea rescue; stationed round the coast were isolated L. units in radio contact with operational control, and when an aeroplane was reported down in the sea, the L. was sent out with inflatable rubber dinghies and supplies which were dropped in the sea near the airmen. Its final duty with the R.A.F. was that of target towing for air-to-air and anti-aircraft gunnery practice. Powered by an 850-h.p. Bristol Mercury air-cooled radial engine the L. had a maximum speed of 217 m.p.h. at 5000 ft. and a slowest speed of 110 m.p.h. with full load. The loaded weight was 6,300 lb.

Lysenko, Trofim (b. 1898). Russian biologist and agriculturalist, president of the Lenin Academy of Agric. Sciences, b. at Karlovka, Ukraine. He continued the work of his fellow countryman Michurin in practical plant breeding. It is reported that he denies the validity of the results in genetics obtained by Gregor Mendel, T. H. Morgan, and the Neo-Mendelians, i.e. the chromosome theory of heredity which most biologists now consider to rest on a firm basis of fact. L. maintains that heritable changes can be brought about in plants by environmental influences such as vernalisation (subjection to extreme temps.) of wheat, and by grafting (the scion being supposed to influence the stock, and vice versa). This is, in other words, the argument of nature versus nurture; L., in accordance with the general ideas of Marxism and Communism, believes that nurture is all-important, and that acquired characters can be inherited, a theory which has not yet been disproved by biologists, though few subscribe to it at the present time. European and Amer. workers say that L.'s experiments are not performed with adequate precautions, and in particular that he neglects (1) to use pure-breeding stock; (2) to employ adequate control experiments; (3) to subject his results to statistical analysis. Dr. Eric Ashby, who has actually examined L.'s experimental plots, reports that the variability of his experimental material is very great, and that it would of itself account for his results. At the time of writing (1949) the controversy remains unsettled. See the article by Dr. J. Huxley in *Nature* (June 18, 25, 1949, in which the relevant literature is fully quoted. See also BREEDING; GENETICS; LAMARCKISM; HEREDITY; MENDELISM.

Lysias (Λυσίας) (c. 458-378 B.C.), Attic orator, b. at Athens, though his father was a Syracusan, Cephalus. At the age of fifteen he was sent with his brothers to Thurii in S. Italy, where he studied under the rhetorician Tisias. About 412 he returned to Athens, but was accused in 404 of being an enemy of the existing gov., and was forced to flee to Megara. He went back to Athens, however, after the fall of the Thirty, and gave his time to the lucrative occupation of writing legal speeches for others, after obtaining high repute as an orator, in 403, by his accusation of Eratosthenes, the murderer of his brother. L. wrote a great number of orations, but only about thirty-five are extant, and of these perhaps not all are genuine, and the only one delivered by him in person was that against Eratosthenes. He is the first really classical orator of the Gks., and his speeches are remarkable for the purity and simplicity of their language, the skill shown in always adapting style to subject, the lucidity of their description, and above all for their striking delineations of character.

Lysimachus (360-281 B.C.), Gk. general under Alexander, was a Macedonian by birth, and was early promoted to attendance on the king. After the death of Alexander, Thrace and the neighbouring countries as far as the Danube were assigned to L., who extended his kingdom still further and founded the city of Lysimachia on the Hellespont. In conjunction with Seleucus he defeated the combined armies of Antigonus and Demetrius at Ipsus (301 B.C.). He obtained possession of Macedonia (286 B.C.) and retained it until his death which occurred on the plain of Corus during a battle against Seleucus.

Lysippus (c. 336-270 B.C.), famous Gk. sculptor, was originally a workman in bronze, and most of his statues were executed in that medium. He was the first to introduce portrait sculpture, and made many representations of Alexander the Great. None of his works is extant. See study by F. Johnson, 1928.

Lysozyme, see under FLEMING, SIR ALEXANDER.

Lyte, Henry Francis (1793-1877), Brit. hymn-writer, b. at Ednam, Scotland, of an ant. Somersetshire family. He entered holy orders, and held sev. curacies; afterwards he had charge of Lower Brixham for twenty-five years. His health compelled him to reside abroad, and he died at Nice, and is buried there in the Eng. cemetery. L. is the author of *Abide with me, Praise, my soul, the King of Heaven*, and other well-known hymns.

Lytham, par. and tn. of Lancashire, England, on the R. Ribble, 8½ m. N.E. by S. of Blackpool. It is a favourite watering-place, and has a pier 900 ft. long. In 1922 the urban dists. of L. and St. Anne's were incorporated to form the municipal bor. of L. St. Anne's. Pop. 30,600.

Lyttelton, Alfred (1857-1913), the eighth son of the fourth Lord L., was educated at Eton and Trinity College, Cambridge.

In 1895 he was elected member of Parliament for Leamington in the Liberal-Unionist interest and held this seat until 1906, after which he became member for St. George's, Hanover Square. From 1903 to 1905 he was secretary of state for the colonies, and was subject to much criticism on his conduct of S. African affairs. He was a famous athlete in his day, playing cricket and football for England. He was also tennis champion (1882-95).

Lyttelton, George, first Baron Lyttelton (1709-73), the eldest son of Sir Thomas L., baronet, of Hagley, Worcestershire. In 1735 he entered the House of Commons as member for Okehampton, and soon acquired considerable reputation as an orator and statesman. He held many important offices, and was raised to the peerage in 1756. He produced many vols. of poetical and historical works. His memoirs and correspondence were pub. in 1845.

Lyttelton, port of S. Is., New Zealand, 5 m. S.E. by E. of Christchurch. The entrance to the harbour is more than 2 m. wide, and is protected by two breakwaters. There is a lighthouse at Godley Head, on the N.W., visible 29 m. The port is approached from Christchurch by road and rail, the latter a direct route through a tunnel; a tunnel road is planned. Pop. 4058.

Lyttelton, Oliver (b. 1893), Brit. statesman and industrialist. He was educated at Eton College and Trinity College, Cambridge. After military service in the First World War he became managing director of the Brit. Metal Corporation, and held directorships in numerous companies. He was elected Conservative member for Aldershot in 1910. During the Second World War he was controller of the non-ferrous metals branch of the Ministry of Supply, 1939-40; minister of state and member of the War Cabinet, 1941-42; minister of production and member of War Cabinet, 1942-45; and president of the board of trade and minister of production, May-July 1945. After the Conservative defeat in 1945 he became chairman of Associated Electrical Industries Ltd. His experience in industrial organisation and supply was of the utmost value to the wartime gov.

Lytton, Edward George Earle Lytton Bulwer, first Baron Lytton (1803-73), Eng. novelist, playwright, and statesman, was a man of unusual versatility. He was educated at a private school and afterwards at Trinity College, Cambridge, where he greatly distinguished himself. Finding it necessary after his marriage to augment his income, he took up his pen, and after contributing to many periodicals turned to novel writing. *Falkland* appeared in 1827, and in the following year he pub. *Pritham*, an excellent and amusing book, and *The Disowned*. Eugene Aram was issued in 1832. *The Last Days of Pompeii* in 1834, and *Rienzi* in 1835. In 1838 *The Lady of Lyons* was produced at Covent Garden, and his other successful plays were *Richelieu* (1839) and

Money (1840). His popular historical novel, *The Last of the Barons*, came out in 1843, and five years later was followed by *Harold*. L. had been in Parliament since 1831, and became (1858-59) secretary of state for the colonies. He was raised to the peerage in 1866. Of his other books the best were *The Cartons* (1850), in which the influence of Sterne is very clearly to be seen. *A Strange Story* (1862), *The Coming Race* (1871), *Kenelm Chillingly* (1873), and *The Parisians* (1873), unfortunately incomplete. L. had a keen sense of character, a sufficiency of historical lore, a knowledge of life and society, and all these qualities he pressed into his service. See lives by T. Cooper, 1873; second earl of Lytton, 1913; also *Letters to His Wife*, 1884, and M. Sadleir, *A Panorama*, 1931.

Lytton, Edward Robert Bulwer, first Earl of Lytton (1831-91), Eng. statesman and poet, son of Bulwer-L., first Baron L., the novelist, entered public life as private secretary to his uncle, Lord Dalling, at Washington and Florence. He was subsequently attaché at The Hague and Vienna, at which last city in 1862 he was second secretary of the legation. He served at Copenhagen (1863), Athens (1864), Lisbon (1865), and at Madrid and Vienna (1868-72), becoming in the last year secretary to the Paris embassy. He succeeded to his father's barony in 1873 and went out to India as viceroy (1876-80), when in 1877 he proclaimed Queen Victoria as empress. On his return he was raised to the earldom. From 1887 to 1891 was ambas. at Paris. Like all the Ls. he had a love of literature, and in 1855, under the pseudonym of 'Owen Meredith,' he pub. *Cytemnestra and other Poems*. *The Wanderer* in 1857, and *Lucile* three years later. *Chronicles and Character* appeared in 1868, and *Ordeal*, or *The Fool of Time* in 1869. His poetry was always much admired, and he had a lyrical gift, though some of his longer pieces are somewhat dull. *King Poppy* (pub. posthumously, 1892) is usually regarded as his masterpiece.

Lytton, Sir Henry (1867-1936), Eng. actor, the 'Savoyard' who for forty years delighted audiences with his acting in Gilbert and Sullivan operas. Making his début in *Princess Ida* at the age of seventeen, in three years he was promoted to the Savoy Company, proceeding thence to the D'Oyly Carte Company, with which he remained many years. He was especially notable in the role of Jack Point. On retirement in 1934 he received a national testimonial, the presentation being made by Mr. Lloyd George, the signatories including Mr. Ramsay MacDonald and Mr. (later Earl) Baldwin. See his *Secrets of a Savoyard* (1922) and *A Wandering Minstrel* (1933).

Lytton, Victor Alexander George Robert Bulwer-Lytton, second Earl of (1876-1947), Brit. governor, statesman, and author; b. at Simla, son of first earl of L., and educated at Eton and Trinity College, Cambridge. He began his public career in 1901 as private secretary to George

Wyndham, chief secretary for Ireland; civil lord of the Admiralty, 1916 and 1919; Brit. commissioner for propaganda, France, 1918; parl. under-secretary of state for India under Edwin Montagu, 1920; he was appointed to an India Office committee on the political claims of Burma and earned a reputation for sympathy with Indian aspirations. Governor of Bengal, 1922-26; for four months in 1925 he acted as governor-general, being proclaimed viceroy on the forty-ninth anniversary of his father's assumption of office. His office in India was rendered difficult through preoccupation with the maintenance of law and order against terrorists and 'non-co-operators.' L. will, however, best be remembered for his sustained labours for international goodwill and understanding through the agency, after the First World War, of the League of Nations and, after the Second World War, of the United Nations Organisation. On his return from India he co-operated closely with Lord Cecil of Chelwood in the work of the League of Nations Union. In 1927-28 he led the Indian delegation to the League Assembly, Geneva, and was a member of the Brit.

delegation, 1931. In 1932 he was appointed chairman of the League of Nations mission to Manchuria to investigate Japan's seizure of that prov. His report on this major infringement of the League Covenant condemned the action of the aggressor, but it failed to prompt the powers to any action stronger than censure. Later he worked hard for the formation of the United Nations Association and became its chairman. Notwithstanding these duties he continued his association with the Trust House movement, the promotion of popular social clubs, and the care and education of state-aided children. He was also keenly interested in housing and tn.-planning, being president of the Garden Cities and Tn. Planning Association, and in the movement to popularise good drama and opera, being chairman of the Old Vic Association and president of the Central School of Speech Training in Dramatic Art. In addition to a biography of his grandfather, the novelist (1913) and Indian reminiscences (1942), he wrote *New Treasures* (1934), *The Web of Life* (1938), and *Love Incarnate*, a harmony of the Gospels (1946).

M

M is the thirteenth letter in the alphabets of W. Europe. It also was the thirteenth letter in the N. Semitic alphabets (see *under* ALPHABET), but it is the twelfth in the Gk., the eleventh in the Etruscan, the twelfth in the Lat., and the fourteenth letter in the early Slavonic alphabets. In the N. Semitic alphabets, as well as in the early Gk., Etruscan, and Lat. alphabets, which were written from right to left, it was written *m*. In early Crete, Chalcis, and its colonies it was drawn with five strokes, so *MM*. In the cursive Rom. writing of the first century A.D., as we meet it in the wall inscriptions and in the waxed tablets of Pompeii, the vertical (slightly oblique) four-stroke *M* (III) was preferred. In the Rom. uncial script, which appears from the third century A.D. onwards, it has the typical rounded shape (*m*), which is the main feature of the uncial hand. Roughly at the same time the cursive minuscule assumes a form similar to the modern small *m*. Like *b*, to which it is closely related, *m* is pronounced with both lips (bi-labial). Curiously enough, *b* is sometimes slipped in after *m*, as in the Gk. *Μαθηματικα*, noon, and the Fr. *nombre* from Lat. *numerus*, number). Unlike *b*, however, *m* is nasal.

M, used by the Romans for the numeral 1000. Their word for mile was *mille passus* (a thousand paces), and the initial letter is commonly considered as having become a symbol for the number.

Maas, see MEUSE.

Maasejck, or **Maeseyck**, tn. on the Meuse, 10½ m. S.W. by W. of Roermond in Limburg, Holland. The brothers Van Eyck were *b*. here. Pop. 4600.

Maasin, port at the mouth of the M., on the S.W. of the is. of Leyte in the Philippine Is., which exports hemp, copra, and tobacco. Pop. 29,300.

Maassluis, port for herring-fishing, on the Nieuwe Waterweg, 10½ m. W. of Rotterdam in Holland. Pop. 7800.

Maastriicht, or **Maestriicht** (anct. *Trajectus Superior*, upper ford), cap. of the prov. of Limburg, Holland. It lies 19 m. N.N.E. of Liège by rail, and except for the suburb, Wilk, which is reached by a stone bridge, is situated on the l. b. of the Maas. There are metal works and manufs. of wine, beer, earthenware, paper, and cigars, etc. The failure to blow up two bridges over the Albert Canal, a result of fifth-column work, was the beginning of the gap in the allied line which led to disaster, in May 1940. Pop. 73,800.

Maat, in Egyptian mythology, the goddess of law and order, and also of truth, the counterpart of Thoth (*q.v.*). She was the daughter of Ra, the Egyptian sun-god. The name itself signifies order and as 'life by rule' was recognised as imperative by all classes in anct. Egypt,

M enjoyed an almost supreme position. She is associated with Ptah (*q.v.*) and Khnum, anct. Egyptian cosmic deity and personification of creative force, in the creation of the universe and the evolution of order out of chaos. The Gks. identified her with Themis.

Mab, **Queen**, queen of the fairies, and Oberon's wife, according to the *Nymphidia* of Drayton and the *Hesperides* of Herrick. Shakespeare, in *A Midsummer Night's Dream*, gives the honour to Titania.

Mabalakat, tn. to the S.S.E. in Pampanga, Luzon, the Philippine Is., connected by rail to S. Fernando. Pop. 40,000.

Mabillon, Jean (1632-1707), Fr. historian, entered the Benedictine order in 1653, and from 1664 onwards was engaged in editing a colossal number of MSS. at the abbey of Saint-Germain-des-Prés in Paris. The result of his investigations was his *Acta Sanctorum ordinis S. Benedicti* (1668-1702), a monumental hist. of the order. His monograph entitled *De Re Diplomatica* (1681) laid the foundations of Lat. palaeography. See J. U. Brinkman, *Mabillon and the Benedictine Historical School*, 1928, and G. Heer, *Jean Mabillon und die Schreiber Benediktiner*, 1934; also monographs by T. Rulnart, 1939 (new ed. 1953), and E. de Broglie, 1888.

Mabinogion, **The**, is another name for the *Red Book*, which was trans. into Eng. and ed. by Lady Charlotte Guest in 1838-1849. *The Red Book of Ihergest* is an invaluable MS., now preserved in Jesus College, Oxford, and containing eleven prose tales of Welsh literature and also a romance entitled 'Hanes Taliesin.' The MS. belongs to the fourteenth and early fifteenth centuries. Three of the stories, 'The Lady of the Fountain,' 'Peredur,' and 'Gereint Son of Erbin,' deal with the Arthurian legend. 'Culhwch and Olwen' and 'The Dream of Rhonabwy' are termed mixed romances, Irish mythology and the deeds of Arthur being freely intermingled. 'Pwyll,' 'Branwen,' 'Manawydan,' and 'Math' are purely Irish in origin. The remaining two stories, 'Lludd and Llofelys' and 'The Dream of Macsen Wledig' refer apparently to the period of Rom. settlements in Britain. See G. and T. Jones (editors), *The Mabinogion* (Everyman's Library), 1949; also eds. by J. Evans, 1907; I. Williams, 1930; and M. Richards, 1948. Trans. by T. P. Ellis and J. Lloyd, 1929.

Mablethorpe and **Sutton**, urb. dist. and seaside resort of Lincolnshire, England, 7 m. N.E. of Alford. A Rom. villa and a submerged forest appear to view at very low tides. Pop. 4890.

Mabuse, Jean (c. 1470-c. 1531), Flem. painter, really Jan Gossaert, was called Mabuse after his bp., Maubeuge. His 'Adoration of the Magi' in the National

Gallery, London, and 'The Upright Judges' in Antwerp are in his early and purely Flem. style, but his triptych of 'Adam and Eve' (1516) in the Berlin Gallery shows the influence of his sojourn in Italy. Thither he went in 1508 in the company of Philip of Burgundy, his patron, and there he copied the masterpieces of Leonardo da Vinci and Michelangelo. See also FLEMISH ART. See M. J. Friedländer, *Von Eyck bis Brueghel*, 1923; also monographs by E. Weiss, 1913, and A. Ségard, 1923.

Mac, Gaelic prefix signifying 'son of,' like the Norman 'Fitz' in Fitzmaurice, the Irish 'O' in O'Grady, and the Welsh 'Map' or 'Ap' in ApRichard ('Pritchard'). MacGregor and MacLean are common examples. A confusion with *magnus* probably accounts for the meaning of 'great' which 'Mac' sometimes seems to bear.

Macadam, Elizabeth (1871-1948), Scottish social worker and writer. Served her apprenticeship in the Women's Univ. Settlement in Southwark, where she trained many generations of social workers. Her three books, *The Equipment of the Social Worker* (1925), *The New Philanthropy* (1934), and *The Social Servant in the Making* (1945), reflect the development of her ideas as a convinced propagandist of training as well as a particularly well-informed and open-minded commentator on social legislation and administration.

McAdam, John Loudon (1756-1836), Scottish inventor, has given his name to the surfacing of roads with granite or other durable stone broken small enough to make a hard, smooth surface, suitable for traffic. In 1816 he successfully 'macadamised' the Bristol roads. He was appointed surveyor-general of metropolitan roads in 1827 and granted £10,000. See life by R. Devereux, 1930.

McAdoo, William Gibbs (1863-1941), Amer. politician, b. in Georgia, a prominent figure in the Democratic party, and an able assistant to President Wilson. Secretary to the Treasury from 1913 to 1919. He was responsible for far-reaching financial reforms, such as the Federal Reserve Banking Act, and, during the war, the introduction of a thrift system by which he secured from 500,000,000 to 700,000,000 dollars every fortnight to provide for the huge Amer. war expenditure. Much interested in railway problems, he was the author of the scheme for constructing the series of tunnels in New York city under the Hudson R. from the New Jersey side to Manhattan Is.

McAlester, tn. of Oklahoma, U.S.A., co. seat of Pittsburg co. There are large oilfields, coal is mined, and natural gas is plentiful. Other manufs. include cotton processing, foundries, and railway workshops. There is an airport. Pop. 12,400.

MacAlpin, Kenneth, see KENNETH I. **Macao** (Chinese *Aman-gao*, harbour of the goddess Ama), Portuguese dependency in China, at present held in virtue of a treaty with China of Dec. 1, 1887. The tn. lies on a peninsula flanking the W. side of the mouth of the Canton R., and with

its gaily painted level roofs presents an attractive appearance to European eyes. Practically all the inhab. are Chinese. The main industries and exports are dried fish, matchboxes, and fire crackers. But it is gold on which M. most depends; for Portugal, having signed no monetary agreements, can still conduct a free market in the metal. With Timor it is the see of a Rom. Catholic bishop. The façade of the former cathedral church of St. Paul is all that remains of a baroque church burnt 100 years ago in a typhoon. Portuguese factors settled here as early as 1557. Area 6 sq. m. Pop. 374,700 (including 8900 Portuguese).

Macaque, group of monkeys, *Macacus cynomolgus*, the common M. of the Malayan archipelago, is representative of the long-tailed section of the genus, *M. inuus*, or the Barbary ape, is a species which is found in N. Africa and on the rock of Gibraltar. *M. silenus* is the warden of India. All species are of stout build, the body large in proportion to the limbs, shoulders abnormally developed, longish muzzle and cheek pouches, large callosities on the buttocks, tail long or short or absent. They live in troops in the forests and are most active. Good-tempered when young, they become savage and brutal as they grow older.

Macaroni (It. *maccaroni*, perhaps from obsolete *maccare*, to bruise), form of wheat paste whose manuf. was for a long time exclusively confined to Italy, where it is an important article of diet. A particular variety of wheat is required for this purpose, i.e. the hard kind which contains a large percentage of gluten. At one time the M. was made by hand but this practice has been superseded by machinery. The wheat is ground into a *semola*, or coarse meal, from which the bran is removed; this is worked into a dough with water, and afterwards forced through a cylinder, generally into tube shapes, but also into sheets, etc. Vermicelli differs from M. only in thickness and shape. Spaghetti is made of the same paste as M., but pressed out into a solid, cord-like form thicker than vermicelli.

Macaronic Verse, species of burlesque, the humour of which depends partly on tacking Lat. suffixes on to all the words so as to suggest the dignity of Lat. poems, and thus turn the rhyme into a mock-heroic. Two lines from *Polemio-Middinta* (1684), which is attributed to Drummond of Hawthornden, are quoted:

'Macaronem, magis doctam milkare cowmas,
Et doctam sweepare flooras, et sternere
beddas.'

The *Liber Macaronicus* of Teofilo Folengo (*q.v.*), who first popularised this device, appeared in 1517. The author was a dissolute Benedictine monk, who explains that his doggerel, like the native macaroni, is nothing but a rude hotch-potch. The Fr. classic writer of such verse is Antoninus de Arena (*d.* 1544). A further illustration is J. R. Lowell's 'Kettelopotomachia' in *The Biglow Papers* (second series).

Macaronies, group of dandies and ex-

quisites of London, who flourished about 1772, and were known by the extravagance of their dress and more especially by their amazing wigs. Charles James Fox was a member of the coterie.

Macaroon, biscuit made of eggs, sugar, and finely crushed almonds. The name (Fr. *macaron*), is perhaps derived, like 'macaroul,' from It. *maccare*, to bruise.

Macarosa, or **Makaraka** (Rom. *Moerum*), fishing tn. and port, 32 m. E. of Split (Spalato), in Dalmatia, Yugoslavia. Pop. 11,000.

MacArt, Cormac, see **CORMAC**.

Macarthur, Douglas (b. 1880), Amer. soldier, b. in Arkansas, son of Lt.-Gen. Arthur (U.S. Army), graduated at U.S. Military Academy, 1903, and at the Engineers' School of Application, 1908. Commissioned second lieutenant of Engineers 1903; by 1920 he was brigadier-general. He was in the Philippines 1903-4, and took part in the Vera Cruz expedition of 1914. He was appointed chief of staff to the 42nd Div. in Aug. 1917; commander of the 84th Infantry brigade in Aug. 1918, and commander of the 42nd Div. in Nov. 1918. M. took part in the fighting in Lunéville, Baccarat, and other sectors; in the Champagne-Marne and Alsace-Marne defenses; and in the St. Mihiel, Pannes, Meuse-Argonne and Sedan offensives. He remained with the army of occupation in Germany till June 1919, when he was appointed superintendent of the U.S. Military Academy. His numerous decorations include the Legion of Honour, the Croix de Guerre, and the It. War Cross. In the Second World War he became world-famous for his defence of the Philippines against overwhelming Jap. odds in 1941-42, notably in the Bataan Peninsula. His delaying operations gained invaluable time for United Nations preparations. No legend ever sprang up so rapidly as the legend of MacArthur. It was the reaction from the disaster of Pearl Harbour. Yet he had but put into operation in the Philippines the forty-year-old strategy dictated by necessity, and the final plans for the defence of the Bataan Peninsula were prepared by Maj.-Gen. George Grunert, who commanded the Amer. forces in the Philippines in 1940. There is no doubt that the Jap. were content to leave the minor front of Bataan while they concentrated on Java and Burma and finally, when they sent some of their best divs. against the Bataan Peninsula, together with dive and low-level bombers, it soon fell, together with 33,000 Amer. and Filipino troops. M., however, was undoubtedly the best fighting general the U.S.A. had produced, though, without air power and mechanized striking units, no soldier could hope to defend the Far E. or launch successful offensives. Appointed commander-in-chief of the whole S.W. Pacific area, with his headquarters in Australia, April 19, 1942, thus controlling troops of all allied nations. Began offensive in the Brit. Solomon Is., Aug. 7, 1942. In 1942 M. was created commander-in-chief of the S.W. Pacific area, and there began the steady counter-offensive (see **PACIFIC CAMPAIGNS IN THE SECOND**

WORLD WAR). In the Pacific M. proved himself one of the greatest military commanders of the century. Appointed after the war to command all army forces in the area, it remained for him to show whether he was equally great as a proconsul. The task before him was of great complexity. Defeat had destroyed the foundations of Jap. national life, and left nothing in their place. All the old beliefs and traditions had gone. The allied bombing had equally disrupted the economic and industrial life of the country. There was grave danger of complete moral, social, and economic breakdown, but throughout 1946 considerable progress was made towards the restoration of normal conditions. M. was fortunate in being able to rely on Jap. co-operation. His directives were issued to a 'Haison' dept., which was in effect the Ministry of Foreign Affairs, and the various Jap. ministries concerned were then left to carry them out; but its prin. functions were supervision and the maintenance of Haison, rather than actual administration. It was for M. to supervise the Jap. nation in their apprenticeship in democracy, and as a result of the phenomenal capacity for work of the average Jap. much progress was made. See study by H. Nicolay, 1942, and F. Hunt, *Macarthur and the War against Japan*, 1945.

Macartney, George, Earl Macartney (1737-1806), Brit. diplomat and administrator, was chief secretary for Ireland from 1769 to 1772, and sat in the Irish Parliament. For two successive periods of five years (1775-85) he was governor of Grenada and Madras respectively. In 1792 he was sent as plenipotentiary to China. See H. M. Robbins, *Our First Ambassador to China*, 1908.

Macassar, or **Mangkasar**, cap. of a dist. of the same name in S. Celebes, Dutch E. Indies. It is made up of the Dutch port (Vlaardingen) and the Malay city, which lies back from the shore. Its ann. commerce in trepang, coffee, copra, spices, pearls, and rubber, etc., amounted to £1,500,000 before the Second World War. Seized by Jap. invaders in Jan. 1942, it was recovered in 1945. Pop. 88,600.

Macassar, Strait of, separates the Is. of Celebes and Borneo, Dutch E. Indies. It was the scene of prolonged naval engagement in 1942. See **NAVAL OPERATIONS IN THE SECOND WORLD WAR**.

Macato, pueblo in the N. of Panay Is., prov. of Capiz, Philippines. Pop. 10,136.

Macaulay, Rose, Eng. novelist, poet, and essayist, b. in Cambridge towards the end of the nineteenth century, her childhood and early youth were spent mainly in Italy. Her first novel, *The Valley Captives*, was pub. in 1911 while she was still a student at Oxford Univ. She has since written some fourteen novels, in which she reflects the contemporary scene with wit and a shrewd understanding. She estab. her reputation with *Potterism* (1920). This with *T. M. by an Idiot* (1923) and *Staying with Relations* (1930) are adjudged her most successful novels. Other novels include *Dangerous Ages* (1921); *Crises Train* (1926); *Keeping Up Appearances* (1928); *The Shadow Flies*

(1932); *Going Abroad* (1934); *I would be Private* (1937); and *And No Man's Wit* (1940). Her most individual work derives from her outstanding gift of historical imagination, combined with her powers of description. *They were Defeated* (1932) is an astonishing *tour de force*, a study of seventeenth-century England built round the life and personality of the poet Herrick; *They went to Portugal* (1946) contains studies of celebrated Englishmen who visited Portugal; and *Fabled Shore* (1949) is the account of a journey undertaken by the author along the E. and S. coast of Spain, a book in which the eye is as richly active on the present scene as the mind on the historical past. M. has written critical studies of Milton (1933) and of the novels of E. M. Forster (1938); also *Some Religious Elements in English Literature* (1931). Her poetry is contained in *The Two Blind Countries* (1914); *Three Days* (1919); and *Poems* (1927); while *A Casual Commentary* (1925) is a vol. of essays.

Macaulay, Thomas Babington, Baron Macaulay (1800-59), Eng. historian and statesman, the son of Zachary M., the philanthropist, was educated privately and at Trinity College, Cambridge. In 1825 he began to contribute to the *Edinburgh Review*, when his essay on Milton appeared. He soon became one of the most valued writers for that periodical, with which his connection endured for many years. He entered Parliament in 1830, and two years later was appointed a commissioner, and a year later secretary of the Board of Control. In 1834, tempted by the large salary that would enable him to save enough to support himself for the rest of his life, he accepted an appointment as a member of the Supreme Council of India, and he stayed in that country for five years. During his exile he assisted in preparing a criminal code for India, which did not, however, become law until the year after his death. On his return to England he was returned to Parliament as member for Edinburgh, and in 1839 became secretary of war, which office he held for two years. Edinburgh rejected him in 1847, but made amends by electing him in 1852. M. did not neglect his literary labours. He pub. *Lays of Ancient Rome* in 1842, and in the following years revised some of his *Edinburgh Review* articles for pub. in book form. Since 1839 he had been at work on his *History of England*, which was to deal with the period from the revolution to the death of George III.; but it was not until 1848 that the first two vols. appeared, vols. III. and IV. being pub. seven years later, and the fifth posthumously (1861). The *History* was received with a chorus of praise. Its sale was enormous, and it was everywhere eagerly discussed. Its vivid style made it eminently readable, and induced the reader to overlook the Whig bias that everywhere dominated it. His work is now read rather for its literary style than for its historical value; his search for effect and his prejudices militate against accuracy. As a narrative writer he is of the first rank, as in his description of England in 1685.

M. was raised to the peerage in 1857, and was buried in Westminster Abbey two years later. See his collected works, 1866 and 1898; Sir G. O. Trevelyan (editor), *Life and Letters of Lord Macaulay*, 1876, 1931; F. Harrison, *Shelley in Early Victorian Literature*, 1895; and C. Firth, *A Commentary on Macaulay's History of England*, 1938; also lives by J. C. Morrison, 1882; A. S. Canning, 1913; and A. Bryant, 1932.

Macaw, general name for large brilliantly coloured parrots of the genus *Ara*, natives of S. America. Their cry is unpleasantly harsh, and they are less docile than the true parrots. Ms. may live to a great age.

Macaw Tree, S. Amer. palm, *Acrocomia sclerocarpa*, known as 'gru-gru' or 'mucaja.' It attains a height of 40 ft. and has a prickly trunk, with a spreading head of large pinnate leaves divided into slender leaflets, which when young are eaten as a vegetable. The tree yields nuts used in the making of margarine and a violet-scented oil used for scented soaps.

Macbeth, king of Scotland, the date of whose birth is unknown, was the son of Findlaech, and hereditary ruler of Moray and Ross. In 1040 he murdered Duncan, the successor of Malcolm, and became king of Scotland, basing his claim to the throne through his wife Gruach. According to St. Berchan, his reign was prosperous, and M. a benefactor; he made a pilgrimage to Rome in 1050. In 1054 he was defeated by Siward at Dunsinane (Perthshire), and in 1057 defeated and slain by Siward and Malcolm the son of Duncan, at Lumphanan in Aberdeenshire. Shakespeare's tragedy of *Macbeth* is based on his life as given in Holinshed. See study by S. R. J. Erskine, 1930.

Macbride, Ernest William (1866-1940) Brit. zoologist, b. at Belfast, N. Ireland. Educated at Queen's College, Belfast, St. John's College, Cambridge, and at London Univ. Strathcona prof. of zoology, McGill Univ., Montreal, 1897-1909; prof. of zoology, Imperial College of Science, S. Kensington, 1913-34. Author of *Text-book of Invertebrate Embryology* (1911); *Introduction to the Study of Heredity* (1924); *Evolution* (1927); *Embryology* (1929); and *Huxley* (1934).

Macbride, Sean (b. 1904), Irish lawyer and statesman, son of John M., who was executed in the Easter Rebellion, 1916. His mother is Maud Gonne, who has played a large part in Irish nationalism. At fifteen M. was a company officer in the I.R.A. (Irish Republican Army) and on its headquarters staff two years later. He was a junior member of Michael Collins's delegation to London to negotiate a settlement. When Collins signed the treaty (see *ERR*) of 1921, M. denounced the 'betrayal' and joined the party (Fianna Fail) of de Valera. In 1931 he was at the head of the inner council of the I.R.A. in conflict with de Valera, who now as Prime Minister soon afterwards adopted the policy of outlawing the extremists of the I.R.A. In the final split between the leaders of the I.R.A. M. left the I.R.A. in

1937 and devoted himself to practice as a lawyer. Between his briefs he defended old I.R.A. comrades sentenced by de Valera's military tribunals. Later he launched a new Republican party—Clanna na Poblachta—the purposes of which were to sever the last link with Britain, secure an independent currency, and end 'partition' (i.e. unite the six cos. of N. Ireland). At the election of Feb. (1948), precipitated by his challenge to de Valera's policy under the External Relations Act (see EIRE), the new party obtained few seats, but, ironically, just enough to unseat de Valera, who had been in office since 1932. John Costello (*Fine Gael*, 1st Minister, *q.v.*) rewarded him with the key post of minister for external affairs in his coalition Cabinet.

Maccabees, The, or The Hasmoneans, Jewish family, who led the struggle for independence against the Syrian power in the second century B.C. For details see under the names of the individual members of the family—JUDAS, JONATHAN, SIMON, and JOHN HYRCANUS.

Maccabees, The Books of the, certain apocryphal writings of which only the first two are of much importance; these two books, as forming part of the LXX., are recognised by Rom. Catholics as canonical. 1 M. begins with a sketch of the conquests of Alexander the Great and the oppression which the Jews suffered from Antiochus Epiphanes. It then continues with a hist. of the Jewish struggle for independence from the first revolt under Mattathias until the death of Simon (135 B.C.). The hist. falls into three divs.: (1) Chaps. iii. 1–ix. 22, dealing with the period in which Judas Maccabaeus was leader; (2) chaps. ix. 22–xii. 53, dealing with the leadership of Jonathan; and (3) chaps. xiii. 1–xvi. 18, under the leadership of Simon. The work then concludes with a note telling of the accession of John Hyrcanus, and referring to 'the chronicles of his priesthood.' 1 M. was originally written in Heb., but only Grk. versions are extant. The author was a patriotic Jew of unknown name. The date of its composition was probably between 135 and 63 B.C., probably at the very beginning of this period. It may even have been commenced at an earlier date. 2 M. is a late composition of inferior historical value. It begins with two letters purporting to be addressed by the Jews of Jerusalem to those in Egypt. It then gives an account of the wars of the M. from about 176 to 161 B.C., covering about the same ground as the first seven chapters of 1 M. The author does not claim great accuracy, and speaks of his work as the epitome of a larger work by a certain Jason of Cyrene. It is much later than 1 M., though before c. 70. 3 M. and 4 M. are not strictly historical. The former deals with the period of Ptolemy Philopator, and the latter is better described by its sub-title, 'The Sovereignty of Reason.' See E. Kautzsch, *Die Apokryphen und Pseudoepigraphen des Alten Testaments*, 1900, 1921; and W. O. E. Oesterley, *An Introduction to the Books of the Apocrypha*, 1935.

MacCarthy, Denis Florence (1817–82), Irish poet, b. in Dublin. His earlier verses appeared in the *Dublin Satirist*, and by 1843 he was a regular contributor to the *Nation*. He received a medal from the Royal Sp. Academy for translating Calderón's dramas; he had previously been granted a Civil List pension. Among his works may be mentioned, *Ballads, Poems, and Lyrics* (1850), a very popular work; *The Bellfounder* (1857); *Under-Glimpses*, etc. (1857); and *Early Life of Shelley* (1871).

MacCarthy, Desmond (b. 1877), Eng. author and literary critic, educated at Eton and Trinity College, Cambridge, and Leipzig Univ. Entering journalism, he gained editorial experience with the *New Quarterly* and the *New Witness*. In 1913 he became a regular contributor to the *New Statesman*, of which in 1920 he was literary editor and later dramatic critic. During the intervening war years he served with the Red Cross, being attached to the Fr. Army. In 1928 he took over the editorship of *Life and Letters*, and in recent years he has contributed a weekly literary article to the *Sunday Times*. Clarity of thought, wide reading, and a discerning knowledge of the literary figures of his time are among his characteristics as a critic and essayist. While not being impressionistic as a critic he is successful, like Hazlitt before him, in elevating his personal judgment into a widely accepted contemporary estimate of literature. His writings over a number of years have been collected under the following titles: *Portraits* (1931); *Criticism* (1932); *Experience* (1935); and *Drama* (1941).

MacCarthy, Justin (1830–1912), Irish historian, novelist, journalist, and politician, b. at Cork. He was Home Rule member at different periods for Longford co., N. Longford, and Londonderry. On the fall of Parnell in 1892 he became chairman of the Home Rule party, a post which he held until 1896. His chief historical works are *Epoch of Reform* (1874); *A History of Our Own Times* (1882–97, and 1905); *A History of the Four Georges and William IV.* (1884–1901); *Modern England* (1899); and *Rome in Ireland* (1904). His numerous novels include *My Enemy's Daughter* (1869); *Lady Judith* (1871); *A Fair Saxon* (1873); *Dear Lady Disdain* (1875); and *Camilla* (1885).

Macchiavelli, see MACHIAVELLI.

McClellan, George Brinton (1826–85), Amer. soldier, one of the most enigmatic and most discussed figures of the Amer. Civil war, b. at Philadelphia and graduated from West Point in 1846. He served with distinction in the war with Mexico, was an instructor afterwards at West Point, and in 1855 was sent to Europe to study military affairs. He resigned from the army in 1857 and became president of a railway company. In 1861 the people of the W. section of Virginia, opposing secession, founded a new state, W. Virginia. M. was called upon by Lincoln to take charge of the troops whose task it was to drive out the

secessionists. This he did with complete success, marking him as the coming man of the war. The President appointed him to take command of the army of the Potomac. This army was intensely patriotic, but it was a mob. In a few months M. made of it a superbly trained and disciplined force, which was to retain its spirit throughout the war. In the winter of 1861 M. was made commander-in-chief of the Union Armies. He soon came into conflict with both the administration and public opinion. Lincoln wanted a direct advance on Richmond which would preclude any Confederate advance on Washington, but M. preferred to move upon the Confederate cap. from the peninsula formed by the James and York Rs. He was allowed to have his way, but was removed from supreme command of the armies, only having charge of the army of the Potomac. He fought a series of battles, among them the victory of Malvern Hill. By Sept. 1862 things were going badly for the Union forces. Lincoln asked him to resume command. He did so without a reference to the past. His new campaign resulted in the bloody battle of Antietam. The administration expected M. to cross the Potomac at once in pursuit of Lee, but he delayed five weeks. In Nov. he was relieved of his command, and that ended his career as a soldier. His friends attributed this blow to the machinations of politicians, and the whole affair has always been shrouded in mystery. Lee in after years said the best commander who ever opposed him was M. The Democrats named M. for President in 1864, but he was defeated by Lincoln. See life by P. S. Michle, 1901.

Macclesfield, mun. bor. and mrkt. tn. of Cheshire, England, 17 m. S.E. of Manchester. It is the chief silk-manufacturing centre of England, producing all kinds of plain and fancy ribbons, etc.; there are also breweries, and coal mines, and slate is quarried in the vicinity. Pop. 37,000.

M'Clintock, Sir Francis Leopold (1819-1907), Brit. explorer and admiral, b. at Dundalk in Ireland, entered the navy in 1831. He first went to the Arctic regions in 1848 with Sir James Ross; his most famous achievement was ascertaining the fate of Sir John Franklin on his expedition with the *Fox* in 1857. He described his expedition in *The Voyage of the 'Fox'*, pub. 1859. See life by Sir C. R. Markham, 1909.

McClure, Sir Robert John le Mesurier (1807-73), Brit. explorer, was a native of Wexford, Ireland. In 1824 he joined the Navy, and in 1836 went on Capt. Back's expedition to the Arctic regions. In 1848 he accompanied Ross to the Arctic, and in 1850 went on his third expedition as commander of the *Investigator*. During this expedition he was successful in journeying through the N. W. passage. He pub. his book on this voyage in 1856.

'McClure's Magazine' was founded in America in 1893 by Mr. S. M. McClure. It includes R. L. Stevenson, J. M. Barrie, Rudyard Kipling, Dean Farrar and many other writers of equal distinction among

its contributors. Miss Tarbell's *History of the Standard Oil Company*, which at the time created such a sensation, first appeared in this monthly, whilst it has also pub. an excellent *Life of Lincoln*.

MacColl, Dugald Sutherland (1859-1948), Eng. artist, art critic, and author, son of a well-known Glasgow preacher of the same names. He was educated at Univ. College School, London Univ. and at Lincoln College, Oxford, where he won the Newdigate prize for a poem on 'The Fall of Carthage.' After visits to the chief European galleries he became art critic to the *Spectator* (1890-95). An iconoclast, he demanded the overthrow of the false gods of the Academy and their replacement by such older contemporaries as Manet, Degas, and Whistler and such younger contemporaries as Sæer, Sickert, Conder, Beardsley, and Augustus John. In 1900, in connection with the Glasgow Exhibition, he wrote his first considerable work, *Nineteenth Century Art*. He ed. the *Architectural Review* (1901-5) and lectured at the Slade School on the hist. of art. M. became a member of the board of trustees of the Tate Gallery, securing reforms in the administration of the Chantrey bequest, and was instrumental in promoting the institution in 1903 of the National Art Collection Fund (*q.v.*). In 1906 he was appointed keeper of the Tate and Wallace collections. His poems, the product of sixty years, were collected in 1940. His two chief books were pub. late in life: *Confessions of a Keeper and other Papers* (1931), a selection from his critical writings, and *Life, Work, and Setting of Philip Wilson Steer* (1945), a highly individual biography throwing much light on the art hist. of the period, for which he was awarded the James Taft Black memorial prize. He occupies a high position in the Brit. school of water-colour, and it was as an artist that he cared to think of himself. His work is clear and direct, his sense of colour delicate and fine. His influence on the revival of this art was great.

McComb, tn. of Pike co., Mississippi, U.S.A., 95 m. N.E. of New Orleans. It is engaged in the cotton manuf. and has lumber, veneer, and tapestry mills, and railroad shops. Pop. 9,800.

MacCormac, Sir William (1836-1901), Brit. surgeon, b. in Ireland. During the Franco-Ger. war of 1870-71 he was attached to the Anglo-Amer. Association, and some years after his return to London became lecturer at St. Thomas's Hospital and surgeon to various other hospitals. During the S. African war of 1899-1902 he acted as surgeon to the troops, and in 1901 was made sergeant-surgeon to King Edward VII. Among his literary works are *Notes and Recollections of an Ambulance Surgeon* (1870), and *Surgical Operations* (1885 and 1889).

McCormack, John (1844-1948), Irish tenor, b. at Athlone. He won the gold medal at Fels Ceoil, Dublin, in 1903. Joining the choir of the Catholic cathedral there, in 1904, with that choir, he sang at the St. Louis Exhibition. In 1905 he received instruction at Milan from Sabba-

tni, and, later, sang at Savona in *L'Amico Fritz*. In 1907 he sang at ballad concerts in London and made his *début* in opera at Covent Garden as Turiddu in *Cavalleria Rusticana*. A greater opportunity waited him in the same season, when he was cast for the part of Don Ottavio in *Don Giovanni*, his singing of the two big arias of that part creating the highest impression of his powers. Later, he appeared with great success in subsequent seasons at Covent Garden, especially with Tetraxini in *La Traviata* and in *Lucia di Lammermoor* and *Rigoletto*; for the old-fashioned type of it, opera was certainly what best suited him. He was also the ideal partner to Melba's Mimi in *La Bohème* in the seasons up to 1914. He sang in *Elijah* at the Royal Choral Society's concerts. From 1910 to 1911 M. was with the Boston Opera Company, and he visited Australia in 1911. After a year with the Chicago Opera Company he visited Australia again. In 1917 he became an Amer. citizen. Later he sang mostly at concerts, and also in the popular film *Song of my Heart*. His singing of Irish folk-songs made him known all over the world. He returned to England in 1924. Raised to the papal peerage in 1928, he became chevalier of the Legion of Honour in 1924, and fought commander of Malta in 1932. He gave his farewell concert in Dublin's Theatre Royal in Oct. 1938. See life by L. A. G. Strong, 1911, 1949.

McCormick, Robert Rutherford, *see* CHICAGO TRIBUNE.

McCosh, James (1811-94), Scottish philosopher, b. at Karskeoch, Ayrshire. The principle on which he based his theology was chiefly that of intuition, and he was quite opposed to the empirical school. His writings include *The Method of the Divine Government*, *Physical and Moral* (1850); *Examination of Mr. J. S. Mill's Philosophy* (1866); *Realistic Philosophy* (1887); and *First and Fundamental Truths* (1889).

McCreery, Sir Richard Loudon (b. 1898), Brit. soldier, educated at Eton and Sandhurst. Entered the 12th Lancers, 1915, and, in the First World War, served in France. Staff College, 1928-29. Served in France, 1940. Promoted major-general, 1943. Chief of staff, Middle E., 1942; Tunisia, 1943. Promoted lieutenant-general, 1944. In Italy, under the supreme command of Gen. (later F.-M. Lord) Sir Harold Alexander, he led the Eighth Army (g.r.) against F.-M. Kesselring's Ger. armies, launching the offensive of May (1944) which resulted in the storming of Cassino (*see* CASSINO, BATTLE OF), the destruction of the Gustav line, S. of the Apennines, and the fall of Rome (June 4) and, soon afterwards, the occupation of Florence (Aug. 22). In the 1945 campaigns his army, in co-operation with the Fifth Amer. Army, destroyed the Gothic line—the last effective Ger. barrier to the Po valley and the plains of Lombardy—and so brought about the final surrender of the Ger. armies (April). *See also* ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS ON. G.O.C.-in-C., Brit.

Forces of Occupation in Austria and Brit. representative on the Allied Commission for Austria, 1945-46. G.O.C.-in-C. of the Brit. Army of Occupation of the Rhine, 1946-48. Brit. Army representative, military staff committee, from 1948.

McGrie, Thomas (1772-1835), Scottish clergyman and writer, b. at Duns, Berwick. His works deal chiefly with eccles. hist., his chief being *Life of John Knox* (1812), this work cleared the reformer from a cloud of prejudice and misunderstanding; *Life of Andrew Melville* (1819), and hist. of the Reformation in Italy and Spain.

McCudden, James Byford (d. 1918), Brit. airman and member of the Royal Flying Corps, son of a sergeant of the Royal Engineers, and eldest of four brothers, all of whom rendered most distinguished service in the First World War. The record of M. was the most remarkable, for he brought down over fifty enemy machines during his service on the W. Front. He joined the R.F.C. as a mechanic in 1913 and served in the corps for five years. Awarded the V.C.

MacCullinan, Cormac, *see* CORMAC.

McCulloch, Horatio (1805-67), Scottish landscape painter, a native of Glasgow. He began by painting snuff-boxes, and first exhibited pictures in 1829. He then became an A.R.S.A., and in 1838 a R.S.A. His chief pictures are 'Mist rising off the Mountains,' 'Deer Forest,' 'Loch-an-Ellan,' and 'Bothwell Castle.'

McCulloch, John (1773-1835), Brit. geologist, b. in Guernsey. He qualified as a surgeon, and was afterwards employed in research work on the geology of Scotland. He wrote *A Description of the Western Isles of Scotland* (1819), and *A System of Geology* (1831).

McCulloch, John Ramsay (1789-1864), Brit. economist and statistician, b. at Whithorn in Wigtonshire. He contributed to the *Scotsman* and the *Edinburgh Review*. Among his works are *The Principles of Political Economy* (1825); *Dictionary of Commerce and Commercial Navigation* (1832); *A Statistical Account of the British Empire* (1837); and *Treatise on Economical Policy* (1853).

MacCunn, Hamish (1868-1916), Scottish musical composer, b. in Greenock. Studied under Sir Hubert Parry. He was conductor to the Carl Rosa and other light opera companies, and prof. of composition at the Guildhall School of Music. The most Scottish of the Scots composers. His concert overtures—*The Land of the Mountain and the Flood* (1887), *The Dowie Dens o' Yarrow* (1888), and *The Ship o' the Fiend* (1888) are his best works. Others include *Bonny Kilmory* and *The Lay of the Last Minstrel* (cantatas, 1888); *Jeannie Deans* (opera, 1894); and *The Golden Girl* (musical comedy, 1905).

Macdiarmid, Hugh, pen-name of Christopher Murray Grieve, Scottish author, b. at Langholm, Dumfriesshire, Aug. 11, 1892; and educated at Langholm Academy and Edinburgh Univ. His first vol. of poems, *Songs and Ballads*, appeared in 1925, followed by *Penny Whisp* and *A Drunk Man looks at a Thistle*. His lyrical poems

are mostly in Scottish dialect, but he also writes in Eng. As a journalist he is on the editorial staff of the *Carlisle Journal*, and is editor of the quarterly, the *Voice of Scotland*. He was one of the founders of the Scottish Nationalist party, and his intense nationalism, with his acceptance of the Socialist view of life, finds expression in his numerous writings, including his poetry, which sometimes with lyrical tenderness, sometimes with harshness reflects his attitude to the social conditions of his time. His *First Hymn to Lenin* was pub. with other poems in 1931, and the *Second Hymn to Lenin* in 1935.

Macdonald, Charles (1837-1918). Amer. civil engineer, b. in Gananoque, Canada, Jan. 26. He was educated at Queen's Univ. Ontario, and the Rensselaer Polytechnic Institute, Troy, New York. After the Civil war, in which he was taken prisoner, he began bridge construction, and soon became one of the foremost bridge-builders in the U.S.A. Among the bridges which he and his associates constructed were the Schuylkill R. bridge; all the bridges between Hoboken and Dover, New Jersey, on the Delaware and Lackawanna system; the Susquehanna R. bridge at Harrisburg; and also the Hawkebury bridge in Australia. He was president of the Amer. Society of Civil Engineers, 1908-9.

Macdonald, Sir Claude Maxwell (1852-1915), Brit. soldier and ambas., served in 1892 in the Egyptian campaign and in the Suakin expedition of 1884. He was minister at Peking, 1896-1900, and during the siege there had command of the legation quarters. He was transferred to Tokyo in 1900, and in 1905 became first Brit. ambas. to Japan, retiring in 1912.

Macdonald, Etienne Jacques Joseph Alexandre (1765-1840), duke of Taranto, marshal of France, b. at Sedan. He entered the army about 1784 and in 1795 captured the Dutch fleet. After withdrawing Suvaroff in Italy he was defeated by him on the Trebia, but was again successful in 1800 by his march across the Splügen. In 1805, however, he fell into disfavour with Napoleon, but was restored in 1809, when he triumphed over the Austrians at Wagram, this service being rewarded by the title of marshal. He was in command in Spain in 1810, and was completely defeated by Blücher at Kautzbach in 1813. He deserted to the Bourbons in 1814. See M. C. Rousset (ed.), *Souvenirs du maréchal Macdonald*, 1892.

MacDonald, Flora (1722-90), Scottish Jacobite, rescuer of Charles Stuart, was b. at Milton, S. Ulst., Hebrides. After the battle of Culloden (1746), she was successful in helping the Pretender to land in Skye, having disguised him as 'Betty Burke', her maid. Because of this she was arrested and imprisoned, but was released in 1747, and three years later she married Macdonald of Kingsburgh. They afterwards went to America, and Flora, who returned alone to Scotland in 1779, was joined later by her husband. See W. Jolly, *Flora MacDonald in Ulst* (1880); and A. MacGregor, *The Life of Flora MacDonald* (1901).

MacDonald, George (1824-1905), Scottish author, b. at Huntly, Aberdeenshire. His first literary work was pub. in 1856. He was the author of *Poems* (1857); *Phantastes, a Fæerie Romance* (1858); and of many novels, including *David Elginbrod* (1862); *Robert Falconer* (1868); *Malcolm* (1874); *The Marquis of Lossie* (1877); and of children's books, such as *The Princess and the Goblin* (1872) and *The Princess and Curdie* (1883). See lib. by Rev. J. Johnson, 1905; and anthology by C. S. Lewis (ed.), 1945.

Macdonald, Sir Gordon (first Baron Macdonald of Gwaenysgor) (b. 1888), Brit. Labour politician and administrator, last Brit. governor of Newfoundland B. at Prestatyn, Flintshire. Went to an elementary school in Ashton-in-Makerfield and began work at thirteen in a coal-mine. Later he studied at Ruskin College, Oxford. Worked for twenty-two years in the pits, being elected miner's agent in 1924. Elected Labour M.P. for Ince, 1929-42. Resigned his seat to serve as regional controller of the coal industry in Lancashire, Cheshire, and N. Wales. In 1946 he was made governor of Newfoundland, his sympathy and fellowship with the people of all classes there making him one of the most popular governors in the list of the is. As the 'poor man's governor,' familiar with the hardships of a Lancashire colliery dist. for forty years, he sponsored the confederation of Newfoundland with Canada as holding out a brighter dawn for the hard-hit inhab. and his term of office ended when he joined the confederation (March 31, 1949).

Macdonald, Sir Hector Archibald (1852-1903), Brit. soldier, who won for himself the sobriquet of 'Fighting Mac.' He was b. in humble circumstances at Muir of Allan-Grange, Ross-shire, Scotland. At the age of eighteen he enlisted in the Gordon Highlanders. Taken prisoner at Majuba in the first Boer war (1881), Gen. Joubert returned him his sword on account of his bravery. He took part in the Nile expedition (1885) under Sir Evelyn Wood. He distinguished himself in the Dongola expedition (1896) and gained a brilliant success in the battle of Omdurman (1898), where he completely routed the Mahdi's troops. In the Transvaal war of 1899 he commanded the Highland Brigade during the Paardeburg, Bloemfontein, and Pretoria campaign under Lord Roberts, and was made K.C.B. in 1901. He committed suicide in Paris, whilst on his way to a court of inquiry about charges brought against him whilst in command in Ceylon.

Macdonald, Sir John Hay Athole, see **KINGSBURGH, LORD**.

MacDonald, James Ramsay (1866-1937), Brit. statesman, b. at Lossiemouth. He was educated at a Moray board school, where, after work on a farm, he was a pupil teacher. In London he worked at sev. very poor clerking jobs, and attended evening classes, obtaining work in a chemical laboratory. In 1888 he became private secretary to Thomas Lough, M.P. He earned his living, after leaving Lough, mainly by writing for

Liberal papers. He joined the Independent Labour party soon after its formation, and stood as its candidate at Southampton in the general election of 1895. In that year non-manual worker delegates were excluded from the Trade Union Congress; this created a difficulty, surmounted by a resolution, drafted by M., and carried in the T.U.C., 1899, setting up a conference to promote working-class representation. M. also drafted the resolutions submitted to this conference, Feb. 27, 1900, the immediate result being the Labour Representation Committee, from 1906 the Labour party, of which he remained secretary till 1912.

Ellott and Fry

JAMES RAMSAY MACDONALD

In 1906 M. was elected for Leicester, which he had already contested in 1900. He was on the London Co. Council 1901-4 and chairman of the I.L.P. 1906-9. He was left a widower in 1911 by the death of Margaret Ethel M., a daughter of Rev. J. H. Gladstone. In that year he became leader of the Labour party. He had already visited distant parts of the empire, and in 1913-14 he again visited India, as a member of the royal commission on Indian public services. In 1914 he attacked Great Britain's entry into the First World War with the result that he was defeated by a great majority at W. Leicester in Dec. 1918 and again, in E. Woolwich, in March 1921. But on his return to Parliament in 1922 as member for the Aberavon div. of Glamorgan, he was placed at the head of a Labour party which had become the official Opposition. At the general election of Dec. 1923 the Labour party and the Liberal party secured the balance, and M. formed the

first Brit. Labour Gov., which lasted from Jan. 22 till Nov. 4, 1924. M. was his own foreign secretary, and raised Brit. popularity abroad. He was prominent in the discussions in the Assembly of the League of Nations in 1924 on the treaties of mutual assistance, delivering an important address in Sept. 1924 on the great task of trying to solve the related problems of security, disarmament, and arbitration in one document which became the Geneva Protocol (q.v.) of 1924. His gov. was deserted by the Liberals on the matter of the Campbell prosecution, and fell. In the succeeding general election great use was made, by anti-Socialists, of the Zinoviev letter; and the Conservatives, who had been violently opposed to all the Labour Gov.'s dealings with Russia, came back triumphant. When the general election of May 1929 left Labour in the position of the largest party in the Commons, M. took office a second time, representing the Seaham div. of Durham Co. In Aug. 1931, when the Labour Gov., in the face of a crisis over the nation's financial situation, resigned, M. accepted office as Prime Minister of a 'National Gov.' pledged to remain in office solely to balance the Budget (see NATIONAL GOVERNMENT).

The formation of the National Gov. meant the final break between M. and the party which he had helped to found, and of which he had been so long leader. With Mr. Snowden and other supporters he formed the 'National Labour party,' the Labour party expelling him and all the members of the new party. The election which followed endorsed his action, and though his personal following was small in the new House of Commons, all but sixty seats were captured by gov. candidates. After four years he decided to retire from the premiership, and in 1935 was succeeded by Mr. Baldwin, he himself retaining the post of Lord President of the Council. In the election of Nov. 1935, which followed Mr. Baldwin's assumption of office, he was heavily defeated in his old constituency of Seaham Harbour, but in Feb. 1936 was returned as a member for the Scottish univ. He d. at sea (Nov. 9) when going to S. America for the benefit of his health, which had been failing for some time. His writings include *The Zoltverein and British Industry* (1903), *Labour and the Empire* (1907), *Socialism and the Government* (1909), *The Awakening of India* (1910), *Syndicalism* (1912), *The Social Unrest* (1913), *National Defence* (1917), *The Government of India* (1919), *Parliament and Revolution* (1919), *A Policy for the Labour Party* (1920), *Socialism, Critical and Constructive* (1921), *Wanderings and Excursions* (1925), *American Speeches* (1930). See lives by Mary Agnes Hamilton, 1921; L. M. Weir, 1928; H. A. Tiltman, 1929; and Lord Elton, 1939.

Macdonald, Sir John Alexander (1815-1891), Canadian Conservative statesman, was b. in Glasgow, Scotland, was second son of Hugh M., who removed with his family to Upper Canada in 1820, and obtained a position in the commercial bank at Kingston. In that city John was

educated at the Royal Grammar School. Called to Bar in 1836, he became Q.C. in 1846. He was elected to the Legislative Assembly, 1844, for Kingston, which he represented until 1878, continuing its member in the new Dominion Parliament. The first offices he held were receiver-generalship and commissionership of Crown lands, for a short time. In 1854 he became attorney-general in a Coalition Gov. In 1857 he became Premier, and, with one brief interval, he continued so till 1862. In 1864 he became attorney-general in Taché's Cabinet. The defeat of the Taché-Macdonald administration of 1864, and the consequent paralysis of gov., brought about the formation—largely through M.'s efforts—of the 'Great Coalition,' and so led to the confederation of the Brit. N. Amer. provs. Following the resignation of George Brown (q.v.) in 1865 M. came to be looked upon as the chief architect of confederation, and certainly at the conferences in Canada and in England of 1864-66 he was prominent in the discussions over the drafting of the Brit. North America Act, 1867. In these circumstances M. was chosen to be the first Prime Minister of the new Dominion of Canada, and he filled that office from 1867 till 1873, and then again from 1878 to his death. His gov. fell in 1873 on account of its members being detected in receiving campaign funds from a railway concessionaire—the so-called 'Pacific Scandal.' Fortunately M.'s reputation survived this catastrophe, and in 1878, after being defeated at Kingston, he sat for Carleton and Lennox and returned to office on the 'National Policy' of high protection; and in the succeeding general elections, 1882, 1886, and 1891, he carried all before him. In 1887 he again became member for Kingston. It is admitted that N. had not a lofty conception of political morality, but if he was an opportunist, he was also a politician of very strict views, and was certainly outstanding in the art of managing men. On the continuance of the Brit. connection and the maintenance of law and order he was uncompromising—a constancy of outlook which was of the greatest value in the difficult transition period of confederation. It was due to M.'s initiative that Brit. Columbia and the N.W. Terr. were included in the dominion, and the project of the Canadian Pacific Railway was also due to him; and in some ways therefore the Dominion of Canada may be regarded as the product of his statesmanship. K.C.B. 1867; P.C. 1879; G.C.B. 1884. See Sir J. Pope, *The Day of Sir John Macdonald*, 1915, and *Memoirs of Sir J. A. Macdonald* (2 vols.), Ottawa (latest ed.), 1930; and *Correspondence of Sir John Macdonald*, Toronto, 1921. The best lives are those of E. B. Blygar, *Anecdotal Life of Sir John Macdonald*, Montreal, 1891; and G. H. Parkin, *Sir John A. Macdonald*, Toronto, 1910. See also *The Makers of Canada*, ed. by Duncan Campbell and others (revised ed.), Oxford Univ. Press, 1926. General historical works on the period of M.'s political career include J. C. Dent, *The Last Forty Years* (2 vols.), Toronto, 1881; and J. S. Willi-

son, *Wilfrid Laurier and the Liberal Party* (2 vols.), Toronto, 1903.

Macdonnell, Randal, see ANTRIM, MARQUESS OF.

Macdonnell Range, mt. range in the N. Ter. of Australia, lying along the tropic of Capricorn. Rainfall produced by its height is carried away by numerous streams, generally ending suddenly in the dry lowland. The Arltunga goldfield is at the E. end.

Macdonough, Thomas (1786-1825), Amer. naval commander, was b. in the state of Delaware, and entered the navy in 1800. He saw active service in the Mediterranean, particularly when the U.S.A. tried to break up the pirate bands which made their headquarters in the Barbary states. M. took part in the bombardment of Tripoli. When the war with England broke out M., in 1814, had charge of the small fleet of fresh-water boats on Lake Champlain, and taking full advantage of the fact that the Brit. authorities had neglected the defence of the lakes, he defeated Sir George Prevost's projected attack on the ter. adjacent to Lower Canada.

McDougall, William (1871-1938), Scottish psychologist, b. in Lancashire; prof. of psychology at Duke Univ., N. Carolina, from 1927 until his death. In the early part of his career he studied medicine at St. Thomas's Hospital, London, after taking his degree at Cambridge Univ. He took his M.B. degree, and in 1898 became a fellow of St. John's College, Cambridge. He was also reader and fellow of Univ. College, London, and Corpus Christi College, Oxford. He served with the R.A.M.C. during the First World War. In 1920 he went to Harvard Univ., and thereafter to Duke Univ. His main contribution to psychology lay in the study of instinct and emotion, which in his classification were interrelated, each instinctive impulse being accompanied by its own quality of emotional experience. His teaching, which was a powerful counterbalance to the mechanistic view of human behaviour, is contained in a remarkable series of books: *An Introduction to Social Psychology* (1901); *The Group Mind* (1920); *An Outline of Psychology* (1923); *An Outline of Abnormal Psychology* (1926); *Modern Materialism and Emergent Evolution* (1924); *Intuition and the Sciences of Life* (1934); *The Frontiers of Psychology* (1935); and *Psycho-Analysis and Social Psychology* (1936). He also wrote a number of other books which had a more direct bearing on the problems of the day, principally on ethics, nationalism, which he considered 'essentially a mental condition,' and the problem of racial degeneration.

MacDowell, Edward Alexander (1861-1908), Amer. musical composer and pianist, b. in New York, Dec. 18, of Scotch-Irish-Quaker descent. Up to the present day M. remains the most striking figure among native Amer. composers, and his services to the cause of the Amer. composer as such cannot be forgotten; he was the first Amer. musician to receive the recognition of

European composers and executants. In 1876-78 he studied at the Paris Conservatoire, the piano under Marmontel and theory under Savard. In 1878 he went to Germany where he studied the piano under Louis Fliert and composition under Raff, the latter exercising a great influence on the development of Macduff. Raff introduced him to Franz Liszt in 1882, and through Liszt's influence Macduff was given the opportunity of playing his first piano suite at the nineteenth annual festival of the *Allgemeine Deutsche Musikverein* held in Zürich. Remaining in Germany till 1888, he devoted himself chiefly to composition, writing piano concertos and tone poems for the orchestra. In 1888 he returned to America and settled in Boston, his first public appearance in America being with the Knisel Quartet in Boston in 1888. His most popular orchestral work, the second *Indran* suite for orchestra, was first performed by the Boston orchestra in 1896. In the latter year he took charge of the newly organised dept. of music at Columbia Univ. His restricted his activity as a piano virtuoso and recitalist, but the next five or six years saw the production of his best piano compositions. In 1897-99 he conducted the Mendelssohn Glee Club in New York. In 1902 his health began to fail, and he resigned his only position. Mental derangement manifested itself in 1903, and he died in New York on Jan. 27, 1908. He was honoured in his lifetime by the degree of Mus.D. Princeton and Pennsylvania univs., and was elected to the Amer. Academy of Arts and Letters. An excellent bibliography of his compositions was pub. by the Library of Congress under the title *Catalogue of the Works of Macduff* by O. G. Sonneck, 1917. See L. Gilman, *Macduff, a Study*, 1909, 111 Page; *Macdowell, his Work and Ideals*, 1911; J. F. Poite, *A Great American Tone Poet*, 1922; *Macdowell*, 1922; also studies by J. F. Poite, 1922; A. F. Brown, 1924, and J. F. Cooke, 1928.

Macduff, port of Banffshire Scotland. It is a popular seaside resort on account of the bathing facilities and bracing air. Littering fisheries and boat building are the chief industries. Pop. 5000.

Mace, The staff 5 ft long originally a weapon, particularly favoured by priests who were forbidden to draw blood by the sword, is now a symbol of office as in Parliament, the Church and universities, brought out on state occasions. The first mayor's M is set with pearls. There is a trade union of mace bearers, founded in 1931.

Macedonia, area comprising (1) Province of Greece, area 13,360 sq. m. pop. 1,686,400. (2) Republic of Yugoslavia, area 26,494 sq. kilometres, pop. 941,900. Anciently M was a country of S.E. Europe, said to have been originally named Emathia, bounded S by the Aegean Sea, E by Thrace and W by Illyria. The chief towns were Edessa, Philippi, Pella, Potidea, and Thessalonica. Edessa and Pella being in turn the capitals. Its boundaries were greatly enlarged by the conquests of Philip of Macedonia

When the Romans conquered it 168 B.C., it was divided into four districts independent of one another, but the whole country was formed into a Roman province after the conquest of the Achaeans, in 146 B.C. Little is known of the history of M till the reign of Amyntas I. (c. 540-500 B.C.) who was a contemporary of Darius Hystaspis (father of the Persian king Darius I.) but from that time the history of these two and of M is more or less intimately connected with that of Greece till at length Philip father of Alexander the Great, became a virtual master of the whole of Greece. The conquests of Alexander extended the Macedonian supremacy over a great part of Asia, and the Macedonians continued to

Yugoslav Embassy

A Yugoslav national festival at Skopje

exercise their sovereignty over Greece till the conquest of Persia by the Romans. In 168 B.C. brought the Macedonian monarchy to an end. Modern M is bounded on the N by the Karadagh Mts and Bulgaria, on the E by the R. Mesta on the S by the Aegean and Greece, and westward by the Shar, Grammus and Linder ranges. The R. Vardar almost bisects M and empties into the gulf of Salonica. Other main streams are the Struma, Mesta and Bistritza, which flow into the Aegean. The Rhodope Shar, Grammus, Nija, Pindus, Perim Dag and Yaini Bistra Mts embrace many summits over 5000 ft. The climate is harsh. There are still some fine belts of forest on the mt slopes. The addition of M to New Greece has meant an accession of arable growth to the country. M, with Thessaly, grows the best cereals in Greece, the output of corn and maize increased by at least 60 per cent and 40 per cent respectively between 1924 and 1925. Figs and olives are also cultivated. Tobacco of good quality

is grown in large quantities in E. M. and in central and W. M., the chief categories being Basma, with small oval leaves and a fine flavour, and Bashibazili a second-quality leaf. Seres, Drama, and Kavalla are the chief centres for tobacco growing, and the ann. output averages 18,000,000 oke (an oke equals 2822 lb.). M. is also notable for silkworm breeding, the prin. centres being Sialista, Stritsani, Serres, and Edessa. Since the agrarian reforms of 1917, which entailed the expropriation of the large estates (chifliks) for the purpose of settling tenant farmers, the only large estates remaining in the country were in M. besides Epirus, Thessaly, Attica, and Eubœa. Gold and silver used to be mined on the Bunar Daghi, and there are salt pans at Kirov; but otherwise the mineral resources are not developed to any extent. The chief secondary industries of M. before the Second World War were the manuf. of agric. implements, boots and shoes, box-making, breweries, cotton-spinning and weaving, knitted articles, silk-spinning and weaving, and tobacco manuf., the chief centre being Salonika (Thessaloniki). The chief tns., besides Salonika, are Kavalla, Drama, Seres, and Gamulidjina. The predominant pop. is Slavonic, but there are Gks. along the coast and in the S.W., and some Turks, Rumanians, and Jews. Over half the pop. are Christians. M. fell a victim to the Turks in the early fifteenth century. When the reforms promised in the treaty of Berlin (1878) were not forthcoming, the Bulgarian Inhab. formed the 'Internal Organisation' (1893), the watchword of which was 'Macedonia for the Macedonians.' Insurrections against Turkish misrule, and the savage repressions which followed these insurrections, led to the interference of Austria and Russia, who extorted further pledges of reform from the obstinate Porte (1903). (See BALKAN WAR.) After the Balkan wars (1912-13), portions of M. were ceded to Greece. After the First World War, under the treaty of Neuilly, 1918, the greater part of M. was ceded to Yugoslavia. After the change of regime in Bulgaria in 1934 the 'Internal Organisation' (or 'Internal Macedonian Revolutionary Organisation') and its followers, the 'Komitadjie', which had heretofore been supported from Bulgaria with arms, was suppressed, and its leader, Mihailoff, whose aim was Macedonian autonomy, was exiled to Turkey. But the Macedonian question still remained a source of potential trouble in S.E. Europe: for a large number of the Macedonians remained opposed to both Greece and Yugoslavia, and wanted either a Macedonian state or union with Bulgaria. In the Second World War Salonika was taken by Ger. forces on April 9, 1941, and the allied Gk. and Brit. forces, overwhelmed by numbers and weight of armament, fell back on Epirus. See further WORLD WAR (1939).

—*Fall of Greece.* See J. Ancel, *La Macédoine*, 1930; S. R. Ladas, *The Exchange of Minorities: Bulgaria, Greece, and Turkey*, 1932; and H. Seton-Watson, *Eastern Europe between the Wars, 1918-1941*, 1946.

For antiquities see F. W. Hasluck, *Athos and its Monasteries*, 1934.

Macedonian Front, Operations on. Allies landed an expeditionary force at Salonica on Oct. 5, 1915, in a general attempt to dominate the Near E. The force was, however, inadequate to prevent the overthrow of the Serbs, and, in 1916, it was heavily reinforced by Fr. and Serbian troops until, by Aug., it numbered over 600,000 men, under the supreme command of Gen. Sarrail (*q.v.*). These forces occupied a broad front N. of Salonica, the left flank resting on the Serbian frontier to the S. of Monastir, the centre occupying the valley of the Vardar to Doiran, and the right flank resting on the Struma R. The immediate purpose of the offensive launched in Aug. 1916 by Sarrail was to force the Bulgarians to defend their gains in Serbia rather than to march against Rumania, and, at the same time, to induce Rumania to enter the war on the side of the Allies. In this the Allies were successful, for Rumania was soon advancing into Bukovina (*q.v.*), but thereafter they were routed. The Rumanian breakdown was largely due to Sarrail's failure to press the offensive in Macedonia, and, indeed, so far from advancing at all, he was driven back from Florina, and the Bulgar forces captured Koritza and Kastoria, the railway through Demir Hisar, and, later, the Gk. port of Kavala (Sept. 1916). The Serbs, however, redeemed this failure by recapturing Monastir, but this isolated success had no effect on Bulgarian plans. In 1917 Sarrail, meeting with further defeats, was superseded by Guillaumat; but decisive operations were not begun until the following year, when Franchet d'Espèrey (*q.v.*) succeeded Guillaumat. The two decisive allied victories were those of the Vardar (Sept. 18-25), and Doiran (Sept. 18-19). Brit. and Gk. troops operated in the region of Lake Doiran, on the right front; Franco-Serb troops in the centre, along the Vardar; and It. troops on the left in Albania. These victories led, in turn, to the capture of Prilep, the Babuna Pass, Ishtip, and finally of the Bulgarian tn., Strumnitza, which threw open the road to Sofia. Bulgaria then agreed to unconditional surrender. See also SALONICA; WORLD WAR, FIRST.

Macedonians, early Christian sect who taught that the Holy Ghost was inferior to the Father and the Son; so called from Macedonius, bishop of Constantinople in the fourth century.

Maceió, city of Brazil, cap. of the state Alagoas. Its port of Juraguá exports sugar, rum, and cotton. There are manufs. of machinery and other goods. Pop. 91,300.

Mace of the Nutmeg, blood-red lacerated membrane which contains a very fragrant oil. If expressed the oil serves as a liniment, and if distilled it possesses the fragrance of mace.

Macer, Æmilius, Rom. jurist, who lived in the reign of Alexander Severus. He wrote sev. books, among which are *De Appellationibus*; *De Re Militari*; *De Officio Prædictis*; *De Publicis Judiciis*; and *Ad Legem de Vicesima Hereditatum*.

Macerata, cap. of the prov. of M. in the Marches, Italy, 22 m. S.W. of Ancona. The city is protected by a wall more than 2½ m. in circumference. It is the see of a bishop, and formerly had a univ. founded in 1270. Chemicals and glass are produced. Pop. 26,700.

Maceration, process by which some of the constituents of plants are extracted by steeping the seeds, leaves, roots, etc., in a suitable solvent; there may be also a certain amount of breaking up of the fibres by mechanical means. The operation is adopted in the preparation of liquors and perfumes.

McEvoy, Ambrose (1878-1927), Eng. painter, studied at the Slade school. He began as a painter of restful interiors and poetic landscapes, and then sprang into fame as a fashionable portrait painter. His water-colours include such landscapes as 'From a Window in Venice' and 'Burton Park'—which reveal the real nature of his talent; and such portraits as 'Lillian,' 'Lady Patricia Ramsay,' 'Miss Lillian Bankhead,' and 'Miss Zita Youngman.' Other pictures are 'The Engraving,' 'The Thunder-storm,' and 'The Book'—genre subjects in Victorian costume; portraits of sailors and winners of the V.C.—work which dates from his experiences in the R. N. div. in the First World War; 'The Ear-ring' (1911) in the Tate Gallery, and 'Noli Me Tangere' (a successful copy of Titian). Examples of his work are also in the Luxembourg Museum and the Municipal Gallery, Johannesburg. He was made A.R.A. in 1924.

McEwen, Sir John Blackwood (1863-1943), Scottish composer, b. at Hawick and educated at Glasgow Univ. Came to London, 1891, and studied music at the Royal Academy of Music. In 1895 he returned to Scotland and settled at Greenock as church choir-master and pianoforte teacher, but in 1898 he was invited to join the Royal Academy of Music as prof. of harmony and composition and remained there until 1936. Knighted 1932. His work became well known through the success of *Grey Galloway*, a border ballad for orchestra. Among his symphonies that in C. sharp minor entitled *Solway*, produced at Bournemouth in 1922, has been often performed, having been pub. by the Carnegie Trust. His compositions include also orchestral works, chamber music, and piano pieces.

Macewen, Sir William (1818-1921), Scottish surgeon. He was knighted in 1902, and became a prof. of surgery at Glasgow Univ. in 1892. He was a pioneer of brain surgery, performing the first operation for abscess of the brain, in 1876, and a disciple of Liston's theory of antiseptics. Among his publs. may be mentioned *Osteotomy* (1880) and *The Growth of Bone* (1912). See A. K. Bowman, *The Life and Teaching of Sir William Macewen*, 1942.

Macfarren, Sir George Alexander (1813-1887), Brit. composer and writer on musical theory, b. in London. He became prof. of the Royal Academy of Music in 1834 and principal in 1875. His musical

productions include operas, cantatas, chamber music, and vocal and instrumental items, but he is best known for his theoretical publs.: *Lectures on Harmony* (1877); *Rudiments of Harmony* (1878); *Counterpoint* (1879); and *A Musical History* (1885).

McGarry, In. in Lanark co., Ontario, Canada, 12 m. S.W. of Smith's Falls; trade in wool and flour is carried on. Pop. 4000.

McGill, James (1741-1813), Scottish philanthropist, b. at Glasgow, who emigrated to Canada, where he settled down in Montreal as a fur merchant. He became a member of the Lower Canadian Assembly, and amongst many other philanthropic enterprises, he presented valuable lands to the McGill Univ. (q.v.).

Macgillecuddy's Reeks, mt. range in Eire, in the co. of Kerry, lying to the W. of Killarney. It has sev. high peaks, including Carnal (Carrantuohill) which attains 3411 ft. In the basin between them and the Maugerton group are the lakes of Killarney.

Macgillivray, James Pittendreich (1856-1938), Scottish sculptor, b. at Port Elphinstone in Aberdeenshire. His sculptures include the Burns statue, the national memorial to Gladstone, and the John Knox Memorial.

Macgillivray, William (1796-1852), Scottish naturalist. He held the post of curator in the museum of the Royal College of Surgeons, Edinburgh (1831-41) and was prof. of botany and natural hist. in Marischal College, Aberdeen. He wrote a *History of British Birds* (1837-52); *A Text Book of Botany* (1840); and many articles.

McGill University, college in Montreal, Canada, which was endowed by James M. with property then valued at £1000. The year of foundation was 1821. Since then it has had other benefactors, among them Lord Strathcona. Under the direction of Sir Wm. Dawson (who retired in 1895, and d. 1899) it made rapid progress. The univ. has an imposing range of buildings on Mt. Royal, with facilities in the shape of laboratories, libraries, etc., for every branch of study. There are residential halls and sev. theological and other colleges are affiliated to it. It is open to women equally with men. The number of students is over 4000.

MacGregor, John (1825-92), Scottish author and philanthropist, b. at Gravesend, was called to the Bar in 1851. He contributed articles and sketches to *Punch* (1845). He invented and built a canoe, in which he journeyed up many European rivers; his book, *A Thousand Miles in the Rob Roy Canoe*, appeared in 1866, and other similar narratives followed. The profits of his writings were given to various philanthropic schemes. See life by E. Hodier, 1891.

MacGregor, Robert, see **Rob Roy**.
Machado, Antonio (1875-1939), Sp. poet, b. at Seville. For a time he taught Fr. at Baeza and later was prof. of Fr. at Segovia. Among his best books are *Soledades* (1903), and *Campos de Castilla* (1912). See study by E. A. Poers, 1940.

Machado, Manuel (1874-1947). Sp. writer, b. at Seville, brother of the above. He arranged plays by Lope de Vega, and wrote Andalusian poetry, including a fine sonnet to de Falla.

Machærodus, or **Sabre-toothed Tiger**, extinct carnivore, as large as a lion, with the upper canine teeth sabre-shaped and extraordinarily developed. Its remains are found in Pleistocene strata in S. Britain and other parts of Europe, in India, and in S. America.

Machale, John (1791-1881), Irish ecclesiastic, b. at Tobbernavine, Co. Mayo; educated at Maynooth College and, after ordination, was appointed lecturer in theology there. In 1820 appeared the first of a series of letters signed 'Hierophilos' directed against the co-education of the Rom. Catholics and Protestants. He was consecrated a bishop in 1825 and, despite opposition, was made archbishop of Tuam in 1834, in which position he continued to express his views against mixed schools and colleges even in face of the acquiescence of three archbishops and fifteen bishops in the scheme for creating national schools. This confirmed his popularity, which was further enhanced by his uncompromising aversion from everything Eng. When Newman came to Ireland M. openly opposed him on the ground that an Englishman was not wanted in a univ. in Dublin, and he quarrelled with Archbishop Cullen over the Catholic Univ., but his eccles. influence gradually waned as that of Cullen grew. M. also associated himself with the agitation of Daniel O'Connell for the emancipation of the Irish Catholics. M. trans. the Pentateuch into Irish, as part of an *Irish Translation of the Holy Bible* (Dublin, 1861). In 1841 he pub. an Irish trans. of sev. of Moore's *Irish Melodies* (later ed. 1871). He also trans. the *Iliad* into Irish verse in eight books (1844-71). His trans. showed some ingenuity, but also little acquaintance with the spirit or measures of Irish poetry. In 1851 he pub. in Irish *The Way of the Cross* by St. Alphonsus Liguori (q.v.). See also MORAL THEOLOGY.

Machar, Josef Svatopluk (1864-1942), Czech poet b. at Kolín. He began as author with verses in which the influence of Musset and Heine was evident, and later, wrote objective poems on social subjects. But his chief work is a large series called collectively *The Consciousness of the Centuries* (1905-26) including *Golgotha*, *In the Days of the Hellenic Sun*, *The Poison of Judea*, *The Barbarians*, *Pagan Flames*, and *The Apostles*. He has also written two other books of verse: *They*, dealing with the Fr. Revolution and *He*, dealing with Napoleon. In his great cycle, written mainly in blank verse, one of his main themes is that life found its apogee in the Rom. Empire which was ruined by Christian morality. In a country many of whose people are Catholics, he is marked by a savage anti-clericalism. See life by V. Martinek, 1912.

Machen, Arthur Llewellyn Jones (1862-1947), Brit. novelist, b. at Chorlton-on-Wharfe and educated at Hereford Grammar

School. In this countryside, the abiding traditions of old religions strongly influenced him, and when he went to London as a young man he had the task of cataloguing a library of occult books. In his own prose, measured and musical, he wrote of strange beliefs, of mystics who walked on lonely hills in Wales, or in sinister streets in Holborn. His earliest works, apart from trans., were *The Chronicle of Clemency* (1884) and *The Anatomy of Tobacco* (1888), in imitation of Rabelais and Burton respectively. His best early work includes *The Great God Pan* (1894), *The Inmost Light* (1894), *The Three Impostors* (1895), *Hieroglyphics* (1902), *The Hill of Dreams* (1907), etc. Popularity eluded him until he wrote *The Great God Pan*. This made his reputation; though *Hieroglyphics* is highly regarded by critics; in it he proclaimed his literary creed and view of art as 'the presentment, in temporal earthly symbols, of an eternal unchanging mystery' (*The Times*, Dec. 16, 1947). From 1910 to 1921 he was on the staff of the *Evening News*, which paper pub. his fantasy *The Bowmen*. From that the legend of the Angels of Mons was born in the popular imagination. There were many who actually believed that the Brit. Army was preserved by divine intervention, visibly manifested. The best remembered of his books besides *The Great God Pan* are *The Hill of Dreams* (1922) and *The Secret Glory* (1922). The worth of his work was recognised by the award of a Civil List pension in 1932. His last books were *The Children of the Pool* (1936) and *Holy Terrors* (1947).

Machiavelli, Niccolò (1469-1527), It. statesman and author, was b. at Florence. In 1488 he was made secretary of 'The Ten,' a board which had the management of foreign affairs. In 1502 he was sent on a mission to the formidable Caesar Borgia, to make professions of friendship on the part of the Florentines. In 1507 he was sent to the Emperor Maximilian. During his mission he sent home letters on the affairs of Germany, and on his return wrote sev. reports: *Rapporto sulle Cose di Lamagna*; *Discorso sopra le Cose dell' Alemagna*; *Ritratti di Lamagna*. In Feb. 1509 he was sent to the camp before Pisa, which was besieged by the Florentines, and in 1510 to France a third time. He returned to Florence in Sept. 1510, having consolidated the alliance of Florence with France. When in 1512 the Medici possessed themselves of Florence, M. was banished, imprisoned, and put to the torture on suspicion of being implicated in a conspiracy against the Medici, but was released by the intervention of Leo X. He then withdrew from public life and wrote his *Discourses on the First Decade of Livy* and *Seven Books on the Art of War* (1519-20), and his *Principe*—not pub. until five years after M.'s death—which may be described as a guide to the perfect autocrat, and is a really great attempt to strike a new path. M. almost alone in his period saw that the world (or Italy) would never be a perfect place until things were looked at unvelled.

Men of his time had no other alternatives to the prevailing systems, but M. wished to get at the fundamental issues of life, and would have liked mankind to do likewise. Every one and everything were to be subordinated to the ends of the State. M.'s work may be said to have called an end to the unsystematised state of medieval times. The *Legazioni*, or letters of the political missions of M., which are the key to his *Principe*, were not made public till the middle of the last century. The chief works of M. not mentioned above are *La Mandragola* (1513) and *La Clizia* (1515, comedies); *Storie Fiorentine*

1912; and M. Brion, *Génie et destinée, Machiavel*, 1948.

Machicolation (Fr. *mèche*, match, combustible matter, and O.F. *roulis*, flowing), architectural term for the opening between the corbels supporting a projecting parapet; or in the vault of a portal, through which combustibles were dropped on the heads of assailants. Also a projecting structure containing a range of such openings.

Machine Drawing, see **ENGINEERING DRAWING**.

Machine Embroidery, see under **EMBROIDERY**.

Machine Guns are distinguished from small arms on the one side and ordnance or artillery on the other. Since the sixteenth century various attempts have been made to produce weapons which could fire a volley, that is, a number of projectiles fired simultaneously. All these have failed, partly because of the difficulty of loading rapidly, partly on account of the cumbersome nature of such a machine, but mainly because such a volley is too concentrated; in addition, range and aim were too uncertain till the introduction of rifling in the nineteenth century. After this revolution something approaching a useful weapon was produced, the Gatling gun, an Amer. invention, and the Fr. mitrailleuse. The former, which was an outcome of the Amer. Civil war, had a cartridge chamber to which were brought in succession ten barrels revolving on an axis. The motion was controlled by a handle turned by the server, who regulated the speed of firing by its means. The original Montigny machine gun, or mitrailleuse, was a collection of twenty-five barrels bound together and fixed. It was more cumbersome than the Gatling; it had a range of some 4500 yds., and fired from 75 to 125 rounds per min. Other similar but more successful weapons were the Gardner and the Nordenflicht, the latter more a naval weapon. In all 'jamming' was a most serious defect, and has not been completely overcome even in modern weapons. The rapidity of fire causes overheating, and yet rapidity is the essential necessity. The Maxim gun, invented by Sir Hiram Maxim, was the first machine gun to prove really efficient. The weight of this gun was 60 lb. for the 0.303" type; the mark II, converted, 64 lb. It was carried on a tripod weighing 48 lb., and the filled ammunition box weighed 21 lb. In this gun a part of the force of the recoil due to the explosion was utilised to eject the spent cartridge cases. The guns of Maxim type consist of two portions: (1) the recoiling, which moves backwards with each explosion, and so opens the breech, and which is forced back again by a fusée spring; and (2) the non-recoiling portion. The non-recoiling portion consists of (1.) a gun-metal barrel casing, which holds liquid for cooling purposes, and has three openings (used respectively for filling, drawing off, and for allowing the steam to escape); this casing is packed with asbestos, and contains the ejector tube through which empty cartridge cases are expelled from the gun; and (2.) the

NICCOLÒ MACHIAVELLI

Uffizi Gallery, Florence. Painter unknown

(1521-25); *Discorso si la Lingua di Dante, Boccaccio, e Petrarca, debba chiamarsi Italiana, Toscana, o Fiorentina*. The best eds. of his works collectively are those of Florence, 6 vols. (1782-86); 5 vols. (1796), and 10 vols. (1818); Molinat, Venice, 12 vols. (1811); Silvestri, 9 vols. (1820-22); Passerini, Panfani, Milanese, 6 vols. only pub. (1873-77). Trans. by C. E. Neville, 1675; E. Farneworth, 1762; O. E. Desmold, 1882; L. Ricci, *The Prince*, 1903; W. Marriott (Everyman's Library), *The Prince*, 1908, and *History of Florence*, 1909; and N. Hill Thompson, 1913. See lives by F. Nitti, 1876; P. Villari, 1877-82, 1895-97 (trans. 1878, 1892); V. Turri, 1902; J. Robertson, 1907; and J. H. Whitfield, 1948. See also T. B. Macaulay, *Critical and Historical Essays*, 1843; L. Dyer, *Machiavelli and the Modern State*, 1904; F. Ercole, *La Politica di Machiavelli*, 1926; E. Guillo, *Machiavelli and Modern Political Science*, 1928; D. Ferrara, *The Private Correspondence of Niccolò Machiavelli*, 1929; Count Sforza, *Machiavelli*,

breech casing, composed of two side plates and one bottom plate, closed by a cover and a rear cross-piece, and containing the buffer spring, resistance piece, and check lever. Along the bottom plate is the trigger bar. The rear cross-piece holds the firing lever and spring, a safety catch, and a shutter for examining the barrel. The recoiling portion consists of a copper-coated barrel and two side plates which carry a lock and crank. The feed block fits under the cover in a recess in the breech casing, and is provided with two slides attached to a pawl, for moving the cartridges transversely. Two stationary pawls prevent the belt from slipping. The feed block has a hand roller and steel guide to ensure the cartridges coming to the right position to be seized by the extractor. Once this gun is loaded pressure on a double trigger is all that is necessary for firing automatically. The manipulation, when once the machine is ready for action, consists merely in aiming, pressing the trigger, and tapping the gun to produce deviation of the line of fire. The principles of the Maxim gun recoiling barrel, tripod mounting, liquid cooling, and continuous belt feed were widely adopted and adapted, and its descendants include the Ger. Maxim, the Russian Maxim (cooled with glycol for low temps. and mounted on a low wheeled carriage or on skis), the Brit. Vickers, and the Austrian Schwarzlose. All these were formerly classified as heavy, and now as medium M. G., i.e. company or battalion support weapons firing ammunition of rifle calibre from a fixed mounting and capable of indirect (overhead) fire and of firing on fixed lines at night or in fog. They may cover an advance or an exposed flank against counter-attack. The range is usually from 800 to 1200 yds. for most effective work, and guns are used in sections, being placed 25 yds. apart. In the early stages of the First World War, the conspicuous advantage in the fire-power of the Ger. Army through the extensive use of the machine gun necessitated immediate steps being taken by the Allies to increase their own machine-gun armament. In the Brit. Army an immediate increase was made in the number of Maxim guns, but the rapid increase of the army made it difficult for supply to keep pace with demand. The lighter, drum-fed Lewis gun, a Belgian invention, was therefore introduced as a platoon weapon, but it was still too heavy and the nature of its tripod mounting made it, by contrast with the Vickers, inaccurate.

In the Second World War light M. G. formed the prin. infantry weapon of all armies engaged—the Brit. Bren, invented at Brno in Czechoslovakia, and the successive modifications of the Ger. M. G. 34 (popularly known in Eng. as the Spandau). The latter's steadiness and high rate of fire enabled it to combine the functions of a light, and, on a different mounting, a medium machine gun, with an automatic searching device by which, by means of a ratchet, the elevation was automatically raised or lowered with the

recoil. Light M. G. generally differ from guns of the Maxim type in that only the breech and not the whole barrel recoils. The term heavy machine gun now denotes a weapon usually of moving-barrel mechanism, fired from a fixed mounting, and throwing a half-inch or 20-mm. ball which can be armour-piercing, explosive, or incendiary. They are usually mounted in vehicles (e.g. the B.S.A.) or small warships and are used for A.A. or anti-tank fire. For cavalry, however, the Hotchkiss air-cooled pattern was adopted, as it could be fitted into a 'bucket' carried at the stirrup. The great fire-power of M. G. made them objects of interest on both sides, and emplacements were constructed for their concealment and protection. Aircraft were armed with various patterns of machine gun from the outset of the war, and aerial combats were normally fought with M. G. The experience of the First World War was reflected in subsequent military organisation in that practically every country increased its number of medium M. G. and in some machine-gun platoons and companies were a feature.

Various modifications of the machine-gun have been produced to meet the special needs of aircraft, where the problem of cooling is automatically solved by the slipstream, but a much higher rate of fire is required (e.g. the Vickers 'K'), and of armoured fighting vehicles where the recoil usually has to be reduced owing to confined space, and the spent cartridge cases are ejected into a chute where they will not impede the actions of the crew. Most modern light M. G. can be adjusted to fire single shots so that they can register on the target without betraying the presence of an automatic weapon, and this has led to the introduction of the semi-automatic arms such as the Amer. B.A.R. and carbine and the Ger. Sturmgewehr, hybrids between the light machine gun and the magazine rifle. Another development of recent date is the sub-machine gun or machine pistol.

Machinery, Agricultural, see AGRICULTURAL MACHINERY.

Machines, Automatic, self-moving M. The word automatic is applied by common consent to M. in which a simple action on the part of the operator is followed by a comparatively complicated series of movements on the part of the machine. Thus the coin-operated, or automatic delivery, machine in its simplest form is so designed that the coin inserted passes through a number of tests, e.g. size, weight, material, etc., devised to test its genuineness, after which, if accepted, it moves on to a position whereby when the drawer is pulled the mechanism allows it to open. Modern developments are on the lines of mechanisms which (a) give change when coins of a higher denomination than the price of the article are inserted, and (b) will operate when a number of coins of various denominations are inserted to make up the total of the article to be purchased. See also CASH REGISTER.

Machine Tools, see TOOLS, MACHINE.

Machpelah, name of a dist. in Hebron,

Palestine, that lay 'before,' i.e. E. of, Mamre (the place by the oaks of which Abraham pitched his tent—Gen. xlii. 18), in which was the hill of Ephron containing a cave (Gen. xxli. 9, 17). According to tradition Abraham bought the cave from the Hittite Ephron for a burial-place and there the dust of Sarah was laid. In this cave he himself is said to have been buried as were also Isaac, Rebecca, Leah, and finally Jacob (Gen. xxv. 9, xlix. 30, and i. 13). There seems no reason to doubt the truth of the tradition which identifies this cave with that under the great mosque at Hebron. It lies on the E. edge of the modern city, on the S.W. slope of the mt. This land, inclining towards the anct. city, must have formed the dist. of M., but of the cave no recent reliable account is available.

Machu Picchu, anct. city of Peru, in the Andes, discovered in 1911 by Hiram Bingham, the Amer. explorer. It is thought that M. P. may have been 'Tampu-tocto,' traditional cradle of Inca civilisation, and that it was built as a refuge when invaders occupied the Cuzco valley about A.D. 800, enjoying a high degree of invulnerability in its situation above the deep valley of the Urubamba R. Overcrowding led to its abandonment for a new Cuzco, eventually the centre of the Inca Empire. When the Spaniards arrived in the sixteenth century, the advantages of M. P. led the Incas to rebuild the city. The profusion of feminine ornaments has led to the theory that M. P. became the final home of the priestesses of the Inca sun god, the Virgins of the Sun. The remains of the city are of great beauty. In Oct. 1918 Bingham formally opened a new highway, named after him, which provides easy access to the site. See C. Sandeman, *A Wanderer in Inca Land*, 1948.

Machynlleth, parl. bor. and par. of Montgomeryshire, Wales, on R. Dovey, 10½ m. from Dolgelly. Manufactures include flannels and coarse woollen fabrics. There are slate quarries and lead mines. Owen Glendower summoned a parliament here in 1402. Pop. 2000.

Macintosh, Charles (1766–1843), Scottish chemist and inventor of waterproof materials. He introduced the manuf. of sugar of lead from Holland (1786), started the first alum works in Scotland (1797), and obtained a patent (1825) for converting malleable iron into steel, helping Neilson to bring his 'hot-blast' process into use (1828). He took out a patent for his 'mackintosh' cloth in 1823. See *Memoir* by G. Macintosh.

Mack, Karl Freiherr von Leiberich, Baron (1752–1828), Austrian soldier, entered the army in 1770, fought against the Turks, and became field-marshal in 1797, commanding the Neapolitans against the Fr. He took Rome, but failed to hold it, and was defeated by Championnet and Macdonald (Etienne-Jacques, later duke of Taranto and marshal of France), giving himself up to the Fr. Escaping from Paris (1800), he fought against the Fr. under Napoleon, but was beaten on the R. Iller and at Ulm (1805). He was im-

prisoned in Austria, but pardoned (1819). See F. L. G. von Rauner, *Historisches Taschenbuch*, 1873; I. Thiers, *Histoire du Consulat*, 1845–63; and T. Hardy, *The Dynasts* (Part I.), 1903.

Mackail, John William (1859–1945). Scottish classical scholar, b. a son of the manse, in Bute, and educated at Ayr Academy, Edinburgh Univ. and Balliol College, Oxford. At Oxford he won many distinctions, and was made an honorary scholar of Balliol. He won the Newdigate prize, and was elected to a fellowship at Balliol, but, in 1884, he entered the education dept., in the offices of whose successor, the Board of Education, he remained until his retirement in 1919. His years as a civil servant were marked by a copious stream of scholarly works, including a prose trans. of the *Eclagues and Georgics*; *Select Epigrams from the Greek Anthology* (1890); *Latin Literature*, a survey of the whole literature of anct. Rome (1895). From 1903 to 1910 he engaged in a trans. of the *Odyssey* into Omar Khayyámish quatrains, a bold interpretative effort. In 1885 he was brought into close contact with the Pre-Raphaelites by his marriage to Margaret, daughter of Sir Edward Burne-Jones, the lifelong friend of Wm. Morris, and his biography of Morris, which was pub. in 1899, besides being generally considered his best work, has been declared by critics to be one of the outstanding biographies in the Eng. language. His interest in Eng. poetry, shown by winning the Newdigate prize, received fuller scope in 1906, when he was elected prof. of poetry at Oxford, and the three vols. of his lectures, *The Springs of Helicon* (1909), *Lectures on Greek Poetry* (1910), and *Lectures on Poetry* (1911), display his knowledge and love of Gk. and Lat. poetry and a close acquaintanceship with Eng. poets from Chaucer to Keats. *The Approach to Shakespeare*, a vol. of criticism pub. in 1930, is one of the best introductions to the study of Shakespeare. Many honours came to him, including honorary degrees of Edinburgh, St. Andrews, Adelaide, Oxford, and Cambridge univs., while Balliol made him an honorary fellow in 1922. In 1924 he was appointed to the professorship of anct. literature by the Royal Academy. Fellow of the Brit. Academy, 1911, he became president in 1932, and received the O.M. in 1935. Later works include *Studies in Humanism* (1938), and *The Sayings of Christ* (1938).

Mackay, Charles (1814–89), Scottish poet, editor of the *Glasgow Argus* (1844–47), and the *Illustrated London News* (1852–59). As special correspondent at New York to *The Times* during the Amer. Civil war (1862–65), he revealed the Fenian conspiracy. His works include *The Salamandrine* (1842); *Voices from the Crowd* (1846); *Egeria* (1850); *Under Green Leaves* (1857); various prose works, and many popular songs, such as *The Good Time Coming*, *Cheer Boys! Cheer!* (see *Collected Songs*, 1859). Miss Correll was his adopted daughter. See his *Through the Long Day* (1887).

Mackay, Hugh (c. 1640–92), Scottish general, fought for Charles II. after the

Restoration (1660), and then for France against Holland. He married a Dutch lady (1673), and later attached himself to William of Orange (1689), accompanying him to England. Sent against Claverhouse, M. was defeated at Killiecrankie. He served in Ireland (1691), and fell fighting in Flanders at Steinkerk. See G. Burnet, *History of his Own Times*, 1724-34; M. Napier, *The Life and Times of Claverhouse*, 1859-62; also life by J. Mackay, 1836.

Mackay, John William (1831-1902), Amer. capitalist, called the 'Silver King.' He emigrated from Ireland to New York (1840), moved to California in 1851, and to Nevada in 1852. He bought many shares (1873) in the Bonanza mines of the Comstock lode, and after disappointments became very rich. With Flood and other partners he estab. the Bank of Nevada in San Francisco. In 1884, with J. G. Bennett, he formed the Commercial Cable Company and the Postal Telegraph Company, to fight Jay Gould and the W. Union.

Mackay, seaport and municipality of Carlisle co., Queensland, Australia, on Pioneer R. The harbour has been much improved by repairing the N. wall and raising the director wall to above high water. It is the centre of a sugar region. Coal is found. Pop. 6000.

McKeesport, tn. of Allegheny co., Pennsylvania, U.S.A., close to the iron centre of Pittsburgh, with iron and tin works of its own. Its lumber mills and iron works are said to be the largest in the world. Coal and iron are produced, and steel tubes, pipes, and sheet steel. On the Monongahela R., the bor. takes its name from a prominent citizen, John McKee. Pop. 53,300.

McKees Rocks, vil. of Allegheny co., Pennsylvania, U.S.A., 3 m. from Pittsburgh, on the Ohio. Coal and lumber are shipped. There are car-shops, iron and steel works, and glass manufs. Pop. 17,000.

McKenna, Reginald (1863-1943), Brit. financier, b. in London. Elected M.P. for N. Monmouthshire, 1895, he represented that constituency till 1918. He was financial secretary to the Treasury on the formation of Campbell-Bannerman's Gov. in 1905. Made Privy Councillor and promoted to Cabinet rank in 1907; he was president of the board of education, 1907-1908, and First Lord of the Admiralty, 1908-11, and during his term of office he caused eight more ships of Dreadnought type to be built; and while home secretary, 1911-15, he had charge of the Welsh Disestablishment Bill (1912). In 1915 he succeeded Lloyd George as chancellor of the exchequer, raised nearly £600,000,000 by a 4 per cent loan, and, as part of war-taxation, along with an excess-profits tax, introduced the McKenna duties (q.v.). He also inaugurated the issue of war-savings certificates. In 1916 he imposed new duties on amusements, railway tickets, matches, and mineral waters. He left office when Lloyd George became Prime Minister, 1916. In 1919 he became chairman of the London City and Midland

Bank—now the Midland Bank—retaining the post up to the time of his death. As a member of the Macmillan Committee on Finance and Industry he signed the report which appeared in 1931 just before the abandonment of the gold standard. See S. McKenna, *Reginald McKenna, a Memoir*, 1948.

McKenna Duties. During the First World War the national expenditure in the belligerent countries was so great that, for example, in Great Britain it was estimated that an expenditure of £1,132,500,000 would be incurred for the financial year 1915-16. Of this huge sum £978,000,000 would be required to meet the credits already voted in the House of Commons. The revenue for the year had been estimated at £267,000,000. In the autumn of 1915 Reginald McKenna, chancellor of the exchequer, introduced a supplementary budget in the House of Commons. The amount required for the financial year had risen now to close on £1,600,000,000, of which over £1,400,000,000 were required to satisfy the credits already voted. The duties on tea, coffee, cocoa, were increased by 50 per cent, and the duty on sugar was raised from 1s. 10d. per cwt. to 9s. 4d. per cwt.; 9d. a gallon was added to the duty on motor spirit, and an *ad valorem* duty of 33 per cent was imposed upon all imported motor cars, cinema films, clocks, watches, musical instruments. The duties, which became known as the McKenna Duties, were repealed by the first Labour Gov. in 1921, but were reimposed by Mr. Winston Churchill, the Conservative chancellor of the exchequer, in 1925. By various finance Acts the 'safeguarding duties,' as they were called, were subsequently extended and renewed on a temporary basis; but in 1932 further extensions were rendered unnecessary by reason of the inception of the protective tariff in the United Kingdom.

Mackennal, Sir Bertram (1863-1931), Australian sculptor, b. in Melbourne, studied art in France. His work soon won him public recognition and he was chosen to carve sev. statues of Queen Victoria, for Australia, Lahore, and Blackburn, and, later, to design the coinage issued on the accession of George V. In 1889-91 he was engaged on the decoration of Gov. House, Melbourne. His other works include the national memorial to Gainsborough, memorials to Edward VII. in St. George's Chapel, Windsor, and elsewhere, and much small decorative sculpture. A.R.A., 1909; R.A., 1922.

Mackensen, Anton Ludwig Friedrich August von (1849-1915), Ger. field-marshal; b. at Haus Lohpitz, near Wittenberg, son of Ludwig M., land agent to Count Alten. In 1869 he entered the 1st Leibhusaren regiment (King's Own Hussars), and served in France 1870-71. He joined the grand general staff 1880, was made captain 1882, major 1888, and colonel 1897. In 1898 he accompanied William II. to Palestine, and in 1899 was ennobled. Major-general in 1900, he became Lieutenant-general in 1903, and

general of cavalry commanding 17th Army Corps on the Vistula, 1908. At the opening of the First World War on the E. front he commanded the Ninth Army, repulsing the Russians at Kutno, Lodz, and Lowicz. In April 1915 he led the forces in W. Galicia, assisting in the break-through at Gorlice. On June 26, 1915, he was made field-marshal, and in Aug. and Sept. again repulsed the Russians, at Brest-Litovsk and Pinsk. In Oct. and Nov. he commanded the army that overran Serbia. In 1916 he completed the conquest of Rumania by subduing the Dobruja dist. After the armistice his troops retiring, he surrendered at Budapest, Dec. 1918. He was detained first at Futak Castle, near Neusatz (now Novi Sad, Yugoslavia), and then at Salonika, for nearly a year. See his *Geschichte der Leibhusaren-regiment* (1892); and essays on army and war hist. in the *Militär Zeitschrift*. See study by M. Luvken, 1920.

His third son, Everhard von M. (b. 1889) was an army commander in the Second World War. In 1947 he was sentenced to life imprisonment for his part in the massacre of 335 It. in the Argentine caves.

Public Archives of Canada
SIR ALEXANDER MACKENZIE

Mackenzie, Sir Alexander (c. 1755 c. 1820), Canadian explorer, b. of Scottish parents in Stornoway, Isle of Lewis (the site of his bp. is denoted by a mural tablet on Martin's Memorial Church). Early in life he emigrated to Canada, and for eight years (1781-89) traded in fur with the Indians at Lake Athabasca. His famous expedition of June-July 1789, consisting of three canoes with Indians, crossed Great Slave Lake and paddled down the riv. which now bears his name. He thought that the riv. which Cook had found flowing into Cook's Inlet might be connected with that which flowed N. from Lake Athabasca. Finding that it flowed into the Arctic, and not into the Pacific,

he named it R. Disappointment, but resolved to go to its mouth and on July 12 he reached the ocean. By Sept. 12 he was back at the Hudson's Bay Company's post of Fort Chipewyan, having travelled 3000 m. in 102 days, and having put on the map one of the continent's greatest rvs. One more possibility of a route to the Pacific still lay open, the Peace R., as it is now called, and M. resolved to explore it. He did not find an easy route to the Pacific, but his small party, starting from a post he had estab. on the Peace R., got to the head-waters of the Fraser R., and he then decided to do the rest of the journey overland. Starting afresh up the Blackwater valley on a stiff march his party got down to the Bella Coola R., and after fifteen days reached the salt water of an inlet. Three days' paddling took him still further towards the open sea into Dean's Channel, where hostile Indians forced him to turn back, but before doing so he had determined his position. The journey had taken seventy-two days, and in thirty-three more M. was back at his post on the Peace R. The real significance of his journey is that he was the first explorer to penetrate the Rocky Mt. barrier, and his historic exploit was, in fact, a forecast of the expansion of Brit. N. America from sea to sea. On his return to England in 1801 he pub. *Voyages from Montreal to the Frozen and Pacific Oceans*. See F. R. de Chateaubriand, *Voyages en Amérique*, 1824, and G. W. Brown, *Building the Canadian Nation*, 1942.

Mackenzie, Alexander (1822-92), Canadian statesman, b. at Dunkeld, Perthshire, Scotland. He emigrated to Canada in 1842, and settled at Kingston, Ontario, where he became a builder and contractor. In 1867, on the union of Canada, he was elected to the Dominion Parliament, and became leader of the reform opposition. In 1873 he organised a Liberal ministry, and became the first Liberal premier of Canada. On its fall in 1878 M. led a brilliant opposition for two years. He was a strong supporter of the close union of Canada and Great Britain, and his ministry is said to have been the purest experienced by Canada.

Mackenzie, Sir Alexander Campbell (1817-1935), Scottish musical composer, teacher of music, and violinist, b. at Edinburgh. His forbears for many generations were professional musicians, his father being leader of the orchestra of the Theatre Royal, Edinburgh, and a writer of many successful songs. M. studied music in Germany, learning the violin under K. W. Ulrich and harmony under Edward Stein, and in London, under Salton and Charles Lucas. One time the conductor of the Philharmonic Society, he became (1888) principal of the Royal Academy of Music on the death of Sir George Macfarren, the institution making remarkable progress under his control. His early works of importance include *The Bride*, a cantata (1891); *Jason* (1892); and an opera *Colomba* (1893). His *La Belle Dame sans Merci* (1893) and *The Dream Jubal* (1899) are also beautiful, if rarely heard, musical compositions. After he

had become principal of the Royal Academy of Music, he did not give up his work of composition, producing, at this later period, *The Pibroch* (1889), the *Britannia* overture (1894), and the *Scottish* Pianoforte Concerto (1897). His other compositions include incidental music to *Coriolanus* and *The Little Minister*, three Scottish Rhapsodies, two oratorios, *The Rose of Sharon* (1884) and *Bethlehem* (1894), part-songs, *Coronation March* (1902), and anthems, etc.

Mackenzie, Charles, *see* COMPTON, HENRY.

Mackenzie, Compton, Brit. novelist, *b.* at W. Hartlepool, Jan. 17, 1882, of a literary and theatrical family; the son of Edward Compton, his full name is Edward Montague Compton, and he adopted the name M. from Scottish ancestry on his paternal grandmother's side. He was educated at St. Paul's School and Magdalen College, Oxford, and studied for the Bar. Forsaking law, he wrote a play, *The Gentleman in Grey*, produced in Edinburgh in 1907, but his career was decided by the outstanding success of his first three novels: *The Passionate Elopement* (1911); *Carnival* (1912); and *Snister Street* (2 vols., 1913-14). The last named in particular estab. a vogue for the realistic biographical novel, a genre to which he returned in 1922 with *The Altar Steps*. His carefully wrought love story of the Eng. country before the war of 1914, *Guy and Pauline*, was pub. in 1915, being written at Capri in that year in which M. was invalided out of the Royal Marines after service in Gallipoli. During the latter years of the war he was military control officer in Athens, and in 1917 director of the Aegean Intelligence Service. His experiences at that time became the subject of three books: *Gallipoli Memories* (1929); *Athenian Memories* (1931); and *Aegean Memories* (1940). The latter first appeared as *Greek Memories* in 1932, but was banned under the Official Secrets Act. As a writer he possesses remarkable insight into the contemporary scene, power of description, and on the whole a stronger grasp of events than of character, his romantic conception of character contrasting with the realism of his background. He has written over thirty novels, including the notable series, 'The Four Winds of Love'—*The East Wind* (1937); *The South Wind of Love* (1937); *The West Wind of Love* (1940); *West to North* (1940). In 1923 he founded the magazine *The Gramophone*, which he has since ed. He is a chevalier of the Legion of Honour, and was appointed lord rector of Glasgow Univ. in 1931.

Mackenzie, Sir George (1636-91), Scottish lawyer, author, and politician, *b.* at Dundee. He entered the Scottish Parliament in 1669 as member for Ross-shire, and became king's advocate in 1677. In spite of his professional work he found time for literature, and pub. *Religio Stoici* (1663); *Moral Gallantry* (1667); *Discourse on the Laws and Customs of Scotland in Matters Criminal* (1678); *Institutions of the Laws of Scotland* (1684); and *A Moral Essay, Preferring Solitude to*

Publick Employment (1685). As criminal prosecutor in the days of the Covenanters, he earned the nickname of 'bluddy Mackenzie.' *See* A. Lang, *Sir George Mackenzie, King's Advocate, his Life and Times*, 1909; and *libo* by T. Ruddiman, prefixed to his *Collected Works*, 1716-22.

Mackenzie, Henry (1745-1831), Scottish novelist, was by profession a lawyer and practised in Edinburgh, later becoming Crown attorney for Scotland. In 1804, for his political services, he was appointed comptroller of taxes for Scotland. It is, however, as a writer he is best remembered. In the late sixties he began to compose his best-known work, *The Man of Feeling*, which was pub. anonymously in 1771, and attracted much attention. Two years later, designed as a contrast to the earlier work, appeared *The Man of the World*, which was at once prolix and dull, and in 1777 appeared his *Julia de Roubigné*, written in a strain of high-wrought sentimentalism. His work shows strongly the influence of Sterne. His *Anecdotes and Egoisms*, first pub. in 1927 (ed. by H. W. Thompson), is an entertaining work of his old age.

Mackenzie, Sir Morell (1837-92), Eng. physician, *b.* at Leytonstone, Essex, and educated professionally at the London Hospital Medical College, Paris, and Budapest. At the London Hospital he held successively the posts of medical officer, assistant physician, and physician from 1860 till 1874, when he resigned. The London Throat Hospital was founded by him in 1863, and his skill as a laryngologist led to his attending the Emperor Frederick III. of Germany in his fatal illness. His most important pub. are: *Diseases of the Throat and Nose* (2 vols.); *The Use of the Laryngoscope*; *Essay on Growths in the Larynx*; *The Hygiene of the Vocal Organs*, etc. *See* *lives* by H. R. Haweis, 1893, and R. S. Stevenson, 1946.

Mackenzie, William Lyon (1795-1861), leader of the Canadian rebellion of 1837-1838, *b.* at Dundee, Scotland. He emigrated to Canada in 1820 and settled in Queenstown, where he became a journalist and ed. a newspaper entitled the *Colonial Advocate*, in which he took an extreme stand against the gov. and violently attacked the Family Compact, or system by which, in each colony, power lay in the hands of a small minority of wealthy and influential people. M. was fearless and sincere, but he poured out such a stream of abuse on his opponents that he aroused the most bitter resentment. He was elected to the legislature, but was expelled for alleged libel on the ministry. He visited the U.S.A. in 1829, and was sent to England in 1832 as the delegate of his party, to appeal against certain abuses. In 1834 he became mayor of Toronto and founded the Canadian Alliance Society. In 1837 he led the rebels in the insurrection of Upper Canada. They were, however, utterly defeated, and M. escaped to the U.S.A. till 1849, when the Canadian Gov. granted an amnesty to all who had taken part in the rebellion, enabling him to return to Toronto. Mr. Wm. Lyon M. King (*q.v.*)

is a grandson of M. See life by C. Lindsay, 1802.

Mackenzie King, William Lyon, see KING.

Mackenzie: 1. Former ter. of N. Canada, now included in the N.W. Ter. (q.v.). 2. Riv. of N. America, originates as the Athabasca in Brit. Columbia, and flows over 600 m. to Lake Athabasca, whence it issues as the Slave R., and after a course of 240 m. enters the Great Slave Lake. As the M. R., it leaves the W. end of the lake and flows into the Arctic Ocean, its final course being estimated at more than 1080 m. Its most important tribs. are the Liard, or Mountain R., Peel R., and Bear R., from Great Bear Lake; near its mouth it forms an intricate delta. This great waterway was first discovered by Sir Alexander Mackenzie in 1789.

Mackerel, popular name given to all members of the Scombridae, a family of teleostean fishes inhabiting the Atlantic, Indian, and Pacific oceans. They are fusiform fishes, covered with small scales, or occasionally with a naked skin surface; the eyes are lateral; the teeth well developed; there are two dorsal fins and generally finlets; the pseudo-branchiae are well developed, and the air-bladder is small, or may be missing entirely. The M. are widely distributed, and are greatly valued as food. Their general colour is reddish, owing to their having a larger supply of blood and nerves than is the case with other fishes, and their temp. also is sev. degrees higher. The back is marked by alternate bands of black and green, and the sides are brilliantly iridescent. In habit these fishes are generally pelagic and spawn in the open sea; they travel at considerable speed. *Scomber scombrus*, the common M., found in the N. Atlantic, has no air-bladder; *S. pneumatophorus* has an air-bladder. *Thunnus*, the tunnies, also belong to this family. *Th. thynnus*, the largest species, reaching a length of 10 ft.; *Th. pelamys*, the bonito, pursues flying-fish, and other species of this genus are provided with long pectoral fins and are called by sailors albacores. Allied genera include *Pelamys*, *Cybius*, *Acanthocybius*, and *Rhacoeconus*. Fossil forms of Scombridae are found in the Eocene and Miocene strata.

Mackinder, Sir Halford John (1861-1947), Eng. geographer, educated at Epsom College, and Christ Church, Oxford. A paper of his on *The Scope and Methods of Geography* so much impressed the council of the Royal Geographical Society that on the society agreeing to subsidise univ. lectures in the subject, M. was appointed to Oxford, he being the second reader in geography to lecture at Oxford since the celebrated Richard Hakluyt. In an address to the Brit. Association in 1895 M. proposed a scheme for a Univ. Institute of Geography where physical and human teaching might be collated, and a few years later his plan was realised as the Oxford School of Geography. In 1899 he led an expedition to Mt. Kenia and climbed the summit of the peak Batian (17,000 ft.). The following year he became reader, and,

later, prof. of geography at London Univ. He succeeded W. A. S. Howins (q.v.) as director of the London School of Economics and Political Science, while continuing as reader at Oxford. His pub. lectures include *Britain and the British Seas* (1902, 1930); *The Rhine, its Valley and History* (1908); *Eight Lectures on India* (1910). In 1910 M. was elected as Unionist member for the Camlachie div. of Glasgow and kept his seat till 1922. He will be chiefly remembered for his theories of geopolitics, a science which in some sort he may be said to have created (see under GEOPOLITICS). He put to the practical test in his political career the main idea of his science, namely the influence of geographical environment upon political development, and the value of geography as a factor in social reconstruction. See especially his *Democratic Ideals and Reality* (1919), which approached politics in a new spirit, stressing the importance of technical knowledge and its scientific application to human relations. He was sent to Russia on a mission as Brit. high commissioner for S. Russia, being knighted on his return. He became Privy Counsellor in 1926 and was chairman of the Imperial Shipping Committee from 1920 to 1945.

Mackinlay, Mrs. J., see STERLING, ANTOINETTE.

McKinley, William (1843-1901), twenty-fifth president of the U.S.A., b. at Niles, Ohio. When the Civil war broke out, he enlisted as a private in the Ohio volunteer infantry and finished as a major. At the end of the war he returned home to study law. He identified himself with the Republican party, and rapidly became known as an able speaker. In 1876 he was elected to Congress. In 1889 he was Republican leader in the House of Representatives, and chairman of the Committee of Ways and Means; as such he introduced and carried the great measure of 1890 known as the M. tariff, which raised the tariff by 50 per cent on the average. In 1891 became governor of Ohio, and was re-elected in 1893. In 1896 he was elected president of the republic, and again in 1900. The Sp.-Amer. war was the chief event of his first term of office. He visited the city of Buffalo (New York) to deliver a public address, a great reception being held for the president on the day following. A Pole, Leon Czolgosz, fired at the president with a revolver. He d. from the effects of his wounds a few days later. His assassin was said to be an anarchist, and was executed in Oct. 1901. Although not taking rank among the greatest presidents he was undoubtedly one of the most popular the country has ever had. His generous motives, the purity of his life, and his devotion to his ailing wife won the Amer. heart. See lives by C. S. Olcott, 1916, and J. G. Butler, 1924.

McKinley, Mount, is situated in Alaska, N. America, and the highest point in that continent. It rises to a height of over 20,000 ft., with glaciers on every side. Dr. Cook laid claim (later disallowed) to having ascended the mt. in 1906 (see

COOK, FREDERICK ALBERT), and in June 1913 a party led by Archdeacon Hudson Stuck accomplished the feat.

Mackinnon, Sir William (1823-93), *b.* in Argyllshire, founder of the Brit. E. Africa Company, and co-founder, with Robert Mackenzie, of the Brit. India Steam Navigation Company which, under his inspiration, created a huge trade around the coasts of India and E. Africa. In 1878 M. leased the coastal ter. between Tunga and Warshelk (formerly the sultan of Zanzibar's mainland ter.) and inland to the E. prov. of the Congo Free State; but the Brit. Gov. refused to ratify this remarkable concession, which would have then secured for Great Britain the whole of what eventually became, under the evil genius of Carl Peters (see KIM, SIR JOHN), Ger. E. Africa. In 1886, however, the Brit. Gov. availed itself of M.'s influence to secure the coast line from Wanga to Kipini and a charter was granted to the Imperial Brit. E. Africa Company (formally incorporated on April 18, 1888) for opening up trade. Among the objects of the company were the abolition of the slave trade, the checking of trade monopoly, and the securing of equal treatment for all nationalities. The ter. of the company, which included Mombasa, was finally taken over by the Brit. Gov. in 1895 for a cash consideration. It is not an overstatement to say that, but for the energy of M., Brit. trade and civilising influence would have been almost entirely excluded from E. Africa, and his work there is comparable with that of Sir George Goldie for W. Africa. M. took a prominent part in the Stanley expedition for the relief of Emin Pasha.

Mackintosh, Charles Rennie (1868-1928), Scottish architect and painter, *b.* in Dennistoun, Glasgow, and educated at Glyn's school there and at the Glasgow School of Art. Apprenticed to a local architect and, having won a travelling scholarship, toured France and Italy. Awarded the Soane gold medal of the Royal Institute of Brit. Architects, 1902; fellow in 1906. He won the limited competition held in 1894 for the new Glasgow School of Art buildings, which were, however, only completed in 1909. It is on these designs that his reputation mainly rests, though he was much better known on the Continent than in Great Britain. He also designed Queen's Cross Church, Glasgow, and (with George Walton) the decorations and furnishing of Cranston's tea-rooms in Glasgow (1897-1904) and also, abroad, the Scottish pavilion at the Turin exhibition (1902)—this leading to his exhibitions in Venice, Munich, Dresden, and other European cities. A pioneer of *art nouveau*, he used its mannerisms as an integral part of an architectural idiom freed from all traces of historical tradition. His work had a strong influence on continental decorative design, but, as his sensitive genius knew little development, there is no direct link between his modernism and the structural evolution of modern architecture—as there is, for example, in the work of Norman Shaw. After 1913 he devoted

himself to landscape painting, especially water-colours—'La Rue du Soleil' and 'Le Fort Maillot' (1927). See N. Pevsner, *Pioneers of the Modern Movement*, 1938.

Mackintosh, Sir James (1765-1832), Brit. philosopher, studied medicine and took his degree in 1787. Eight years later he was called to the Bar, and from 1818 until 1824 was prof. of law and general politics at Haileybury. For sev. years he sat in the House of Commons. He became known in 1791 through his *Vindiciæ Gallicæ*, which was a reply to Burke's *Reflections on the Revolution in France*. He was the author of many works, including a *History of England* (1830), a *History of the Revolution in England in 1688* (1834), and various philosophical writings. See life by R. J. Mackintosh, 1836.

Maeklin, Charles (c. 1697-1797), Irish dramatist and actor, began his theatrical career about 1725, and in his profession attained to a high position, one of his most successful roles being Shylock. He acted mainly at Covent Garden until his retirement from the stage in 1789. He wrote many plays, and produced most of them himself. In 1759 he produced *Love à-la-mode* at Drury Lane, in which he acted with his daughter Charlotte. This and *The Man of the World*, played at Covent Garden in 1781, were his most successful plays. See lives by F. A. Congreve, 1798, and Judge Parry, 1891.

Maclaren, Ian, see WATSON, JOHN.

Maclaurin, Colin (1698-1746), Scottish mathematician, was a native of Argyllshire. He was educated at Glasgow Univ. and in 1717 was appointed prof. of mathematics at Marischal College, Aberdeen. His next appointment was to the chair of mathematics at Edinburgh Univ. in 1725. He was instrumental in preparing the defences at Edinburgh against the Pretender in 1745. He is remembered for his contributions to science with regard to the principles of fluxion which helped to explain the theory of the tides. In 1740 he shared with Euler (*q.v.*) and Daniel Bernoulli (*q.v.*) the prize offered by the Pr. Academy of Science for an essay on the flux and reflux of the sea. This essay was subsequently revised by M. and included in his *Treatise on Fluxions*. M.'s purpose in this treatise was to found the doctrine of fluxions on geometrical demonstration and he thus laid down the grounds of the fluxional method, regarding fluxions as velocities, after Newton; but the most valuable part of the work is that devoted to physical applications, in which he incorporated his essay on tides. In this he investigated the attraction of an ellipsoid of revolution, and demonstrated that a homogeneous fluid mass revolving uniformly round an axis under the action of gravity must assume the form of an ellipsoid of revolution. The significance of his investigation in relation to the theory of the tides, the shape of the earth, and kindred questions, has always caused it to be regarded as one of the cardinal problems of mathematical physics. Among his writings are *A Treatise on Fluxions* (1742) and *An Account of Sir*

Isaac Newton's Philosophical Discoveries (1748).

Macle, in crystallography, a term used for the phenomenon otherwise known as twinning. This occurs when two crystals have a common face and are so disposed that one may be brought into the position of the other by rotation about an axis called the twin-axis. The term was once generally used, but is now only found with any frequency among Fr. writers. The mineral known as chialstolite, consisting of aluminium silicate with magnesium and iron, is also called M. It is commonly used for making beads for rosaries.

McLean, Norman (1865-1947), Brit. orientalist, b. at Lanark, son of the Rev. Daniel M. of Jamaica. He was educated at the high school and univ. of Edinburgh and at Christ's College, Cambridge, where he remained for the rest of his life, becoming master in 1927. Heb. lecturer at Christ's College, and later univ. lecturer in Aramaic. He collaborated with Prof. A. E. Brooke on their life work, the preparation of the larger Cambridge ed. of the Septuagint, of which the 2 vols. from Genesis to the second book of Chronicles appeared between 1900 and 1932. To the *Encyclopædia Biblica* M. contributed, in co-operation with Sir Arthur Shipley and others, a series of articles on the flora and fauna of the Bible. But his most valuable work was in Syriac, where his name will always be associated with that of Wm. Wright, whose pupil he was. He wrote numerous articles for the eleventh ed. of the *Ency. Brit.* on Syriac literature.

McLean: 1. Tn. of Clarence co., New S. Wales, on the Clarence R., 28 m. N.E. of Grafton. Pop. 2000. 2. Co. of N. Dakota, U.S.A., having for its W. boundary the R. Missouri. Pop. 16,000.

MacLeish, Archibald (b. 1892), Amer. poet, b. at Glencoe, Illinois, U.S.A. Educated at Yale and Harvard. His early verse, *Tower of Ivory* (1917), embodies his subjective experiences as a soldier in the First World War and there is a return to this individualistic mood in *The Humble of A. MacLeish* (1928). This latter work and the interim vols. of verse, *The Happy Marriage* (1924), *The Pot of Earth* (1925), and *Streets in the Moon* (1926), reveal the influence of T. S. Eliot and Ezra Pound. His *Conquistador* (1932) was awarded the Pulitzer prize. It is an epic in verse based on the eye-witness account of Bernal Diaz del Castillo (q.v.) entitled *The True History of the Conquest of Mexico* (1632). In *Public Speech* (1936) he begins to show his growing preoccupation with collectivist social theory, and in similar vein is his *America War Promises* (1939)—a call to save democracy. After the First World War he practised law for a time and then became assistant editor of *Fortune* and afterwards director of the Harvard School of Journalism. In 1939 he was appointed librarian of Congress and in 1944 he became an assistant secretary of state. His other works include *Panic* (1935), a verse drama; *The Fall of the City* (1937), a radio verse

play illustrating the hollowness of totalitarian dictatorship; *The Irresponsibles* (1940), a rebuke to contemporary writers and scholars for their indifference towards democracy; and various essays.

Macleod, Fiona, see SHARP, WILLIAM.
Macleod, John James Rickard (1876-1935), Brit. physiologist, b. at Cluny, near Dunkeld, Scotland. He was educated at Aberdeen Grammar School, Marischal College, Aberdeen, Leipzig, and Cambridge. Demonstrator in physiology, London Hospital, 1899-1902, he was prof. of physiology, Western Reserve Univ., Cleveland, Ohio, 1903-18. He was president of the Amer. Physiological Society, 1922, F.R.S., 1923, sharer in the Nobel prize for medicine, 1923, and president of the Royal Canadian Institute, 1925. His publs. include works on general physiology, on metabolism of carbohydrates, and on diabetes and insulin, of which he is one of the inventors.

Macleod, Norman (1812-72), Scottish author and minister, a native of Campbelltown, Argyllshire. He was educated at Glasgow Univ., and studied divinity in Edinburgh, becoming a minister at Loudon in Ayrshire (1838). In 1843 he went to Dalkeith, and in 1852 to the Barony church, Glasgow, as minister. He became one of the most distinguished ministers and most popular preachers of his Church and, in 1857, was made one of the royal chaplains in Scotland, and became a trusted friend of Queen Victoria. Among his literary works are *Eastward* (1866); *Reminiscences of a Highland Parish* (1867); and *Peeps at the Far East* (1871); as well as articles in *Good Words*, which he ed. (1866 et seq.). See memoir by Donald M., 1876.

MacLise, Daniel (1806-70), Irish painter, came from Cork to London in 1827, and acquired fame as a portrait painter. He was elected a member of the Royal Academy in 1840, and subsequently refused the presidency of that institution. In the late fifties he painted two magnificent frescoes in the Royal Gallery of the House of Lords. He is, perhaps, most popularly known for the long series of character sketches of notable folk which he contributed to *Fraser's Magazine* (1830-38), which have been collected under the title of *The MacLise Portrait Gallery* (1874, 1882).

McLoughlin, John (1784-1857), fur trader, a founder of Brit. Columbia and of Oregon and a famous servant of the Hudson's Bay Company, b. at Rivière du Loup, of mixed Scottish, Irish, and Fr. ancestry. He studied medicine in Quebec, qualifying as a physician at nineteen after serving an apprenticeship with Dr. James Fisher, who was regarded as the father of medical legislation in Lower Canada. He joined the N. W. Company (which had not then amalgamated with the Hudson's Bay Company) about 1803 to try his fortunes as a young physician and acted as surgeon at Kamistiquia—a proposal being made about the same time by Simon McTavish, the most influential figure in the company, that he should enter the fur trade. 'This sad experiment,'

as he termed it, expired in 1808 and it is evident from his letters that he very nearly gave up the fur trade. But by 1814 he had become a partner in the N. W. Company, being in charge of the Rainy Lake Dist. Seven years later he accepted a commission in the Hudson's Bay Company as chief factor, and in 1823 was put in charge of the Columbia dept. The following year he was in charge at Fort George (Astoria) but soon afterwards transferred his headquarters to Fort Vancouver, which he built. He occupied a nearly independent position under the famous George Simpson (see HUDSON'S BAY COMPANY), the greatest figure in the hist. of the Hudson's Bay Company, and over a period of twenty-five years did more than any other man to lay the foundations of commerce along the Brit. Columbian coast. He sent out expeditions which built strategic points along the sea and far up into the interior. One of them chose the site of Victoria; and Fort Vancouver became not only a fur-trading centre but a prosperous agric. community. He enforced law and order with a firm hand, but with all his firmness he was just and humane and was loved and admired by Indians and whites alike. Called 'the Great White Eagle' by the Indians on account of his flowing white hair, he reigned over the whole Columbian region almost like a feudal lord. To-day his name stands high among the founders of both Brit. Columbia and Oregon. See F. V. Holman, *Dr. John McLaughlin*, 1807; R. G. Montgomery, *The White-headed Eagle: John McLaughlin, Builder of an Empire*, 1935; R. C. Johnston, *John McLaughlin, Patriarch of the North-West*, 1935; E. K. Rich (editor), (Champlain Society), *McLaughlin's Fort Vancouver Letters* (three series: 1825-38, 1839-44, and 1844-46), 1912-45.

MacMahon, Marie Edmé Patrice Maurice de (1808-93), duke of Magenta, marshal of France, and second president of the third republic, b. at Sully, Seine-et-Loire, France, of Irish descent. He graduated at the military school of St. Cyr, and served in the Algiers campaign of 1830. In 1835 he went to the Crimea, and took part in the operations against Sebastopol successfully assaulting Malakov. On the outbreak of the war with Austria in 1859 he distinguished himself at the battle of Magenta, and again at the battle of Solferino. In 1870 he was defeated at Welsenberg and at Worth. In 1871 he was called to the army of Versailles to recover Paris from the Commune, and on Thiers's resignation in 1873 he was elected president of France, resigning six years later. See E. Daudet, *Le Maréchal de MacMahon*, 1883; L. Lafarge, *Histoire complète de MacMahon*, 1898; and L. Rousset, *La France sous la troisième République, et la république conservatrice*, 1929.

Macmillan, Daniel (1813-57), Eng. publisher, and senior partner of a business which was founded in 1843 and afterwards carried on so successfully by the younger brother Alexander (1818-96). The first vol. with the name of M. on the title-page

was A. R. Craig's *Philosophy of Training*. Seven years later (1850) the firm adopted the title M. and Co., which it has retained ever since. Daniel M. began life as an assistant to a bookseller in Cambridge, in whose house he learned his trade and acquired a taste for literature. Alexander, who was also of Scottish birth, was a publisher of the 'old school,' whose intimate association with contemporary men of letters has been made the subject of a memoir. After his brother's death he transferred the business in 1858 from Cambridge to London, and with the increase of trade, was able to open a branch in New York (1869). The firm began by specialising in technical and educational works and still holds important copyrights in books of this class. A great factor in the early success of the business was the publication of Kingsley's works and *Tom Brown's School-days*. When, in 1890, Frazer's *The Golden Bough* made its appearance, the firm of M. was rewarded not only in its association with Frazer but in the power his masterpiece had to draw to the firm's imprint a long list of works on folklore, comparative religion, anthropology, and kindred subjects. In 1893 the business was turned into a limited liability company. In 1901 a publishing centre for India, Burma, and Ceylon was started in Bombay. Among the readers for M. were John Morley and Charles Whibley. Sometimes the firm's readers blundered, as when Bernard Shaw's juvenile novels were appreciated and declined; while other episodes, as recorded in Charles Morgan's *The House of Macmillan, 1843-1913*, show the fate of Thomas Hardy's first books, or explain why W. B. Yeats was rejected, or why Robert Elsmere went to another publisher, and why Maurice Hewlett's *The Forster Lovers*, despite adverse reports, was published by the firm and scored a resounding success. See T. Hughes, *Memoirs of Daniel Macmillan, 1852, and C. L. Graves, The Life and Letters of Alexander Macmillan*, 1910.

McMillan, Margaret (1861-1931), Scottish educationist, b. in New York of Scottish parents. Her father d. in 1863, and her mother brought her and her elder sister Rachel (b. 1850) to Inverness, the home of her maternal grandparents. She was educated at Inverness High School and Academy. She trained herself to earn a living first as a governess and later as an actress. Her interest in the growing Labour movement, however, led her to abandon her previous intentions, and she accepted an invitation to join the Independent Labour party formed in Bradford in 1893. The following year she became a member of the Bradford School Board, and this was the beginning of her pioneer work in securing medical treatment in schools. In that year the first recorded medical inspection of schoolchildren was held in Bradford. In 1902 she left Bradford to work with her sister in London. Through her books and lectures she continued her campaign for the health of schoolchildren, and in 1910 she opened a clinic in Deptford for the treatment of

children. This was linked to a nursery school for infants and a camp school for boys. Children were able to sleep in the open air with benefit to their health. By 1914 the scheme developed into the successful Day and Night Nursery School. Her reputation grew. Grants were made to the school by the Board of Education and the L.C.C., of which she became a member in 1919. She was awarded the C.B.E. in 1917. The nursery school movement being well estab., she turned her attention to the training of teachers in the care of children. In 1923 the Nursery Schools Association was founded, of which

MARGARET McMILLAN

she became first president. She collected students around her, and they used the nursery school as a centre for their training. In 1930 new buildings were opened, known as the Rachel M. Training School in memory of Rachel M., who d. in 1917. Pubs.: *Early Childhood* (1900); *Education through Imagination* (1903); *Labour and Childhood* (1906); *The Camp School* (1917); *The Nursery School* (1919); *The Life of Rachel McMillan* (1927). Appointed C.H., 1930. See Albert Mansbridge, *Margaret McMillan, Prophet and Pioneer*, 1932, and D'Arcy Cresswell, *Margaret McMillan: a Memoir*, 1949.

Macmonnies, Frederik (1863-1937), Amer. sculptor, b. in Brooklyn, New York. At the age of seventeen he was apprenticed to A. St. Gaudens; and in 1884 he went to Europe and studied under Falguere in Paris, opening a studio of his own within a couple of years. His statue of 'Diana' was honourably mentioned in the Salon of 1889; and his 'Bacchante' (Salon,

1894) was purchased for the Luxembourg. His best-known works besides the above include the statues of Nathan Hale in New York, and Sir Harry Vane in Boston; the doors of the congressional library in Washington; the Prospect Park triumphal arch in Brooklyn; the battle monument at W. Point; and Princeton battle monument ('Washington at Princeton'), 1918.

McNaughton's Case, celebrated case in Eng. criminal law which estab. the test of irresponsibility for a criminal offence on the ground of insanity. The case was decided in 1843, and lays down the doctrine that, to estab. a defence on the ground of insanity, it must be clearly proved that, at the time of the committing of the act, the party accused was labouring under such a defect of reason, from disease of the mind, as not to know the nature and quality of the act he was doing, or, if he did know it, that he did not know he was doing what was wrong. Thus, the question of knowledge of right or wrong, instead of being put generally and indefinitely, is put in reference to the particular act at the particular time of committing it (see further under CRIMINAL LAW). The defect in the rule is that it seems to imply that the mind may be partially diseased, whereas many pathologists hold that if the mind is diseased it is wholly diseased.

McNaughton, Hon. Andrew George Latta, Canadian soldier, engineer, and administrator, b. at Moosomin, Saskatchewan, Feb. 25, 1887; educated at Bishop's College School, Lennoxville, and McGill Univ., Montreal, where he took his B.Sc. degree in 1910 and M.Sc. in 1912. He entered the Canadian Army in 1910, and served throughout the First World War; D.S.O. 1917. He was wounded at the second battle of Ypres, 1915, and at Solissons, 1918. After the war he studied at the Royal Staff College, Camberley (1921), and at the Imperial Defence College (1928). In the intervening years he was engaged in the reorganization of the Canadian Army, and was deputy chief of Canadian general staff (1923-26), becoming Chief of Staff (1929-35) with rank of major-general. He attended the Imperial Conference in London, 1930, and represented Canada at Geneva in 1932. He was also concerned with the development of Imperial and Canadian Airways. On the outbreak of war in 1939 he was chosen to command the 1st Div., Canadian Overseas Force. He was promoted Lieutenant-general in 1940, and commanded the Canadian Corps, 1940-42, being then appointed commander-in-chief, a post which he held until his retirement in 1944 with the rank of general. In that year he was appointed minister of defence to deal with the crisis over the voluntary system for overseas service. He held office until the formation of a new gov. after the 1945 elections. He has latterly been permanent Canadian delegate to the United Nations Organisation. He has also been distinguished as an engineer and scientist. He was the joint inventor of the cathode ray direction finder in 1926, and in 1940 he was awarded

the Sir John Kennedy medal at the Engineering Institute of Canada. He has been closely concerned with the development of atomic energy. President, Canadian Atomic Energy Control Board, 1946-48. He holds honorary degree of LL.D. at McGill Univ., Queen's Univ., and univs. of Birmingham, Ottawa, and Saskatchewan. C.H., 1946; P.C. (Canada), since 1944.

MacNeice, Louis, Irish poet, b. in Belfast, Sept. 12, 1907; educated at Marlborough School and Merton College, Oxford. For some years he lectured in classics, first at Birmingham Univ., and later at Bedford College for Women, and in 1940 was in U.S.A. as lecturer in Eng. at Cornell Univ. Returning to England for war service, he joined the Brit. Broadcasting Corporation, and has been feature writer and producer since 1941. His first vol. of poems, *Blind Fireworks*, was pub. in 1929, and has been followed by others, including *Autumn Journal* (1939); *The Last Ditch* (1940); *Plant and Phantom* (1941); *Spring Board* (1944); and *Holes in the Sky* (1948). His ability in reflecting the spirit of his times in his own emotional experience has earned him an appreciative public. The Group Theatre produced his verse trans. of *Aeschylus' Agamemnon* in 1936, and his play, *Out of the Picture*, in 1937. His study of the poetry of W. B. Yeats was pub. in 1941.

MacNeill, Cyril (1888-1937), Eng. author, who wrote under the pseudonym of 'Sapper,' educated at Cheltenham and the Royal Military Academy, Woolwich, passing out into the Royal Engineers in 1907, and retiring in 1919 with the rank of Lieutenant-colonel. He wrote numerous novels and short stories of 'thriller' type which enjoyed wide popularity, their outstanding character being 'Bulldog Drummond.'

MacNeill, John Gordon Swift (1849-1926), Irish politician, b. in Dublin and educated at Trinity College, Dublin, and Christ Church, Oxford. Prof. of constitutional and criminal law at King's Inn, Dublin, 1882-88. He took silk in 1893, and in 1906 was commended by Campbell-Bannerman in the House of Commons for procuring the abolition of flogging in the navy. McN. also succeeded in obtaining recognition of the principle that a minister of the Crown must not be director of a public company. He represented S. Donegal as a Nationalist, 1887-1918. He pub. *The Irish Parliament, what it was and what it did* (1885); *Tilted Corruption* (1894); *The Constitutional and Parliamentary History of Ireland till the Union* (1917); *Phases of Irish History* (1919); and *Studies in the Constitution of the Irish Free State* (1925).

Macomb, co. seat of McDonough co., Illinois, U.S.A., 60 m. N.E. of Quincy, and is engaged chiefly in the manuf. of stoneware. The W. Illinois State Teachers' College is here. Pop. 8700.

Macon, cap. of the dept. of Saône-et-Loire, France, on the R. Saône, where the riv. is crossed by a bridge of twelve arches. The interesting features of the tn. are the ruins of a cathedral and the church of St.

Peter in Romanesque style. Its anct. name was Matisco, and it was the bp. of Lamartine. It trades chiefly in wine, and casks, vats, and watches are made. Pop. 21,000.

Macon, co. seat of Bibb co., Georgia, U.S.A., on the Ocmulgee R., 80 m. S.E. of Atlanta, and a great railway centre. It possesses a Rom. Catholic college, a Wesleyan college, and Mercer (Baptist) Univ. It also manufs. flour and iron goods, and is the centre of a peach- and cotton-growing dist. Pop. 57,800.

McPherson, Aimée Semple (1890-1944), Amer. evangelist, b. near Ingersoll, Ontario. She began her career as an evangelist at the early age of seventeen, and toured the U.S.A., Canada, England, and Australia, holding revivalist meetings which were widely attended. In 1914 she settled in Los Angeles and founded (1921) the Echo Park Evangelistic Association, of which she became president. This grew into the International Church of the Four Square Gospel for which a temple was built in Los Angeles. Pubs.: *The Bridal Trail* (1915); *Divine Healing Sermons* (1920); and *The Second Coming of Christ* (1920).

Macpherson, James (1736-96), Scottish man of letters, began to write poetry at an early age. In 1762-63 he pub. two poems, *Fingal and Temora*, which he stated were trans. from the Gaelic of Ossian. The works attracted much attention and had a considerable effect on European literature, but presently the critics cast doubts upon the source, and a prolonged controversy took place. M. seems not to have been seriously concerned at the charge of forgery, and made no particular effort to rebut it. M., in 1775, ed. *Original Papers containing the Secret History of Great Britain from the Restoration to the Accession of George I.* See Boswell's Johnson, (passim), and life and letters by T. B. Saunders, 1895; and J. S. Smart, *James Macpherson: an Episode in Literature*, 1905.

Macquarie: 1. Bay of Tasmania, on the W. coast; forms an important harbour. 2. Is. on the S. Pacific, belongs to New Zealand and is a centre for seal fishing. A meteorology station has been estab. here. Area 170 sq. m. 3. Riv. of New S. Wales formed by the junction of the Fish and Campbell streams, and after a course of 350 m. joining the Darling R.

Macrauchenia, extinct animal with horse-like skull, tapir-like nasal bones, llama-like neck, and teeth partly horse-like and partly rhinoceros-like; found in S. Amer. later Tertiary.

Macready, William Charles (1793-1873), Brit. actor, made his first appearance in the provs. in 1810, and six years later played in London, where his Richard III. made him popular. He held a high position in his profession until his retirement in 1851. A great, powerful, and intelligent actor, he was not an amiable man, nor happy, as may be gathered from his *Diary*, a new ed. of which appeared in 1912. See lives by Lady Pollock, 1885; W. Archer, 1890; and W. T. Price, 1895.

Macrinus, M. Opilius Severus, Emperor of Rome (A.D. 217-218), b. at Caesarea, Mauritania, A.D. 164, of humble parentage. At the instigation of his patron, Plautianus, he was admitted to the service of the Emperor Septimius Severus, and after receiving sev. appointments of trust, eventually became prefect of the praetorians under Caracalla, an office in which he acquitted himself prudently and honourably. On the death of Caracalla he was proclaimed emperor. He eventually met his death at Chalcedon, and was succeeded by Elagabalus.

Macrobius, Ambrosius Aurelius Theodosius, Rom. grammarian whose period is uncertain, but who probably lived about the beginning of the fifth century. Only a comparatively small number of his works are extant, amongst which are a commentary on Cicero's *Dream of Scipio*, and a collection of essays, *Saturnaliorum convivium libri septem*, the latter incomplete.

Macrocollon, see under MANUSCRIPTS.

Macrocosm, see MICROCOSM and MACROCOSM.

Macroductyles, sub-order or tribe of the order Gallatores, wading birds, characterised by the four elongated toes on each foot. M. include the gulls, waterhens, and coots. The name *Macroductylus* was formerly given to a genus of lamellicorn beetles, now merged in Scarabaeidae.

Macronissos, see MAKRONISI.

Maerom, tn. in Co. Cork, Eire, on the R. Sullane, 20 m. W. of Cork. Pop. 3500.

Macropodians, or **Macropodidae**, family of marsupials or pouched animals with large powerful hind feet, comprising all the kangaroos. The name is also given to sea spiders and spider crabs, a family of Oxyrhynchi.

Macroura, or **Macrura**, group of decapod crustaceans, characterised by long broad-swimming tails, and including the lobsters, crayfish, prawns, and shrimps.

Macrozamia, genus of tall evergreen perennials (order Cycadaceae) with long, leathery, graceful palm-like leaves and bearing scaly ovoid cones. They grow well but slowly in a greenhouse, needing liberal watering.

McTaggart, John McTaggart Ellis (1866-1925), Scottish philosopher; educated at Clifton College and Trinity College, Cambridge. He became a fellow of Trinity in 1891, and was lecturer at Cambridge Univ. from 1897 to 1923. In his philosophical teaching he was a follower of Hegel, on whom he pub. *Studies in the Hegelian Dialectic* in 1896 and *Studies in Hegelian Cosmology* in 1901. His own philosophy, which was a variation of Hegelianism, is expounded in his unfinished work, *The Nature of Existence*, the first vol. of which appeared in 1921. As a metaphysician he was a realist in his method of knowledge although ontologically he tended towards idealism. He also wrote a critique of religion, *Some Dogmas of Religion* (1910). See memoir by G. Lowes Dickinson, 1931.

Maetan, prov. of the Philippines, consists of a small coral is. off the E. coast of Cebu. Magellan was killed here in 1521.

MacWhirter, John (1839-1911), Scottish painter, b. at Inglis Green, near Edinburgh. He was a pupil at the art school of the Board of Manufacturers, Edinburgh. In 1879 he was elected an A.R.S. and in 1891 an R.A. The most characteristic of his works are his noble Highland landscapes, portraying the rugged grandeur and beauty of the moors. Perhaps his best-known picture is 'June in the Austrian Tyrol' in the Tate Gallery, London. Other examples of his work are 'Loch Katrine,' 'The Lord of the Glen,' 'The Silver Strand,' and 'The Track of the Hurricane,' etc.

Madagascar, Fr. colony lying off the S.E. coast of Africa, about 250 m. from the mainland, from which it is separated by the Mozambique Channel. It is an is. 980 m. long and its extreme width is 360 m., with an estimated area of 241,091 sq. m., excluding dependent is. of which the chief are the Comoro Is., added to it in 1914. It is the third largest is. in the world. The interior is traversed by a mt. range, rising in some places to over 10,000 ft., which lies parallel to the E. coast, making the descent to the sea very abrupt; on the W. and S.W. are wide grassy plains. Numerous rivers flow E. and W., all of little use for navigation. Extinct volcanoes and hot springs are found in various parts of the is., the highest peak being Ankarobia (over 9000 ft.) in the N.E. The coast is remarkably unindented, and the chief harbours are Diego-Suarez, Tamatave, Majunga, and Tulcar. There is some magnificent scenery in M. The falls of Fanarano on the road from Tamatave to the cap., and Lake Itasy in the interior, are famous. Travellers claim, not unjustly, that the 220-m. stretch between Tamatave and Antananarivo is not inferior in the variety and splendour of its scenery to any journey of similar length anywhere; magnificent waterfalls, densely forested slopes with rushing rivers, tumbling with cataracts, rolling grassy moors, savannah-like plains, and mts. of all sizes, with outcroppings of crystalline rock assuming the most fantastic shapes.

Vegetation is luxuriant, and the is. is ringed around the coast with dense forests which supply valuable timber such as ebony, bamboo, rosewood, etc., besides rubber palms, gums, and rubber trees. Many rare varieties of orchids and ferns are found, and a peculiar feature is the traveller's tree (*Ravenala madagascariensis*). Fruits abound, and include mangoes, tamarinds, bananas, lemons, bread-fruit, and ground-nuts, and coffee, cocoa, sugarcane, hemp, and vanilla are cultivated to a considerable extent. The climate is salubrious for about half the year in the central plateau where lies Antananarivo, the cap., but during the rainy season it is unhealthy for Europeans. The E. and N. coasts are very wet, the S. and W. of the is. very dry. The highest mean temp. (80°) occurs at Diego-Suarez, and the average rainfall is about 28 in., but it may exceed 40 in., while in the S. are waterless deserts. Hurricanes and thunderstorms are prevalent and severe. The

country is rich in minerals, gold, graphite, corundum, phosphates, mica, precious stones, silver, zinc, antimony, copper, iron, and lead being found; the first six are mined. In 1946 the mineral output was valued at about 96,500,000 francs, of which graphite accounted for 39,689,000 francs, and mica for 44,329,000 francs. The prin. agric. products are potatoes, rice, maize, coffee, haricot beans, sugar, tapioca, and spirits. Agriculture and cattle breeding are the chief occupations of the natives. Exports in 1946 amounted to 2,789,500,000 francs, the most valuable being vanilla and coffee; imports were valued at 1,262,000,000 francs.

as their religion, though retaining many of their old-time superstitious and customs. The Hovas differ considerably from the other tribes—the Sihanakas, Ibaras, Betallos, and the Sakalavas, but the origin of them all presents the same problem. Though discoveries of fossil bones, etc., have proved M. to have been once a part of Africa, it is equally certain that the Malagasy are of E. origin, the Hovas, the latest arrivals, being definitely Malay in type, the other tribes Polynesian. Their language,—for all tribes speak the same tongue,—manners, and customs are distinctly akin to those of the South Sea islanders. To M. Alfred

A HILL VILLAGE IN MADAGASCAR

Paul Popp

The fauna includes many curious animals, such as the aye-aye and lemur, but is devoid of the larger carnivora. There are over 240 species of birds, many of brilliant plumage, and also sev. varieties of chameleons. Fossils of extinct animals, birds, and reptiles have been found, including the *Apyornis*, *Mullerornis*, *hipopotami*, and a gigantic dinosaur.

Under Fr. influence excellent motor roads have been constructed, and there is railway communication between Antananarivo (pop. 163,000) and the port of Tamatave, from Antananarivo to Antsirabe to the S., and from Moramanga to the Antsihanaka prov. in the N. These lines have been extended and electrified. Filanzenas, a native type of palanquins, are used as a means of conveyance for short distances. The pop. numbers about 4,000,000 of whom 50,000 are Europeans. The native pop. is made up of many different tribes, the Hovas being the chief. They are of fine physique, strongly proportioned, and active in habit. They inhabit the Imerina plateau in centre of the is., and profess Protestant Christianity.

Granddier (1836-1921) most of our knowledge of M. is due. He explored it thoroughly, 1865-70, and his great treatise *Histoire physique, naturelle et politique de Madagascar* (1875-1917), remains the standard work on the is.

M. was known to Ptolemy under the name of Menuthios, and it is certain that there were Arab settlements over a thousand years ago, for traces of Arab occupation are evident to-day in the Malagasy language. Marco Polo mentioned it, but the first known European to land on its shores was Diaz, the Portuguese, who visited the is. in 1500. Later the Dutch and then the Fr. estab. small ports in different parts of the country, which was ultimately brought under Fr. control in 1890. Some ill-conceived attempts were made by Brit. expeditions to settle in the is. This was in the reign of Charles I., the active organizer of such attempts being Wm. Courton, whose association, backed by the earl of Arundel and the earl of Southampton and Endymion Porter, groom of the king's bed-chamber, sought a footing in the is.; but

their efforts were generally thwarted by the E. India Company, and of a party of more than a hundred colonists who went out in 1644 only nine survived to tell the tale of the horrors through which they had lived. M. has no political hist. until the time of Radama. Indeed, it has not even a name of its own, for 'Madagascar' seems to have been coined by Marco Polo, (through confusion with Arab tales of 'Mogadishu.' No single tribe gained any lasting ascendancy until the rise, at the end of the eighteenth century, in the prov., of Imerina, the homeland of the Ilova race, of Adrianampoinimerina and Radama. A reign of terror for a quarter of a century followed the reforms of Radama, who had stopped the export of slaves and made a treaty with Sir Robert Farquhar, governor-general of Mauritius, which helped the is.'s progress. Radama was succeeded by one of his wives, Princess Ranaivalona, who turned out all the Eng. missionaries, had two hundred of their converts put to death in barbarous manner, and generally undid all the good work done by Radama. Her son, Radama II., also a reactionary, was murdered in 1863, two years after his mother's death. The next king, Raimilalahivouy, wanted to prevent annexation by the Fr. at 1 with the aid of Brit. officers, armed and trained a body of native levies. But these efforts proved abortive, and with the Fr. bombardment of Antananarivo in 1895 the Fr. protectorate became perpetual. Queen Ranaivalona III. was deposed and exiled to Algeria, where she d. in 1917. She had reigned since 1883. The is. is administered by a governor-general assisted by a gov. council and a representative assembly. Though a Fr. colony, it is not represented in the Fr. Parliament, but a financial and economic delegation, composed of thirty Frenchmen and twenty-four natives, meets annually. Natives are employed in minor posts in both military and civil gov. Education is now compulsory between the ages of eight and fourteen. Since the Fr. occupation of 1896 the country has contracted a debt of 849.6 million francs, mainly for public works.

Part of the is. was seized by Brit. forces in May 1912 to forestall a possible landing by the Jap. Royal Marines, taken through mine-strewn waters, carried out a surprise assault, and in a short time had captured the port and tn. of Diego-Suarez. Another force, including the Scots Fusiliers, Welch Fusiliers, E. Lancashire Regiment, and S. Lancashire Regiment, landed simultaneously at Ambararata and overcoming stiffer resistance reached Antsirabe, which they took by storm. Carrier-borne aircraft played a successful part in the operations. Suspicion of the Vichy (q.v.) Gov.'s pro-Axis (see AXIS) intentions prompted the Brit. Gov. to extend its control over the is. and in Sept. a Brit. E. African force, under Gen. Platt, supported by S. African armoured cars, marched on the cap., which was entered after but little resistance on Sept. 23. The Vichy governor retired still further

inland rather than surrender. The Brit. forces, however, were received with popular acclamation in Antananarivo. After the war the Fr. authorities resumed control of the is. In March 1947 a Nationalist rising broke out against the Fr., which was provoked by a combination of political and economic factors. The leading political party, known as the Mouvement Démocratique de la Malgache and dominated by the class which ruled M. before the Fr. conquest, had accepted the principles of local autonomy provided by the Fr. Union (see under FRANCE, Constitution), but then changed its mind and determined to seize power for itself. The garrison maintained by the Fr. was a small one and with the initial advantage of surprise, the rebels succeeded in creating widespread disturbances accompanied by loss of life. Thousands of Malagasy were involved in the massacre of political opponents, and there was a particularly heavy attack on Moramanga railway junction, while the country 50 m. N. of that place had by June become deserted and desolate with burnt houses standing empty beside unharvested rice fields.

Madariaga, Salvador de, Sp. diplomatist and author, b. at Coruña, 1886, son of Don José de M., colonel Sp. Army. He was educated at the Collège Chaptal, Paris, Ecole Polytechnique, Paris, and Ecole Supérieure des Mines, Paris, and speaks and writes Sp., Eng., and Fr. with equal facility. For a time he was connected with the permanent bureaux of the League of Nations, and later was prof. in Sp. studies at Oxford. When the Sp. republic was proclaimed, M. was sent as Sp. minister to the U.S.A. He was ambas. to France from 1932 to 1934, chief Sp. delegate to the League of Nations, 1931-36, and minister of education in 1934. His works include *The Genius of Spain* (1923), on modern Sp. writers; *La Girafa Sagrada* (1925), a fantastic story; *Shelley and Calderón and other Essays on Spanish and English Poetry* (1920); *Spanish Folk-songs* (1921); *Don Quixote* (1934); *The World's Destiny* (1938); *Christopher Columbus* (1939); *Hernán Cortés* (1941); *Spain* (1942); *The Heart of Jade* (1944), a novel; *The Rise of the Spanish-American*

Empire (1946); and *The Fall of the Spanish-American Empire* (1947).

Maddaloni, tn. of Italy in the prov. of Caserta, 15 m. N.N.E. of Naples; it is supposed to be built on the site of the ant. Suessula. There is a splendid aqueduct near by, which was built by Charles III. to convey water to the cascades in the gardens at Caserta. Pop. 26,000.

Madden, Sir Charles Edward (1862-1935), Engr. admiral. He took a prominent part in naval design under Lord Fisher when the *Dreadnought* was laid down. During the period 1912-22 he rose from rear-admiral in a battle squadron to the position of commander-in-chief of the Atlantic fleet. He accompanied Adm. Jellicoe as chief of staff during the First World War, and was present at the battle of Jutland. In 1927 he returned to active employment as successor to Adm. Beatty in the post of First Sea Lord, retiring in 1930. K.C.M.G., 1919; baronet, 1919; O.M., 1931.

Madden, Sir Frederic (1810-73), Brit. archaeologist. b. at Portsmouth, devoted himself to the study of Norman Fr. and A.-S., and collated the MSS. of Caedmon for the univ. of Oxford, 1825. He was keeper of the MSS. at the Brit. Museum, 1837-66. He made many important contributions to paleographic literature, and ed. (*inter alia*) *Havelok the Dane* (1828); *Laysamon's Brut* (1847), and, in conjunction with Josiah Forshall, *Wycliffe's Bible* (1850).

MADDER

Madder, name given to sev. species of genus *Rubia*. Dyers' M. (*R. tinctorum*) is a trailing or climbing ann. and its root from early times has been extensively used for the production of a wide range of dyes, notably Turkey-red, all of which are very stable. Synthetic dyes have now almost entirely superseded it. See RUBIA.

Mādha, only important ls. of an archipelago of volcanic origin, situated some

400 m. from the N.W. coast of Africa. It is 520 m. W. of Lisbon and administratively (like the Azores), a part of Portugal. M. or the Ms., consist of M., Porto Santo, and three uninhabited is. (*desertas*). M. is one mass of basalt, rising with a steep ascent from S. and N. towards the interior, the highest point being Rod Peak (6165 ft.). The declivities of the mt. masses are furrowed by deep and generally narrow valleys and depressions, traversed by streams of clear water. The coast-line is bold and rocky, with good natural harbours. The climate is remarkably mild and equable, and for this reason M. is much resorted to by consumptive invalids, especially from England. The soil is fertile, and there are vineyards and orchards, producing choice wines and fruits, but the vineyards, once very extensive, have at times suffered greatly from the ravages of the oidium, and in late years sugar plantations have to a considerable extent replaced them. Cochineal is also an important product. The commerce with England is considerable, the prin. export being Madeira wine. M. was discovered about 1420 by Zarco and soon afterwards settled by the Portuguese, to whom it still belongs. It was in Brit. occupation from 1807 to 1814. Funchal (pop. 48,400) is in regular communication with Lisbon and Liverpool. Other tns. are Ponta do Sol (8000), and Machico (11,000). The inhab. of mixed Portuguese, Moorish, and Negro blood, are engaged mainly in agriculture and fishing. A serious rebellion broke out in April-May 1931, but after a demonstration by warships, the rebels speedily surrendered. Total area 315 sq. m. (Madeira, 270 sq. m.). Pop. 249,700. See A. S. Brown, *Madeira, Canary Islands, and Azores* (13th ed.) 1927, and C. H. Miles, *A Glimpse of Madeira*, 1919.

Madeira River (Rio Madeira), riv. of Brazil, and the main trib. of the Amazon. Formed by a union of the Mamoré and the Beni, it flows through Amazonas to join the Amazon, after some 900 m. below Manaus. In 1914 it was explored by the Roosevelt-Rondon expedition, its chief trib. being renamed as Rio Roosevelt. It is navigable for a distance of 715 m. by ocean steamers.

Madeira Wine is manufactured in the Madeira Is., from a mixture of black and white grapes; when vinted separately these grapes produce Tinta and Verdelho wines. High-class wines known as Bual, Sercial, and Malmsay are also manufactured in Madeira. The vines were brought from Cyprus or Crete in the fifteenth century; in 1852 they were totally destroyed by the oidium disease, but new shoots were afterwards replanted.

Madeleine, La, tn. in the dept. of Nord, France, forms a suburb of Lille. It has chemical and textile manufs. Pop. 21,800.

Madeley, par. of Shropshire, England, on the Severn, 14 m. E.S.E. of Shrewsbury. It has coal- and iron-mines, and iron foundries. Pop. 8000.

Mādhava Āchārya (Hindi, spiritual teacher), Hindu scholar and philosopher,

lived in the fourteenth century under King Bukka, to whom he acted as chief minister and spiritual adviser. He became abbot of the monastery of Sringeri.

Madhya-Bharat, see INDIA.

Madison, James (1751-1836) fourth president of the U.S.A. at Port Conway, Virginia, graduated at Princeton (1772), and afterwards studied law. He was appointed a member of the Virginia Convention (1776) and of the Continental Congress (1780) and thenceforth devoted himself to politics. In 1781 he was elected to the Virginia Legislature and became a zealous advocate of religious freedom. M. was also a member of the

remained until his death. See G. Hunt, *The Life of James Madison*, 1903, and (ed.) *The Writings of J. Madison*, 1900-10 and H. Adams, *History of the U.S.A. during the Administration of James Madison*, 1930.

Madison 1 Cap of Wisconsin, U.S.A., and co seat of Dane co., stands on an isthmus between lakes Mendota and Monona 82 m W of Milwaukee, in a valley. It contains the state capitol, univ. and other important buildings and has manufactures of machinery, boots and shoes, farming implements etc. There are also limestone quarries and railway shops. The state fish hatchery and forest pro-

Constitutional Convention at Philadelphia in 1787, which drew up the U.S. Constitution. His work bringing him the title of 'Father of the Constitution'. It was he who drew up the plan whereby the Gov. was to be composed of three div. — legislative, executive and judicial. He collaborated with Hamilton in *The Federalist* (1802). He was elected to the Lower House in the first National Congress of 1789. He became a leader of the Republican party, and held the post of secretary of state during Jefferson's presidency. Mainly through the influence of Jefferson his lifelong friend he was elected president in 1809 and his period of office was a stormy one, its chief event being the war with England (1812-14). He was elected to a second term as president in 1812. In 1814, when Brit. troops captured Washington and burned the White House, M.'s wife the famous and charming Dolley M. saved Stuart's celebrated painting of George Washington and also the original draft of the Declaration of Independence. In 1817 he retired to his seat at Montpelier, Virginia, where he

ducts laboratory are at M. Pop. 67,400. 2 Co seat of Jefferson co., Indiana, U.S.A. standing on the Ohio R., 46 m S.S. of Indianapolis. It has flour mills, pork packing factories and manufactures of furniture, engines and boilers. It is the shipping centre for an agric. region. Pop. 6,900. 3 Bor. in Morris co. New Jersey stands on the Lackawanna R. 26 m W of New York, the seat of the Drew Theological Seminary, and famous for its rose culture. Pop. 7,900.

Madison River, one of the headstreams of the Missouri, rises in the Rocky Mts., Montana, and has a course of 230 m.

Madisonville, co seat of Hopkins co., Kentucky, U.S.A., has coal mines, tobacco factories, lumber mills, etc. Farming is carried on in the dist. Pop. 8,200.

Madness, see INSANITY, LUNACY.

Madoc, or Mad. 2, second son of Owen Gwynedd, Prince of Wales, lived in the twelfth century. According to a Welsh legend, he is said to have discovered America about 1170 at which time he

was forced to fly from Wales on account of a rebellion against his dynasty, which proved successful. He is believed to have sailed on a second voyage of discovery, after which he was heard of no more. His story forms the subject of a poem by R. Southey, entitled *Madoc*, 1805.

MADONNA (It. for 'Our Lady'), the usual title in Lat. countries for Mary, the mother of Jesus, and widely used for pictures and statues of her, particularly when represented with her Son. There is no authentic likeness. The earliest representation is that in the catacombs of S. Priscilla (early second century). The Byzantine pictures attributed formerly to S. Luke are not earlier than the sixth century. See Anna Jameson, *Legends of the Madonna*, 1872, 1902. See also **MARIOLATRY**, **MARY**, **THE VIRGIN**.

MADRAS: 1. Prov. of India, occupying most of the S. peninsula. Northward its boundaries, passing from W. to E., are Bombay, Hyderabad, the Central Provs., and Orissa. The coasts are flanked by the W. and E. Ghats, which from the interior seem to be little more than hills, because between them the great central plateau reaches an elevation of from 1000 to 3000 ft. The highest peak is Anaimudi (8850 ft.) in Travancore. The Nilgiri Hills are an offshoot of the W. Ghats. Between Nellore and M. on the E. coast is the lake of Pulicat (37 m. long), whilst the narrow coastal strip on the W. has its shores indented by sev. lagoons, the largest of which is Cochin (120 m.). Along the Malabar or W. coast there is an ann. rainfall of 100-250 in., but the highlands intercept the rain clouds, so that on their landward side the precipitation is as low as 20 in. On the E. coast, the heaviest fall is 50-80 in., and it is below 50 in. in Madura and Negapatam, etc. Famines are comparatively frequent but are more severe in the N. than in the S. interior, where rains pass over the Palghat Gap. The famine relief system has attained a high degree of proficiency. The three chief rivs., the Godavari, Kistna, and Cauvery, all rise in the W. Ghats, and after a S.E. course empty into the bay of Bengal. All are sacred rivs. to the Hindus, and all are dammed in their lower courses in the interests of irrigation. M. is notable for the success of its irrigation schemes, among which must be mentioned the Periyar R. scheme. A dam and tunnel through the Travancore Hills leads the R. Periyar on to the plains of Madura and conveys the rainfall across the watershed. M. is served by the S. Indian and by the M. and S. Malabar railways connecting it with Bengal on the N. and Bombay on the W. The prov. has an area of 142,277 sq. m., of which 15,724 sq. m. are forests, teak, ebony, and rosewood being the trees of highest commercial value. Agriculture is the most important industry. Rice is grown in great quantities, chiefly on the wet W. coast; in the interior, where rainfall is scanty and irrigation not practised, cotton flourishes. Elsewhere oil-seeds, millet, sugar-cane, tobacco, tea, coffee, and indigo are produced, and there is a

valuable yield of quinine. The manufacturing industries are those concerned with cotton (there were sixty-seven mills in 1945-46), rice, and tobacco, fish and coffee curing, and oil and indigo pressing. Salt, quinine, and manganese ore are produced. Included in the M. States Agency are Cochin (1,422,800), Pudukkottai (438,300), and Travancore (6,070,000). Pondicherry, Karikal, and Yanaon on the E. and Mahé on the W. coast belong to France. M., the cap., Tuticorin, Godavari, Tinnevely, and

E.N.I.

MADRAS: AN INSHORE FISHERMAN
The craft is a catamaran, made of solid logs lashed together.

Negapatam are the chief ports, and other towns of importance are Trichinopoly (159,500), Tanjore, Calicut (126,300), Madura, and Salem. Ootacamund, in the Nilgiri Hills, is the summer cap. Some of the most beautiful examples of Indian architecture are to be found in M., notably in the temples of Madura and Trichinopoly. There are three univs., the M., the Andhra, and the Annamalai. The Andhra was founded in 1926; the Annamalai Univ., founded in 1926, is the first attempt in S. India at organising a unitary residential type of univ. The natives speak the Dravidian dialects, Tamil, Telugu, etc. Nine-tenths of the pop. (49,341,810) are Hindus, the remnant being Moslems and Christians. M. was not only the oldest but the most important of the three original presidencies before

Clive's conquest of Bengal, though it was small in area prior to the annexation of the Carnatic in 1801. The first trading establishment made by the Brit. in the Madras Prov. was at Poddapall (now Nizampatam) in 1611 and the next was at Masulipatam. In 1640 the Eng. were permitted to make a settlement and M. (the tn.), or Fort George as it was then called, was founded by Eng. factors in the same year. By 1801 most of the country from the N. Circars to Cape Comorin was under Brit. rule. The M. Presidency was constituted an autonomous prov. in 1937 under a governor and council of ministers. Administration under the machinery of the Government of India Act, 1935 proved impossible and in 1939 the governor assumed discretionary powers and later had the assistance of four official advisers.

siege ended in failure (1758). The old fort is still in use, not only as a fortress, but to house many of the gov. offices. Pop. 777,500.

Madrazo y Kunt, Don Federico de (1815-1894), Sp. historical portrait painter, son of the painter José de M. He became court painter at Madrid and prof. at the Madrid Academy. Among his pictures are 'The Women at the Sepulchre,' 'Godefroi de Bouillon proclaimed King of Jerusalem' (1837); and 'Maria Christina as a Nun' (1843).

Madre de Dios: 1. Riv. in S. America, rises in Peru, flows through Bolivia, and joins the Beni near its junction with the Mamore. The total length is about 850 m., most of which is navigable. 2. Chillon archipelago in lat. 50°-51° S. It is separated from the mainland and from the is-

THE ROYAL PALACE, MADRID

2. Cap. of M. Prov., and the third largest seaport in the country. It stretches some 9 m. along the coast, and about half that distance inland. Though structurally the city does not present an imposing whole, the Gov. House, Senate House, high court, cathedrals, Scottish Kirk, G.P.O., and Chattrai Palace, now the revenue office, are all buildings of conspicuous architecture. Besides M. (formerly Presidency) College, the headquarters of the univ., there are six missionary and various law, medical, and engineering colleges. Both the S. Indian railway and the M. and S. Mahrastra lines have their termini here. There is no natural harbour, but one has been constructed at great expense to accommodate large vessels. Nearly half of the foreign trade of the prov. passes out through the port of M., but its volume is only one-ninth that of Calcutta. In George Town, the business quarter, there are iron foundries, tanneries, cigar manufactories, and cotton-mills, etc. It was taken by the Fr. under La Bourdonnais in 1746, but given back two years later by the treaty of Aix-la-Chapelle. During the Seven Years war it was again blockaded by the Fr., this time under Lally, but the

of Chatham and Hanover by Conception Strait. 3. Dept. of Peru, in the S.W. of the state, bordered on the W. by Bolivia, on the N. by Brazil, on the E. by the prov. of Cuzco, and on the S. by Puna prov. The M. de D. R. flows through the dept., which lies at the S. extremity of the forest region called the Montaña. Area, 58,827 sq. m. Pop. 1,900 (0.08 persq. m.); cap. Maldonado.

Madrid: 1. Prov. of Spain, occupies the E. and S. slopes of the Guadarrama Mts., stretching towards Toledo. The Tagus forms the S. boundary for some distance. The soil is not particularly fertile, the rainfall is deficient, and the rivers are used for irrigation. The forests in the N.E. part of the prov. provide good timber; in the S.E. dist. fruit and vegetables are grown. The Sierra de Guadarrama contains quarries of granite and gypsum. Most of the great railways of the country converge in this prov. Area 3039 sq. m. Pop. 1,721,717 (of whom 1,187,142 live in the city of M.). 2. Cap. of Spain and of M. prov., built on an elevated plateau margin into the tableland of New Castile. The climate is healthy, but oppressively hot in the summer and bitterly cold in the winter. The central

part of the city is almost a square, formerly surrounded by a wall with five gates and eleven doorways of which three only still exist. The Puerta del Sol forms the centre of M., the largest of all the plazas, with ten streets leading from it. There are 12 m. of subways in the city and an underground railway modelled on that of Paris. A great deal of the city is very fine, with good houses and broad streets. M. is the largest city in Spain, the meeting-place of Parliament, the see of an archbishop, the seat of a univ., and was the chief residence of the king. Among the chief buildings are the royal palace, occupying the site of the anc. Moorish citadel, and built in the Tuscan style of white granite; to the S. of the palace lies the armoury, with one of the finest collections in existence; the picture gallery, adjoining the Salón del Prado, contains nearly 2000 pictures, including works by Titian, Raphael, Velazquez, Van Dyck, etc.; the Biblioteca Nacional, founded 1866, includes the national library, with over 600,000 vols. and 30,000 MSS., also the archæological museum and the fine arts academy of San Fernando. The churches are not of great architectural merit. In the Paseo de Recoletos, with its well-designed public garden running the whole length of it, are embassies, museums, and private palaces, as also elsewhere in this pleasant quarter of the city. The post office is a grandiose building with graceful towers, and the banks of M. are for the most part built in a very good style of their own, albeit somewhat ornate. The loftiest building in M. is the telephone exchange and next is the fairly recently built Circolo de Bellas Artes or Fine Arts Club, which has a swimming bath and a theatre with over a thousand seats. The industries of the city have developed since the first decade of the present century. There are a great variety of manufs., including tobacco, furniture, leather goods, glass, and chemicals.

The hist. of the city begins with the Moors, who called it Majrit, during the first half of the tenth century. In 1083 Alfonso VI. captured it from the Moors. Charles V. resided there frequently, and Philip II. made the city his cap. in 1560 and held his court there. King Alfonso XIII. fled from M. in 1931 when the Sp. Republic was estab. The city suffered severely in the civil war of 1936-39. It became the centre of gravity in Oct. 1936, some three months after the outbreak, Navalcarnero, the key tn. on the road to the cap., having fallen to Franco on Oct. 2. On Nov. 4 Franco's forces captured the Getafe airport, but found the aerodrome completely destroyed. The insurgent forces then penetrated into the suburbs and the univ. quarter, the inhab. meeting them with boiling oil and water. After this the city held out for a long time, Franco holding off to await Ger. and It. aid. On Nov. 14 Franco bombed the city from the air, inflicting great suffering on the civilian pop. It was not until after the fall of Barcelona, Valencia, and other cities

in the Republican zone early in 1939 that M. surrendered (March 28), having stood a siege of two and a half years' duration under the able conduct of Gen. Mola. See J. Ortega Rubio, *History of Madrid*, 1921; C. E. Kany, *Life in Madrid, 1750-1800*, 1932; and G. Cox, *Influence of Madrid*, 1937.

Madrigal, short poem generally on the subject of love. Pietro Casella, a contemporary of Dante, is the first composer who is known to have written Ms. under that name. After the fourteenth century the word seems to have dropped out of musical use and to have denoted pastoral or idyllic lyrical poems which had formed the themes of musical settings. The word reappeared in its musical sense in the sixteenth century when Flem. composers who had settled in Italy as church musicians and It. composers wrote unaccompanied choral compositions under that style (see on this Percy A. Scholes, *The Oxford Companion to Music*). The M. proper consists of three verses or strophes, generally bound together by rhymes; but the name is sometimes applied to love-poems of any form. Among the Its. the best writers of Ms. are Petrarch and Tasso and, in modern times, Carducci and D'Annunzio; among the Fr. Montreuil (the thirteenth-century trouvère), Marot (according to Warton 'the reviver of the madrigal'), Luinez, and Mouret; among the Ger. Ziegler, Voss, Goethe, and A. W. Schlegel; and among the Eng. the poets of the Elizabethan and Caroline ages, such as Lodge, Wither, Carew, and Sackling. The musical M. is a setting of a poem of the kind described in contrapuntal style for two to six voices (sometimes for one voice with instruments contributing the polyphony). Blom dates it from the fourteenth century but the M. as we know it is a sixteenth-seventeenth century form which 'should not be confused with its predecessor either poetically or musically' (Thompson). Originating with the Flemings about the middle of the sixteenth century, it went out of fashion about the beginning of the seventeenth century, but the later gloe is a similar composition. It. composers of Ms. include A. Gabrieli, Ruffo, Palestrina, Gesualdo, and Monteverdi. The Eng. madrigalists are especially famous, and include Byrd, Bennet, Orlando Gibbons, Morley, Weelkes, Bateson, Tomkins, and Wilbye—the last named in Dr. Fellowes' opinion 'perhaps the greatest of all madrigal writers, either English, or Italian, or Flemish.' See E. H. Fellowes, *The English Madrigal Composers*, 1921, 1948.

Madroño Tree, or *Arbutus Menziesii*, Californian evergreen (order Ericaceae). The smooth trunk and branches are brilliant maroon, the large leaves are dark green, and the flowers, which are borne in masses, are wax-white; they are followed by loose clusters of scarlet berries. The tree is slow-growing, but attains a height of about 100 ft. The wood yields a fine charcoal.

Madura: 1. Dist. of India in Madras Prov., bounded on the E. by the gulf of

Manaar The chief city, M situated on the S bank of the Vaigai R. was for more than 2000 years the religious cap of the Carnatic and its rulers are spoken of by the anc. Gk. geographers. The walls of its anct. fortifications remain and a large palace, a great temple with pyramidal towers and numerous Hindu edifices attest the former magnificence of the place. Pop. of city including cantonment, 239 100. See B. Havell, *Indian Architecture* 1913. 2. Is. and autonomous state of the Netherlands E. India, separated from Java by the Surabaya Strait. It is mountainous and not particularly fertile but possesses salt mines and large tracts of timber. The only navigable riv.

Maebashi, cap. of the prov. of Gumma, in central Hondu Japan, 70 m. N.W. of Tokyo. It is noted for its silk trade. Pop. 87 200.

Mæcenas, C. Cilnius, Rom. (questrian), descended both on his father's and mother's side from the Lucuniones of Etruria. His paternal ancestors were the (Ilus) a powerful family at Arretium, and his maternal ancestors the Maccinates, at Arretium. M. was one of the chief friends and ministers of Augustus, and enjoyed for many years the confidence of the latter. But towards the latter years of his life a coolness sprang up between them, and M. retired entirely from public life. He d. 8 B.C. The name of M. however

COURT OF MINAKSHI TEMPLE, MADURAI

(Continued from page 660)

is the Marignan and the main port are Bangkok, Samutep and Paimkuan. Pop. including that of the numerous small is. adjacent 2 000 000.

Madvig, Johan Nicolai (1804-81) Dan. philosopher, statesman and classical scholar, chiefly known for his eds. of Cicero, Livy, Tacitus, and for his Gk. and Lat. grammar books for schools. He was appointed prof. of the Lat. language and literature at Copenhagen (1827). As a politician M. was minister of education (1848), director of public instruction (1852), and later president of the Dan. Parliament. He was also a distinguished paleogeographer.

Mæander (Gk. Μαῖαδης) Riv. of Asia Minor, proverbial for its winding course, rising in the S. of Thracia (close to the source of the Mæisus (97)), flowing between Lydia and Caria, of which it forms the boundary, debouching into the Icarian Sea between Myus and Priene. As a god M. is represented as the father of the nymph Cyane, mother of Caunus, whence the latter is called by Ovid *Mæandrus furens*.

rests mainly on his patronage of literature, especially of Virgil and Horace. Virgil was indebted to him for the recovery of his farm which had been appropriated by the soldiery in the div. of lands in 41 B.C. and it was at the request of M. that he undertook the *Cæciliæ*. To Horace M. was a still greater benefactor. He presented him with a farm in the Sabine country. His name became a synonym for a patron of the arts.

Mæcianus, Lucius Volusius, Rom. jurist, who lived in the time of Antoninus Pius and Marcus Aurelius. He was one of the legal advisers of Antoninus and one of the instructors of Aurelius in law. The writings of M. which are mentioned in the Florentine Index are sixteen books on *Fideicommissa* (trusts) and fourteen on *Judicia Publica*. There are forty-four excerpts from M. in the Digest. M. is cited by Papinianus, Ulpianus, and Paulus.

Mædisians, **MAIDSTONE**.

Maelstrom (A. S. *mælstrom*), a great whirlpool in the sea, usually associated with the celebrated whirlpool arising occasionally in a strong current off the

is. of Moskoe on the W. coast of Norway. It is very dangerous in winter, especially when the N.W. wind interferes with the set of the tide. Formerly, and erroneously, it was supposed to be dangerous enough to engulf ships at any time.

Mænades, see BACCHAE.

Mænura, see LYRE-BIRDS.

Maerlant, Jacob van (b. c. 1235), Flem. poet of the thirteenth century, probably b. on the is. of Voorne. The founder of the didactic school of poetry in the Netherlands, he has been called the 'father of Flemish poetry.' His prin. work is the *Mirror of History*, left uncompleted; and he also wrote *The Secret of Secrets* (1824); *Flowers of Nature* (1857); and a poem, *The Lands over the Sea* (1291), a summons to the crusades.

Maes, or Maas, Nicolaes (1632-93), Dutch genre and portrait painter, b. at Dordrecht; a pupil of Rembrandt. A rare painter, but little is known of his life. About 1665 he left the studio of Rembrandt and went to Antwerp, where he lived until 1678 and later returned to Antwerp where he d. His early pictures are extremely rare, but the National Gallery (London) has some of the best: 'The Idle Servant,' 'The Dutch Housewife,' 'The Cradle,' and 'Portrait of a Girl.' If popularity is a guide to merit the picture curiously entitled 'The Never-ending Prayer' in the Ryks or State Museum of Amsterdam, ranks very high. It is a masterpiece of small and large painting in unity and has a sombre richness which distinguishes it from such a picture as 'Boys Bathing,' in the Louvre. Also in the Ryks, Amsterdam, is the 'Old Woman at the Spinning Wheel,' also a popular favourite. Other works in various galleries are 'Old Woman Saving Grace' (Louvre), 'Interior' (Wallace Collection), and some portraits in the Old Pinakothek, Munich. The change in style of his later pictures is so marked as to raise a doubt whether they were his work or perhaps that of another pupil of Rembrandt. Other paintings, mostly in Dutch collections, are 'The Card Players,' 'The Listener,' 'Old Woman Peeling an Apple,' 'The Inquisitive Servant,' and 'Hagar's Farewell'—all establishing him as one of the best of the Dutch genre artists.

Maeseyck, see MAASEYCK.

Maesteg, tn. in Glamorgan-shire, Wales, 8 in. S.E. of Neath. Chiefly engaged in coal-mining, and has iron-works. Pop. (1931) 25,500.

Maestricht, see MAANTRICHT.

Maestro, wind blowing from the N.W. around the Adriatic Sea, usually in the summer, foretelling fine weather.

Maeterlinck, Maurice Polydore, Marie Bernard (1862-1949), Belgian dramatist, poet, and essayist, b. in Ghent, where he was educated at the univ. Becoming a barrister, he went to Paris at the age of twenty-five, and came into touch with the Fr. and Belgian symbolists—Villiers de l'Isle Adam, Le Roy, Verhaeren, and Rodenbach—whose ideals won his sympathy and support. His wealth permitted him to abandon law and take up literature

as his lifework. The vol. of verse entitled *Serres chaudes* appeared in 1889; the play *La Princesse Maleine*, later the same year. His works include the following plays: *L'Intruse*, *Les Aveugles* (1890); *Les Sept Princesses* (1891); *Pelléas et Mélisande* (1892); the famous 'marionette' plays *Atlantide* et *Palomides*, *Intérieur*, and *La Mort de Tintagiles* (1894); *Aglaraine et Sélysette* (1896); *Monna Vanna* (1902); *Joyzelle* (1903); and *L'Oiseau bleu* (1909). Other plays are a trans. from Itzysbroeck (1891); a study of Novalis and *Annabella*, a trans. of Ford's 'Tis Pity She's a Whore' (1895); *Le Trésor des humbles* (1896); *La Sagesse et la destinée* (1898); *La Vie des abeilles* (1901); *Le Temple enseveli* (1902); *La Mort* (1913); *Mary Magdalaine* (1913); and *Le Bourgmestre de Stilemonde* (1918), produced in an Eng. trans. by Sir J. Martin-Harvey in 1920. His work is mystical to a degree. Mirbeau's fantastical critique of M. as a 'Belgian Shakespeare' no longer calls for serious comment, but few would disagree with Mauchef in calling him one of the century's most original, most beautiful, and strongest types of genius. His essays, of which *La Sagesse et la Destinée* (1902) are of the highest quality, show the influence chiefly of Emerson and Novalis, but his plays suggest a fatalistic turn of mind. Studies in the psychology of terror, of despair, and other emotional phenomena, they are devoid of action and of dramatic commonplace; they are not pre-eminently suited for the stage, although they have often met with a good reception. An Eng. trans. of *L'Oiseau bleu*, by A. Teixeira de Mattos *The Blue Bird*—had great success in the theatre. Debussy's setting of *Pelléas* is one of the greatest of modern operas. A certain sentimentality mars moments in his *L'Oiseau bleu* as in many of his writings. But it is a lively theatrical fairy story which is a masterpiece of its kind. His later plays and essays revealed a freer acceptance of modern life, but little real deepening of vision or more capacity to create human character. He has been called a mystic man of the world and this, perhaps, defines aptly his qualities and defects. His later works include *The Wreck of the Storm* (essays concerning the First World War, 1916); *Betrothal* (1918); *Les Semeurs dans la montagne* (1919); *The Life of the White Ant* (1926); *The Life of Space* (1927); *The Magic of the Stars* (1930); *The Life of the Ant* (1931); *L'Araignée d'or* (1932); *La Grande Loi* (1933); *Arant le grand silence* (1931); *Pigeons and Spiders* (1935); *The Hour-Glass* (1936); *L'Ombre des ailes* (1936); *Devant Dieu* (1937); and *The Abbot of Setubal* (play, 1940). See A. Symons, *The Symbolist Movement in Literature*, 1899; A. van Bever, *Maeterlinck*, 1904; E. Thomas, *Maurice Maeterlinck*, 1911; H. Rose, *On Maeterlinck*, 1911; J. Bothall, *Life and Works*, 1913; and Gertrude Leblanc, *Souvenirs*, 1931; also monographs by C. Harry, 1900, 1932; and A. Bailly, 1931.

Mafeking, tn. in the N. of Cape Prov., S. Africa, and the centre of the protectorate of Brit. Bechuanaland. Pop. (white)

3000; (others) 2800; European (2300). It is situated in a gold-mining dist. The tn. was laid out in 1885 by Sir Charles Warren. M. is particularly remembered in connection with the 280 days' siege it underwent during the Boer war of 1899. It was gallantly defended by Col. (later Lord) Baden-Powell, to whose resource and courage was due the fact that it was able to hold out against the invaders for seven months, until it was relieved by Col. (later F.-M. Lord) Plumer with Rhodesian forces. The investment was followed with the closest interest in England, and on the receipt of the news of the relief London gave itself up to rejoicing of unaccustomed spontaneity—whence the word 'matlicking.' From M. Jameson in 1895 set out on his unfortunate exploit on behalf of the Reformers. M. owes much of its present development to its importance as a railway centre, and to its railway workshops. In these workshops during the siege were manufactured a look-out tower, ammunition, and a searchlight, and even a gun—improvised out of drain-pipes (called 'The Wolf' and now to be seen at the Royal United Service Institution). See J. A. Hamilton, *The Siege of Mafeking*, 1900, and F. D. Baillie, *Mafeking, a Diary of the Siege*, 1900.

Maffei, Francesco Scipione, Marchese di (1675-1755), It. dramatist and archaeologist, b. at Verona. He first adopted the military profession, but abandoned this for literature. His tragedy *Merope*, produced in 1713, was highly esteemed. In 1731-32 appeared his prin. work, *Verona illustrata* (2 vols.), treating of the origin, hist., and literature of Verona. He also wrote *Introduction to the Science of Mathematics*. His complete works were pub. in 1790.

Mafia, or Mafia, secret society of Sicily. Historically, the M. is said to be a consequence of the long period of bad foreign wars, before the unity of Italy through Garibaldi. For long the M. dominated Sicilian social life, embracing all classes and always holding itself out as the supporters of the particular gov. in power. It issued decrees, fixed land rents, and practised extortion on a wide scale. Resistance to its 'decrees' was met with murders and vendettas. Finally it was crushed under the Fascist regime. See C. Mori, *The Last Struggle*, 1922-29 (trans. 1933).

Malra, tn. in Estremadura, Portugal, 15 m. N.W. of Lisbon, noted for its great and beautiful pile of buildings erected in imitation of the Escorial of Spain by John V. in 1717-31. The buildings include a church, royal palace, monastery, and college. Pop. 4000.

Magadha, in ant. India the name of the kingdom of Prasil, the cap. of which, Pallibothra (Sanskrit Pataliputra), was situated on the Ganges. The Gk. knowledge of this kingdom was probably derived from the expedition of Seleucus against Sandracottus Chandragupta (q.v.), king of M.

Magalhães, Fernão de, see MAGELLAN, FERDINAND.

Magallanes: 1. Ter. of Chile, comprising the whole of the coast strip S. of 47° S., i.e. between the gulf de Penas and Cape Horn, and all the Is., except half the Is. of Tierra del Fuego and Staten Is. Mts. and forests occupy the N. part; desolate and sterile pampas plains, abounding in lagoons and salt marshes, the S. part. Timber and furs are produced; gold, coal, and copper are found. Area 52,271 sq. m. Pop. 48,801. 2. Cap. (formerly Punta Arenas) of M. ter., on the strait of Magellan. The most southerly tn. in the world, formerly a convict station, it is the centre of supplies for various stations in Tierra del Fuego, S. Patagonia, and the Falkland Is., and a coaling station for vessels passing through the strait. A new mole, enlarging the port facilities, was opened in 1927. Rye and barley are grown; tallow, hides, frozen meat, and wool are exported. Pop. 27,000.

Magazines. This term is usually applied to periodical pubs. which deal with general or particular subjects in literature or art, and often contain stories and poems. The modern magazine dates from 1731, when Cave pub. the *Gentleman's Magazine*, which continued until 1907. This was followed by the *Scots Magazine* in 1739 (ended in 1817), the *Monthly Review* (1749-1815), and the famous though short-lived *London Magazine* (1820-29). *Blackwood's Magazine* appeared in 1817, having a great influence owing to its topical criticisms. An *Edinburgh Monthly Review* was pub. from 1819 to 1823. *Fraser's Magazine* (1830), which became *Longman's Magazine* in 1882, numbered Carlyle and Thackeray among its contributors. The first magazine pub. at one shilling was *Tait's Edinburgh Magazine* (1832). Among the other M. pub. under these conditions were *Temple Bar* (1860-1906) and the *Cornhill*, the latter ed. by Thackeray. The price was reduced to sixpence with *Longman's Magazine* (1882-1905). *Review of Reviews*, pub. in 1890, and the *Strand Magazine* in 1891 were others. Among the more prominent Amer. M. are (or were) *Scribner's* (ceased pub. in 1939), the *Century* (merged in the *Forum* in 1930), *Harper's*, *Cosmopolitan*, the *Saturday Evening Post*, the *Forum* (founded 1886), now *Current History* and *Forum*. The twentieth century has seen the issue of innumerable M. designed to cater for the public's demand for short stories and 'potted' knowledge. Illustrations from drawings or photographs are a notable feature of many. There have also been brought out sev. M., such as the *London Mercury* (extinct), the *Adiphi*, and the *Criterion* (extinct), which have made their mark as examples of high-class M. In France the *Revue des Deux Mondes* holds a high place as a critical review. The earliest Canadian M. were the *Canadian Magazine*, pub. in Quebec in the 1820s; the *Nova Scotia Magazine* and some Fr.-Canadian pubs., notably the *Qu'ec Magazine*, which were started in the last part of the eighteenth century. The *Sydney University Magazine*, begun in 1855, was the

first of the Australian M. of repute, and it is worthy of note that the tone of dominion univ. M. of to-day is uniformly high, particularly the *Queen's Quarterly*, the organ of Queen's Univ., Kingston, Ontario. Other well-known dominion M. are the *Canadian Forum* and the *Dalhousie Review* (Canada) and the *Bulletin* (Australia). See H. W. Peet, *A Bibliography of Journalism*, 1913; H. Mott, *A History of American Magazines 1741-1850*, 1930; and F. Sper, *The Periodical Press of London, Theatrical and Literary*, 1937.

Magdala, hill fortress of Abyssinia, stood on the plateau of Talanta at an altitude of 9110 ft.; it was the stronghold of Theodosius, and in 1683 was taken and destroyed by the Brit. under Sir Robert Napier, afterwards Lord Napier of M.

Magdalena: 1. Chief riv. of Colombia, rises in the Central Cordillera and unites with the Cauca, 130 m. from the Caribbean Sea. It ends in a large delta, enclosing the small is. of Los Gómez, and is closed to sea-going vessels by reason of a large bar at the mouth; goods are conveyed by rail from Barranquilla to the point whence the riv. is navigable. The total length of the M. is 1060 m. 2. Small tn. in the Argentine Republic, situated on the Río de la Plata, 52 m. S.E. by E. from Buenos Aires. Pop. 4000. 3. Dept. of Colombia, in the N.E. It is bounded to the W. by the R. M., to the E. by Venezuela, and to the N. by the Caribbean Sea. Sugar, cocoa, coffee, maize, and bananas are produced; coal, copper, silver, and gold are mined; cattle and horses are bred. Cap. Santa Marta. Area 20,813 sq. m. Pop. 420,300.

Magdalen College, Oxford, one of the colleges of the univ., was founded in 1453 by Wm. of Waynflete, who had held the post of Lord High Chancellor of England. The building was begun in 1474, and is considered one of the most beautiful of all the Oxford colleges. The tower is one of the most interesting features of the college, and it is from the top of this that a Latin hymn is sung on May Day morning. A new quadrangle was built on to the college in 1885. M. Walks, part of which is known as Addison's Walk, round an is. in the Cherwell, are also famous. During the time of James II. the college came much to the fore in its resistance of the king's choice of a Catholic president. Cardinal Wolsey, John Lyly, Hampden, Addison, and Gibbon were among its former members. See H. A. Wilson, *Magdalen College*, 1899.

Magdalen College School was founded in 1480, on the same foundation as M. College, the choristers of which are now amongst its pupils.

Magdalen Hall, Oxford, was founded by Wm. of Waynflete, close to M. College, with which it was connected. In 1602 it became an independent hall and in 1822 its members were moved to the premises now occupied by Hertford College. In 1874 the hall was dissolved, and its fellows and students became incorporated as Hertford College (q.v.).

Magdalene, or Magdalen, Mary, name of

a woman mentioned in the Gospels as a disciple of Jesus (Luke viii. 2). It is recorded that seven demons were cast out of her. She apparently came from Magdala or Magadan (mod. El-Mejdel), near Tiberias. She witnessed the crucifixion of Christ, followed Him to burial, and prepared sweet spices for the sepulchre. The account in John xx. tells how she found the tomb empty, and was the first to behold the risen Jesus (see also Mark xvi. 9). From confusion with the woman who anointed Christ's feet in Simon's house (Luke vii. 37), the popular conception of her has been that of one fallen from chastity who later repented of her sins. Hence the name M. asylums was adopted for homes for penitent women, and the word maudlin (weeping) is derived from this same unfounded idea. There are many famous pictures of the M. by Correggio, Titian, Paul Veronese, and others. She has also been confused with Mary of Bethany, sister of Lazarus, and with the daughter of the Syro-Phoenician woman (Mark vii.). See legendary life by Ibrahan Marcus (ninth century) and by Vincent of Beauvais (thirteenth century).

Magdalene College, Cambridge, founded in 1542 by Baron Audley of Walden. In 1428 a Benedictine students' home had been erected on the site, which on the dissolution of the monasteries passed into the hands of Lord Audley, whose representative, the owner of Audley End, still has the power of appointing the master of the college, while the foundation of the college consists of a master, seven fellows, and the students. The most interesting and valuable possession of this college is the library, containing some MSS. and the books, including the MS. of the *Diary*, given to it by Samuel Pepys, who was one of the students.

Magdeburg, tn. of Saxony-Anhalt, Germany, formerly cap. of Saxony, on the l. b. of the Elbe, 88 m. (by rail) W.S.W. of Berlin. The city was (before the Second World War) important commercially, and it includes within its municipality the former tns. of Neustadt, Sudenburg, and Buckau. With the exception of one fine boulevard, Der Breite Weg (or Broadway), the streets are uneven and narrow. Its cathedral, a noble Gothic edifice, dates from the beginning of the thirteenth century, and contains the tombs of Otto the Great and his Eng. wife, the Princess Editha. Here also is the mausoleum of Ernest, archbishop of Saxony, the masterpiece of Vischer of Nuremberg. The prin. manufs. included (before the Second World War) Germany's chief locomotive works, steel works, woolen, silk, and cotton goods, tobacco, gloves, leather, holly, sugar, and vinegar, and there was a large trade in chemicals, cereals, and fruit. The tn. was founded by Charlemagne about 805, and a Benedictine monastery was estab. here in 937, which in 968 was raised to the dignity of an archbishopric. During the Middle Ages M. joined the Hanseatic League. The city suffered severely during the Thirty Years war, and gallantly held out for

nearly seven months when invested by Tilly. It fell, however, and was sacked and burnt, some 30,000 of its inhab. perishing; the cathedral was the only important building to escape destruction. The archbishopric was converted into a duchy in 1648, and was presented to Brandenburg. Marshal Ney captured the city in 1806, but it was restored to Prussia in 1811. The aerodrome was bombed by the R.A.F., July 23, 1940. Heavy bomb loads caused much destruction on July 5, 1941, and the factories were again bombed on Aug. 12, 1941, and on sev. occasions in subsequent years. In the invasion of Germany the Allies reached the Elbe S. of M. on April, 11 1945. The Gers. fought tenaciously to deny possession of M. itself, which, however, fell to the Amers. on April 18. Pop. 307,000.

Magee, William Connor (1821-91), Eng. prelate, b. at Cork, and educated at Trinity College, Dublin. He held various ministries, and in 1868 became bishop of Peterborough, and archbishop of York in 1891. He was an active organizer of the Church Defence Society, and as a debater and orator had few equals. He pub. *The Gospel and the Age* (1884) and *The Atonement* (1886). See J. C. MacDonnell, *Life and Correspondence*, 1896.

Magellan, Ferdinand (Portuguese *Fernão de Magalhães*) (1480-1521), celebrated Portuguese navigator, b. at Villa de Sabrosa, Trás-os-Montes, the discoverer of the strait of Magellan and the Philippines. Distinguished for his skill and enterprise, he served under Albuquerque in the E. Indies for sev. years, taking part in the capture of Malacca (1511). Considering that his services were not properly recompensed, he renounced allegiance to Portugal and went over to Spain, where Charles V. warmly received him and gave him command of a fleet of five vessels, with which he set out in 1519 to discover a W. route to the E. Indies. He was the first navigator of the Pacific Ocean, so called by him, and on his voyage also discovered the strait which bears his name, and the Ladrones. He met his death in the Philippines where he became the ally of the prince of Cebu, one of the smaller is., against the prince of another little is. of the group. M. was killed in 1521 in a battle in Mactán. His flagship, the *Trinidad*, having become leaky, was kept behind at Tidor in the E. Indies. The only ship of the five to return to Spain was the *Vitoria*, which was thus the first to circumnavigate the globe. See A. Pigafetta, *The First Voyage round the World by Magellan* (Eng. trans. 1874); and lives by F. J. Gifford, 1890; E. F. Beuson, 1929; and S. Zweig, 1938.

Magellan, Strait of, between S. America and Tierra del Fuego, 360 m. in length, varies in width from 24 to 17 m. It was discovered by the Portuguese explorer Magellan in 1520. The strait is difficult of navigation, and is enclosed on the W. by steep wooded mts. See also *TERRA AUSTRALIS INCOGNITA*.

Magellanic Clouds (Nubecula Major and Minor), two oval cloudlike patches of

nebulous light near the S. pole of the heavens, named by the navigator, Andrea Corsali, after Magellan. The Major is in the constellation Dorado, and the Minor is situated in a blank space between Hydrus and Tucana. The greater number of the variable stars of the heavens are found in these clouds. The greater nebula covers an area of about 12 square degrees and the lesser about 10 square degrees, according to Herschel.

Magendie, François (1783-1855), physiologist and physician, b. at Bordeaux, and educated at Paris. His manual of physiology, entitled *Précis Élémentaire de physiologie*, appeared in 1816. In 1821 he became a member of the Academy of Sciences and ten years later prof. of anatomy and medicine in the Collège de France, where he became noted for his experiments on the physiology of the nerves. Among his works are (*Fr. titles trans.*) *Lectures on the Physical Phenomena of Life* (1839) and *Lectures on the Functions and Instases of the Nervous System* (1839). He was also the founder of the *Journal de Physiologie expérimentale*. See life by C. Bernard, 1856.

Magenta, tn. in Lombardy, Italy, 15 m. W. of Milan, noted for the great battle fought there in 1859 between the allied Fr. and Sardinians and the Austrians, in which the former were victorious. Silks are made, and the tn. gave its name to a colour (see *FUCHSINE*). Pop. 5000.

Magenta, see FUCHSINE.

Magero Island, near the coast of Finnmarken, Norway, in the Arctic Ocean. It is irregular in outline and terminates on the N. in North Cape, the most northerly point of Europe. Pop. 32,500.

Magersfontein, battlefield, the scene of a Brit. defeat in the Boer war, 1899, in the W. of the Orange Free State, S. Africa, near the Modder R. There is a monument to the dead of the Anglo-Boer war which is the objective of an ann. Scottish pilgrimage.

Maggiore, Lake (the *Lacus Verbanus* of the Romans), in Italy, is bounded by Piedmont, Lombardy, and the Swiss Canton Ticino. It is 39 m. in length and of an irregular shape; the greatest depth is 1230 ft. The R. Ticino flows through the lake, which is traversed by steam packets. In the S.W. portion are the B. Romanca Isles; on the N. and W. it is enclosed by high mts. and on the S. and E. by vine-covered slopes. (See illustration, p. 666.)

Maggot, the grub or larva of a fly or other insect hatching from an egg deposited in its food supply. The term, which is unscientific, is usually applied to legless larvae, such as those of the blue-bottle and green-bottle flies; one of the latter is the well-known sheep M. The Ms. of fruit include a large number of insect types. The Ms. found in plant galls are those of the gall wasps.

Maghera, par. and mrkt. tn. of Londonderry, N. Ireland, 14½ m. N. of Cookstown. There are manu. of sewn muslins and linens. Pop. 7600.

Magherafelt, par. and mrkt. tn. of Londonderry, N. Ireland, 7 m. S.E. of

Maghiana, see under JHANE

Magi (derived from *mag* or *m* *ny* Ichlevi priest, *mikuth* a man who wears his hair in a particular manner, *moqh*, distin gulsher) a tribe of the Medians which were set aside for the management of the sacred rites and for the preservation and propagation of the traditional knowledge. From the Medians the institution of the M found its way under Cyrus into Persia. They were not only the 'keepers of the sacred things, the learned of the people, the philosophers and servants of C m, but also diviners, mantics, augurs,

some unreasoning association of ideas from a mere synchronisation which association has become stereotyped in the early traditions of particular races and fostered by the natural hope of penetrating the mystery of nature's laws. For an exhaustive collection of curious peasant and other beliefs that have come down through the folklore of various European nations see Hind's *Popular Antiquities* and the pub's of the Folklore Society.

Black M or the black art or M proper is that branch of M which was practised with evil intentions generally by unofficial persons like witches or sorcerers.

TAKE MAGGIORE AND THE ISOLA DEI FISCATORI

and astrologers, and no transaction of importance took place without or amongst their advice.

Magic, word of sacerdotal origin, being derived from the Magi whose earlier functions were divinatory or prophetic but later in the Persian court sank to the level of mere occultism. M is closely akin to superstition, the belief in it as the art of exorcising spirits or producing supernatural effects being as deep seated in the psychology of races low in the scale of civilisation as any belief in extra-mundane influence. It is difficult to account for the origin of M. Sir E. B. Tylor (*Early History of Mankind*) attributes the earliest practice of M to the belief in an objective connection between two things, a man and a rude drawing of him, or two events, the death of a child and the great hawk's nocturnal cry—when in truth the connection could only be subjective. It seems more correct to say that all such connections are due to

in contradistinction to Black M, white M carries the altruistic practice of M. This situation is exemplified in the medieval beliefs in good and bad fairies. The term enchantment, which is derived from *fat* *incantare* (to repeat a chant or charm over) denotes the practice of entrancing another by charms or sorcery. Doubtless hypnotic suggestion would be looked upon by lower races as enchantment. An obvious application of white M is the healing of disease by sorcerers and is used generally by M among early orient and various aboriginal races had and has over and above its spiritual or sacerdotal significance this utilitarian aspect. See J. G. I. Gracioso, *Bibliotheca magica et pneumatica*, 1848; G. Turner, *Nineteen Years in Polynesia*, 1861; Sir E. B. Tylor, *Researches into the Early History of Mankind*, 1865; R. Magic Lantern, or **Optical Lantern** apparatus for projecting upon a white screen enlarged representations of diagrams, pictures, etc., drawn or photographed on glass slides. The instrument is said to have been invented by Athanasius Kircher who described it in 1646. It was at first used as an amusing toy, but in its later developments is a means of representing small pictures and objects to large audiences. The cinematograph is essentially an optical lantern. The instrument consists of a lantern body to contain the source of light and the reflectors in optical system, and a slot to accommodate the slide frame. The light is generally sunlight (or) of the electric arc. The optical system in the ordinary type consists of a 'condensing' lens which transmits the rays from light to the object and an 'objective' which receives the rays from the object and transmits them to the screen.

Magic Squares, sets of numbers arranged in the form of a square in such a manner that the sum of the numbers in each vertical and horizontal column and in each diagonal is constant. The following may serve as examples of their construction.

In Fig 1 the numbers 1 to 5 are arranged in any order in the first row; the second commences with the number in the fourth cell of the first row and proceeds in the same relative order. The third row commences with the number in the

centre and the even numbers at the corners. M.S. were in old times universally believed to possess astrological qualities.

Maginot, Andre (1857-1932) Fr soldier at Paris organizer of the famous fortifications which became known as the **Maginot line**. He enlisted as an infantryman in the First World War and was soon promoted to the rank of sergeant but, after three months was so badly wounded at the fortress of Douaumont in the great Verdun battle that the next month he was released from military service. He was able to turn his attention to the larger problems of the protection of his country from the recurrent German menace. In 1917 he became minister of colonies. In 1922 and again in 1929 he was minister of war. Together with Lavalé the Fr president he worked out the scheme for the **Maginot line**. The original scheme was completed in 1934 but in the meantime, in 1932, its creator had died. The line stretched from the Belgian frontier to the Swiss frontier. It cost more than £30,000,000 to construct and was subsequently augmented in strength. The **Maginot line** was outflanked by the Germans in 1940 and in June of that year they crossed the Rhine and broke through the line. The overrating of the **Maginot line** and the

passive strategy resulting from it are regarded as one of the contributory causes of the Fr. collapse. As early as 1927 the Maginot line was described by Maj.-Gen. Paller, the Brit. mechanized war expert, as 'the tombstone of France.' See also under WESTERN FRONT IN SECOND WORLD WAR.

Magione, vil. of Central Italy, 8 m. W.N.W. of Perugia. It suffered damage in the battles of 1944. The church of the Madonna delle Grazie was hit and the castle of the Knights of Malta was damaged by shell-fire, but remained structurally intact.

Magistrate, one in whom is vested jurisdiction or executive authority in affairs of civil gov., in other words, an administrator of the law. In this sense the king is the first M. in a monarchical state, while in a republic the president is the chief M. The word is now more usually applied to subordinate officers to whom a part of executive judicial power is delegated; in England it means, specifically, a minor judicial officer, such as a justice of the peace, a stipendiary, or a police magistrate; in Scotland, a provost or bailie of a burgh. Prior to the Local Government Act, 1888, the administrative work of the co. fell to the lot of the justices or magistracy, but the Act, while leaving them their judicial functions, took away the bulk of their administrative functions. See also JUSTICE OF THE PEACE. See Stone's *Justices' Manual* (annually), 79th ed. (1917) by F. J. Hayward. See also W. Shaw, *Evidence and Procedure in Magistrates' Courts*, 1946; J. P. Eddy, *Justices' Handbook*, 1947; L. Page, *Justice of the Peace* (3rd ed.), 1947; F. J. Hayward and H. Wright, *Office of Magistrate* (5th ed.), 1948; and F. T. Giles, *The Magistrates' Court*, 1949.

Magliabecchi, Antonio da Marco (1633-1714), lt. librarian and bibliophile, b. at Florence, famed for his vast and varied knowledge of languages and antiquities. For many years he was librarian to Cosimo III., grand duke of Tuscany. At his death he left his collection of MSS. and early eds. to the grand duke, who gave it to the city.

Maglie, tn. in the prov. of Lecce, Italy, 19 m. E.N.E. of Gallipoli. Pop. 9000.

Magna Carta, or **The Great Charter**, the famous document granted by King John at Runnymede, on the R. Thames, to the barons in 1215, viewed in after times as the basis of Eng. liberties and described by the historian Hallam as the 'keystone of English liberty.' Its great underlying principle is that the king must keep the law. John's oppressions and tyrannies aroused the barons to take up arms to redress their grievances, their demands being based on the charter voluntarily granted by Henry I. In addition, it contained sixty-three clauses embodying provisions for the protection of the rights of feudal proprietors and against the abuse of the royal prerogative. Its prin. provisions were the redress of a number of grievances connected with feudal tenures; provisions regarding the relief of heirs, wards, and marriage of the widows of

tenants-in-chief; the inviolability of the liberties of the city of London and other ports and tns.; freedom of commerce to foreign merchants; the strict administration of justice; the permanent abode of the court of common pleas at Westminster; the holding of assizes in the different co.s, and the estab. of assizes; the abolition of extraordinary taxation; the protection of life, liberty, and property; one standard of weights and measures; no banishment or imprisonment save by judgment of peers. It may be noted that the word 'outlawed' in M. C. is out of date and meaningless, but a standing committee of the House of Commons, when discussing the Administration of Justice (Miscellaneous Provisions) Bill which, *inter alia*, proposed to repeal the word from M. C., decided for sentimental reasons to leave the anct. statute as it was on the Statute Book. See K. Hantos, *Magna Carta*, 1904, and W. S. McKechnie, *Magna Carta*, 1905.

Magna Carta (Charta) Island, 2 m. N.W. of Staines, in the Thames, Surrey, England. It was the site of the signing of *Magna Carta* by King John in 1215.

Magna Græcia, name given by the anct. historians and geographers to the Hellenic settlements of pre-Rom. times in the S. of Italy. They included Bruttium, Lucania, Apulia, and Iapygia. Important cities were Tarentum and Cumæ. The Gks. colonised extensively in the Mediterranean, but the term M. G. was exclusively used to denote those settlements in S. Italy not including Sicily, which was a separate colony. Of all the cities of M. G., Tarentum was the most important, and lent its influence to the other tns. under the Hellenic civilisation. The best part of the hist. of M. G. may be studied in the hist. of Tarentum (q.v.) itself.

Magnanum Alloys, see under MAGNESIUM.

Magnes, Judah Leon (1877-1948), Jewish rabbi and Zionist, b. in San Francisco. He was educated at Cincinnati Univ., and Heb. Union College, and, later, at Berlin and Heidelberg. Appointed instructor and librarian at the Heb. Union College in 1903, he became rabbi of Temple Israel, Brooklyn, 1904. His early years were spent in the Jewish ministry. He was secretary of the Amer. Zionists 1905-8, but had no sympathy with political Zionism, the soul of the Jewish people or, as he termed it, the mission of Israel being much more important than the ambitions of the Jewish Nationalists. He settled in Palestine in 1922. M. was the official and trusted adviser to a succession of Brit. high commissioners. His relations with the official Zionists in Palestine and elsewhere were always strained, for as time passed he became certain that an Arab-Jewish *entente* was essential. To the decisions taken on Nov. 10, 1917 by the United Nations he made strong objections, although the idea of internationalisation of the Holy City appealed to him. His prin. work, however, was in connection with the Heb. Univ., on Mt. Scopus, the site of which he chose as far back as 1912. When

in 1925 it at last took shape he became chancellor (in the Amer. sense), that is to say head of its administration. Thenceforth the Univ. was almost the whole of his life. In 1935, when its constitution was remodelled, M. became president.

Magnesia: 1. *Magnesia ad Mareandrum*, anct. city of Ionia, Asia Minor, 10 m. N.E. of Miletus, near the Mæander. Until it fell into the hands of the Romans it was a wealthy and prosperous city. It was destroyed by the Cimmerians about 700 B.C., and here Themistocles, the Athenian patriot, d. 449 B.C. 2. *Magnesia ad Sipylum*, Turkish city on the Hermus, near Mt. Sipylum, N.W. of Lydia. Near this in Scipio defeated Antiochus of Syria, in 190 B.C. Its modern name is Manissa, and it contains 31,000 inhab. 3. Div. in anct. Thessaly, along the E. coast, with Mt. Pelion and Mt. Ossa on its borders.

Magnesia, see MAGNESIUM.

Magnesia, Sulphate of, see EPSOMITE.

Magnesium Limestones, formation occurring in the middle div. of the Permian system. It consists of a bed of brown shale with bands of marl slate and a superposed zone of dolomite. It is a characteristic feature of the Permian system in the E. of England and is represented in the W. by continuous limestones and sandstones. The term M. L. as a rock is applied to dolomite, a mineral crystallising in octohedra and consisting of calcium and magnesium carbonate.

Magnesite, mineral consisting of magnesium carbonate ($MgCO_3$). It is polymorphous with calcite, and is met with in three forms, crystalline, massive, and earthy. The crystals occur in rhombohedra, and have a hardness of 4 and a sp. gr. of 3. The other forms are white in colour and are often mixed with meerschaum or other magnesium salts. The mineral is mined in Kubra, Madras, and California, and is used for the manu. of fire-bricks, as a source of magnesium salts, and as a pigment.

Magnesium, symbol Mg; atomic number 12; atomic weight 24.32, a metallic bivalent element. First known in the form of the sulphate, or Epsom salts, in the eighteenth century the oxide, or magnesia alba, was prepared, and was at first thought to be chemically identical with lime. In 1808 Davy demonstrated that magnesia was the oxide of a metal; the metal was obtained in a fairly pure state by Bussy in 1829. M. occurs in the form of carbonate in magnesite, dolomite, and magnesian limestone; as sulphate in sea water and some mineral waters, as at Epsom in Surrey, and Seidlitz in Bohemia, also as the mineral kieserite; it occurs as chloride in the mineral carnallite at Stassfurt; it also enters into the composition of many silicates, as hornblende, talc, olivine, asbestos, and meerschaum. Metallic M. is commonly prepared from the mineral carnallite, which is fused with fluorspar in the presence of metallic sodium. The impure metal thus obtained is then sublimed and the product pressed into the form of ribbon. It is usually prepared from fused carnallite by electrolysis.

The operation is performed in an iron pot which acts as the cathode, whilst carbon rods form the anode. The whole apparatus is closed inside an electric furnace so that the temp. may be so maintained that the resulting M. shall remain molten. A current of coal gas and hydrogen serves to prevent the access of oxygen which would cause oxidation. Chlorine, a gaseous product of the electrolysis, is led off by a side pipe. M. is a lustrous white metal of sp. gr. 1.75 and melting-point $649^\circ C$. It is malleable and ductile. When heated in air it burns with great brilliancy, forming the oxide MgO , a white powder slightly soluble in water and very infusible (used as a refractory lining for furnaces); at the same time a little M. nitride is usually formed, Mg_3N_2 . When the metal burns in chlorine, the chlorine $MgCl_2$ is formed. It may also be prepared by the action of hydrochloric acid on magnesia or M. carbonate. The bromide and iodide resemble the chloride; they are soluble in water and occur in sea water.

The sulphate formerly obtained from the springs at Epsom is now obtained from the mineral kieserite; the salt is fairly soluble in water. M. is used in photography for producing a brilliant light rich in chemical rays; it is used for a similar purpose in pyrotechny. The salts are useful purgatives. The sulphate, or Epsom salts, is most commonly employed, and acts by virtue of abstracting water from the tissues into the bowel; the stronger the solution, the more water is thus abstracted. Fluid magnesia is an aperient prepared by dissolving the carbonate in water impregnated with carbon dioxide. Citrate of magnesia, a popular effervescent aperient, consists of a mixture of bicarbonate of soda with tartaric and citric acids with a small proportion of Epsom salts. M. finds a ready use in chem., since it is a powerful reducing agent. It is very valuable in organic chem. in the form of M. alkyl compounds which serve to effect numerous syntheses. The magnalium alloys contain M. and aluminium in various proportions. A common one contains 10 per cent M. is of a silvery colour, and can be soldered. One containing 25 per cent M. is very like bronze. The magnalium alloy also possesses the advantage of being lighter, bulk for bulk, than aluminium, and they are used for castings. They do not corrode easily, and have considerable tensile strength. An aircraft, called the Planet Satellite, has been constructed entirely of M. See E. V. Pennell, *Magnesium, its Production and Use* (2nd ed.), 1948.

Magnet, see under MAGNETISM.

Magnetic Belts, see ELECTRO-THERAPY.

Magnetic Pole and Units, see MAGNETISM.

Magnetism. The familiar property of a magnet, viz. its power of attracting iron and steel, has been known since the time of Thales of Miletus (640-546 B.C.). The name magnet is derived from the town of Magnesia (now Manissa), in whose neighbourhood natural magnets were found. This mineral, known as magnetite (q.v.) or

lodestone, contains considerable quantities of the oxides of iron, FeO and Fe_2O_3 . It was used as a crude compass (hence the name lodestone; lode = A. -S. *löd* = way) before artificial magnets were employed for that purpose. Artificial magnets were formerly made by stroking iron with a magnet, but in 1819 Oersted discovered the phenomenon of electromagnetism (q.v.), and since that time powerful magnets are made as follows. A solenoid (Gk. $\sigma\lambda\eta\iota$, a pipe) consisting of a narrow tube of any non-magnetisable substance is closely wound with a large number of turns of insulated wire. The bar to be magnetised is then placed inside the solenoid and a current is passed through the wire. Iron, nickel, and cobalt are highly magnetisable, but the best substances for making permanent magnets that will retain their M. if treated with care are steel alloys containing small quantities of tungsten, cobalt, aluminium, etc. The residual power of soft iron is very small, although it is highly magnetic. It is therefore used for the cores of electro-magnets (q.v.). All steel magnets lose their M. if they are heated in a bright red heat; they lose some of their M. if subjected to shocks or hammering, and they are best kept by storing together in pairs, opposite poles (see below) being connected by short pieces of soft iron.

Properties of a Magnet.—If a bar magnet is dipped into iron filings, the latter cling to the ends of the bar and very few to the middle of the bar. The regions near the ends are called the poles of the magnet, and there appears to be no difference between them as regards their power of attraction of the filings; this fact can be confirmed by quantitative experiments. Such a magnet, if pivoted so that it can rotate about a vertical axis in a neighbourhood free from iron and electrical machinery, will come to rest in a line approximately N. and S. (see below). The pole of the magnet that seeks the N. is called the N. pole, the other is called the S. pole. Experiment shows that like poles repel and unlike poles attract each other. This fact accounts for the behaviour of the compass; the earth itself is a magnet, with a magnetic S. pole in the Arctic regions and a magnetic N. pole in the Antarctic regions. It also explains why a magnet attracts iron; the iron becomes magnetised, and is then attracted by the magnet. These familiar properties of a magnet, and the fact that the earth was a magnet, were discovered by Wm. Gilbert (q.v.), 'the father of magnetic philosophy.'

Quantitative Magnetism.—The quantitative law of the force of attraction and repulsion between magnetic poles was determined by Coulomb (1736-1806) and verified more exactly by Gauss (1777-1855). Defining unit magnetic pole as one that repels a similar pole placed one centimetre away in *vacuo* with a force of one dyne, Coulomb's experiments led to the conclusion that a pole of strength m repels a pole of strength m' at a distance of r cm. in *vacuo* with a force of $\frac{mm'}{r^2}$ dynes.

For mathematical computations it is con-

venient to designate N. poles as positive poles and S. poles as negative poles, and it can be shown that every magnet can be regarded for quantitative calculations as consisting of two poles of strengths $+m$ and $-m$. The pole strength of a good small steel magnet is of the order of 200 units.

The regions of magnetic attractions and repulsions round a magnet is known as a magnetic field. The character of a magnetic field was investigated by Faraday (1791-1867), to whom the idea of 'action at a distance' was repugnant. Instead of magnetic poles attracting or repelling each other without the intervention of a medium, Faraday imagined the medium traversed by lines of magnetic force that gave the direction of the magnetic force at any point. Fig. 2. shows the lines of magnetic force in the neighbourhood of a bar magnet. The arrows indicate the direction in which a free pole would move. Faraday imagined these lines to spread in all directions, beginning on N. poles and ending on S. poles, and this physical theory was mathematically interpreted at a later date by Maxwell with great success. A magnetic 'map' can be surveyed by means of a small compass or, alternatively, by means of iron filings sprinkled on a card placed above the magnet or magnets. The filings become magnetised and act as a myriad of small compasses that set themselves along the lines of force. The quantitative character of a magnetic field is determined by defining the magnetic force at a point in the field. The unit of magnetic force is 1 gauss, defined as the strength of the field at a point where a unit pole is repelled with a mechanical force of 1 dyne. Thus the magnetic force at a point is H gauss if a pole of strength m placed there is repelled with a mechanical force of mH dynes. The strongest magnetic fields are those between the poles of the most powerful electromagnets; they are of the order of 50,000 gauss. The strength of the earth's magnetic field in London at the present time is about 0.45 gauss. Quantitative measurements in M. involve the use of a magnetometer (q.v.).

Theories of Magnetism.—All substances are magnetic to a slight degree, and their feeble magnetic properties may be observed when they are placed in an intense magnetic field. The extent to which they are magnetised is, generally speaking, directly proportional to the strength of the magnetising force. Most substances are paramagnetic, i.e. they become magnetised with their magnetic axes (the line joining the S. pole to the N. pole) parallel to the magnetising force; a few, notably bismuth, are diamagnetic; these substances become magnetised with their axes making an angle of 180° with the magnetising force. The ferromagnetic substances, iron, nickel, cobalt, and some of their alloys, are all paramagnetic, but the extent to which they are magnetised depends not only on the magnetising force, but also on their previous magnetic hist. Furthermore, if the magnetising force is increased, a stage is reached when the magnet becomes saturated, i.e. its pole strength reaches

a maximum value. Now when a magnet is broken in two, we do not obtain two halves, one with a N pole the other with a S pole. Two new poles appear at the point of fracture, however often this process is repeated the same result is obtained: every magnet has two poles. Weber suggested that every magnet was really composed of magnetic particles, particles that we now believe to be of molecular dimensions. Iwing developed his theory and suggested that since the act of magnetisation did not change the chemical character nor the weight of

electron (qv) the elementary charge of electricity. This idea has been developed by physicists notably Einstein, de Haas, and Bohr. An electric current flowing round a circular coil has a magnetic field similar to that of a magnet whose axis coincides with that of the coil; the electrical theory of matter attempts to ascribe the magnetic properties of bodies to the orbital motions of the electrons in the atom. The quantum theory of the atom developed by Einstein and Bohr supported the magneton theory, and more recently direct experimental evidence of the existence of a magneton has been obtained by Gerlach and Stern.

Terrestrial Magnetism. The importance of the magnetic properties of the earth was realised by navigators and it is to sailors and those connected with nautical matters that most of the investigations and records of terrestrial magnetic phenomena are due. By a series of observations at different points of the earth's surface it has been possible to chart the magnetic elements peculiar to a locality, and thus of able mariners to correct their compasses to the true geographical meridian. The magnetic elements at any point on the earth's surface are (i) the horizontal component of the earth's magnetic force, (ii) the declination (or magnetic variation) the angle between the magnetic meridian and the geographical meridian, (iii) the angle of dip (or inclination) the angle between the direction of the earth's resultant magnetic force and the horizontal at that point. The magnetic elements are by no means constant; they are subject to secular change, to diurnal variations, and to irregular changes known as magnetic storms that are especially violent in the Arctic and Antarctic regions. The declination in London for example was $11^{\circ} 15'$ in 1580, in 1607 it was nil, in 1800 it was $24^{\circ} 0'$ W, and it is now about 10° W and decreasing by 1° yearly. The magnetic poles of the earth are at present situated at 71° long 96° W (N pole) and at 73° long 155° E (S pole).

The daily variation of the declination in London takes place from 1° to W in the morning and then returns; the extent of the variation being $12'$ in summer and $7'$ in winter. As the variation is also greater during the day than at night it is evident that the cause is connected with solar radiation. The intensity of the magnetic storms is found to bear some relation to the frequency of sun spots, and often to displays of aurora borealis. The actual cause of the earth's M and its secular changes is of course. The obvious suggestion that the former is due to the lodestone present in the earth does not nearly account for the magnitude of the magnetic effects or for the secular changes, other tentative explanations have similar grave defects.

The variation of the earth's magnetic force from one locality to another requires the constant attention of mariners during a voyage. The modern gyro-compass that is used as a master compass on all large vessels is not a magnetic compass,

General Electric Co. Ltd.

THE USE OF THE ELECTRO-MAGNET IN INDUSTRY

4 in diameter lifting magnet lifting 30 wt ft of disks

the specimen but simply endowed it with magnetic properties, magnetisable substances consisted of molecular magnets. According to this theory an ordinary piece of iron is made up of molecular magnets arranged in haphazard fashion so that they neutralise each others effect on external bodies. This disorder disappears when the iron is placed in a magnetic field and the molecular magnets are set with their axes parallel to the field. Free poles appear at the ends of the magnet while the central portions exhibit only feeble magnetic powers because equal and opposite poles neutralise each others effects. This theory accounts for the appearance of new poles wherever the magnet is broken, and the state of saturation is reached when all the molecular magnets have been arranged in order. Subsequent loss of M is explained by the partial return to disordered array.

Early in the present century Weiss suggested the existence of the magneton or elementary magnet, an analogue of the

and it is set so that it always indicates the true geographical meridian. It is interesting to note that a magnetic compass, freely suspended, will come to rest in a vertical position at the earth's magnetic poles.

Magnetic Observatory.—The prin. observatory in Great Britain is at Eskdalemuir in Scotland, on a site far removed from the presence of iron and electrical machinery. Formerly the headquarters of the gov. survey were at Kew, but the advent of the trams and the electrification of the S. railway at Richmond, about 1 m. away, caused irregular variations of the magnetic field, so that reliable survey became impossible. The authorities received compensation for this magnetic interference and removed to the present site.

Piddock, *A Treatise on Electricity*, 1925; E. C. Stoner, *Magnetism and Atomic Structure*, 1926, and *Magnetism and Matter*, 1934; S. Chapman, *The Earth's Magnetism*, 1936; N. F. Mott and others, *Magnetism*, 1938; L. F. Bates, *Modern Magnetism*, 1939; J. A. Fleming (editor), *Terrestrial Magnetism and Electricity*, 1939; and S. Chapman and J. Bartlett, *Geomagnetism*, 1940. See also J. C. Beattie, *Report of a Magnetic Survey of South Africa*, 1909.

Magnetite, mineral consisting mainly of black oxide of iron, Fe_3O_4 . It is identical with lodestone, and is famous under that name for its magnetic qualities (A.-S. *līd*, way). It occurs as crystals in the cubic system, having a hardness of 6 and a sp. gr. of 5; it is black and opaque, and has a metallic lustre. It is widely distributed entering into the composition of many volcanic rocks, and is valuable as an iron ore.

Magneto-electric Machine, see **ELECTRIC GENERATOR**.

Magnetograph, instrument automatically recording the daily variations of either the horizontal or vertical components of the earth's magnetic force, or the declination (see **MAGNETISM**) at a given magnetic observatory. Ms. are essentially sensitive magnetometers (q.v.) in which the movements of the magnetic needle are magnified by focusing a beam of light reflected from a light mirror, attached to it, on a strip of sensitized paper. The paper is wrapped round a drum that slowly revolves by clockwork. The magnetic needle is mounted differently for each of the three magnetic elements recorded.

Magneto Ignition, see under **MOTOR CARS**.

Magnetometer, instrument for comparing the strengths of magnetic fields (see **MAGNETISM**). A common pattern of M. consists essentially of a very short compass, pivoted so that it can rotate in a horizontal plane, carrying a light non-

magnetic pointer fixed at right angles to its centre. The pointer moves over a circular scale graduated in degrees. With this M. the strength of a magnetic field F at a given point can be compared with the horizontal component of the earth's magnetic field H at the same point. It is convenient for purposes of computation to arrange F and H at right angles to each other. The M. is placed with its needle centred over the point in question and the deflection θ of the needle from the magnetic meridian is observed. The needle sets itself in the direction of the resultant of F and H : it follows from the parallelogram of forces that $F = H \tan \theta$.

A more sensitive pattern consists of a short bar magnet mounted on the back of a small plane mirror suspended by means of a fine torsionless fibre of unspun silk. Small deflections of the M. needle are read by reflecting a beam of light by the mirror on to a distant scale.

Magnificat, song of thanksgiving of the Virgin Mary (Luke i. 46-55), incorporated into the evening service of the Anglican Church, to be said or sung after the first lesson. It forms part of Rom. Catholic vespers, its place here dating back to about the sixth century.

Magnifying Glass, see **LENS**.

Magnitogorsk, industrial city near the site of a vil. at the foot of the Magnitnaya Mt. on the S. slopes of the Urals, in the Chelyabinsk region of the R.S.F.S.R. It owes its existence to the presence of two hills consisting of high-grade iron ore and partly to Stalin's presence, when he warned the Russian people in 1931 that they must make Russia as strong as the surrounding capitalist nations or perish. By 1933 250,000 people—Communists, kulaks, foreigners, Tartars, and a mass of Russian peasants—had made of M. one of the biggest steel production centres in Europe. Money was spent on it lavishly, men froze, hungered, and suffered, but the work of construction went on with a disregard for individuals and with a mass heroism unparalleled in hist. As in the case of other new industrial regions developed during the period of the first Five-Years plan, the semi-trained workers of M. could not operate the elaborate machines installed and costly equipment was often ruined, while men were gassed, poisoned, and maimed. Yet the output of steel increased from year to year and the importance of M. to the Soviet Union may be gauged from the fact that its steel played a vital part in the defence of Stalingrad. Great blast furnaces and steel mills supply large machine-building and machine tool works both at M. and in other tns. of the Urals; while a great chemical industry has been estab. The whole M. combine covers an area of nearly 30 sq. m. in the valley of the R. Ural. Pop. 145,900.

Magnitude, in astronomy, the brightness of a star. The term was used in the form *peripha* by Ptolemy, who pub. a catalogue of the stars visible in the N. hemisphere, and divided them into six classes according to their brightness, with which was naturally associated some idea of their

relative size. The six Ma. of Ptolemy were arranged with the brightest in the first M., and proceeded to the sixth M., or least visible stars. He also introduced some measure of subdivision, attaching the symbol μ to the M. of a star if it exceeded the average of its class, and attaching the symbol σ if it was below the average in brightness. Many attempts have been made to catalogue the stars with respect to M., and the following is given as the result of observations on the numbers and M. of stars between the N. pole and 35° S.: 1st M., 14; 2nd M., 48; 3rd M., 152; 4th M., 313; 5th M., 854; 6th M., 2010. It is estimated that the numbers of stars required to give the same light as a star of the first M. are as follows, counting from the first M. to the sixth: 1, 24, 6, 16, 40, 100.

Magnolia, large genus of hardy and half-hardy deciduous and evergreen flowering shrubs of the order Magnoliaceae with fragrant solitary flowers. *M. grandiflora* is a fine evergreen tree attaining a height of 70 ft. in America, known as the American holly. From its seeds the free-flowering Exmouth variety was propagated, and the Chinese yulan, *M. conspicua*, of which there is a purple-flowered double-flowered variety. The yulan bears large, water-lily-like fragrant flowers on leafless twigs in March. *M. stellata* is a small shrub with an abundance of white star-shaped blooms, which appear in April. It is a garden favourite and is best kept as a bush, in which state it will remain fruit-flowering for years. Both the Jap. *M. Sieboldii* (parviflora) and its Chinese cousin *M. sinensis* are good strong garden plants, though like most of the favourite flowering shrubs, they are damaged by late spring frosts. Both tend to form small bushy trees, very symmetrical when well grown. These Ms. flower over a long season; *M. parviflora*, in particular, is seldom without flowers from June to Aug. A light soil is necessary for the M. and the addition of ample manure is also desirable. The M. should, when possible, be grown in sheltered positions. Some species need the assistance of glass.

Magnoliaceae, natural order of trees and shrubs, divided into two tribes: Magnolieae, with carpels in a cone, and Winterae, with carpels in a single whorl.

'Magnolia State', see MISSISSIPPI.

Magnus, name of the kings of Norway, among whom may be mentioned:

Magnus the Good (d. 1047), accepted as king in 1035, who became king of Denmark also in 1042, was a son of St. Olaf.

Magnus the Barefooted (1073-1103), became king in 1095. He subdued the Orkneys and the Hebrides, but was killed while on an expedition to Ireland.

Magnus the Lawgiver (1238-80), son of Haakon IV., reigned from 1263. He constituted himself a reformer of the laws of his country, compiled laws for Iceland, and made the crown hereditary.

Magnus Eriksson (1316-74), king of Norway and Sweden in 1319. In 1313 Norway was given to his son Haakon, and in 1363 he himself was forced to give up the throne to Albert of Mecklenburg.

Magnusson, Arni (1663-1730), Norse scholar, b. in Iceland. After studying in Copenhagen, he acted for a short while (1701-2) as prof. of Dan. antiquities in the univ. there. Subsequently he travelled through Iceland (1702-12), making a collection of N. antiquities and old Icelandic MSS. This valuable collection, a great part of which was destroyed by fire in 1728, is preserved in the Copenhagen Univ. See *Catalogue*, with memoir, by Dr. Kr. Kaalund (1888-94).

Mago (d. 203 B.C.), Carthaginian soldier, the youngest son of Hamilcar Barca and brother of Hannibal. He took part in Hannibal's great campaign in Italy (217-216 B.C.), and then joined his other brother Hasdrubal in Spain, where he carried on the war for many years. He was defeated by M. Junius Silanus in 207, and at Salpica by Scipio Africanus in 206. The Carthaginian Gov. forthwith ordered him to invade Liguria (204-203 B.C.), and he d. of his wounds on his voyage back to his native city.

Magog, see GOG and MAGOG.

Magpie, familiar name of sev. species of *Pica*, a genus of passeriform birds belonging to the family Corvidae. *P. pica*, or *caudata*, the commonest species, is known all over Europe, and extends through the Palaearctic region; it can easily be tamed; *P. nuttalli*, a native of California, is distinguished by a bright yellow bill and a naked blue spot behind the eye.

Magnificum, see MAINZ.

Magwe: 1. Div. of Upper Burma, comprising the Irrawaddy valley from the delta to the confluence of the Chindwin. Area 17,576 sq. m. Pop. 1,905,300. 2. Dist. of Upper Burma in the M. div. The Irrawaddy forms its W. boundary. The soil is fertile, and oilseeds, rice, cotton, maize, etc. are grown and there are oil-mills. Area 3313 sq. m. Pop. 199,000. 3. Cap. of above dist., and port of the Irrawaddy R., 70 m. S. of Pagan. Pop. 7500.

Magyarország, see HUNGARY.

Magyars, dominant race of Hungary, constitute a branch of the Finno-Ugric tribe, and came originally from the plains E. of the Carpathians. About the year 896 they descended into the Moravian realm, under the leadership of Arpad, the great national hero, and caused great devastation and pillage, until they were driven back by the Gers. in the tenth century. After this they settled down to a more peaceful existence, embraced Christianity, formed laws, and made rapid advances in civilisation. There are other races in Hungary, Serbians, Wallachs, Ruthenians, Slovaks, and Gers., but the M. have always taken the most prominent part in public affairs. The language spoken is of Finnish derivation. See also HUNGARY.

Mahabaleshwar, chief hill-station of Bombay Prov. on the E. slope of the W. Ghats, founded as a sanatorium in 1828. It is situated on a ridge about 4500 ft. high, 74 m. S. of Poona. Near the foot of the hill is the source of the R. Krishna, marked by an anct. temple which is the resort of Hindu pilgrims.

Mahābhārata, sacred book of the Hindus, and one of the two great epics of anc. India, the other being *Rāmāyana*. It is probably the longest epic in the world, being about eight times as long as the *Iliad* and *Odyssey* together. The authorship has been ascribed to Vyāsa, but that is probably a generic name; it bears all the marks of being a compilation, for its contents are heterogeneous in the extreme. The leading story relates the contest between the Kurus, representing the spirit of evil, and the Pandus, representing the spirit of good. The temporary triumph of evil is shown by the adversities of the Pandus, while their ultimate renunciation of an earthy for a heavenly kingdom signifies the final victory of good. The text was first printed in 1834-39 in Calcutta. See R. C. Dutt, *Mahabharata* (1899) (Everyman's Library, 1910), and E. W. Hopkins, *The Great Epic of India, its Character and Origin*, 1901, 1921.

Mahadeva, see SIVA.

Mahaffy, Sir John Pentland (1839-1919). Irish classical scholar, b. in Switzerland. He was prof. of anc. hist. at Dublin. His chief publs. are a trans. of Kuno Fischer's *Commentary on Kant* (1866); *Social Life in Greece from Homer to Alexander* (1874); *Greek Antiquities* (1876, a standard school-book); *History of Classical Greek Literature* (1880); *The Greek World under Roman sway* (1890); *The Silver Age of the Greek World* (1906). He also deciphered and ed. the Petrie Papyrus in the *Cunningham Memoirs* (1891-1905).

Mahallat: 1. (formerly Anar). Prov. of Central Persia between Kashan and Iraq, and traversed by the Kum R. Pop. about 20,000. 2. Cap. of the above. Pop. about 9000.

Mahan, Alfred Thayer (1840-1914), Amer. rear-admiral and writer, b. Sept. 27, at New York. He served in the navy for forty years, retiring in 1896, and became rear-admiral (retired) in 1906. He was the author of *The Gulf and Inland Waters* (1833); *Influence of Sea Power upon History* (1890); *Influence of Sea Power upon the French Revolution and Empire* (1892); *Life of Nelson* (1897); *The Interest of the United States in Sea Power* (1897); *The Problem of Asia* (1900); *The South African War* (1900); *From Sail to Steam* (1907); *Naval Administration and Warfare* (1908); *The Harcat W'than* (1909); and *Interest of America in International Conditions* (1910). His books on the influence of sea power on hist. struck a new note and soon attained the position of classics on the subject. The grip of the Brit. Navy during the First World War and its remorseless blockade of Germany fully substantiated M.'s theories while in the Second World War, the combined power of the Brit. and Amer. Navies supplied still further confirmation of the validity of M.'s teaching, subject to such modifications as may be necessary through the phenomenal development of air power.

Mahanadi, or **Mahanuddy**, riv. in India, rises in the Rajpur dist., Central Provs., and flows first N.E., then S.E., and finally through Orissa to the bay of Bengal, which it enters by numerous arms. It is

connected with sev. canals and is used for irrigation purposes. Its length is 520 m.

Mahanoy City, bor. of Schuylkill co., Pennsylvania, U.S.A., in a valley bounded on the S.E. by the Broad Mt., produces anthracite coal. Pop. 15,000.

Maharajah, see RAJAHI.

Mahatma, Sanskrit word used in theosophy, meaning 'great soul.' It has been given to members of a great brotherhood, persons who are believed to have attained to a higher state of evolution than that of average humanity and who possess the 'secret wisdom of theosophy.' They 'work ever for the service of their race with a perfect and selfless devotion, holding their high powers in trust for the common good, content to be without recognition, having power beyond all desires of the personal self' (Annie Besant). The M. is said by W. theosophists to be endowed with preternatural powers acquired by ascetic or astral means. The name was conferred, as a kind of title, on Gandhi by the illiterate, who looked upon him as a saint on account of his sincerity, asceticism, and simple eloquence. See also THEOSOPIHY.

Mahāvamsa, title of two celebrated books written in Pāli, and recording the hist. of Ceylon from its earliest period to the reign of Mahāsena, who d. in A.D. 302.

Mahavilly-Gunga, chief riv. in Ceylon, rises in the centre of the Is., flows N. past Kandy, and enters the Indian Ocean to the S. of Trincomalee.

Mahāvira, was the twenty-fourth and last deified saint of the Jains, and his name signifies 'great hero.' His story is told in the *Kalpa-Sutra* and the *Mahāvira-Charita*, two works held in great authority by the Jains. M. appears to have been a contemporary of Buddha.

Māhayāna, or the Great Vehicle, is the name given to a developed or widened form of Buddhism, but, as some say, a divergence altogether from 'official' Buddhism or the tradition of the Pāli canon. Buckmann pointed out that 'the picture of a vehicle was frequently used in Buddhism to symbolize the doctrine which bore the disciples across the world to the goal of Nirvāna.' When in N. India 'official' or the more original form of Buddhism underwent a schismatic change, being developed and widened, the new form was named M. or the Great Vehicle, the older form being named Hinayāna or the Little (or Low) Vehicle. The M. teaches the existence of many Bodhisattvas and develops both a theism and polytheism which are far removed from the original creed of Buddhism, and would seem to have been developed during the conversion of China to Buddhism between the second century B.C. and the eighth century A.D. According to some, however, the newer form was Hinayāna Buddhism, represented mainly in Ceylon, while the Māhayānists were the upholders of the older teaching who refused to deny the persisting reality of the man or soul, and after their expulsion by the Vibhajjavādins or Hinayānists

found their way to China and came later to be called Mahayānist. However that may be, it seems that neither form can claim to be compatible with official Buddhism; yet both can claim to have originated from the mandate set forth in N. India by the Gautama. The essential difference between the two is usually expressed as that between the ideal of *arahan* (saint) and that of the *bodhisattva* (enlightenment-being). In this context *aranship* means the man fading out, when consummated, into no-longer-man, whatever that may ultimately mean; *bodhisattva* means the man, in consummating, culminating as man, *as de jure*, if not *de facto* a Buddha. That this means hosts of Buddhas is merely a way of expressing the universal pervasion of man (see Rhys Davids, *Buddhism: its Birth and Dispersal*, 1912; revised ed. 1934). These new metaphysical theories, developed in the later schools of Buddhism, did not, in the opinion of some writers, contravene older ideals, but, rather, supplemented them by the doctrine that each individual was potentially a Buddha, and that he should aim both at attaining Nirvāṇa for himself and at becoming a Buddha, whereby he can preach to others. The metaphysical teaching of M. is known as the doctrine of the *void* or *śūnyatā*. It is found chiefly in the class of sūtras known as *Prajnaparamita* and is generally termed negativism. See also Monier-Williams, *Buddhism* (1890) and works by G. Hopkins, H. Hackmann, and D. T. Suzuki, 1907.

Mahdi ('he who is guided aright,' from Arab *hadd*, be guided), the expected Messiah of the Moslems, supposed to have been promised by Mohammed (though not mentioned in the Koran) to come and fill the world with righteousness, as the 'Imām' or caliph of God. Abdulla, a Persian Shia of the tenth century, much influenced by Zoroaster's doctrines, prophesied the coming of a future Muslim teacher, greater even than Mohammed, who should never die. This teaching was accepted by the sect of Ismailis, from whom arose the first caliph of the Fatimite dynasty in N. Africa. 'Obaid-Allah al-mahdi' (909-33). Other fanatics who claimed to be 'al-mahdi' and waged religious wars in different parts were the third Abbasid caliph (775-c.84), the descendants of 'Alī, one of whom disappeared mysteriously in 879, and the Dongolero Mohammed Ahmed (c. 1843-45) who attempted to conquer the E. Sudan. He made El-'Obeid his cap. (1883), Khartoum was taken (1885), and Gordon killed. The empire was overthrown by Anglo-Egyptian forces, and Mohammed's successor crushed by the Brit. expedition to Dongola (1896), and by Kitchener's victories at Atbara and Omdurman (1898). See J. Darmesteter, *The Mahdi, Past and Present*, 1885; Sir F. Wingate, *Mahdism and the Egyptian Sudan*, 1891; B. Burleigh, *Sirdar and Khalifa*, 1898; and R. A. Hermann, *The Mahdi of Allah*, 1931.

Mahdia (Mahdiya, Mahediya), port of Tunis situated at the end of a rocky

promontory, some 47 m. by rail S.E. of Suse and 100 m. S. of Kairwan. There is accommodation in the port only for small boats, steamers having to lie at anchor in the roadstead 400 yds. outside the port. M. is on the site of a Phœnician settlement and was founded by 'Obaid Allāh in A.H. 303 (A.D. 912), the first Fatimite caliph, who made it his cap. It became a place of some importance owing to its fortifications, strategic situation, and trade. When the seat of the Fatimite emperor was removed to Egypt, the Zirides, a branch of the Sanhaja Berbers, ruled as their nominal lieutenants at M. The Zirite dynasty was eventually extinguished by Roger I. of Sicily, who captured M. in 1148 and established his authority over all the Tunisian coast. The Normans held the place for a short time but were driven out again by Almohades (q.v.). A corsair, Dragut, also made it his cap. but was expelled by the Spaniards, who dismantled the fortifications (c. 1575). Pop. 9000.

Mahe: 1. Tn. on the Malabar coast of India, 33 m. N.N.W. of Calicut, belonging to the Fr. Pop., with adjoining dist., 14,700. 2. Largest is. of the Seychelles, in the Indian Ocean, 17 m. long and covered with high granite mts. The chief tn. is Port Victoria. Area 554 sq. m.

Maheshwar, tn. in Indore, 'Madhya Bharat, India, stands on the N. bank of the Narmada R.; it is of great antiquity, and has many historical associations. Manufs. silk and cotton. Pop. 10,000.

Mahler, Gustav (1860-1911), Austrian composer and conductor, b. at Kalitz, Bohemia. He won the conservatoire prize at Vienna, 1873, and then studied philosophy at the univ. His first completed work was *Das klagende Lied* (pub. 1899), a cantata, the poem of which was written by him in 1878. He composed his first vol. of songs in 1883, in which year he also began his first symphony. He adapted Weber's opera fragment *The Three Pintos*, which was performed in Leipzig in 1888. M. held the posts of director of Royal Opera in Budapest, 1888, and of Vienna Opera in 1897—the greatest period of the Vienna Opera House. He went to America in 1907, completing there his *Lied von der Erde* based on Chinese poems. His works include ten symphonies (the last unfinished), two song-cycles, and many other songs, including five to words by Rückert and settings from *Des Knaben Wunderhorn*. See P. Bekker, *Mahler's Symphonies*, 1921; also lives by G. Adler, 1916; R. Mengelberg, 1923; R. Specht, 1905, 1925; and A. Mahler, *Memories and Letters* (Eng. trans. 1916).

Mahmud I. (1696-1754), sultan of Turkey, the son of Mustafa II. He ascended the throne in 1730 after the deposition of his uncle, Ahmed III., and continued the war against Nadir, Shah of Persia, but with little success, making peace in 1736. He then entered upon a war with Russia and lost Ochakov in 1737. The Austrians, the allies of Russia, met with a serious defeat at Krotzka, and peace was made at Belgrade in 1740.

Mahmud II (1785-1839), sultan of Turkey, the son of Abd ul Hamid I, and the successor of his brother Mustafa IV, in 1808. The war with Russia was concluded four years after his accession by the treaty of Bucharest. In 1821 the war of Gk. Independence broke out, and Gk. sailors of the Turkish Navy mutinied. After the battle of Navarino Russia declared war (1827), and forced M. to sign the peace of Adrianople (1829). In order to suppress his upstart vassal, Mehmet Ali, the pasha of Egypt, he secured a Russian alliance in 1833, and ordered the invasion of Syria in 1839, and died before the news of his defeat reached him.

Mahmud of Ghazni (999-1030) powerful

popular than formerly, but it is still used for cabinet work and aeroplane propellers. Honduras M. and Mexican M. come from an allied species, both grow also in India. Species of *Corocarpus* are known in N. America as mt. M. Substitutes for M. include the somewhat coarse wood of *Persea indica* of Madras, the wood of *Podocarpus totara*, the M. or Totara pine of New Zealand, the wood of several species of eucalyptus notably the blue gum (*E. globulus*) and *E. resinifera*. The Indian redwood (*Soyimida febrifuga*) is sometimes called the Indian M. *Ahaya senegalensis* is the African M. and the woods are very similar. The Sp. cedar (*Cedrella odorata*) and Australian cedar (*C. australis*) are

Disc of Education Gulf Coast

ruler of Afghanistan and the first Imamoonach to assume the title of sultan. His father Sabuktigin, died in 997, and left his throne to a younger son Ismail Mahmud, who was governor of Nishapur. He hastened to Ghazni, deposed his brother and seized the throne. He repeatedly made incursions into India (1001, 1006, 1007, and 1009), and carried away much booty. He also subdued Ghor Turkistan, and Khwarizm (Khiva), and extended his kingdom as far as Samarkand on the N. and Kurdistan on the W.

Mahoba, tn in the Hamirpur dist., United Prov., India 87 m SSW of Cawnpore. It has interesting architectural antiquities. Pop. 11,000.

Mahogany, fragrant aromatic wood of *Swietenia mahagoni*, a large central Amer. and Cuban tree. The heartwood is close-grained, hard, and durable, and takes a fine polish, and its production is a very important industry not only in its native ter., but also in India, where it has been successfully introduced and extensively planted. M. furniture appears to be less

also called M. White M. or Prima Vera (*Labeana Donnell Smithii*) resembles M. except in colour. Of the Australian Eucalypts *E. cotyroides* or swamp M. and *E. resinifera* a red wood, also resemble M. very closely, the latter being one of the first to be exported from Australia as timber. The commercial quality of M. is indicated by the markings in the wood: *watered* (transverse wavy lines), *berry* (longitudinal lines), *fastooned* (wreath-like), *whirl cord* (whirl lines), etc. The commercial names are the Sp. (W. Indian), the Honduras and the Mexican.

Mohomedanism, see MOHAMMEDANISM

Mahomet, see MOHAMMAD

Mahon, see PORT MAHON

Mahonia, or Ash-barberry, genus of the Berberidaceae family and closely allied to the barberry, consisting of elegant evergreen shrubs, with pinnate leaves and yellow flowers. There are over forty species and they are found mostly in N. America, Spain, Mexico, and China. Several kinds are cultivated in gardens for their ornamental foliage and flowers,

especially the Jap M (*M. Japonica*), indigenous to China. The fruits of M., like those of the barberry, are frequently insipid and harsh.

Mahony, Francis Sylvester, known as **Father Prout** (1801-66), a humorist entered the order of Jesuits, but abandoned the priesthood in 1832 for literature and became a contributor to *Fraser's Magazine*. His best work contributed originally to that periodical, is the *Reliques of Father Prout* (1846).

Society of Antiquaries of Scotland

MAIDEN

Mahrattas, or **Marathas**, term commonly applied to a mixed race, mainly of Hindu origin, inhabiting Central India, chiefly in the states of Baroda, Indore, and Gwalior but now used to designate all Marathi speaking Hindus in India. They are first mentioned in the seventeenth century as robbers and rebels who rose against the Mogul emperor at Delhi under the leadership of Shivaji, a Hindu adventurer, who proclaimed himself the chief. He was succeeded by his son, Sambaji (1690), who endeavoured to carry out his father's policy, but nine years later he fell into the hands of his enemy, Aurangzeb(e), who put him to death. For over a century they waged incessant war against the Mogul dynasty with varying success but at length they sustained a heavy defeat at Paniput in 1761 at the hands of Ahmed Shah Abdali, the amir of Afghanistan. Their power was eventually broken by the Brit in 1818. The M. are an active and hardy people, and devout worshippers of Brahma. Their language is akin to

Gujarati and Sindhi and their literature is abundant. Marathi speakers now number about 20,000,000. See also **INDIA History**.

Mahren, see **MORAVIA**.

Mährisch-Schönberg, see **STUMPFEN**.
Mai, Angelo, Cardinal (1782-1854), Italian antiquary and philologist, b. in the vil. of Schignano in Lombardy, and educated in various Jesuit estates. He became custodian of the Ambrosian Library, Milan and discovered many forgotten works chiefly from palimpsests. Pope Pius VII. gave him the charge of the Vatican Library, which resulted in the pub. of the famous *Codex Vaticanus*.

Maia, in Grk. mythology, the daughter of Atlas and Pleione was the eldest of the Pleiades and the most beautiful of the seven sisters. In a grotto on Mt. Cyllene M. became the mother of Hermes. The Romans identified her with an old It. goddess of spring.

Maida Vale, residential suburb in the N.W. of London adjoining Kilburn, in the bor. of Edgware.

Maiden, early form of guillotine. An axe was fixed in a frame about 10 ft. high, so that it could move upwards in grooves. When the axe had reached the topmost point it was still in place and fell on the victim's neck. It was first used at the execution of the minor agents employed to murder Elizabeth (1561). It was last used in 1710 and is displayed in the museum of the Society of Antiquaries of Scotland, in Edinburgh.

Maiden Castle, magnificent prehistoric earthwork near Dorchester, Dorset, was a Neolithic settlement with an immense long barrow. It later became a large hill city of the Early Iron Age with a multiple defence system. About A.D. 70 its townsfolk were transferred to the Roman Dorchester and the imposing earthwork was abandoned.

Maidenhair Fern, or *Adiantum Capillus Veneris*, pretty Bilt. fern found in moist, warm situations. It bears its fructification (sporangia containing spores) in short marginal patches on the edges of the subdiv. of the fronds, which are in turn to protect it. It grows well in pots where frost is excluded. M. grass (*Briza media*) is more commonly called quaking grass. M. tree is *Salsburgia adiantifolia*.

Maidenhair Tree, see **GINKGO**.

Maidenhead, municipal bor. in Berkshire, England, beautifully situated on the r.b. of the Thames 28 m. W. of London. It is connected with Taplow on the l.b. of the Thames by a seven-arched bridge. The town is very old and in 1399 was the scene of a contest between the armies of Henry IV. and Richard II. There are many commons and manorial wastes near M. which have been presented to the National Trust. These include Cook Marsh and Winter Hill, with good views towards the Chilterns, Cookham Dean Common and other commons between M. and Marlow with an area of over 600 ac., one containing the remains of a Roman camp known as Robin Hood's Arbour, and Cookham Moor, 3 m. N. of M. Pop. 26,000.

Maid of Norway, see MARGARET.

Maid of Honour are the immediate attendants upon the queen, under the direction of the mistress of the robes. A queen regnant has eight M. of H., a queen consort four. They are given the courtesy title of 'Honourable,' accompany Her Majesty in turn on all occasions, and take precedence next after the daughters of barons.

Maidstone (A.-S. *Mengaid-* or *Medwigston*, i.e. the city of the Medway). (*Blædesstana* is given as the earliest form and 'maiden's stone' as the probable meaning in the *Oxford English Place Names*), co. tn. of Kent, 41 m. S.E. of London by railway and 34 m. by road. A municipal bor., assize and mkt. tn. possessing its own court of quarter sessions. It contains among numerous public buildings a tn. hall, co. hall, co. mental hospital, co. ophthalmic hospital, W. Kent General Hospital, and a museum of local antiquities. There is a sixteenth-century grammar school. It is the depot tn. of the Queen's Own Royal W. Kent Regiment. On the banks of the R. Medway is a group of noteworthy auct. buildings, including the par. church of All Saints, the old college, the archbishop's palace, and the tithe barn. The latter building houses a unique collection of auct. carriages; the tn. possesses sev. parks, including the picturesque Moto Park of over 400 ac. Industries including paper-making, brewing, agric. and electrical engineering, fruit canning, printing, and confectionery. Around the tn. are extensive fruit orchards and hop gardens. Some 337 properties were destroyed or severely damaged and 6,381 were damaged as a result of enemy action during the Second World War. The tn. was shelled by long-range guns in France, but only minor damage was caused. Pop. (1931) 42,300; (1947 (st.)) 49,500.

Maidu, name of a group of Indian tribes, formerly occupying the N.E. of California, U.S.A. A few are still found in this region, while some live near the Round Valley reservation. Their chief occupation is basket weaving. See *Lauren Bride, Tribes of California*, 1877, and R. B. Dixon, *The Northern Maidu*, Amer. Museum of Natural Hist. (vol. xvii.), 1905.

Maidu Language, see under NORTH AMERICAN NATIVE LANGUAGES, *Pacific Areas*.

Malgre, see MEAGRE.

Malides, or **Malans**, sea spiders, with the first pair of feet much larger than the second pair (macropodan). The carapace is much longer than it is wide.

Malikop, tn. of the Adyghe autonomous region of the S.S.F.S.R., on the R. Bielala, 65 m. S.E. of Krasnodar. It is the centre of an oil-producing dist. and a pipe-line links it with Tuzpse on the Black Sea. Pop. 67,300.

Malikov, Apollon' Nikolaevich (1821-1907), Russian poet, b. of an old Russian noble family. He was a student at the univ. of St. Petersburg. He soon achieved celebrity in the literary circles of the cap., and pub. a book of verso

showing the influence of his Gk. and Rom. studies. Later he became intensely nationalistic, looking upon Russians as a chosen people. For decades he served as a censor. The fruit of his thoughts about Russia was embodied in his tragedy *Two Worlds* in which he drew the contrast between E. and W., between Paganism and Christianity.

Mail Armour, fabric of meshes used as a defence against weapons; chain-mail was composed of interlinked rings of metal, and was introduced into the Rom. Army in imitation of the Gauls, and much worn under the later empire, and also in the twelfth and thirteenth centuries. It was very good for its purpose, a 'coat of mail' being marvellously hard to penetrate, but was very expensive to manuf. Later the word mail was used for any kind of armour. See ARMS, ARMOUR.

Mail Coaches, see COACH AND COACHING.

Maillois, Aristide Joseph Bonaventura (1861-1944), Fr. sculptor, b. at Banyuls-sur-Mer in Roussillon, son of a cloth merchant and vineyard owner. Educated at the École des Beaux Arts he began as a palster and then took up tapestry work. In 1900 he taught himself sculpture. With his ceramics he attracted a Paris dealer, Vollard, who cast them in bronze; these sold well and M. began to exhibit in 1902. Attention abroad was attracted to him by his large figures in stone and bronze. Between 1910 and 1914 he was engaged in producing studies for the memorial to Cézanne at Aix-en-Provence. He owed much to Count Harry Kessler, for whose Cranch Press he executed wood engravings. After the First World War his large works included the war memorial for his native Banyuls. As a sculptor his style, temperament, and conception differed fundamentally from that of the great romantic master, Rodin. Where Rodin employed structural beauty in the abstract, M. pursued the classic structure, and where Brancusi and Archipenko concentrated on simplified form, setting in motion revolutionary changes, M. belonged definitely to a period that is past; but by his own quality of workmanship, he had become part of the hierarchy of sculptors whose reputation will endure. He was the first to revolt against the cloying idealism that mars Rodin's pursuit of the naturalistic. Nothing could be more subtly achieved than many of M.'s standing or reclining terra-cottas, but nothing could be more enchanting than their simplicity. They have the directness and grace of Tanagra figurines, and the rustic beauty of the S. countryside where he spent most of his days. Among his best works is 'Ja Douleur,' a monument to the dead, at Céret, and 'Pomone,' a bronze statuette, and the great series of illustrations of Virgil's *Ecliques* which he executed for Kessler. See studies by O. Mirbeau, 1921; M. Denis, 1925; J. Rowald, 1939; and M. Bouvier, 1945.

Maim, By the old law of England he that maimed any man, whereby he lost any part of his body, was sentenced to lose the like part of his own body. This relic

of the *lex talionis* (q.v.) for long survived in Sweden, but has now disappeared from the criminal codes of all civilised nations. At the common law (q.v.), it was only the loss of those limbs or members which might be useful to a man in fight that amounted to maiming, or mayhem, as it was called. It is a felony, punishable by penal servitude to the extent of life, to wound, shoot at, or cause grievous bodily harm to a person with intent to M. him. To kill, M., or wound cattle is a felony. To M. or wound any dog, bird, or beast, not being cattle, is punishable summarily.

Maimachin, vil. of Mongolia, situated on the Russian frontier, opposite Kiakhta, an *entrepôt* of the Chinese trade with Russia.

Maimana, dist. and tn. in Afghanistan, Asia, stands 2860 ft. above the sea. The tn. is large, but has no important industries, its only manufs. being carpets. The pop. is considerably mixed, the largest proportion being Afghans.

Maimand, small tn. in the prov. of Fars, Persia, is famed for its manuf. of rose water, and noted for its almonds. Pop. 5000.

Maimansingh, see MYMENSINGH.

Maimbourg, Louis (1610-86), Fr. scholar, b. at Nancy, entered the Jesuit order and studied theology at Rome. On his return to France, he was employed as a preacher. Having pub. in 1685, *Traité historique de l'établissement et des prérogatives de l'Eglise de Rome*, a work in which he defended the principles of the Gallican Church, the pope caused him to be expelled from the Jesuit order. He also wrote a hist. of the pontificate of St. Gregory (1686), and hist. of Arianism (1673), Lutheranism (1680), and Calvinism (1682). A collected ed. of his works was pub. in Paris in 14 vols. (1668-87).

Maimon, Salomon (1754-1800), Ger. philosopher, b. of Jewish parentage near Mir, in Polish Lithuania. He was trained in the study of Talmud to become a rabbi, but went to Berlin to study medicine, where he was attracted by the philosophy of Maimonides. In 1770 he pub. a commentary on that philosopher's *Mohr Nebuchim* (or *Nebuchim*). His *Vernunft über die Transzendentalphilosophie*, pub. in 1790, estab. his reputation, and secured his friendship with such men as Moses Mendelssohn and Kant. His philosophy is based on that of Kant, but he owes a large debt to Hume. His *Autobiography* was pub. in 1792 (Eng. trans. by J. C. Murray, 1888). See J. Fromer, *Salomon Maimons Lebensgeschichte*, 1911, and A. Zuhersky, *Salomon Maimon und der kritische Idealismus*, 1925; also lives by S. J. Wolff, 1813; J. H. Witte, 1876; and F. Kuntze, 1912.

Maimonides, or more properly **Moses Ben Maimon** ('the light of Israel') (1135-1204), one of the most celebrated of the Jewish rabbis, a theologian, philosopher, and physician, b. at Cordova in Spain, son of a local judge of the Jewish community. Owing to the persecutions of the Jews he removed to Fez in 1160, but afterwards travelled to Jerusalem, ultimately settling

near Cairo, where he became physician to the sultan, and superintendent to the Jewish communities. He won such fame as a physician that the ruler of Palestine, the lieutenant of Saladin, made him physician of his court and of Saladin's family. It is said that he even received an invitation to become the physician of Richard Cœur de Lion during his crusade, but that M. declined as he had grown weary of wandering. His three great works are *The Luminary*, the *Mishneh Torah* (1180) and the *Mohr Nebuchim*. His first book, *The Luminary*, is an attempt to illuminate the construction and contents of the Mishna (q.v.) (Judah's code), but it also shed light on other matters—physics, astronomy, and mathematics. His *Thirteen Dogmas* soon became, and have remained, the most popular definition of orthodox Judaism. Until his time the laws of the rabbis had never been scientifically arranged by subjects. The work of co-ordinating the laws was accomplished by M. in the *Mishneh Torah*, literally 'Repetition of the Law,' which despite criticism, has remained the most distinguished code of Jewish law. His crowning achievement was his philosophical work *Mohr Nebuchim* or 'Teacher of the Perplexed,' originally written in Arabic, trans. into Heb. by his disciple, Samuel Aben Tibbon, and into Lat. by Justinian, bishop of Nablus (Paris, 1520), and by the younger Buxtorf (Basel, 1629), with a preface, which contains an account of the life of M.; and *Pad Hazakah* or 'The Strong Hand,' which contains a complete digest of the Heb. laws. The best ed. is that printed at Amsterdam (1702, 4 vols.). M. founded a college at Alexandria for the instruction of his countrymen, in which he delivered lectures on philosophy and the Jewish laws. A M. fund was instituted by the Heb. Univ. of Palestine in 1935, in the form of an endowment for Jewish research and science. See A. Rohner, *Das Schöpfungsproblem bei Moses Maimonides*, Albert Magnus, and Thomas von Aquin, 1913, and S. Sarachek, *Faith and Reason*, 1935; also studies by L. C. Lévi, 1911, and J. Munz, 1912.

Main, riv. of Germany, the largest affluent the Rhine receives from the right, is formed by the union of two branches, the White and Red M., 4 m. below Kulmbach, in Bavaria. The M. has a winding westward course 310 m. in length to the Rhine, into which it falls at Mainz. It is navigable for the last 220 m. The printrs., on its banks, are Schweinfurt, Würzburg, Aschaffenburg, Offenbach, and Frankfurt-on-M., sev. of which (especially Schweinfurt on account of its ball-bearing factories) suffered considerable damage from air raids in the Second World War. The riv. is linked with the Danube by the M.-Danube Canal (Ludwigskanal) from Bamberg to Kohlheim, navigable for barges of 1500 tons.

Maine, Sir Henry James Sumner (1822-1888), Eng. jurist and legal historian, eldest son of James M., M.P., of Kelso, Roxburgh, b. in India. Educated at Christ's Hospital and Pembroke College,

Cambridge; in 1847 he was made regius prof. of civil law at Cambridge, and in 1852 reader in Rom. law and jurisprudence for the Inns of Court; called to the Bar in 1850. He went to India as legal member of the Indian Council, which post he held with distinction for seven years. Appointed in 1869 corpus prof. of jurisprudence at Oxford; became a bench of the Middle Temple in 1881. His best known work is *Ancient Law* (1861; now ed. by Sir F. Pollock, 1930). He also wrote *Village Communities in East and West* (1871, 1890); *The Early History of Institutions* (1875, 1890); *Early Law and Custom* (1883, 1890), *Popular Government* (1885); and *International Law* (1888). See J. Hutchinson, *Notable Middle Templars*, 1902; and W. S. Holdsworth, *Some Masters of English Law*, 1938.

Maine, most north-easterly state of the U.S.A., known as the Pine Tree State, bounded N.E., N., and N.W. by Canada, W. by New Hampshire, and S.E. by the gulf of M. Owing to the beautiful climate and fine scenery, it contains more summer resorts than any other state. So greatly is the coast indented that though only some 250 m. by straight measure its windings make the actual length 2486 m. There are 1300 wooded is., among them Grand Manan Is. and Mt. Desert containing Acadia National Park. M. was at one time overrun by the Laurentian glacier, and as a result there are innumerable lakes affording excellent fishing. The N. part of the state is hilly, the highest peak being Mt. Katahdin (5273 ft.). The prin. rivs. are the St. John, Kennebec, Androscoggin, and Penobscot; their waters are utilized as a source of power. Moose, caribou, and deer abound, so that there are good hunting and shooting. A considerable part of the state is unfit for cultivation, but in the valleys the soil is good, and farming, especially dairy and poultry farming, and market gardening are carried on. M. has the largest potato output in the U.S.A.; oats, hay, and apples are also grown, and horses, cattle, sheep, and pigs are reared. Granite, limestone, feldspar, and slate are quarried. Fishing and the canning of fish, and lumber are important industries, the latter, there being wood-pulp and paper mills, being the chief manufacturing product: 110,000 ac. of standing timber were destroyed in a fire in 1947, and M. was declared a distressed area. Other manufs. are cotton and woollen goods, and boots and shoes. The chief tns. are Portland, the main port (73,600); Lewiston (38,600); Bangor (29,800); Auburn (19,800); Biddeford (19,700), and Augusta, the cap. (19,300). The state is governed by a Senate of thirty-three members and a House of Representatives of 151 members, both elected for two years; it sends two senators and three representatives to Congress. There is a state univ. at Orono, Bowdoin College (q.v.) at Brunswick, Bates College at Lewiston, and Colby College at Waterville. Communications are good, there being excellent roads, some 2750 m. of railway, steam and electric, which connects

with Canadian lines, and forty-seven airports.

Sir Ferdinando Gorges, regarded as the founder of M., was granted land S. of the Kennebec R. in 1622. During the Eng. Commonwealth, however, Massachusetts took possession of the dist. and retained it until 1820, when M. was admitted to the Union as a separate state. The boundary was long a cause of dispute first between England and France, then Britain and U.S.A. It was finally settled in 1842 by the Webster-Ashburton Treaty. Area 33,215 sq. m. (including 2175 of water); pop. 911,000.

See Maine Historical Society's Collections and Baxter MSS., 46 vols. (Portland), 1865-1916; L. L. Hubbard, *Woods and Lakes of Maine*, 1883; J. S. C. Abbott, *History of Maine* (2nd ed.), 1892; W. Macdonald, *The Government of Maine*, 1902; H. S. Burrage, *Beginnings of Colonial Maine*, 1914; L. C. Hatch, *Maine: a History*, 1919; G. Starkie, *Maine, its History, Resources, and Government*, 1930; and Federal Writers' Project, *Maine: a Guide 'Down East'*, 1937.

Maine, old Fr. prov. It formed with Perche a military gov. during the sixteenth century, and since 1790 has been merged in the depts. of Sarthe and Mayenne, of which the caps. are Le Mans and Laval. In 1835 the bishoprics of Le Mans and Laval were separated. Until the end of the ninth century the hist. of M. can only be traced through that of the bishops of Le Mans. The first hereditary count of M. was Roger (c. 892 c. 898). In 1110 M. formed part of Anjou, but in 1154 it became an Eng. possession under Henry Plantagenet. In 1204 it again passed into the hands of the Fr., and in 1216 was given to the count of Provence. In 1328 it once more passed to the crown of France, but was given to Louis, the second son of King John II., in 1356. In 1425 it was taken by the Eng. and lost again in 1448, returning permanently to the crown of France in 1451.

Maine de Biran (real name Maine François Pierre Gonthier de Biran) (1766-1824). Fr. philosopher, b. at Bergerac, son of a physician. Early devoted himself to the study of psychology and continued to do so whenever time allowed, leading a secluded life during the revolution on his paternal estate at Bergerac. But after the Reign of Terror he took some part in political affairs, becoming, in 1797, a member of the Council of Five Hundred. He was subsequently excluded from that body as a suspected royalist. In 1816 he became councillor of state. His philosophical works include the essay *Influence de l'habitude* (1802); *L'aperception immédiate* (1807); and *Examen des leçons de philosophie de Laromiguière* (1817). The first named revealed the influence of Locke and Condillac's sensualist philosophy, but he subsequently concluded that Condillac's notion of passive receptivity in the formation of habits as the sole source of conscious experience was erroneous in both fact and method. He developed the genetic method and concentrated on the psychological aspect of

experience, progressing from intellectualist to mystical theosophist. His chief works, which showed both metaphysical subtlety and great originality, were not pub. in his lifetime, but an incomplete collection, by Victor Cousin, appeared in 1834 and 1841, new ed. by P. Tisserand, 1920 ff. See A. Lang, *Maine de Biran und die neuere Philosophie* (Cologne), 1901; and monographs by E. Naville, 1874; A. Kähmann, 1901; M. Couailhac, 1905; A. de la Valette-Monbrun, 1914; and G. Feraud, 1938.

Maine-et-Loire, dept. in France, formed out of the old prov. of Anjou, and named from its two prin. rivs. the Maine and the Loire, is bounded N. by the depts of Mayenne and Sarthe, E. by Indre-et-Loire, S. by the depts. of Vienne, Deux-Sèvres, and Vendée, and W. by Loire-Inférieure. It has four arrons., Angers, Cholet, Saumur, and Segré. Area 2810 sq. m. Pop. 496,068. The dept. presents a pleasing variety of low hills, mostly planted with vines (the Saumur vintage of wine is well known), and of plains, which are very fertile, growing cereals, hemp, and beet. There are granite, freestone, and slate quarries, and coal is mined near Chalonnes. The dept. belongs entirely to the basin of the Loire, which riv. crosses it from E. to W., and forms in its course a very beautiful ls. The N. dists. are drained by the Mayenne and its feeder the Oudon, by the Sarthe and its feeder the Loire, and by the Authlon. The Mayenne and the Sarthe unite above Angers, and form the Maine, which after a course of about 5 m. falls into the Loire S. by W. of Angers, the cap.

Mainland, Orkney Is., see POMONA.

Mainotes, The, inhab. of the Maina peninsula, S. Greece, are sometimes regarded as descendants of the anc. Spartans, whose land they now occupy, but more probably they are of Slavonic origin. They number 60,000. Formerly independent, they fought for the liberty of Greece, but after the death of their leader Petros Mavromicheli their independence was destroyed.

Mainpuri, dist. of the United Provs., India. It has an area of 1679 sq. m. and is mainly an agric. dist., reasonably well irrigated; but has few arts or manufs. beyond the making of glass bangles, wood-carving, and cotton-spinning. Its chief exports are wheat and other grains, oil-seeds, hides, and cotton. The chief tn., of the same name, has a pop. of about 19,000.

Maintenance, in criminal law, means the officious intermeddling in a lawsuit that in no way concerns one, by *maintaining* or assisting either party with money or other material aid to prosecute or defend it. Champerty (q.v.) is a species of M. M. is a misdemeanour punishable by fine and imprisonment. Prosecutions are never heard of, owing to the great difficulty of proving a manifestly improper motive in any particular case. It is not M. to help a poor litigant out of charity, and as assistance, pecuniary or otherwise, is always justifiable where one has an interest in the subject-matter in dispute, as that of a

remainderman (q.v.), or a superior landlord, though not actually a party to the action. Apparently it is never M. to assist another in a *criminal* prosecution or defence. The term originates in the feudal practice by which lesser persons wore the badge of the greater barons and fought in their wars, in return for protection and M. in quarrels. Statutes against the practice, which gave independent power to the barons, were virtually disregarded until Henry VII. insisted upon their observance.

Maintenance, Cap of, in heraldry, a cap of crimson velvet turned up with ermine which is carried before a Brit. sovereign at his coronation, opening of Parliament, or other state occasion, by the hereditary bearer, the marquess of Winchester. A similar C. of M., also called 'cap of dignity,' is the privilege of certain noble families. The ducal cap has two peaks behind, and is surmounted with the family crest.

Vicomtesse de Rense

MADAME DE MAINTENON
Painting by H. Rigaud.

Maintenon, Françoise d'Aubigné, Marquise de (1631-1719), daughter of Constant d'Aubigné and of Jeanne de Cardillac, and granddaughter of Théodore Agrippa d'Aubigné. Françoise was b. in the prison of Niort, where her father was then confined. On obtaining his release, he went (1639) with his wife and daughter to Martinique, where he d. in 1645. Françoise and her mother then returned to France, and on her mother's death, her father's sisters placed her in a convent, where, at the age of fourteen, she was reluctantly converted to Rom. Catholicism. When she was sixteen she became acquainted with the poet Scarron, whom she married. She now lived in the midst of the refined and intellectual

society which frequented the house of the poet. He d. in 1660, and four years afterwards she was entrusted with the education of the two sons whom Mme de Montespan had borne to Louis XIV. and now becoming acquainted with the king soon fascinated him and exercised an extraordinary ascendancy over him. In 1684, after the death of the queen, Louis privately married her, and she had much influence in the selection of ministers and generals. When he d. in 1715, she retired to the former abbey of St. Cyr, and here she d. See lives by C. C. Dyson, 1909; Mme Saint-René Taillandier, 1920; and H. C. Barnard, 1934; also M. Daniellou, *Madame de Maintenon, éducatrice*, 1946.

Maintenon, tn. in the dept. of Eure-et-Loire, France. 10 m. N.W. of Chartres. There is a seventeenth-century aqueduct, and a château of the fifteenth to the seventeenth century, both damaged. The tn. suffered some destruction in the Second World War. Pop. 1793.

Mainz, or **Mayence**, anct. city and fortress of the Ger. Empire, in the Rhineland-Palatinate, 20 m. W.S.W. of Frankfurt. It is situated on the l. b. of the Rhine, just below the influx of the Main, and is connected with Kassel on the opposite side by a fine modern bridge. In the centre of the tn. stands the cathedral, which dates from the thirteenth century. Other notable buildings are the old electoral palace, containing important public collections and a library, the Romano-Ger. museum, gallery, and church of St. Stephen (1257-1328). M. is an important riv. port. Furniture, pianos, machinery, chemicals, leather goods, soap, etc., are manufactured. It manufs. sparkling wine and is the headquarters of the Rhine wine trade. M. (anct. *Maguntiacum*) was founded in 13 B.C. by Drusus, and there are sev. interesting Rom. remains. After the fall of the Rom. Empire, the fort suffered from attacks by Vandals and Huns, but regained its strength by the thirteenth century, when it was the head of a confederacy of Rhenish cities. Gutenberg (q.v.) made it famous in the fifteenth century as a centre of book printing. The small size of the type of the *Mainz Indulgence* is the first evidence of the use of metal matrices and hand moulds for casting type. The detailed studies, e.g. of Zedler and Winslow, tend to limit Gutenberg's invention to these mechanisms but they do not destroy the claim of M. to be the bp. of typography. It was captured by the Fr. in 1797, and formally ceded to France by the treaty of Lunéville (1801). It was restored to Germany by the treaty of Paris (1814), and was assigned to Hesse-Darmstadt in 1816. The outer fortifications were removed in 1920. During the Fr. Army's occupation of the Rhine after the First World War, M. was the headquarters of the commander-in-chief.

M. was involved in the W. front campaign in March 1945. M. itself being reached by the Allies on the 20th. So swift and heavy were the blows of the Amer. Third Army across the lower

Moselle and the W. bank of the Rhine that the Gers. were too disorganized to defend the E. bank. In these circumstances the Amer. Seventh Army, exploiting the adventurous seizure of the Remagen bridgehead, crossed the Rhine between M. and Mannheim. While the Third Army crossed near Oppenheim, to the S. of M. (22-24 March). Darmstadt, Frankfurt, Aschaffenburg, Marburg, and other large tns. fell in swift succession as the war approached its closing days. See further under WESTERN FRONT IN SECOND WORLD WAR. See G. J. Holler, *Das goldene Mainz und seine Geschichte* (vol. 1.), 1910; A. Trönnier and W. Haefele, *Mainz die Gutenbergstadt, 1410-1940*, 1940. Pop. 159,000.

Mair, John, see MAJOR, JOHN.

Maisky, Ivan Mikhailovich (b. 1881), Russian diplomatist and writer on political subjects, educated at a secondary school in Omsk and at St. Petersburg and Munich Univs. Began as a journalist and then entered the Soviet diplomatic service, being chief of the press dept., in the foreign office, Moscow (1922), Counsellor at the Soviet Embassy, London, 1925-27. Minister to Finland, 1929-32. Amb. of U.S.S.R. in Great Britain, 1932-43, in which capacity he greatly improved Anglo-Russian relations. Assistant people's commissar for foreign affairs, U.S.S.R., 1943-46. He negotiated a trade agreement with Great Britain in 1934 and the Anglo-Soviet Naval Treaty of 1937. He also negotiated pacts of mutual assistance with Finland, Poland, and Czechoslovakia at various times between 1932 and 1941. In 1942 he concluded agreements with Canada on the estab. of diplomatic and consular relations. He wrote *Germany and the War* (1916); *Political Germany* (1917); *Modern Mongolia* (1927); *Foreign Policy of the R.S.F.S.R.* (1922); and *Before the Storm* (1944).

Maisonneuve, Paul de Chomedey, Sieur de (d. 1676), Fr. colonial missionary and first governor of Montreal. A veteran warrior, imbued with the spirit of the early crusaders, he was chosen to be the leader of a body of devout Fr. men and women whose mission in the Iroquois country led to the founding of Montreal. With a party of only forty men and four women, M. left Quebec on May 8, 1642, in a pinnace, a barge, and two row-boats, and ten days later reached the is. of Montreal, where he preached a sermon and raised an altar. M. had been warned at Quebec to abandon the plan, but he declared that his followers would go on even 'if every tree were an Iroquois.' Though the beginnings of Montreal were full of peril, M. and his co-founders refused to admit defeat. He was governor of the settlement of Montreal for twenty-two years and proved a tower of strength. Among his associates was Jeanne Mance, under whom was founded the first hospital in Montreal, to which she fearlessly devoted the rest of her life. A decade later came Marguerite Bourgeoys, who founded the first school in Montreal. The tn. of M., named after

the sieur de M., is a manufacturing centre adjoining the city of Montreal.

Maisons-Alfort, tn. in the dept. of Seine, France, on the Marne, 3 m. S.E. of Paris. It has a veterinary school founded by Bourgelat in 1766. Pop. 36,400.

Maisons-Laffitte, tn. in the dept. of Seine-et-Oise, France, on the l. b. of the Seine, 10 m. N. of Versailles. Pop. 13,500.

Maistre, Joseph Marie, Comte de (1754-1821), Fr. publicist and philosopher, b. at Chambéry, son of Comte François-Xavier de M., president of the Senate of Savoy. In 1792, on the approach of the republican armies, he fled with his prince, the king of Sardinia, but a year later he returned to Chambéry. Forced to leave Savoy, he settled at Lausanne, where he pub. his *Lettres d'un royaliste sarvoisien à ses compatriotes* and the *Adresse de quelques parents des militaires sarvoisiens à la nation française*. In 1796 he made a world-wide reputation with his book, *Considérations sur la Révolution française*. In 1797 he left Lausanne for Turin, but the conquest of Piedmont compelled him to flee to Venice. Later the king of Sardinia sent him as minister-plenipotentiary to St. Petersburg. Here he pub. a number of works, notably *Éraumes de la Philosophie à Liou* (1817); *De l'Épiscopat* (1819); *De l'Église gallicane* (1821); and *Œuvres de St. Petersbourg* (1821). The founder of ultramontanism and an inveterate and prejudiced enemy of revolutionary ideas, he scourged without mercy or discrimination the 'irreligious doctrines of the eighteenth century.' See J. Mandoni, *Un Homme d'état italien*, 1900; G. Goyau, *La Pensée religieuse de Maistre* (2nd ed.), 1921, and F. Bayle, *Les Idées politiques de Joseph de Maistre*, 1915.

Maistre, Xavier de (1763-1832), Fr. soldier and writer, brother of the above, b. at Chambéry. He served in the Piedmontese Army, but on the annexation of Savoy by the Fr. soldiers he took a commission in the Russian Army, in which he rose to the rank of general. He served in the Austro-Russian campaign and fought in the Caucasus. Finally he settled in St. Petersburg, where he d. He wrote a very pleasant fantasy called *Voyage autour de ma chambre* in 1794. His subsequent works include *Les Larmes de la cité d'Aoste* (1811); *Les Prisonniers du Caucase* (1815); *La jeune Sibérienne* (1815); and *L'Expédition nocturne* (1825). See O. A. Sainte-Beuve, *Portraits contemporains* (vol. III.), 1870-71; A. Berthier, *Xavier de Maistre*, 1920; and H. Bordeaux, *Amours de Xavier de Maistre*, 1931.

Maitland, Frederic William, Sir (1850-1906), Brit. jurist and legal historian; educated at Eton College and Trinity College, Cambridge. Called to the Bar, 1876, and practised for eight years. Appointed reader in Eng. law at Cambridge, 1884; Downing prof. there from 1888 till his death. Founded the Selden Society for the study of Eng. law and ed. the vols. of the society (1887). His merits as a legal historian were shown in his first important work, *Bracton's Note-*

Book (1887). The work on which his reputation chiefly rests is the *History of English Law before the time of Edward I.* written in collaboration with Sir F. Pollock (2 vols. 1895), the standard authority on the subject and remarkable for its use of paradox. Other works include *Doomsday Book and Beyond* (1897); *Roman Canon Law in the Church of England* (1898); *English Law and the Renaissance* (Ride lecture for 1901); *Year Books of Edward II.* (text and trans.) for 1307-10 (pub. in 1903-5). His lectures (1887) on the *Constitutional History of England from Edward I. to the present time* were pub. posthumously (1908). His collected papers were ed. by H. A. L. Fisher in 1911. See also W. S. Holdsworth, *Some Makers of English Law* (1938).

Maitland, John (and Duke of), see LAUDERDALE, EARL.

Maitland, Sir Richard (1496-1586), of Lethington, Scottish poet, lawyer, and historian, son of Wm. M. of Lethington and Thiristane, who fell at Flodden, and of Martha, daughter of George, Lord Seaton, studied at St. Andrews, and in France, and on his return to Scotland was successively employed by James V., the Regent Arran, and Mary of Lorraine. About 1551-52 he received the honour of knighthood, became a lord of the court of session in 1561 (before which, however, he had the misfortune to lose his sight), and Lord Privy Seal in 1562. All his own verses were written after his sixtieth year, and show what things he had most deeply at heart. For the most part, they consist of lamentations for the distracted state of his native country, the feuds of the nobles, and the discontent of the common people. A complete ed. of M.'s original poems was first pub. in 1830 (one 4to vol.) by the Maitland Club, a society of literary antiquaries. His collection of early Scottish poetry consists of two MS. vols. now in the Pepysian Library, Magdalen College, Oxford. M.'s prin. historical performance is the *Historie and Chronicle of the House and Surname of Seyton*. See W. A. Gaigle (ed.), *The Maitland Folio Manuscript*, 1919.

Maitland, Samuel Roffey (1702-1866), Eng. historian of Scottish birth, b. in London. Educated at Westminster and Cambridge; called to the Bar, 1816, but took holy orders, 1821. Wrote an admirable monograph on the Albigenses and Waldenses (1832). From 1838 to 1849 he ed. the *British Magazine*, to which he contributed papers which were pub. later as *The Dark Ages* (1841) and *The Reformation in England* (1849).

Maitland, William (1528-73), son of Sir Richard M., Lord Lethington; known as 'Secretary Lethington.' He was educated at St. Andrews. He became secretary of state to the queen regent of Scotland in 1558, but joined the Lords of Congregation, then in arms against her. In 1560 he acted as speaker in the Convention of Estates and was sent on a mission to the Eng. court as the representative of Protestant interests in Scotland. He was secretary of state, 1561-66,

being responsible for the foreign policy of Mary Queen of Scots, whom he and Moray supported in opposition to the more extreme proposals of Knox. He showed a conciliatory attitude towards England and worked for the union of the two crowns. He represented Mary Queen of Scots at the court of Elizabeth, but provoked the hostility of the Eng. queen by his connivance at the murder of Rizzio (1566). At first he favoured Bothwell and participated in the murder of Darnley, but on Bothwell's marriage with Mary he sided with the insurgents against Mary's forces at Langside. After Mary's flight to England he secretly favoured her cause and formed a party of her adherents and, together with Kirkcaldy, held out in Edinburgh castle till 1573, when he surrendered. He d. in prison at Leith.

Maitland, West and East, two adjoining tns. in New S. Wales, Australia, 120 m. N. of Sydney. It is both an agric. and an industrial centre: the productivity of the alluvial lands has been much increased by irrigation plants, and various agric. products are to be found in the dist., including oranges and other citrus fruits from the Paterson R. area. There are textile mills, manufs. of bricks, tiles, and pottery, engineering and locomotive workshops, etc., whilst to the S. are the world's richest coal seams. Cessnock is a neighbouring mining tn. of recent development. Pop. 19,500.

Malwand, tn. in Afghanistan, situated 35 m. N.W. of Kandahar, was the scene of a Brit. defeat by Ayub Khan, July 27, 1880.

Maixent (or Maxence), Saint (c. 147-615), abbot of Saint-saturnin, b. at Agde. He entered the monastery of Saint-Saturnin in Poltoux and became abbot there about 500. In 507 he received the visit of King Clovis, who came to request his prayers on behalf of an expedition against the Visigoths. His day is June 26.

Maize, or Indian Corn (*Zea Mays*), cereal grass with broad leaves and stout succulent stems indigenous to the Amer. continent. When ripe the valuable seeds are arranged in compact rows on a rachis; they are white, yellow, red, or purple in colour, very firm and flattened at the apex. The crop is of great economic importance in the warmer parts of America, S. Europe, India, and Australia. The plant is frequently grown in gardens for its ornamental effect and for the green unripened cobs which are used as the vegetable called sweet or sugar corn. It is also grown as a fodder crop. The ripe seeds are fermented in S. America to produce M. beer. A meal flour known as corn meal is widely used in the U.S.A. for making corn bread which is served hot. Hominy, which is ground M. boiled in water and milk, is also widely used in the U.S.A.

Majorda, see BAGRADAS.

Majesty (Fr. *majesté*, Lat. *majestas*, grandeur, greatness, from the base *mag-*, as in *magnus*, great, *major*, greater, etc.), dignity, greatness, a term used especially to express the dignity and power of a sovereign. This application is to be

traced to the use of *majestas* in Lat., to express the supreme sovereign dignity of the Rom. state, the *majestas reipublice* or *populi Romani*, hence *majestatem ledere*, or *minuere*, was to commit high treason, *crimen majestatis*. Mommsen conjectures that the crime of *crimen majestatis* or *lese-majesty* in earlier times related exclusively to violation of the rights of the plebs, and only later extended to violations of popular rights generally. There is, however, little evidence in support of this conjecture. In its more precise use, *crimen majestatis* was distinguished from *perduellio*, which connoted essentially acts hostile to the state, as treason and desertion, whereas *crimen majestatis* meant rather some act involving an attack on the respect due to the dignity or sovereignty whether of the people or their representative the king. Later usage, however, made no distinction between *lese-majesty* and *perduellio*, except to assign a much lighter punishment to the former. The term *majesty* was strictly confined in the Middle Ages to successors of the Rom. emperors in the W. Later, the word is used of kings also. In England the use is generally assigned to the reign of Henry VIII. The full form in Eng. use is 'His Most Gracious Majesty.'

Majolica, name properly applied to a species of It. ware in which the body is coated with a thin enamel, on which is laid and fired a painted decoration. It is also applied to similar wares in imitation of the It. ware in other countries. The word in It. is *maiolica*. It has usually been supposed that this ware first came from the is. of Majorca, but it is more likely that the name was given by the It. to the lustrated sp. were imported by ships hailing from the Balearic Isles.

Major, or Mair, John (c. 1469-1550), Scottish historian, a native of (Gleghorn in N. Berwick, studied at Cambridge and Paris, and was the teacher of John Knox and George Buchanan. In 1508 he was a doctor of the Sorbonne, and in 1519 became prof. of divinity at St. Andrews. He wrote in Lat. treatises on divinity and morals, and a *History of Greater Britain*, in which the separate hist. of England and Scotland (*Historia de Gestis Scotorum*) were brought together (pub. 1521). In his writings, while upholding the doctrinal teaching of Rome, he was outspoken in condemning the corruptions of the clergy. He appears to have been a judge on sev. tribunals. Some of his works are *In Libros Sententiarum* (1508); *In quatuor Evangelia Expositiones Luculentæ* (1529); and an introduction to Aristotle's *Dialectics* (1521).

Major, commissioned army rank, being the lowest of field officers. Originally sergeant-M., but sergeant was dropped in the seventeenth century. In Brit. service M. is second-in-command of armoured regiments, commands battery in R.A. and company in R.E.; one is second-in-command and two command companies in Infantry. M. who are second-in-command of a unit relieve the commanding officer of most of the duties unconnected with field training, such as

interior economy, messing, and regimental institutes. The term M. for the chief of a group is found in pipe-M., bugle-M., drum-M., trumpet-M., all of whom are non-commissioned officers. The most conspicuous M. is probably the sergeant-M., the senior warrant officer of a unit. (In the Household Cavalry corporal-M.). In a sense he is the general manager of a unit and comes into contact with almost every phase of its activities. The efficiency of the N.C.O.s. is due mainly to the sergeant-M., more correctly, the regimental sergeant-M. In the U.S. Army M.s. command cavalry squadrons and battalions of artillery and infantry. In European armies generally (except for

resemble the Catalans in their appearance and manners, number about 272,400, are hospitable and industrious, and mostly employ themselves in agriculture. The chief products of the is. are marble, coal, iron, slate, plaster, some semi-precious stones, the common cereals and legumes, oranges, silk, lemons, oil, wine of excellent quality, olives, figs, and aromatic herbs. The chief tn. is Palma (*q.v.*) the cap. In the Sp. civil war M. was held by the insurgents. In Dec. 1936 an It. force landed on the is. and took possession on behalf of the Fascist leader, Gen. Franco. *See* Lady Sheppard, *Mediterranean Island*, 1949.

Major-General, *see* under GENERAL.

MAJORCA: PALMA, A GENERAL VIEW SHOWING THE PORT

E.N.A.

the Russian) M.s. hold more senior appointments than in the Brit. Army. Thus infantry battalions are commanded by M.s., while in the Ger. service this rank was commonly held by the second-in-command of a regiment and not infrequently by regimental commanders.

Major, in music, greater. A M. third consists of four semitones, a minor third of three. A M. tone is the whole tone, having the ratio 8 : 9; a minor tone that having the ratio 9 : 10. Intervals have had the term M. applied to them in a conflicting manner.

Majorca (Sp. Mallorca), largest of the Balearic Isles (*q.v.*), lies 107 m. S.E. of the mouth of the Ebro, the nearest point of the Sp. coast, and 171 m. N. of Algiers. Its greatest length (from E. to W.) is 64 m., and its breadth (from N. to S.) 48 m., with an area of 1310 sq. m. The N.E. half of the is. is mountainous; the other parts are finely diversified with hills, valleys, and plains. The climate is healthful, the sea breeze preserving a nearly equable temp. over the whole is. The inhab., who much

Majorian (Lat. Julius Valerius Majorianus) (d. A.D. 461), Rom. soldier and one of the transient emperors in the W. (457-461). He was one of those made emperor by the Ger. general and regent Ricimer, who bestowed the imperial dignity he himself despised upon sev. noble Romans, and thereby infiltrated Ger. settlements on Rom. soil. M. won a victory over the Vandals on the coast of the Campania in 458, defeated and then concluded an alliance with Theodoric the Visigoth in 460, and crossed the Pyrenees to join forces with the fleet he had concentrated at Carthage. But the Vandal king, by corrupting some of M.'s officers, succeeded in destroying this fleet. His defeat so prejudiced his military reputation that Ricimer, with as little compunction as he had shown when he deposed Avitus (*q.v.*) in 456, forced M. to abdicate (461). M. d. a few days after his abdication—either of dysentery or assassination.

Majority, the age at which a person becomes *sui juris*, i.e. legally old enough to manage his own affairs. By Eng. law an

infant attains his M. at twenty-one (see INFANCY).

Majsa, or **Kiskunmajsa**, tn. in the comitat of Pest-pilis-solt-kiskun, Hungary, 25 m. N.W. of Szegedin.

Majuba Hill, in Natal (properly **Amajuba**, Zulu for 'hill of doves'), mt. in N. Natal, part of the Drakensberg range, rising about 7000 ft. above the sea, and over 2000 ft. above the level of the surrounding country. It overlooks the pass through the Drakensberg known as Laing's Nek, and is 8 m. S. of the Transvaal border and 18 m. N. of the tn. of New-castle. The railway from Durban to Johannesburg skirts the base of the mts. The Boers defeated the Brit. here in 1881, Gen. Colley being killed and about half his command lost.

Makalla, or **Mokalla**, port of Arabia, 300 m. N.E. of Aden, the prin. port of Hadhramaut. M., together with Shihir and dependencies, is under one sultan, who is in treaty relations with Britain, his tribesmen being part of the Aden protectorate. Pop. 18,000.

Makalla, Baggara Arabs of Semitic origin, so called from an Arabic word denoting that they are great cattle owners and breeders. They occupy the country W. of the White Nile between the Shilluk ter. and Dar Nuba, being found principally in Kordofan. They are true nomad Arabs, having intermarried little with the Nuba and having preserved most of their national characteristics. The date of their arrival in the Sudan is uncertain; they appear to have drifted up the Nile valley and to have dispossessed the original Nuba pop.

Makaraka, see **MACARSKA**.

Makart, Hans (1840-84) Austrian painter, b. at Salzburg, son of an inspector of the imperial castle. When as a youth he entered the Vienna Academy, Ger. art was under the rule of Cornelius's cold classicism. It was entirely intellectual and academic, and it is not surprising that M., poor draughtsman to the last, with a passionate and sensual love of colour was found to be devoid of all talent. He went to Munich, and there attracting Piloty with his 'Cupid's' and 'Plague in Florence,' his fame became firmly estab. He used such bad pigments that most of his large paintings have perished.

Makerere College, E. African institute of higher education approaching univ. status. It is situated in spacious grounds on M. hill, 2 m. from Kampala, Uganda, but is an inter-territorial foundation in whose support all the Brit. E. African govs. take part. It had its origins in the Uganda Technical College for the training of African artisans, but as that college served only one side of the colony's educational needs, the scope of the institution was extended in 1922 to include vocations other than those of a purely technical nature. On Aug. 1, 1922 the name of the technical school was changed to M. C. and arrangements made to include in its activities the teaching of medicine, agriculture, veterinary science, engineering, surveying, and the training of schoolmasters and clerks. There was also

added a three-year arts course which prepared candidates for matriculation through the Cambridge school certificate. For six years the training of artisans was carried on side by side with that of students in the professional courses, but in 1929 a separate and well-equipped technical school was opened at Kampala to provide for the former. The main buildings at M. consist of an assembly hall with class-rooms attached in one block, a laboratory and science class-room, boarding-houses, dining-hall, principal's office, common room and library, bursar's and general office, dispensary, kitchen, and stores. There are three playing-fields within half a mile of the college and tennis courts within the precincts. In its report on advanced education the Commission on Higher Education in E. Africa, appointed in 1936, recommended that the then existing post-secondary courses at M., and its associated institutions—Mulago Medical School, Kawanda Agric. School and Old Entebbe Veterinary School—should be grouped together to form a higher college of E. Africa. The Gov. of the United Kingdom asked Parliament for a grant of £100,000 towards the cost of carrying out this proposal. Tanganyika also offered a grant of £100,000, while the Uganda Gov. was prepared to give up to £250,000. With the improvement of the standard of the secondary schools, the school-leaving examination or a local equivalent became the entrance examination to this higher college (to-day, however, M. C. is unwilling to accept the Cambridge certificate or the senior school leaving examination in place of the M. C. entrance examination) which subsequently developed its univ. studies, including courses for the London degree. The first principal of the re-organised college was Mr. G. C. Turner, headmaster of Marlborough College, who was appointed in 1939. On his retirement in 1946 he was succeeded by Dr. W. D. Lamont. The present organisation of M. C. is based on Eng. public school lines, there are six 'houses' with house tutors and prefects. Religious instruction is given by chaplains. M. C. and its associated institutions are the only centre for advanced education in E. Africa and pupils attend from all over E. Africa. The number of students pursuing the general cultural course was, up to recent times, a small minority of the total; the rest followed the vocational courses. Many hundreds of students have passed through the college since its foundation. A large number of these are absorbed in various branches of the African civil service. The majority of schoolmasters trained at the college are working in the schools of the missionary societies. Many students trained at the pre-vocational science course have become fully qualified medical aids, and are capable, under some supervision, of running dist. stations and hospitals by themselves. M. C. is rapidly developing the status of a univ. college and legal instruments have been prepared to revise its constitution accordingly.

Make-up, **Theatrical**. Stage M. can,

broadly speaking, be divided into two main headings, straight M. and character M. By the former is meant any M. which helps us to appear at, or about, our own age. Character M. can either age or disfigure our natural appearance and needs considerable study and practice. Stage lighting tends to flatten our features and give our natural colouring a dull, drab appearance and this has to be counteracted by the use of grease-paint. (Generally speaking, modern stage lighting calls for the use of the following grease-paints: (1) No. 5; (2) No. 9; (3) (a) medium blue liner (for fair people), for lining round the eyes and shading, (b) dark blue liner for dark people; (4) carmine-vermilion and lake liner for lips; (5) carmine I. for cheeks if found necessary. A very little cold cream or M. grease should be smoothed all over the face, neck, and eye sockets before using any grease-paint. This should be used very sparingly as the amount required varies according to the type of skin. By the use of varying amounts of No. 5 and No. 9 grease-paint a fair, medium, or dark colouring can be obtained, but this is only achieved by experiment and practice as each individual skin is different in texture. The lining and shading of the eyes should be done very carefully and the black liner should be avoided at all costs. Unless the eyebrows are very pale it is seldom necessary in a straight M. to use any colour on them, but if found essential the brown liner is best for this purpose. In the case of women, carmine-vermilion mixed with lake should be used for the upper lip, and carmine-vermilion alone for the lower. Men should use lake for the upper and a mixture of carmine-vermilion and lake for the lower. The whole secret of a successful M. is the blending of the No. 5 and No. 9 and the achievement of a smooth foundation, and this can only be achieved by practice and knowing one's own face.

Makeyevka, tn. of the Stalino region of the Ukrainian S.S.R., 13 m. N.E. of Stalino. It has coal-mines, and metal and chemical industries. Pop. 240,100.

Makhaach-Kala, cap. of the Daghestan A.S.S.R., on the W. coast of the Caspian Sea. It lies in an oil-bearing dist. and has a pipe-line to Grozny. There are machinery and engineering works. The railway from Azov to Baku passes through the tn. Pop. 86,800.

Mako, tn. of Hungary, cap. of the co. of Csanád, 135 m. S.E. of Budapest. The most noteworthy building is the palace of the bishop of Csanád, whose usual residence is in Temesvár. The tn. possesses numerous mills, and the surrounding country is fertile, producing corn and wine, and affording excellent pasturage for cattle. Pop. 36,000.

Makran, dist. in the S.E. of Persia, and S.W. of Baluchistan, bounded S. by the Arabian Sea. It is noted for its fruit. Area 23,260 sq. m. Pop. 78,000.

Makrizi Taki Addin Abu Ahmed Mohammed (1360-1442), Arabic historian and geographer, b. in Makriz, near Baalbek. He early devoted himself to the study of hist., jurisprudence, tradition,

astrology, etc., at Cairo, where also he afterwards held the offices of Mohtashir, or inspector of weights and measures, of khatib and imam at different mosques. M. wrote a hist. of the Mamluk sultans, two treatises on Muslim (Kufic) coins, weights, and measures which have been ed. and trans. by Tychsen (Into Lat.) and by Silvestre de Sacy (in a Fr.-Arabic chrestomathy) (q.v.), but his most important work is his *Description of Egypt*, which gives an account of the hist. of the country from its conquest by the Moslems, as well as a description of its natural hist. and antiquities and of the manners and customs of the inhab. He commenced writing *On the Important Personages who had Visited Egypt*, and intended to fill eighty vols., but only a small portion of these (one autograph vol. is in the Imperial Library at Paris) was really accomplished.

Makronisi, Gk. is. in the Aegean Sea. Here in 1943 was instituted by the Gk. Gov. a scheme for the education in citizenship of sev. thousand men who had at one time served in the guerrilla ranks during the civil war which followed the Second World War.

Malabar, maritime dist. of Madras Prov. India, is bounded on the E. by the dist. of Coimbatore, while on the W. its shores are washed by the Arabian Sea; it extends in lat. from 19° 15' to 12° 18' N. Area 5800 sq. m. Pop. 3,929,400. The surface is occupied in the E. by the Nilgiris, and the W. Ghats cover a great portion of the dist. Rice, coconuts, and rubber are produced. The name of this dist. is applied to the whole S.W. coast of S. India. Calicut (127,000) is the cap. See K. M. Panikkar, *Malabar and the Portuguese, 1500-1663*, 1929.

Malabon, dist. of the Philippines on the Isle of Luzon.

Malabuyoc, dist. of Cebu Is., Philippines.

Malacca, tn. on the W. coast of the Malay Peninsula, which, with the terr. lying around and beyond, forms one of the Straits Settlements and gives its name to the strait which divides Sumatra from the Malay Peninsula. Its name, which is Melaka, is that of a species of jungle fruit, and is also borne by the small riv. on the r. b. of which the old Dutch tn. stands. The Dutch tn. is connected by a bridge with the business quarter on the l. b. which is inhabited exclusively by Chinese, Eurasians, and Malays. M., now a somnolent tn. and, before the Second World War, a favourite resort of rich Chinese who had retired from business, was visited by few ships and was the least important of the three Brit. settlements on the straits which gave their name to the colony. Since 1511 it has continued to be the possession of one or other of the European powers. For its hist. see further under *MALAYA, History*. It fell to the Jap. in Jan. 1942, but reverted to the Brit. authorities in Sept. '45. Area of colony 640 sq. m. Pop. 236,000, of which 107,000 are Malays, 85,300 Chinese, and 28,300 Indians. See Sir F. Swettenham, *British Malaya*, 1906, and Sir R. O.

Winstedt, *Malaya, the Straits Settlements and the Malay States*, 1923, and *A History of Malaya*, 1935.

Malachi, last of the minor prophets, about whose person nothing is known. His personal existence seems doubtful, for the Septuagint has in 1.1., 'by the hand of his messenger'; the Targum has 'by the hand of Malachi (or, of my messenger), whose name is Ezra the scribe.' The prophecy belongs to the age of Ezra and Nehemiah, the period during which Judah was a Persian prov. It was written after the rebuilding of the temple. A comparison of the book of M., with Ezra and Nehemiah shows much similarity of subject-matter, especially in the strong condemnations of inter-marriage with the heathen and the people's laxity in the payment of the priestly dues. M. further prophesies the purification of the priesthood by the Messiah. See W. E. Barnes, *Illego, Zechariah, and Malachi*, 1917, and E. A. Annett, *The Hidden Centuries: Malachi to Maltheic*, 1926.

Malachite, mineral consisting of basic cupric carbonate $\text{CuCO}_3 \cdot \text{Cu(OH)}_2$. It has a fine green colour; it generally occurs massive, with a mammillated, reniform, or botryoidal surface. It is occasionally found as dark green monoclinic crystals, and when associated with limonite as compact fibrous or earthy masses. It is found in great quantity in Siberia and the finer quality is used for making ornaments, mosaic, etc., as it takes a fair polish. It also occurs with other copper ores in Russia, Australia, Arizona, etc., and is smelted with other mineral.

Malachite Green, brilliant green dye derived from coal-tar. It is a double salt, consisting of the chlorides of zinc and tetramethyldiaminotriphenyl carbinol. M. G. dyes silk and wool without any previous preparation of the material, but cotton requires to be mordanted with tannin and tartar emetic. It is not very fast to light, and much more valuable green dyes are now known.

Malachy, St., or Malachy O'Morgair (1094-1148), illustrious Irish prelate, b. at Arnach, of a noble family. Early placing himself under the tutelage of a pious recluse named Imac, his ascetic example was followed by other young men and a monastery grew up round the cell of Imac. Ordained priest at the age of twenty-five, he preached among the poor. Having sought out Malchi, bishop of Lismore, he learnt from him the rule of auct. ecclies. discipline, and on his return was placed at the head of the Bangor abbacy. Thence he took the episcopal see of Connor, but on the ruin of this tn. by the king of Ulster he returned to Armagh, of which he was elected archbishop in 1127. He endeavoured to revive auct. discipline in this diocese, and provided the parishes with pastors. In 1135, having had Gelax accepted as his successor, he returned to Connor, installed a bishop there, and himself went to live in Down, where he founded a new episcopal see. In 1148 he set out for Rome to confer with Pope Eugenius III. on the needs

of the Irish Church, but expired at Clairvaux in the arms of St. Bernard. The life of St. M. was written in Lat. by St. Bernard and trans. into It. by Maffei. See W. Harris's ed. of Sir J. Ware's *Bishops*, 1739.

Malacology (from Gk. *malakos*, soft, *logos*, discourse), science which is concerned with soft-bodied invertebrates and particularly molluscs.

Malacopterygii, Cuvier's name for an order of fishes in which the rays of the fins are soft and cartilaginous and not pointed at the extremities. The Salmonidae salmon and trout family) are examples.

Malacostraca, that div. of the Crustacea which includes the higher forms such as crabs, lobsters, shrimps, woodlice, and sand-hoppers. The remaining species are placed in the div. Entomostraca, and include the barnacles, water 'lice', etc.

Málaga, seaport of Spain, and cap. of a prov. of the same name, on a bay of the Mediterranean, 65 m. N.E. of Gibraltar. The tn. is enclosed by mts. and commanded by a fine old Moorish castle, called the Gibralfaro, built in the thirteenth century on the site of a former Phœnician stronghold. Other important buildings are the cathedral with a spire 280 ft. high, the episcopal palace, an opera house, and a bull-ring. The climate of M. is noted for its uniform mildness and constant sunshine, which make the place a favourite resort for invalids. The harbour, which is formed by sev. moles, is capable of holding hundreds of ships. M. is a very important commercial centre, and exports wine, olives, figs, raisins, lemons, etc. The manufs. include textiles, rope, leather, etc., and there are cigar factories, sugar mills, and iron foundries. Pop., prov. 722,848; tn. 277,882.

Málaga Wine is produced chiefly from the Axarquía dist. of M., and the finest is made from the muscatel grapes, *Doña* and *Lágrimas* being the best known varieties.

Malahide, coastal tn. of Co. Dublin, Ire., 12 m. N.E. of Dublin, in the King's plain. It is a beauty spot, with a fine view of the Dublin and Wicklow mts. across the plain. Golf has contributed to the renewal of its popularity.

Malaita, is. of the Brit. Solomon Is. protectorate, lying S.E. of the large is. Ysabel, being crossed in the centre by lat. 9° S. and long. 161° E. Area 2396 sq. m. It was named Iramos by the Spaniards, whose explorer, Mendana, visited the Solomons in 1595. Cape Astrolabe at the N. end of the is. is named after one of two Fr. frigates under the command of the ill-fated La Pérouse, who came to the is. twenty years after Mendana (he was wrecked off Vanikoro Is.). M. is the most densely populated of all the Solomons (pop. estimated at 40,000, mainly Melanesians). There are two distinct classes of natives on M., namely the 'salt-water men' who spend their time in fishing 'or a certain kind of shell found near Juki harbour and used as money. They live mostly on coral islets, some of which have been built artificially on the reefs and are all mapped

out on a system of taboos or *tambus*, which are rigidly respected. The others are the bushmen. Most of the plantation labour used in the protectorate comes from M. The bushman is also excellent at forest clearing.

Malakand, pass lying N. of Peshawar in the N.W. Frontier Prov., Pakistan. It extends from the valley of Kabul to that of the Swat R. Dargal is at the mouth of the pass. In 1897 the Swats attacked the Brit. frontier post here and this led to the M. expedition of that year. Irrigation works have been begun in the vicinity. The tn. of M. is the headquarters of the Delir-Swat-Chitral agency.

Malakoff: 1. Tn. in the dept. of Seine, France, a S.W. suburb of Paris. Originally it was called *Californina*, but was renamed as above in 1818. 2. Fort of Sebastopol, Crimea, noted for its storming by the Fr. in Sept. 1855.

Malalas, or Malelas, Johannes, Byzantine chronicler of the sixth century, was probably of Syrian origin, but little is known of his life. He wrote a universal hist., from the creation to the reign of Justinian. His hist. was trans. into Lat. by Edmund Chilmead (d. 1653), and first pub., ed. by Hody, in 1691 as an appendix. See Jebb, *Bentley* (Eng. Men of Letters), 1882.

Malan, Daniel François (b. 1871), S. African statesman, b. at Riebeck West, Cape Prov.; educated at Victoria College, Stellenbosch, and at Utrecht Univ. Dutch Reformed minister. Then elected member for Calvinia in Hertzog's Nationalist Gov., in which he became minister of the interior, health, and education, 1924-1933. He founded the Nationalist (Afrikaner) party (subsequently called 'Nationalist' as distinguished from the 'Afrikaner' party) standing for an independent S. African republic outside the Brit. Commonwealth, strongly anti-Semitic and Nazi-sympathising. Opposed the Union's entry into the Second World War, and joined forces with Gen. Hertzog (q.v.) in Jan 1940, to combat Gen. Smuts's policy of imperial co-operation and war against Hitlerism. At this time his party held only twenty-eight seats (out of 150) in the House of Assembly. Never, however, a revolutionary, he showed his uncompromising hostility to the Ossewabrandwag (q.v.), a movement which he described as heading the Union towards internecine warfare, and he urged his 'reunited party' in 1942-43 to resign from it. In the new House of Assembly (July 1943) his party lost two, and Gen. Smuts's party gained seventeen seats. This election was in effect a referendum on the clear-cut alternative of neutrality or war. M., however, did not cloak his intentions before the election and declared: 'Our policy if we gain power is to cease active participation in the war and to withdraw our troops for our own defence within our own borders—a policy to which Mr. Havenga, leader of the Afrikaner party, lent his support. His position on the continuing of membership of the

Brit. Commonwealth of Nations has always tended to change from a policy of 'loosening the ties between the members of the commonwealth' to staying in with a view to such advantages as might be secured by membership. His advent to power in 1948 was somewhat unexpected; but a significant development before that election was a party pact between M. as leader of the Nationalist party and Havenga as leader of the Afrikaner party. The general election of May resulted in the defeat of Smuts, who even lost his own seat, and M. on June 3 formed a new Cabinet, which included the Afrikaner leader. In a broadcast (June 3) M. said S. Africa would gladly continue her good relations with Britain and other commonwealth countries if her status as a sovereign state was not prejudiced. Later in the year he said that S. Africa aligned herself with anti-Communist countries and approved W. European Union. Following the conference of dominion prime ministers in London (May 1949) on the question whether India could become a republic and yet remain in the Commonwealth, M., on his return to Cape Town, delivered in the Assembly what seemed to be an unequivocal assurance that in his view S. Africa should never leave the commonwealth—although he 'believed that South Africa's greatest chance of unity would be as a republic within the commonwealth.' He said also that, since the Crown had been named as a connecting link as 'head of the commonwealth' he had felt it necessary at the conference to make it clear that this headship implied no formal constitutional function—in other words that it did not in any way suggest that the commonwealth was or resembled a super-state—and he said that 'to his surprise he found complete unanimity among the prime ministers on that point.' On the colour question M. stands for the separation of natives, the migration of whom into the tn. gave rise, in his opinion, to serious conditions endangering the safety of life and property; and on his accession to power his gov. took steps to abolish native representation in the House of Assembly.

Malapterurus, genus of fish typified by *M. electricus*, the electric catfish, found in the fresh water of tropical Africa. The electric organ is of cutaneous origin and is thickest on the abdomen but extends over the whole body.

Malaria (from It. *mala*, bad, and *aria*, air), diseased condition common in tropical and marshy dists., and associated with parasites of certain gnats and mosquitoes. The names marsh-fever, jungle-fever, ague, etc., are applied to forms of the disease, and the names remittent, intermittent, tertian, quartan fever, etc., to forms characterised by particular kinds of periodicity. The paroxysms comprise cold, hot, and sweating stages, which recur in that order. The first stage is marked by shivering and a feeling of chill on the part of the patient, although the body temp. is much higher than normal. The cold feeling is due to the constriction of the surface blood-vessels; the interior

vessels become correspondingly gorged, and there is considerable enlargement of the spleen and an increased flow of urine. The second stage commences with a feeling of heat internally which gradually proceeds to the surface, giving the usual feverish sensations of excessive heat, increased thirst, dry skin, and mental confusion or delirium. The body temp. is still high, but not so high as in the 'cold' stage, the enlargement of the spleen continues, but the flow of urine becomes scanty. The third stage commences with an amelioration of the dry condition of the skin, proceeding to profuse perspiration. The body temp. falls, the patient feels considerably exhausted but easier, and may fall into a deep sleep. If there is an interval of normal conditions between the paroxysms, the fever is known as *intermittent*; if the symptoms are merely ameliorated for a time, the fever is called *remittent*. If the paroxysms recur daily the fever is designated *quotidian*; if on alternate days, *tertian*; if two days elapse between paroxysms, *quartan*. If two paroxysms occur in a day, the fever is called *double quotidian*. The quotidian form usually occurs in the morning, the tertian at noon, and the quartan in the afternoon. The cause of M. is the presence of specific protozoa (species of *Plasmodium*) in the blood. It is now sufficiently well estab. that these protozoa are parasitic on the mosquito, and that human beings are infected from the bite of a mosquito. It was in 1894 that Sir Patrick Manson put forward the 'mosquito-M.' theory. He suggested that flagellating bodies were set free in the stomach of a mosquito and that these gained access to water through the insects' drowning in it and that man acquired infection by imbibition of water. A vital discovery was made in 1897 by Sir Ronald Ross (*q.v.*), who found pigmented bodies (oocysts) in the stomach-wall of 'dapple-winged' mosquitoes bred from larvae and in 1898-99 Koch and Pfeiffer confirmed Ross's findings in birds as applicable to human M. (But many more discoveries, biological and chemical, will have to be made before it will be safe to say that the solution of the malaria problem in the world generally is appreciably nearer than of old' (Wallace of Kedah, Malaya).) When the organisms are estab. in the blood, they multiply by throwing off spores (merozoites) and at the same time liberate a toxin which causes the feverish symptoms. The manner in which the cycle of reproduction and growth is carried on accounts for the periodicity of the malarial paroxysms, the tertian, quartan, etc., forms being due to different species of parasites, possibly from different species of mosquito. The process of reproduction may recur again and again as long as the patient lives, the protozoa acting upon the blood and turning the haemoglobin into melanin. The parasites, however, have another phase of existence which they pass in the body of the mosquito, the process of reproduction being in this case sexual. The mosquito thus serves as a definite host to carry infection from one patient

to another, human beings serving as intermediate hosts.

The prevention of M. is, therefore, concerned with the extinction of the mosquito. Mosquito nets are useful as a means of defence if the meshes be sufficiently fine, but permanently healthy conditions can be estab. only by preventing the reproduction of the kinds of mosquito or gnats responsible for the infection. These mosquitoes belong to the genus *Anopheles*, different species of which thrive in different countries. The life-history of the mosquito comprises stages as ovum, larva, pupa, and insect. The ova are deposited on the surface of still or slowly moving water, the larvae and pupae also float about on the water, and the complete insect may be developed within thirty days of the deposition of the ova. The partial or complete extinction of the insect may therefore be effected by thoroughly draining off all surface waters which tend to become stagnant, and by stocking standing water with fish and other carnivorous animals that will devour the larvae. A thin film of oil spread on the water suffocates larvae and pupae, for neither can breathe under water. Even if the insect is suppressed only for a time, the cycle of existence of the parasite may be broken and the mosquito itself is thus rendered comparatively harmless. For example, *Anopheles maculipennis*, or the speckled-wing mosquito, still flourishes in England, and at the outbreak of the first World War, was not acting as a carrier of M. organisms, although it was associated with the disease in other parts of Europe and in America. After the return of infected soldiers to England, these species of *Anopheles* carried infection from man to man, and there is always the possibility of M. being spread in this way by insects previously uninfected.

The most effective treatment for M. once contracted is the administration of quinine, which destroys the parasite. The doses should be 30 grains taken daily, and should gradually be decreased, according to symptoms, to 6 grains. The treatment must be continued for at least three months. The sulphate is most commonly employed, and may be given in solution by the mouth, rectum, or hypodermically. As a prophylactic measure, doses of 2 to 4 grains are taken systematically by dwellers in malarial regions. Synthetic anti-malarial drugs have been developed recently, e.g. mepacrin and paludrine, and proved of great value during the Second World War. The new insecticides such as 'D.D.T.' have been used with success against mosquito larvae. Large numbers of natives in the tropics and sub-tropics are infected with M. parasites, and foreign residents should live as far as possible from native quarters, for there *Anopheles* will be more abundant, and will almost certainly be infected. The insects may be kept away by rubbing the skin with preparations containing strong essential oils, such as oil of lavender, oil of thyme, or oil of oranges. Houses and beds

should be screened at night, for the insects feed nocturnally.

After the cause of *M.* and the life-history of the organism were known, the quantitative investigation of *M.* as an epidemic disease was first attempted in the Punjab by S. R. Christophers in 1908. Results of this show that as an epidemic disease *M.* may be localised or regional. Mild or allied epidemics may be due to seasonal recurrence of *M.*; severe ones may occur amongst non-immune forces or labour gangs in foreign countries. The so-called 'pandemics' of *M.* are best regarded as regional epidemics, for they were probably due to a seasonal recrudescence of the disease, and what appeared to be the diffusibility characteristic of pandemics was due to the recrudescence beginning at different times in different individuals.

There are three recognised zones of malarial distribution; temperate, i.e. between 40° and 60° N., where the benign tertian is the prevailing form (in the corresponding zone in the S. hemisphere *M.* is uncommon); sub-tropical (between 40° N. and 40° S.), where sub-tertian and benign tertian are both common, the former being epidemic in autumn; and tropical, where sub-tertian predominates. There are countries where all the known favouring conditions are present and yet infection does not spread. Dr. Harold Scott states that the reasons for this are not known. The disease may, also, 'occur in one place and not in another apparently similar, only a mile or so distant.' The explanation may be the absence of breeding sites near the latter. Again, infection may occur in the suburbs of larger towns, but not in the centre; 'a potent reason for this is the construction of closed drains in the towns.' Again, the climate may be apparently favourable (e.g. Fiji, Barbados), and yet *M.* is absent, probably because the suitable vector is wanting. In Denmark and elsewhere *M.* has died out and England is almost free; 'agricultural developments, zoophilism, general improved hygiene are probably responsible. . . . On the other hand Corsica is an example of a foreign country formerly highly cultivated and healthy, now very malarious.'

The International Health Board of the Rockefeller Foundation has provided funds for campaigns against *M.* in parts of S. America, Italy, Palestine, and the Philippine Is. During the present century, the incidence of *M.* in the U.S.A. has been decreased by approximately 5 per cent. For successful eradication of the disease, all preventive measures must be used, for while man is infected mosquitoes will be infected and vice versa. In spite of modern control measures *M.* remains a serious menace, and is responsible for more deaths than any one other disease. See also BACTERIA; EPIDEMIOLOGY; ENTOMOLOGY; and INSECT BITES AND STINGS.

Medicine, 1939; W. Herms and H. Gray, *Mosquito Control*, 2nd ed., 1944; W. N. Bispham, *Malaria: Diagnosis, its Treatment and Prophylaxis*, 1944; and J. F. Marshall, *Report on the Proceedings of the Hayling Mosquito Control*.

Mälar, Lake, in Sweden, extends inland from the Baltic for 81 m. and varies in breadth from 2 to 23 m.; the R. Arvoga enters its W. end and serves to connect it with Lake Hjelmar. Stockholm is situated on the strait connecting Lake M. with the Baltic.

Malaspina Glacier, Alaska, N. America, is one of the largest glaciers in the N. regions; it lies W. of Yakutat Bay and is fed by the snows of St. Elias Range.

Malatesta, celebrated family of masters and tyrants of Rimini whose sway endured with intermissions, from the thirteenth to the sixteenth century. Rimini, defeated by Cesena, took the desperate course of granting citizenship to two members of the powerful M. tribe, Giovanni and M., in order to secure their military aid. The M. family thereupon settled in Rimini, Giovanni being made *podestà*, the initial step to the sovereign power afterwards consolidated by his descendants. During the struggles of the Guelphs and Ghibellines the M. succeeded by all manner of crimes and violence in becoming masters and tyrants of Rimini—tyrants were prominent in the period 1313 to the end of the fifteenth century, for the despots, as they have been called, answered a deep-seated and generally felt need. A powerful man, rich and enterprising, could be expected to give a more continuous and thus, presumably, more successful direction to the state and keep his possible rivals in check or destroy them. Giovanni d. in 1247 and was succeeded by his son M., surnamed M. da Verrucchio (1242-1312), the true founder of his house, a determined foe of the Ghibellines, who led the Guelphs back in triumph to Rimini. The pope (Boniface VIII.), while conscious of the threatened rights of the holy see, preferred to maintain good relations with a *condottiere* who had restored the Guelphs in the Romagna and in 1299 conferred high honours on M. This tyrant, who lived to a hundred, and was placed in hell (*Inferno*) by Dante, had four sons, Malatestino, Giovanni the Lame, Paolo the Handsome, and Pandolfo, but only the eldest and youngest survived him. Giovanni the Lame, in return for his military help to Giovanni da Polenta of Ravenna, was given the hand of the latter's beautiful daughter, known to hist. and poetry as Francesca da Rimini. But her love had been given to Paolo and the two lovers, being surprised by Giovanni, were slain on the spot (1285)—an episode of the story of the M. which is immortalised in Dante's *Inferno*. Giovanni the Lame d. in 1304. Malatestino became lord of Rimini and on his death (1317) power devolved on Pandolfo, who d. in 1326, leaving two heirs, M. and Galeotto. The former (surnamed *Gustafamiglia*) tried to aggrandise his small principality by force of arms and treachery, but it was devastated by Cardinal

Albornoz at the instance of Pope Innocent VI., and thereafter **Gustafungia** ruled in subordination to the papal see. He was then granted **Pesaro** which, later, devolved on his descendants. **Carlo** and **Galeazzo**. The former was father of **Parisina**, wife of the marquis of Este, who discovered her incestuous love for **Hugo**, his handsome bastard son, and the lovers were beheaded in Ferrara castle. Byron's poem, *Parisina*, is founded on this story as told in Gibbon's *Antiquities of the House of Brunswick*. **Sigismondo M.** (1417-68) received the state of **Rimini** by bequest of his brother, **Galeotto** (1411-32), an ascetic who d. early. **Sigismondo** is the faithless, splendid, and tragic personage to whom **Rimini** owes its renown during the Renaissance. A patron of art and letters and a soldier, he was excommunicated (1460) for waging war on the pope, **Pius II.** (**Enea Silvio Piccolomini**). To **Sigismondo** is due the erection of the church or duomo of **St. Francis**, or temple of the **M.**, the most famous building in **Rimini** and one of the most important monuments of the Renaissance in all Italy. Originally a Franciscan church dating from the close of the thirteenth century, it was entirely remodelled in 1450 by order of **Sigismondo M.**, whose tomb is inside the main entrance (the church was amongst those seriously damaged in the Second World War). **Sigismondo** was dissolute, but his passion for **Isotta degli Atti**, who acquired (1413) considerable influence over him and bore him sev. children, is said to have endured to his death. Their marriage only took place in 1456. When **Pius II.** proclaimed a crusade against the Turks at the assembly at **Mantua**, **Sigismondo** had hampered his strenuous efforts by secretly inviting the **Grand Turk** to invade Italy. This was adduced against him at his trial (in his absence) in **Rome** (1460) for conspiring against the pope and he was sentenced to be burned as a heretic and to confiscation of his property. **Sigismondo** then prepared to defend himself (1462) against the forces of the **Bishop Vitelleschi** and other leaders sent against him by **Rome**, and at length he was forced to make his submission. He was deprived of all his possessions save **Rimini** but, his power having been broken, the sentence of excommunication was withdrawn. **Sigismondo** was followed by his illegitimate son, **Roberto** (by another than **Isotta**), who, in 1475, married the daughter of the duke of **Urbino**, and, at the invitation of the pope, valiantly defended him against the assaults of the duke of **Calabria**, dying in 1482 from the hardships of the campaign. His descendant, **Pandolfo** (called **Pandolfaccio** in allusion to his evil character) sold his rights in **Rimini** to **Venice**, an arrangement of which **Pope Julius II.** so strongly disapproved that he marched against and crushed the **Venetians** (1509) and became master of **Rimini**. **Pandolfo** made sev. attempts to regain his city from him but in vain, for his former subjects preferred the papal regime and **Pandolfo d.** in poverty (1534). From that time the **M.** became citizens of **Venice**.

Malatia, Malatiah, or Aspuzo, tn. of **Asutic Turkey**, in the vilayet of the same name, 100 m. N.E. of **Marash**, near the **Euphrates**. It is noted for its orchards and vineyards, and there are copper-mines in the vilayet. About one-fifth of the pop. are **Armenians** and the rest **Turks**; in 1895 **M.** was the scene of a massacre of (Christians). Pop. (vilayet) 138,500; (tn.) 38,000.

Malaviya, Pandit Madan Mohan (1861-1948), Hindu Nationalist politician, b. at **Allahabad**, studied at the gov. high school there, and the **Muir Central College**. He was associated with the **Indian National Congress** almost from its inception, being a delegate to the second session held in **Calcutta** in 1896. Became editor of the weekly paper, *Hindustan*, and also ed. the *Indian Union*. Some years later he started a weekly Hindu paper, the *Abhyudaya*, and, many years later still, collaborated in founding the **Nationalist** daily paper, the *Leader*, at **Allahabad**. In 1902 he became a member of the **United Provs. Legislative Council**. In 1910, on the introduction of the **Morley-Minto** reforms (see *INDIA, History*), he was elected to the **Imperial Legislative Council** and remained a member until 1921. **M.** was the originator and for long the president of the militant **Hindu Mahasabha**, the founder and for many years the vice-chancellor of the **Benares Hindu Univ.**, and three president of the **Indian National Congress**. For nearly fifty years he was a constitutional if vehement advocate of **Indian political advancement**, but in 1930 seems to have been somewhat carried off his feet by the civil disobedience movement. Notwithstanding his constant political activities his deepest attachments were to **Hinduism** and his outstanding contribution to neo-Hinduism was his creation of the **Hindu Univ.** at **Benares** out of the nucleus of the **Central Hindu College**.

Malaya, or British Malaya, situated in the S. part of the **Kra peninsula**, being the S.E. corner of **Asia** between **India** and **China**. It lies between 1° and 7° N. and between 100° and 105° E., and is bounded on the N. by **Siam (Thailand)** and on the W., S., and E. by the **Netherlands E. Indies**, **Sarawak**, and **Brit. N. Borneo**. Before the Second World War it comprised the colony of the **Straits Settlements**, the (Federated) **Malay States** of **Perak**, **Selangor**, **Negeri Sembilan**, and **Pahang**, and the (Unfederated) **Malay States** of **Johore**, **Kedah**, **Kelantan**, **Trengganu**, and **Perlis**, all these **Malay states** constituting the **Malay Peninsula**. The (Federated) **Malay States** have an area of 27,540 sq. m. and a pop. (1941) of 2,212,000, and the (Unfederated) **States** have an area of 22,100 sq. m. and a pop. (1941) of 1,872,300. The **Straits Settlements** (q.v.) comprised not only **Singapore**, but **Christmas Is.** and the **Cocon-Keeling** group of Is., **Penang**, including **Prov. Wellesley**, and **Malacca**, the total area being 1321 sq. m. and the pop. (1941) 1,427,000 (of whom **Singapore** had 769,200). The post-war (1947) 'Malayan Union' denoted the crown colony of the

Malayan Union and included the nine Malay States and Penang and Malacca under a Brit. governor. The Malayan Union (see under *History*), however, was soon replaced by a federation under a governor-general, whose jurisdiction covers all these territories and others: i.e. Singapore (a separate colony under its own governor), the Malay States (previously Federated and Unfederated), Sarawak (a crown colony under its own governor), Brunei (a Brit.-protected state in Borneo under a sultan, with a resident as adviser to the governor-general), and Brit. N. Borneo (a crown colony under a governor), the rights and interests of the rajas of Sarawak and those of the Brit. N. Borneo Company having been acquired by the Brit. Gov. since the end of the Second World War.

Chinese now outnumber Malays in M., while each comprise a little less than half the entire pop., the remainder being for the most part Arabs, Europeans, Indians, and Jap. Eng. and Malay are the general languages, 'Bazaar Malay' being the lingua franca of the larger towns and in frequent use between Chinese from various provinces.

The characteristic features of the climate of M. are uniform temp., high humidity, and copious rainfall, and arise mainly from the maritime exposure of the peninsula. The excessive temps. which are found in continental tropical areas are never experienced. An air temp. of 100° F. has very rarely been recorded in M. under standard conditions. Four seasons may be distinguished, namely, that of the S.W. monsoon, that of the N.E. monsoon, and two shorter seasons separating the end of each of these from the beginning of the other. The highest recorded rainfall occurs in the Larut Hills near Taiping where the average is 232 in. Taiping itself, at the foot of these hills, has the highest rainfall of the low-level stations with an average of 166 in. The nights are reasonably cold everywhere, and although the days are frequently hot and, on account of the high humidity, somewhat oppressive, it very rarely happens that refreshing sleep is not obtained at night. The effect of the heat and humidity is, however, cumulative, and after a few years Europeans require a change to a bracing climate.

The chief exports and sources of revenue of M. are tin and rubber. Among other exports are copra, timber, rice, and padi, canned pineapples, areca nuts, tapioea, rattans, palm oil and kernels, gambier, and gold. In all there are over 1100 m. of railway in the states, the Johore State railway (120 m.), opened in 1909, establishing through communication between Penang and Singapore. The imperial gov. before the Second World War completed the system S. of Siam so as to have a trunk line through the whole Malay Peninsula, branching at Gemas in Negri Sembilan, to the W. and E. coast lines, and joining up with the S. Siamese lines through Perlis and Kelantan. There are 6000 m. of metalled cart roads, 2000 m. of bridle roads and paths, while the rivers

are navigable for small boats. The states before the Second World War maintained a highly efficient regiment of Sikh troops, and were policed by a mixed force of Indians and Malays officered by Europeans. Under the treaty of 1895 the states were obliged to furnish troops for service in the colony if the gov. should be at war with a foreign nation. Before the Second World War the officer administering the gov. of the Straits Settlements was *ex-officio* high commissioner for the Federated Malay States and the other Malay states in the Brit. sphere. There was a Federal Council, created in 1909, consisting of the high commissioner, the chief secretary to the gov., the four Brit. residents of each of the states, and various other departmental heads. Previously there was a Brit. resident general, but in 1911 that title was superseded by that of chief secretary. The supreme authority in each of the four states was vested in the State Council, consisting of the sultan of each state, the Brit. resident and his secretary, together with native chiefs and Chinese merchants. In 1936, as a further step towards decentralisation, the post of chief secretary to the gov. was abolished, and the post of federal secretary was substituted, this official being the channel of communication between the states and the high commissioner in matters appertaining purely to the states. In purely federal matters his duties were assimilated to those of a colonial secretary in the colonies.

Administration under the Brit. regime effected salutary changes in M. With the transfer in 1887 to the Colonial Office it was decided to recruit a separate Straits civil service, composed of cadets specially trained in the languages and customs of the Chinese and Malays. A step towards self-government was made some years ago by the transfer of a number of posts in the Straits Settlements to a local civil service confined to Asiatic or Eurasian Brit. subjects. The rapid development of M. led to the recruitment of many professional and technical officers and this recruitment of specialists led to great advances in administration. Transport was improved out of recognition. For centuries rivers had been the only means of communication, but by 1910 there were over 5000 m. of metalled roads traversed by motor cars, lorries, and buses. The first few miles of railway were built by Perak in 1885; the total length of line by 1940 was over 1100 m. In 1901 the revenue of the Straits Settlements was £700,000 and that of the Federated Malay States in 1897 (the first year after federation) was £825,000; by 1913 the totals were, respectively, about £1,500,000 and £5,166,000. In 1937 the revenue of all M. was about £18,000,000, made up of just over £4,000,000 from the Straits Settlements, £8,750,000 from the Federated and about £5,000,000 from the Unfederated Malay States. The relative prosperity of M. compared with other Brit. colonial dependencies may be judged from the fact that in 1937 the revenue came to over £3 15s. per head of the pop., while in other

dependences it averaged just over £1. Expenditure on public works was in 1937 five times what it was in 1918, and that on public health, education, and agriculture three times. Malayan trade of £121,300,000 in 1938 came to more than the total trade of New Zealand, more than all the trade of the seventeen Brit. African colonies together, and more than half the trade of the Indian Empire. M.'s best customer was the U.S.A., which in 1938 bought 40.7 per cent of her rubber and 54.9 per cent of her tin, while Great Britain bought 18.7 per cent of the rubber and 6.8 per cent of the tin. Other customers were France, Germany, Holland, Italy, Dutch E. Indies, and Japan. In 1926, a peak year, the motor industry's demand for tin and rubber had made M.'s trade soar to £264,000,000, or more than half that of all the other Brit. colonies put together. The 345 ac. under para rubber in 1897 had increased by 1937 to 3,302,000 ac., of which 2,026,000 were owned by estates and the rest by Asiatic small holders. Having an adequate revenue at its disposal, the gov. of M. was able to develop health and education to a point attained perhaps nowhere in the E. except in Japan. This was the more remarkable because till 1867 the colony was a Cinderella of India, and till 1874 the Malay States were the scene of barbarous anarchy (Sir Richard Winstedt). It was by its preventive medicine and its sanitary services that M. won special praise. An Institute of Medical Research, estab. at Kuala Lumpur in 1900, acquired international fame for its investigation of beri-beri, Jap. riv. fever, tropical typhus, leprosy, and yaws. From time to time it was assisted by researchers from the Rockefeller Foundation, e.g. in the treatment of hookworm and malaria; while as early as 1901 the gov. employed with great success the then recent (1897) discoveries of Sir Ronald Ross to combat malaria (q.v.), the chief cause of mortality in the tropics. As regards education it may be mentioned that in 1947-48 more children attended school in M. (as well as in Singapore and the Borneo ter.) than over previously. The univ. of M. came into existence in Oct 1949.

History.—N. M., containing Kedah and Kelantan with the oldest Malay pops., formed part of a big Buddhist empire, Sri Vijaya, which for five centuries dominated the straits of Malacca. Little is known of this empire, but from its later days down to the Brit. period M. was seldom at peace. In the fourteenth century Majapahit, the last Hindu kingdom of Java, finally broke the power of Sri Vijaya, and then itself suffered from the aggression of the Siamese, both in M. and in its ter. of Java and Sumatra, and from the tidal wave of Islam which thereafter became the chief spiritual force in the Malay world. Singapore too was lost to Majapahit and utterly destroyed. A fugitive Malay prince from Singapore founded a port kingdom at Malacca which was to become so famous that on the continent M. is still known as the Malacca Peninsula, and for about a century Malacca

was governed by Malay sultans whose sway extended over the Malay Peninsula and Sumatra. In 1511 Malacca was conquered by Alfonso d'Albuquerque and became the centre of Portuguese trade in the far E. When, however, Portuguese power declined Malacca was captured in 1641 by the Dutch, becoming merely a prov. governorship, the Dutch E. India Company's headquarters being in Java. In 1795 an alliance between Holland and France moved England to take over Malacca as a naval base. England held Malacca till 1818 when it was restored to the Dutch, only to be ceded to England again in 1824. D'Albuquerque's conquest of Malacca had disrupted the loosely knit Malay Empire, though under the name of Johore its last fragments cohered for three centuries, until the partition of the Malay world into Dutch and Eng. spheres covered Pahang and Johore from the is. cap. at Lingga (S. of Singapore) and left those two states to the rule of ministers who made themselves sultans. Among other Malay peoples whose disruptive influence was felt in Malayan hist. down to the Brit. period were the Bugis of Macassar, who, towards the end of the seventeenth century estab. themselves in Selangor, and in 1722 became *de facto* rulers of the Johore Empire with headquarters at the is. of Rhio. Weakened by conflicts between Bugis and other Malays, the sultan of Johore lost his hold over the modern Negri Sembilan (q.v.), which in 1773 seceded from his decaying empire to form a separate confederation. Between the Bugis and their rivals, the Minangkabaus gave the death-blow to the Malay Empire, which still comprised the Rhio-Lingga archipelago, Johore, and Pahang (q.v.), and thereby paved the way to Brit and Dutch infiltration into the Malay Peninsula. Fear of the Bugis from Selangor (q.v.) led the sultan of Kedah (q.v.) in 1786 to lease to England the is. of Penang, the first of the three settlements of Penang, Singapore, and Malacca, to be known later, collectively, as the Straits Settlements (q.v.). The chief figure in the negotiations over Penang was Francis Light, an ex-naval officer but at this time a trader, and the chief factor in the acquisition of Penang was England's need of a naval base on the E. shore of the bay of Bengal. On Aug. 11, 1786, Light hoisted the Brit. flag on Penang, calling it Prince of Wales Is. Later the sultan of Kedah, in the vain hope of a defensive alliance, also ceded a tract on the mainland named Prov. Wellesley after the future duke of Wellington, who had reported against abandoning the settlement of Penang. The acquisition of Penang was not entirely creditable, for even if it had not broken its pledge, the E. India Company had stood by and allowed Light to take Penang by an implicit assurance to Kedah of military protection. However, the Malays soon forgot the method of this acquisition in the enjoyment of the prosperity which followed free trade.

Singapore was acquired in 1819 through the foresight of a Bengal official, Thomas Stamford Raffles, the greatest figure in

Brit. Malayan hist. When Java in 1811 capitulated to a Brit. expedition, the governor general of India, Lord Minto, appointed Raffles its lieutenant governor, in which office he effected notable reforms, including the abolition of slavery and torture and the introduction of an equitable land system. When Java was retroceded to the Dutch Raffles was posted to Bencoolen and from there, with the approval of the new governor general of India Lord Hastings, sought a new trading station S. of Malacca. His difficulties were enhanced by the London Convention of 1814 which returned their old possessions to the Dutch, for it was not clear whether these also included Rido,

stalked sultan of Johore in 1819, agreements were made to allow the Eng. to lease land for trading factories, and in 1821 a final treaty was concluded between Husain, the Temenggong, and the Brit. abdicating Singapore to the Brit. for ever a treaty which was destined to convert a mangrove swamp into one of the world's greatest ports and to change Johore from forest and jungle into a prosperous state. Under the same treaty Britain took over Malacca while the Dutch received Sumatra.

The is. of Pangkor and the Simbilan Is. were ceded to Great Britain by Perak in 1826, for the suppression of piracy. In 1874 the cession was confirmed by the

Malayan Information Office

TIN MINING, PERAK HYDRAULIC MINING

Jingga, Johore and Pahang, though the Dutch had admitted that they did not. Raffles, however, was instructed that he might only establish a centre at Lhio if the Dutch did not anticipate him and in the same context it seemed to be admitted by his superiors that Malacca too was Dutch. Eventually Raffles, thwarted by confusing instructions and the jealousy of the lieutenant governor of Penang who was anxious to any rival settlement came in 1818 upon the almost uninhabited mangrove is. of Singapore where at least there were no Dutch. Raffles's difficulty now was to find a ruler from whom title might be derived, especially as the reputed ruler, Abdur-Rahman, claimed to be ruler of Lingga only and not of Johore. Hence Raffles installed the latter's brother, Husain, who had married a daughter of the Temenggong of Johore, as the successor to his father Sultan Mahmud, so that Husain could give him a legal title to Singapore, and the Temenggong abetted him (see Sir R. Winstedt *Britain and Malaya*, 1944). Husain was duly in-

stalled sultan of Johore in 1819, agreements were made to allow the Eng. to lease land for trading factories, and in 1821 a final treaty was concluded between Husain, the Temenggong, and the Brit. abdicating Singapore to the Brit. for ever a treaty which was destined to convert a mangrove swamp into one of the world's greatest ports and to change Johore from forest and jungle into a prosperous state. Under the same treaty Britain took over Malacca while the Dutch received Sumatra.

The is. of Pangkor and the Simbilan Is. were ceded to Great Britain by Perak in 1826, for the suppression of piracy. In 1874 the cession was confirmed by the treaty of Pangkor, by which the str. of ter on the mainland opposite, known as the Dindings, also became Brit. In Feb 1935 the Dindings str. was retroceded to the state of Perak. In 1805 Penang was made a separate presidency, of equal rank with Madras and Bombay. It was reduced to a lieutenant governorship subordinate to Bengal in 1830. In 1826 Singapore and Malacca were incorporated with it under one gov.. Penang still remaining the seat of government. In 1827 customs duties were abolished, and in 1836 the seat of government of the Straits Settlements was transferred to Singapore. From the founding of Penang in 1786 down to 1858 the constitutional hist. of the Straits Settlements is part of the hist. of the E. India Company, and in Malaya were reflected the evil and disadvantages apparent in the administration of India by a trading company, so that in so remote a peninsula despite the work of Raffles many reforms were bound to be belated (Sir Richard Winstedt). But in 1858 the

E. India Company was abolished, though at least its occasional firmness in foreign policy had saved most of the Malay Peninsula from subjugation by Siam. With the abolition of the E. India Company the Straits Settlements fell automatically under the India Office for a brief space. Then, in 1867, the Brit. Gov., bowing to local agitation, approved their transfer to the Colonial Office.

The next period in the hist. of M. was the gradual institution by treaties of the Brit. protectorate over the Malay States between 1874 and 1914.

From 1786 (acquisition of Penang) for the ensuing 100 years or more the Brit. Gov. made various protectorate, boundary, and commercial treaties with the W. Malay States, but always disavowed any wish to become implicated in the affairs of these states. But bitter discussions arose in M., especially over the question of the succession to the throne in a number of states, and for twenty years after 1857 M. was torn by civil war with consequent loss of trade, while piracy was rampant in the straits of Malacca. Serious faction fights occurred among Chinese miners in Perak. Sheer anarchy compelled the Brit. Gov. to intervene. In Nov. 1873 Sir Andrew Clarke came to Singapore with the task of reporting what steps should be taken by the colonial gov. (Straits Settlements) to promote the restoration of peace and order, and especially to examine the question of appointing a Brit. officer to reside in any of the states. Within a year Clarke had placed Brit. advisers in Negri Sembilan, Perak, and Selangor. The first resident of Perak, James Birch, used his powers under the Pangkor Treaty to collect taxes. His proposals naturally excited hostility among the Malay chiefs. Still more were they opposed to Birch's policy of helping slaves, and particularly debt-bondsmen, to escape, without offering compensation to the owners for their lost feudal perquisites. In view of this provocation it is hardly surprising that Birch was assassinated, though in the ultimate result debt-slavery was abolished, for the next resident, Sir Hugh Low, saw that to govern through fear was both impolitic and costly. He therefore made the chiefs into local headmen to replace an expensive and unsuccessful police and at the same time compounded the matter of their feudal perquisites by allowing them a 'commission' on the taxes they collected. In this way the Perak war was ended. At this time, too, the Brit. Gov., adopting the provisions of the Indian Councils Act, 1861, set up legislative councils with 'unofficial' as well as official members and executive powers were added to the legislative powers of these Malay councils. The sultan of Perak became president of a state council, which, assuming both legislative and executive powers, has served as a model to recent times. On it sat also the resident, the leading Malay chiefs, and representative Chinese. Clarke also turned his attention to the pirate lairs of Selangor, which had involved that state's reactionary sultan in war with the

prince of Kedah and his ally, the ruler of Pahang. In the end the Selangor chiefs voiced the prevailing Malay desire for a Brit. resident and one was duly appointed at the end of 1874, and, in the same year, a Brit. superintendent was appointed in Sungai Ujong (*see* NEGRI SEMBILAN). Now, however, Britain was averse to sending any more residents until sufficient time had elapsed in which to test the experiment. In 1880 the nine petty interwarring states of old Negri Sembilan were at length induced to form a confederation, compose their differences, and accept one resident for the whole confederation. Pahang too had been ravaged by civil war; for thirty years (1857-87) taxes and monopolies imposed a crushing burden on the people. The ruler gave away land to European and Chinese miners regardless of the rights of previous prospectors, landowners, or peasants. He too accepted a Brit. agent (1887) and assumed the title of sultan; but murders and executions continued for some time, and indeed the last civil 'war' in M. was only ended in 1895 when the four states of Perak, Selangor, Negri Sembilan, and Pahang formed themselves into a federation. In 1909 by a further agreement a federal council was constituted. By a policy of decentralisation, approved by the imperial gov. in 1933, the state govts. resumed a greater measure of control over local affairs.

By a treaty of 1909 Siam ceded to Britain all suzerain rights over the Unfederated states (Kedah, Kelantan, Trengganu, and Johore) in consideration of the abolition of consular jurisdiction in Siam. Under this, the Bangkok Treaty, the Federated Malay States were to finance Siam's construction of a railway through Siamese M. to link up Bangkok with Penang, Kuala Lumpur, and Singapore. In 1885 the sultan of Johore agreed to provide a residence for a Brit. consular agent. By 1911 misrule had made the administration too complicated for untamed Malay minds and the sultan asked for a general adviser. Thus, within four decades, from the Siamese frontiers down to Singapore, the Malays had thrown in their lot with Britain (Sir Richard Winstedt).

Constitutionally the gov. of M. throughout the seventy years before the Second World War was anomalous, in the sense that there were marked political divergences between the Malay States and the Straits Settlements which reflected the differences between a crown colony and a protectorate created by treaty. Under the Brit. reign the ruler or sultan of a Malay state remained *de jure* an independent sovereign, even though he had surrendered his political independence. Unlike the ordinances of a crown colony such as the Straits Settlements, the laws of the Malay States were not subject to the Crown veto; they required only the consent of the Malay rulers. In brief the Colonial Office directed the administration of the Straits Settlements but 'advised' the govts. of the different Malay states. In spite of differences in language the

treaties with the Unfederated states had the same purpose as those made with the Federated Malay states: viz. that each state should seek and act upon Brit. advice in all matters not touching Malay custom and religion. But unlike the other Unfederated Malay states, Johore had a written constitution dating from 1895, which provided for a council of Malay ministers (without executive powers), an executive council, and a council of state (corresponding to a legislative council) presided over by the Malay Prime Minister; whereas all the other states had only the usual state council. The position of an adviser in an Unfederated Malay state differed from that of the resident in a Federated state. For the Malays of some of the Unfederated states were educated persons and had administered their own states before calling for Brit. assistance, whence it was but just to consult them and allow them to continue to take part in administration. None of these comparatively new states was willing to join the existing federation or surrender any part of its administrative autonomy to any federal body or association. Each passed its own laws, albeit copied from the laws of the federation. No scheme of 'centralisation' deceived them; the 'bait of a united Malaya' was dangled before them in vain' (Sir Richard Winstedt). That consummation was indeed destined only to be achieved through the pressure of events, during and following the Second World War when first a Malayan union and then a federation of M. came into existence. For events in M. during the Second World War are MALAYA, BRITISH, JAPANESE INVASION OF 1941-42).

After the Second World War it was realised by the imperial gov. that the divided and separatist position of the administration in a country scarcely larger than England, however appropriate as a necessary and useful stage in the political development of the Malay States, was no longer adapted to the complexity of modern administrative and economic developments. A stage had been reached when the system of government should be simplified and reformed. Moreover international relations, as well as the security and other interests of the Brit. Commonwealth, required that M. should be able to exercise an influence as a united and enlightened country appropriate to her economic and strategic importance; while, on the other hand, the Brit. Crown should provide the common link which would draw together the communities of M. and promote a sense of common interest and the development of common institutions. Accordingly Sir Harold MacMichael, as special representative of the imperial gov., was sent on a mission to the Malay States, with whose rulers he concluded an agreement to supplement the existing treaties. Under these agreements it was proposed that the existing combination of the Straits Settlements of Penang, Malacca, and Singapore in one political unit should be readjusted as follows: the settlement of Singapore

should be a separate colony, and the settlements of Penang and Malacca should be administered with the Malay States in a Malayan union. These proposals were to be carried into effect, so far as the Malay States were concerned, under the Foreign Jurisdiction Act, 1890, and, as regarded the Straits Settlements, under a projected Straits Settlements (Appeal) Bill. The policy of the imperial gov. was 'to promote a broad-based citizenship which would include, without discrimination of race or creed, all who could establish a claim, by reason of birth or residence, to belong to the country'; and it was therefore proposed to create by order in council a Malayan union citizenship. There was also to be instituted a supreme court of the Malayan Union and a supreme court of Singapore. Finally the co-ordination and direction of the policies of the gov. as between the Malayan Union and Singapore were to be achieved through a governor-general (Cmd. 6724, 1946). But before this policy could be implemented there was considerable agitation in M. among the rulers. In the result a committee representing the Malayan Gov., Malay rulers, and the United Malays' National Organisation was appointed in July 1946 to draft a new constitution of M. Its report, while giving the central gov. of the projected Malayan Federation most of the wider powers it claimed under the original union plan, marked an appreciable advance in M.'s political development and gave full scope for further development. It stipulated the necessity of elections to the central legislature as soon as possible, made Malayan citizenship attainable by any immigrant who had lived in the country fifteen years and genuinely regarded it as his home, and provided machinery by which Singapore (or any of the Brit. ters. in Borneo) could enter the federation. In 1949 federation had been functioning for more than a year and, like all federal constitutions, was not an easy piece of machinery to work. But (apart from Penang's petition in July 1949 for secession from the federation and restoration to crown colony status) friction with the central administration was only serious in the case of one state, Johore, whose attitude generally was not constructive. But the citizenship question, the racial relationship, remained paramount, and it was evident that to achieve any permanent improvement the Malays must be willing to share more political and administrative power and the Chinese to share more economic power. The basic reasons for the difficulty of the racial question (which in its long-term implications is of much greater importance than the suppression of the Communist rising, the future of rubber and tin, or imperial strategy in S.E. Asia and the Indian Ocean) are that the two elements differ in almost every major particular—in temperament, in economic function, in religion and language, and in degree of education. These differences no doubt existed before the Second World War, but the general level of prosperity and

well-being in M. then was such that they were forgotten, whereas the effect of the Communist rising has been to accentuate the differences still further, especially as the bandits were nearly all Chinese and the Malay pop. regarded the movement as essentially Chinese. Despite the Communist campaign of violence in M. rubber production reached a record level in 1948; the rice crop was the highest on record, and tin production was above 1939 levels.

Malayan Communist Rising.—Outbreaks of terrorist violence in the ters. of the Malayan Federation began early in 1948. These were subsequently found to be part of a Communist plot to overthrow the existing system of administration. An Emergency Powers Bill was passed in M. on July 5 and, on Aug. 23 the Communist party was outlawed. At about the same time the United Kingdom Gov. decided to send out the 2nd Guards Brigade with detachments of auxiliary troops. The spearhead of this rising was composed of Chinese Communists, many of them recent immigrants in sympathy with the Communist campaign in China, who launched their own campaign of murder and sabotage to subvert the administration and set up a Communist state. The victims were principally Chinese, but brutal outrages were also directed against European managers of mines and rubber plantations. The original plan to seize power was thwarted by the staunchness of the Brit. and Malay officials, the heroism of the European business and commercial community, and, above all, the grim determination of the Malays to prevent their country being seized against their will by a Chinese faction. After some initial hesitation, due to a want of appreciation of the extent and seriousness of the rising, the organisation of local security forces, the reinforcement of the fighting services, and the employment of emergency measures broke up the Communist rebels into isolated bands. The task of overcoming these bands, however, was to prove long and difficult, though by the early summer of 1949 the position showed a marked improvement. In view of the failure of their original rising the Communists had to consider a change of tactics or bide their time, but their objective—the seizure of power and the imposition of a Chinese-dominated regime—remained constant. Until this hard core could be physically eliminated from the confines of M. there was no ground for complacency. But a better appreciation of the problem was gained through an understanding of the character of the Communist movement in M., of which there were two main branches: the armed wing in semi-military formations, partially uniformed, formerly the Malayan People's Anti-Jap. Army, now renamed the Malayan People's Anti-Brit. Army, and an elaborate civilian organisation that dealt with propaganda, supplies, intelligence, and communications. To this civilian branch belonged many of the *Loi Tung Tai*, or 'killer squads,' groups of ten or a dozen men who were responsible for many of the murders of Kuomintang

officials and schoolmasters, suspected informers, and who blackmailed merchants. Directing the whole campaign was the central executive committee of the Malayan Communist party, which issued directives to the various state committees. In March (1949) a process had begun of withdrawing the Malayan People's Anti-Brit. Army from the coastal dists. and concentrating them in a few remote and inaccessible regions of the peninsula. These, however, were at least kept on the run; for the troops, Brit., Ghurka, and Malay, had gained greatly in experience and efficiency in this arduous and monotonous type of operations against determined bandits, whose most threatening areas were now in the dist. round Temerloh in W. Pongang and the Siamese frontier, especially that salient of Siam which juts into Perak and Kedah. Of the many measures taken by the civil authorities those aimed at controlling the squatter problem was most effective; for some specially notorious communities were shifted in toto and hundreds of Chinese sent back to China. Although Malayan bandits were now at bay it had to be borne in mind that the emergency must be viewed in its S.E. Asian context; for as long as rampant Communism prevailed in S.E. Asia there could never be the same settled conditions or the same degree of physical security for Asiatic and European alike as before the Second World War.

Malaya, British, Japanese Invasion of (1941-42). The Jap. force, having rapidly overrun Fr. Indo-China and Siam (Thailand), invaded Brit. M. on Dec. 8, 1941. Their immediate objective was Singapore, but the ultimate aim was to secure the resources of Sumatra and Java and even to conquer India. The enemy's operations were facilitated by the fact that he held command of the seas in the Pacific, having treacherously raided Pearl Harbour from the air without declaring war and sunk the Brit. battle cruisers *Prince of Wales* and *Repulse* early in the month. Thus he was able to land troops in any number with impunity almost

anywhere. Yet his progressive occupation of the peninsula was effected only at heavy cost. The imperial forces, Brit., Australian, Indian, and Malayan, made a gallant resistance and proved that, on anything like equal terms, they were more than a match for their assailants; but they were always heavily outnumbered, both on land and in the air, and, moreover, had to contend with much superior mechanised forces. In the early part of the campaign in N. M. Jap. tanks played a secondary part, coming into action only after advance troops had prepared the way; but later, as the ground favoured mechanised operations, tanks were employed as the spearhead of the attack, in the familiar tier manner. The Jap. success on land was largely due to the initial element of surprise, and also to the very strong forces of shock troops which they were able to mass at Singapore for their attack down the Malay Peninsula. By the bombing of the Brit. advanced aerodromes, and by attacks on aircraft there, the enemy was able to establish mastery in the air in N. M. within the first twenty-four hours of battle. From that moment a defensive strategy of controlled withdrawals seemed to be the only feasible course for the imperial forces. Moreover the Jap. infiltration tactics were disconcerting even to troops trained for operations in jungle and rubber country. The a Ivance of the main Jap. forces into Kedah, Kelantan, Trengganu, and Perak, which states were all soon overrun, was much assisted by this infiltration from both the E. and W. coasts, troops being landed from vast numbers of sampans and other small craft, which made effective use of the shallow coastal waters where no naval forces, even had they been available, could penetrate. The squadrons allocated for the defence of Singapore could not be risked in the battle in the S. With the co-operation of the army and air forces of the Netherlands E. Indies, bombing sorties were carried out almost daily, but with comparatively minor inconvenience to the enemy. Harassed on their flanks and in the rear, the defending forces, attacked from all sides at once, and bombed ceaselessly from the air, became fatigued with constant watching and steadily fell back to ill-prepared positions further S. Sev. bodies of the defenders were encircled and had to fight their way out again to re-establish contact with the main bodies. The peninsula is remarkable for its jungle, and it was hoped that their familiarity with the tangled and difficult ways through these jungles might confer some advantage on the imperial forces; but it was soon evident that the enemy, aided by fifth columnists, was equally familiar with every jungle track. The Jap. showed themselves, too, to be able fighters in this type of country, hacking their way through the jungle between and behind the defenders' lines and wading and swimming fully equipped through crocodile-infested rivers, as if they had been fully trained for such warfare. Alor Star (cap. of Kedah), Kota Bharu

(cap. of Kelantan), and Kuala Trengganu (cap. of Trengganu), quickly fell to the enemy. Then followed fierce fighting for the Kuantan R. in Pahang; but after its passage had been forced that state too was overrun. Thus after four weeks of fighting in N. M., the imperial forces had withdrawn from the all-important Kedah and Siamese borders to those of Perak and Selangor and to positions at Kuantan on the E. coast. This constituted a major reverse; for one of the world's richest tin-mining areas, many hundreds of ac. of rubber country, iron mines, and other valuable natural resources had fallen to the enemy, who had meanwhile also seized the is. of Penang, useful as a base for air and sea operations against Sumatra and into the Indian Ocean. By Jan. 6, 1942, the Brit. forces had left the Kuantan area, while the Jap. were in occupation of the valuable Kuantan aerodrome, though only after bitter resistance by the Australian troops. From Ipoh, the important rubber centre of Perak, the invaders soon swarmed over lower Perak; and Penang, having, as stated above, been captured, their control over this narrow seaway along the W. coast was complete. Having now crossed into the state of Selangor they were threatening the important city of Kuala Lumpur, cap. of the Federated Malay States and second city of all M. (see also KUALA LUMPUR). Kuala Lumpur was evacuated in the second week of Jan. and with it went control of Port Swettenham. A week later the imperial forces withdrew to positions S. of Kuala Lumpur, which the Jap. now occupied (Jan. 11). The enemy's land and air forces closely followed up the Brit. withdrawal and the battle continued fiercely N. of Seremban. The retreat from Kuala Lumpur was forced on the defenders by lack of air support, the Jap. use of tanks, and through their overwhelming fatigue from weeks of continuous fighting under hopeless conditions. This form of warfare required extremely strong nerves, for even where the tanks are threatened troops should be reasonably certain of safety in their rear. Even at night, day all around and the men were liable to be cut off at any moment of the day or night. Guerrilla tactics behind the Jap. lines were adopted but proved only partially effective. By Jan. 17 the enemy had secured a foothold on the S. bank of the Muar R., S. of Malacca on the W. coast of the peninsula. In the following week the Jap., pushing on through the states of Selangor and Negri Sembilan, past Malacca, consolidated new positions in Johore, the southernmost state of the peninsula, on the W. coast of the Muar R. Here there was protracted and most bitter fighting, but always the defenders fell back before overwhelming numbers. On the E. coast, having made themselves masters of Pahang, the invaders intensified their operations in Johore. The weary Brit. and Indian troops, still resisting with unmounted courage, withdrew further S. and joined up with the Australians, who had been kept in reserve in Johore. With ever increasing air

support from Singapore, the imperial forces inflicted heavy losses on the enemy and their hopes of holding up the Jap. advance were renewed. But soon the crushing weight of the invader's numbers, coupled with their methods of infiltration, forced the imperial forces to yield further ground and, on the last day of Jan., the mainland was abandoned and the defence concentrated on Singapore Is., a forlorn hope, for the great fortifications there were designed solely as a naval base and were not adapted to defence from the landward side, a contingency which had never been dreamt of.

The enemy, however, had not escaped severe punishment. After Jan. 18, when the Jap. had landed at Butu Pahat on the W. coast only 65 mi. from Singapore and infiltrated southwards from Muar, compelling the Indian troops to fall back, Australian troops beat off sev. attacks and destroyed a number of Jap. tanks. But the enemy abstained from a direct frontal assault preferring infiltration, combined with nocturnal landings on the Brit. flanks. On Jan. 21 Singapore was raided by about 100 planes, 13 being shot down, but nearly 300 persons were killed and over 500 injured, the bombing being indiscriminate. Numerous raids were made subsequently, but many were successfully intercepted by Brit. Hurricane fighters, and altogether by this date the enemy had lost at least 120 planes. For some days the imperial forces succeeded in holding positions at Kluang and at Batu Pahat in S. Johore, but this latter place was taken by the enemy on Jan. 25. The imperial forces were withdrawn from the Malayan mainland on the night of Jan. 30-31. A part of the famous causeway to Johore Bahru, carrying rail and road traffic, was blown up by Brit. soldiers and the siege of Singapore began. The operation of withdrawal was covered by a gallant final stand S. of Kulai (some 18 mi. from the causeway) by the Gordon Highlanders, Argyll and Sutherland Highlanders, and Australian troops, who inflicted great losses on the enemy.

There was an ominous lull, apart from minor air raids, for some days. But on Sunday night (Feb. 8) the enemy landed on the Is. in force, occupying a 10-mi. stretch of coast in the N.W. of the Is. The Brit. forward troops were pressed back and the landing parties filtered eastwards, their progress being preceded by a very heavy artillery barrage on the N. part of the Is. The barrage lasted throughout the day and night of the 8th—one uninterupted roar shaking every window in the city. Further landings were made on the 10th, accompanied by continuous dive-bombing and machine-gunning by Jap. aircraft. Hurricanes offered a gallant resistance, but there were very few machines. Big fires raged on Feb. 9 on the N. part of the Is. like an angry sunset before a storm, gusts of wind fanning the flames to great heights. Next day the Jap. drive was directed on Singapore city itself, the advance being pressed home with tanks and considerable bomber and fighter support. The enemy was repulsed and dropped a note from the

air, addressed to the Brit. commander, demanding unconditional surrender. Fierce resistance, however, still continued outside the doomed city and sev. quite successful counter-attacks were made. Guns of Brit. naval vessels rendered some aid to the garrison, firing on the causeway and the S. shore of Johore. The next day Singapore was heavily shelled and dive-bombed again. The fighting now reached the more southerly of the two main reservoirs. The enemy also made a successful move to cut off the Seletar naval base. As at Hong Kong, so here, the cutting of the water supply was the prelude to the end. On Feb. 15 the garrison was forced to capitulate unconditionally. Some 60,000 imperial troops—Brit., 15,000; Australian, 13,000; Indian, 32,000—were made prisoner, and a large amount of material was also captured. Singapore was regained on Sept. 3, 1945, following the surrender of Japan. See F. S. Chapman, *The Jungle is Neutral*, 1948, and A. E. Percival, *The War in Malaya*, 1949.

Malay-Polynesian Languages, see under LINGUISTIC FAMILIES.

Malays (properly Malayus, Malay word, the derivation of which has not yet been satisfactorily ascertained) is the name given, in a restricted sense, to the inhab. of the Malay Peninsula, and used to denote, not only these, but also the inhab. of the large and small, of the Indian Archipelago, of Malacca, and of the numerous Is. of the Pacific. In physical appearance the M. are a brown-complexioned race rather darker than the Chinese, but not so swarthy as the Hindus. They have long, black, shining, but coarse hair, little or no beard, a large mouth, eyes large and dark, nose generally short and flat, lips rather thicker than those of Europeans, and high cheek-bones. In stature the Indo-M. are for the most part below the middle height, while the Polynesians generally exceed it. The Indo-M. have also slight, well-formed limbs, and are particularly small about the wrists and ankles. Such is the general appearance of the M. proper, or inhab. of the peninsula and Indian Is. But these also have their sub-divs. There are the civilised M., who have a written language, and have made some progress in the arts of life; there are also the *orang-laut*, literally 'men of the sea', a kind of scapulars or robbers; and the *wang-banua* or *orang utan*, 'wild men' or 'savages', dwelling in the woods or forests, and supposed to be the aborigines of the peninsula and Is. 'These three classes of Malays,' says Cratford, 'existed nearly three centuries and a half ago, when the Portuguese first arrived in the waters of the Archipelago, just as they do at the present day. That people describe them as having existed also for two centuries and a half in fore that event, as, without doubt, they did in times far earlier.' Still, while so widely differing in habits, all these speak essentially the same language. The M. are essentially Islanders, and have much of the daring and enterprise for which nations familiar with the sea are

famous. Their original seat is by themselves stated to have been Menangkabo, in the is. of Sumatra, rather than the peninsula itself. Even the M. of Borneo claim to have had a Menangkabo origin. Palembang, however, also in Sumatra, has been mentioned as the original seat of Malay civilisation; and others, again, point to Java as the source from which both Menangkabo and Palembang received their first settlers. The Javanese would seem to have been even the founders of Malacca. Monuments, which prove their presence in the country of the M., have been discovered.

The Malay language is simple and easy in its construction, harmonious in its pronunciation, and easily acquired by Europeans. It is the lingua franca of the E.

E.N. 1.

A MALAY WOMAN OF PENANG

Archipelago. Of its numerous dialects the Javanese is the most refined, a superiority which it owes to the influence upon it of Sanskrit literature. Many Arabic words have also been incorporated with it, by means of which the Javanese are able to supply the deficiency of scientific terms in their own tongue. The civilised M. are Moslems, having embraced that faith in the thirteenth or fourteenth century. The tribes in the interior and the 'men of the sea' have either no religion at all, or such as can be regarded only in the light of most debased superstition. The moral character of the Indo-M. generally does not stand high; they are passionate, treacherous, and revengeful. Although good sailors and able to amass wealth by legitimate commerce, they prefer piracy. See H. Clifford, *Studies in Brown Humanity*, 1895; W. W. Skoat, *Malay Magic*, 1900; W. E. Maxwell, *A Manual of the Malay Language*, 1907; A. Wright and T. H. Reid, *The Malay Peninsula*, 1913; Sir H. Clifford, *Malayan Monographs*, 1913; Sir R. O. Winstedt, *Malayan*

Memories, 1916, and *Malay Grammar* (2nd ed.), 1927; and L. R. Wheeler, *The Modern Malay*, 1928. See also bibliography under MALAYA.

Malbaie, see MURRAY BAY.

Malbork (formerly Marienburg), tn. of Poland, formerly known as Marienburg in the prov. of E. Prussia (q.v.). It is 35 m. S.E. of Gdansk (formerly Danzig), and situated on the Nogat, a channel of the Vistula. As Marienburg it was famous as the seat of the grand masters of the Teutonic Knights, transferred hither from Venice. The Marienburger Schloss became one of the largest and most strongly fortified buildings in Germany, but after it had passed into the possession of the Poles in the fifteenth century it was allowed to fall into decay. In 1773 the tn. passed to Prussia and the castle was restored at the beginning of the nineteenth century. Before the Second World War it had mills, of agric. machinery, saw mills, flour sugar, etc. The tn. was captured by the Russians in 1945 after fierce fighting which left the famous Gothic castle practically in ruins, together with the cathedral and the city of M. itself. It took the knights about a century to build the massive schloss regarded as the largest and strongest in medieval Europe, with walls 10 to 15 ft. thick and quarters for a garrison of 10,000 men. Half of it was destroyed in the few weeks' siege by the Russians. What was left testified to the architectural and engineering skill of its builders; for the castle was provided with fittings, such as a system of steam heating in the floors, lifts to convey the food to the refectory, wells to provide water for the top floor and a mill to grind the flour, all constructed in a manner that could hardly be bettered by modern engineers. Attempts were being made in 1948 to preserve what remained of the castle. Pop. (1939) 12,000.

Malchin, tn. in Mecklenburg, Germany, dating from the thirteenth century, situated about 2 m. E.S.E. of Gadow on the Peene, which runs into the Rostock Bay. Pop. 7200.

Malcolm I. (Macdonald) (d. 954), king of Scotland, succeeded to the crown in 943. He made a treaty with Edmund the W. Saxon king in 945, and renewed it with his successor, Eadred, but in 950 the Scots made a foray to the Tees. Eventually, however, they were unable to stay the progress of the W. Saxons, and in 954 Northumbria was lost and M. slain.

Malcolm II. (Mac Kenneth) (d. 1031), king of Scotland, son of Kenneth II., succeeded in 1005 by defeating and killing Kenneth III. In 1018 he won a great victory over the Adulf Cudel, which led to the cession of Lothian to the Scottish kingdom and about the same time Cumbria N. of the Solway became an appanage of the kingdom. In 1031 M. did homage to Canute.

Malcolm III. (called Canmore) (d. 1093), king of Scotland, succeeded his father, Duncan I., after the defeat of Macbeth by Earl Siward of Northumbria in 1054. He married Margaret, sister of Edgar Atheling, and did homage to the Eng. kings in

1072 and 1091. He was treacherously slain while invading Northumberland. See Jane Oliver, *Sing. Morning Star* (novel), 1949.

Malcolm IV. (the Maiden) (1141-65), king of Scotland, succeeded his grandfather, David I., in 1153. He surrendered Northumberland and Cumberland to Henry II. in 1157, and received in return Huntingdon. He served with the Eng. forces in the expedition against Toulouse (1159), and as a result encountered rebellions in Scotland (1160-64).

Malcolm, Sir John (1769-1833), Indian administrator and diplomatist, b. at Burnfoot in Scotland. In 1798 he was appointed by Lord Wellesley assistant to the resident at Hyderabad. He was envoy to Persia (1800, 1807, 1810); private secretary to Wellesley (1801-2); political agent to Wellesley during the Maratta war (1803-4); governor of Bombay (1826-30); and M.P. for Linnecston (1831-32). He wrote *Political History of India* (1811); *History of Persia* (1815); *Administration of India* (1833); and *Life of Clive* (pub. 1836).

Malcomia, a genus of crucifers, of which the best-known species is *M. maritima* (Virginian stock), a valuable garden plant with numerous varieties of various colours, giving a lengthy succession of bloom.

Malczewski, Antoni (1792-1825), Polish poet. During the Napoleonic wars he served as a lieutenant of engineers in the Polish contingents of Napoleon's army. He took part in the heroic defence of Modlin against the Russians. In 1818 he was one of the first to accomplish the ascent of Mt. Blanc. He subsequently returned to Poland, where he managed an estate in the country, but devoted most of his time to his literary work, which took the shape of one big narrative poem, *Maria* (1825). As a poet M. links Polish literature with the romanticism of the W. of Europe and, particularly, with that of England. In many ways his great poem was inspired by Byron. The descriptions of a battle between Poles and Tartars, the vast loneliness of the steppes, the wild gaiety of a carnival, are all famous in Poland. See life by J. Ujejski, 1922.

Malda, dist. in W. Bengal, India. Agriculture is carried on and silk, indigo, and mangoes are produced. The Mahananda R., a trib. of the Ganges, flows through the centre of the dist., upon which is situated the tn. of M., the cap. Pop. (of dist.) 1,233,000.

Maldegem, tn. of Belgium in the prov. of F. Flanders, 17 m. N.W. of Ghent, engaged in agriculture, tree-nurseries, and manufs. of lace, baskets, and leather. Pop. 12,500.

Malden: 1. Par. and vil. of Surrey, England, on the R. Hogsmill, about 3 m. from Kingston-on-Thames. Berton College, afterwards removed to Oxford, was founded here in 1264 and still owns property in the dist. Pop. (with Coombe) 38,800. 2. City of Middlesex co., Massachusetts, U.S.A., on the M. R., 5 m. N. of Boston. It is noted for the manuf. of rubber boots and shoes; chemicals,

leather goods, and furniture are also produced. Pop. 58,000. 3. Is. in the S. Pacific which has an active trade in guano. It was taken possession of by Britain in 1861. Area 35 sq. m. Pop. 150.

Maldivé Islands, group of twelve coral is., in the Indian Ocean, 400 m. S.W. of Ceylon which are trib. to Ceylon, and governed by a sultan. The natives are expert navigators, and are largely engaged in bonito fishery, that fish being one of the chief exports and the prin. article of food. Mall, or King's Is., is the cap. of the group and the residence of the sultan, and from it the trade, which is carried on chiefly with Calcutta, is conducted. The prin. exports are bonito fish, tortoiseshell, coco-nuts, cohi-arn, copra, and cowries. The climate is unhealthy. The old form of gov. was abrogated in 1932 and a new constitution introduced, the former Prime Minister, Abdul Majid Dill, becoming sultan. There is now a popular assembly of thirty-three members and a cabinet of four ministers, the prime minister being chosen by the sultan from the members of the Assembly. Pop. (all of whom are Muslims), 93,000.

Maldon: 1. Municipal bor., mrkt. tn., and riv. port of Essex, at the influx of the R. Chelmer to the Blackwater estuary, 41 m. E.N.E. of London. There are manufs. of crystallised salt, breweries, an oyster fishery, and some shipbuilding. Many Rom. remains are in the neighbourhood. Pop. 10,000. 2. Mining tn. in Talbot co., Victoria, Australia, at the foot of Mt. Tarrangower, 40 m. from Sandhurst. Pop. 3077.

Maldon, The Battle of, took place in 993, according to the *Anglo-Saxon Chronicle*, and was a contest between Olaf Trygvesson, later king of Norway, and the ealdorman Bryhtnoth, which resulted in the death of Bryhtnoth. It is described in a contemporary epic poem of which about 700 lines still exist, but no one of the enemy is mentioned by name, and it was written immediately after the battle, before the poet had time to find out any information about the opponents. A copy of the poem is contained in H. Sweet, *Anglo-Saxon Reader*, 1876.

Maldonado: 1. Tn. in Peru, cap. of the Madre de Dios dept., situated on the R. Madre de Dios. 2. Dept. of Uruguay on the sea-coast, with Rocha to the E., Lavalleja to the N., and Capadones to the W. Agriculture and stock-raising are the chief occupations. Area 1687 sq. m. Pop. 67,915. 3. Cap. of the above dept., seaport, and naval station on the Rio de la Plata, 70 m. E. of Montevideo. The is. of Gorriti shelters its harbour. It has limestone quarries, and exports cattle and hides and limestone to Montevideo. Pop. 86,000.

Malebranche, Nicolas (1628-1715), Fr. philosopher, b. at Paris, where his father was president of the chamber of accounts. At the age of twenty-two he entered the congregation of the Oratory, and devoted himself to the study of Bible hist. and of the fathers of the church, till Descartes's treatise, *De Homine*, falling into his hands,

attracted him to philosophy. His famous work, *De la recherche de la vérité*, was pub. at Paris in 2 vols. (1674-75). It shows great depth and originality of thought, combined with perspicuity and elegance, and had for its object the psychological investigation of the causes of the errors to which the human mind is liable, and of the nature of truth and the way of reaching it. He maintains that we see all things in God (his famous *vision en Dieu*), that all beings and thoughts exist in God. His system is a kind of mystic idealism. It was immediately opposed by Antoine Arnauld, Bossuet, and many others, and was subjected to a thorough and critical examination by Locke and Leibniz. Besides the work above mentioned M. wrote *Conversations métaphysiques chrétiennes* (1677); *Traité de morale* (1697); and *Traité de la communication de mouvement* (1699). An ed. of his works was pub. in 1712, and a selection, ed. by J. Simon, 1839-71. See A. Keller, *Das Kausalitätsproblem bei Malebranche und Hume*, 1899, and L. Bridet, *La Théorie de la connaissance dans la philosophie de Malebranche*, 1929, also studies by P. Monnickin, 1927; H. Bouhier, 1929; and R. W. Church, 1931.

Male Fern (*Nephrodium*, or *Asplenium filix-mas*), one of the commonest ferns. Its bluish-green, bipinnate fronds rise erectly from a stout stock like the feathers from a shuttlecock. The fern exhibits wide variation in type, and has been split up into three sub-species. The spore capsules are borne in circular sort or heaps on the back of the fronds, and at first are covered by kidney-shaped scales. The plant, and especially the root, contains antacid properties, and oil of M. F. is used as a vermifuge.

Malakula, formerly *Mallicolo*, i. of the New Hebrides, W. Pacific, extends some 55 m. N.W. to S.E. between 167° 10' E. and 167° 47' E. long and between 15° 30' S. and 16° 45' S. lat., being the second largest is. of the group. To the W. is the open sea; to the E. lie Rapa, Ambrym, and Epif Is.; to the N. the large is. of Espiritu Santo; off the S.W. coast is the archipelago called the Makelive Is., and small is. of coral formation, such as Van and Aiden, are separated from its coasts by narrow channels. A mt. chain runs along the whole length of the E. coast and another inland parallel to the S. coast. Sharp Peak is 2765 ft. high and Mt. Penat 2125 ft. Very little is known of the interior. There are no large rivers, but some considerable streams, some good harbours, and many bays. The only indigenous mammal is the flying fox (*Pteropus*); but wild pigs, rats, and wild cats are found in the bush and are hunted. There are sev. varieties of lizards and snakes. There are also varieties of pigeons and a black hawk (*nemba*), which latter is represented in native ceremonial. The flora includes bread-fruit trees, tree-fern, bamboos, wild cane, umbrella palm, ivy-nut or thatching palm, cycas, kava plant (*Achyranthes aspera*) with bright red leaves used for adornment, and many kinds of croton, which also figures prominently in ritual.

The natives of M. are Melanesians and extremely primitive, and as yet they are not accustomed to white people exploring the bush. They are rapidly disappearing on account of disease. They are of medium height, with chocolate-coloured skins, woolly hair, and prognathous faces. The climate is tropical and has the usual attendant ill of malarial-infected mosquitoes. There is a Presbyterian mission-house at Urua on the E. coast. The is. folk have been the subject of much field work by anthropologists. See A. B. Denoon, *Malakula: a Vanishing People in the New Hebrides*, 1934, and J. Layard, *Malakula: Stone Men of Malakula*, 1942.

Maler Kotla: State of E. Punjab, India, one of the Cis-Sutlej states which came under Brit. influence in 1809. Tobacco, sugar-cane, cotton, and wheat are grown. Area 168 sq. m. Pop. 88,100. 2. Tn. of India, cap. of the above, 30 m. from Ludhiana. Pop. 30,100.

Male-herbes, *Chrétien* Guillaume de Lamoignon (1721-94), Fr. statesman, b. in Paris, the associate of Turgot and those who sought by moderate reforms to prop the weakness of the old monarchy of France. Among other offices he held those of president of the *Conseil des Aides* and minister of the king's household. When Louis XVI. was brought to trial, M. claimed the post of his defender. His fearless integrity drew upon him the hatred and suspicions of the party in power and he was guillotined on April 22. The works of M., who was a member of the Fr. Academy and of the Academy of Belles Lettres and Inscriptions, mostly on subjects of natural hist. and rural economy. His *Discours et opinions diverses*, printed in 1779, are still quoted as authorities on financial questions. See also by E. Vignaux, 1874, and J. M. Simon, 1938.

Malet, Lucas (1852-1931) (pseudonym of Mary St. Leger Harrison), Eng. novelist, b. at Exeter, daughter of Charles Kineley (q.v.) and wife of Wm. Harrison (formerly rector of Clavely). Her most celebrated work was *History of Sir Richard Calmady* (1901). Others include *Colonel Enderby's Wife* (1895); *The Far Horizon* (1909); *Idrian Savage* (1911); *The Survivors* (1923); and *The Dogs of War* (1924).

Malham, vil. in the W. Riding of Yorkshire, England, 6 m. E. of Settle, on the R. Aire. The Craven Fault, a displacement of limestone, forms two amphitheatres of rock, M. Cove and Gordale Scar. 1 m. from the vil. M. Tarn, N. of the cove, is an upland lake.

Malherbe, François de (1555-1629), Fr. poet, was b. at Caen in Normandy. He accompanied Henri of Angoulême, son of Henri II., who went to Provence as governor in 1579, and remained attached to his household till that prince's death in 1585. He was patronised by Henri IV., on whose death his widow, Marie de Medici, settled a pension upon him. M. has been styled a competent judge, the restorer of the Fr. language and poetry. His complete works were pub. in *Grands Écrivains de la France* (1802). See

F. Brunot, *La Doctrine de Malherbe*, 1891, and R. Bray, *La Formation de la doctrine classique* (2nd ed.), 1931.

Malibran, Maria Felicità (1808-36), Fr. operatic singer, b. at Paris, a daughter of Manuel Garcia, Sp. tenor. She made her début in 1825 in *The Barber of Seville* at Covent Garden, and then went to America. She later sang with great success in France and Italy.

Malic Acid, or Monohydroxysuccinic Acid ($C_4H_5O_5$), an organic acid which occurs in the free state and in the form of its salts in many fruits, including apples, grapes, and mountain-ash berries. It forms deliquescent crystals melting at $100^\circ C$; it dissolves readily in water and alcohol. It may be prepared by boiling bromosuccinic acid with silver hydroxide and water, or by treating aspartic acid with nitrous acid. It is usually obtained by squeezing the juice out of unripe mountain-ash berries; the juice is boiled with milk of lime, and the resulting precipitate is dissolved with hot nitric acid, crystals of calcium hydrogen malate being formed. The salt is then decomposed with oxalic acid.

Malice, in popular language, means ill will or spite against a particular person or class of persons. In law it occasionally has this meaning, as, for example, in the case of an action for malicious prosecution (*q.v.*), and again in the law of libel (*see* DEFAMATION) the defence of 'qualified privilege' is rebuttable by proof of such M. in the defendant. But its general use in the criminal law is notoriously devoid of any special significance, and in practically all cases it merely connotes that which is unlawful and is tantamount to criminal intent (on this subject *see* CRIMINAL LAW). M. when used in law in the non-technical sense, is generally called express M., or M. in fact, in contradistinction to technical or implied M., i.e. the M. or criminal intention that is really nothing more than an inference of law resulting from doing the objectively criminal act, *e.g.* murder is generally defined as killing with 'M. aforethought,' or *premeditation*, while manslaughter (*q.v.*) is defined as killing another without M., either express or implied. (*See also* MALICIOUS INJURIES TO PROPERTY.) In civil actions M., or indeed any other state of mind, is for the most part irrelevant, and it is now settled law (1) that a violation of a legal right committed knowingly gives a right to sue for damages, not on the ground of malicious intention, but simply because the interference with other people's contractual relations is wrongful if not justified; (2) if such violation or interference be unjustifiable, the presence or absence of M. is immaterial to the cause of action.

Malicious Injuries to Property are classified in the Eng. criminal law either according to the nature of the property or the manner of injury. They are for the most part dealt with in the Criminal Law Consolidated Act, 1861. Arson is treated as a distinct specific offence, though there is no scientific reason for so doing. Every kind of arson is a felony, and in all but one

case (attempting to set fire to crops and stacks—seven years) the punishment may be up to fourteen years' penal servitude, penal servitude for life, and in two cases death (arson of ships and vessels). M. l. to houses by explosion so as to endanger life is a felony punishable by penal servitude up to life; but the maximum punishment for malicious injury to vessels by explosion is only seven years, while a life sentence may be given for malicious injury by altering signals so as to endanger vessels. The Act further deals with numerous other specific M. l., *e.g.* destruction of manufs. and machinery; damaging mines by water; destruction of vessels wrecked or stranded; damaging sea and riv. banks, dams, and walls; destruction of bridges, viaducts, aqueducts, and turnpikes, throwing obstacles across any railway; and damaging books, works of art, etc., in public museums. The punishments range from a minimum of five years up to life imprisonment, while lesser injuries may be disposed of summarily by magistrates. The fact that injuries or attempted injuries to property are committed in the furtherance of a political purpose is no defence to a criminal prosecution.

Malicious Prosecution. To set in motion the machinery of the criminal law against a person without 'reasonable and probable cause,' for so doing, renders the prosecutor liable to an action for M. P. But not every person who gets an acquittal at the hands of a jury, or whose prosecution is summarily dismissed by justices, will necessarily succeed in a civil action of M. P. If a crime has been committed and the circumstances were such that the prosecutor had reasonable cause for believing that the plaintiff (in the civil action) was probably the guilty person, he is justified in protecting his interests by prosecuting him. It is on the plaintiff, if the judge decides that there was an absence of reasonable and probable cause, to prove affirmatively, to the satisfaction of the jury, that the defendant (prosecutor) was actuated by malice or some indirect motive like personal spite or ill will against him; but if the judge decides on the facts that there was such cause, then malicious motives are immaterial, and there is no case to go to the jury. As a rule a claim for damages for M. P. is joined with a claim for false imprisonment (*q.v.*), for there cannot be a prosecution without at least technical imprisonment. The false imprisonment, however, is more or less merged in the M. P. where joined with such a claim. *See also* VEXATIOUS INDICTMENTS ACTS.

Malignant Jaundice, *see under* JAUNDICE.

Malignant Pustules, *see* ANTHRAX.

Malignants, name given by the Parliamentarians to the Royalists during the Great Rebellion in England. It occurs in the Great Remonstrance of 1641.

Maligne Lake, forms part of the Jasper National Park on the slopes of the Rocky Mts., Alberta, Canada. The lake is about 5 m. in length; it is about 10 m. S.W. of Jasper.

Maliki, *see under* SUNNISM.

Malinao, pueblo of Albay prov., Luzon, Philippine Is. Near it is the extinct *M. volcano*. Pop. 13,000.

Malindi, seaport of Kenya, at the mouth of Sabaki R., 70 m. N.E. of Mombasa. Vasco da Gama visited it in 1498 and raised a pillar. Copra, cotton, and maize are exported from the port, and rubber is produced in the neighbourhood. Pop. 5,000.

Malines, see MICHELEN.

Malingering, word of obscure derivation, but according to Cotgrave comes from the Fr. *malinure*, sickly, denoting pretended or feigned illness for any purpose, but especially to evade military or naval duty. *M.* is also a common practice of mendicants to avoid labour, pampers to shirk allotted tasks, and criminals to prevent the infliction of punishment. It takes various forms, e.g. military doctors have found pieces of metal inserted in the head to indicate previous fracture of some part of the skull; an appearance of fever has been induced by swallowing tobacco juice, or by various stimulants, such as brandy or cantharides; lameness by tying ligatures round the leg, causing it to swell; internal applications have been used to produce cardiac derangement. Manifestations of the nature of inflammation, purulent expectoration, and fevers, are, however, not easily feigned, nor any disease whose diagnostic symptoms are well settled, and which operate to produce a perceptible systematic change. It is otherwise with diseases symptomatically uncertain or variable and characterised by no peculiar outward appearance, like epilepsy and insanity. *M. per se* is no offence apart from the special case of soldiers and sailors unless the malingeringer's assumed illness is for the purpose of obtaining money, and he actually attempts so to obtain it. A test involving pain, to detect *M.*, may only be employed by the authority of a visiting committee of justices or a prison commissioner.

Malinowski, Bronislaw Kaspar (1881-1942), Anglo-Polish social anthropologist, b. at Cracow, Poland, and educated at the Polish Univ. there. He accompanied the Robert Mond anthropological expedition to New Guinea and N.W. Melanesia in 1914 and visited Australia in 1918 and Mexico in 1926. Reader in social anthropology (1924-27) and prof. (from 1927) in the Univ. of London. Visiting prof. to Yale (1939). His work in London Univ. from 1927 made him world famous as one of the leading social anthropologists, his prin. pubs. on the subject being *Argonauts of the Western Pacific: Native Enterprise and Adventure in the Archipelagoes of Melanesian New Guinea* (1922); *Sex and Repression in Savage Society* (1928); *The Sexual Life of Savages in N.W. Melanesia* (1929); and *Coral gardens and their magic . . . in the Trobriand Islands* (2 vols.) (1935). Some of his works are written in Polish but most of them are in English. D. at New Haven, Connecticut, after presiding at the inaugural meeting of the Polish Institute of Art and Science, New York, of which he was chairman.

Malinowsky, Rodion Yakovlevich (b. 1899), Russian soldier. Served in the Stalingrad offensive, 1942. Commanded the troops which occupied Istosov-on-Don, Feb. 1913, when he was promoted colonel-general. General of army, May 1913. Awarded the order of Lenin 1911 and 1945; order of Suvarov, 1943. Commander of the S.W. front in Russia, 1943. Commander-in-chief of the Third Ukrainian front or group of armies in 1944. In Jan. 1944 his main spearhead struck at the centre of the Ger. front in the S., along the line of the railway running S.E. from Dniepropetrovsk, the impetus of his attack carrying his forces through the Ger. line on a front of 94 m. and ending in the capture of Nikopol (8 Feb.). In March 1944 in four days' fighting his armies again broke through the Ger. line on a front of 105 m. along the Ingulets R., his brilliant co-operation with the First Ukrainian group under Zhukov (*q.v.*), the Second under Konev (*q.v.*), and the Fourth under Tolbukhin resulting in the liberation of the Ukraine and carrying the Russian Armies to the Balkans. In Aug. 1944 his armies assailed the strong positions covering Jassy, sweeping everything before them and capturing Kishinev (Aug. 24), and soon afterwards consolidated their grip on the chief passes leading to Transylvania. Signed the Rumanian armistice at Moscow, Sept. 1944. (*See further under EASTERN FRONT or RUSSO-GERMAN CAMPAIGN in SECOND WORLD WAR.*) Gold Star Medal, 1945. Titled Hero of Soviet Union, 1945. Commander-in-chief of the Soviet forces in Manchuria, 1945-46.

Malipiero, Gian Francesco (b. 1882), It. musical composer, b. in Venice, studied at Bologna under Bossi and in Germany under Max Bruch. A cultured and advanced musician with plenty of inspiration. *M.* has tried all kinds of musical composition, but scorns all the customs of the more immediate It. past and wishes to see It. music regenerated (S. holes). He produced an opera, *Canossa*, in 1914, but without success. Among his best known works are *Sette Canzoni* (symphonic drama), *L'Orfide*, a trilogy (dramatic), *Didrambo tragico* (1917), together with a number of songs and piano pieces. He ed. a complete ed. of Monteverdi's works. His writings include *L'Orchestra* (1920); *Tedro* (1920); *Studio Monteverdi* (1930); and *Four Stravinsky* (1942).

Mallard, genus *Anas boschas*, subfamily Anatinae of the order Anseriformes. The common wild duck of Great Britain and the N. hemisphere, from which most domesticated breeds are derived. In the male the general colour is brown, deepening into black on the lower back, the rump and tail-coverts being black, with a purplish or green gloss; wing-coverts ashy grey, washed with brown; the colour of the speculum varies, according to the light, from rich purple to steel-blue or greenish blue; head and neck all round metallic green changing into purple according to the light; on the lower throat a narrow white band not completely joining at the nape; foreneck and

chest deep chestnut; remainder of under-surface greyish-white and finely freckled; bill olive-yellowish; feet and toes orange; total length 22 in., wing 11 in. and tail 3.5 in. The female, which is smaller, is entirely different from the male, having mottled brown and buff plumage, with reddish margins and centres to the feathers, imparting a narrowly streaked appearance to head and neck, and broadly streaked appearance to the back—but it should be noticed that there is great variation in these markings. Of all fresh-water ducks the M. is the commonest, and though it was more plentiful in former days there are still so many retired dists. in Great Britain where it is encouraged to breed that it is extremely numerous in some places, and every winter there is a great accession of migrants from the Continent. At this season it quits its N. habitat and is absent from many of the N. dists. of Scotland and its is. Like the tatic duck the M. is almost omnivorous in its choice of food, many kinds of aquatic plants and weeds, as well as water insects, worms, and slugs, forming its usual diet, though it will also eat grain and acorns.

Mallarmé, Stéphane (1842-98), Fr. poet and theorist, b. in Paris. He was prof. of Eng. at Tournon, Besançon, Avignon, and Paris successively. In 1876 he pub. his *L'Après-midi d'un faune*, and in 1887 *Poésies complètes*. His vol. *vers et prose*, containing some of his most important work, appeared in 1893. He had previously pub. in 1883 a notable trans. of the poems of Edgar Allan Poe and some essays of literary criticism. His poems contain some verses of extraordinary beauty and grace, but are, for the most part, wrapped in mysticism, and are not very intelligible. M. is an important figure in the development of Fr. literature of the Third Empire and his influence on Paul Valéry and other later writers is as great as that of Verlaine. Early a friend of Mistral he understood Provençal poetry and its intimate relationship to instinct better than did most Fr. writers, and as an admirer of Eng. poetry—notably Poe—he inculcated from that source a spirit that was also new to the Fr. Hence when at thirty he came to Paris, moulded by these two formative influences into an Anglo-Provençal, he had much to teach the Fr., whose tradition, whether Romantic or Classicist, was eloquence or rhetoric rather than poetry, and had in any case tended by 1870 to become sterile. M. expresses in his fragmentary pieces the spirit of a new kind of literature which whether the only true literature or not certainly dominates the whole period of the Third Empire. In England Blake had much of the spirit which M. would have re-echoed had he known of Blake's work; and in France Baudelaire, Rimbaud, and Gérard de Nerval were all precursors in the Mallarmean conception of poetry; but M. himself was the first Fr. writer to formulate a definite theory of the function of poetry (*Poésies et prose*). According to M. reality is not art; nothing that tells a tale is poetry; nothing that

teaches a lesson is poetry; nothing that expresses feeling is poetry; drama is the least poetic of all forms of writing. Poetry must learn from music. Thus he condemns nearly all previous literature, save for some isolated exceptions. He proclaims that the true function of poetry is to restore the eternal, and its true subjects the failures of reality, as exemplified in Baudelaire's *Fleurs du mal* (1857) and *La Nuit d'Idunée* (0000). M. was himself an indifferent writer whether in verse or prose; he was essentially a thinker and talker. He seems deliberately to make his verse incomprehensible to square with his theories—theories which impelled him to Symbolism, the strongest single influence in Fr. literature of the period. See A. Symons, *The Symbolist Movement in Literature*, 1900; Sir E. Gosse, *French Profiles*, 1905; A. Thibaudet, *La Poésie de Stéphane Mallarmé*, 1923; E. Dujardin, *Mallarmé parmi ses siens*, 1936; and D. Saurat, *Modern French Literature*, 1946.

Malleability, physical property of materials which determines the extent to which their shape can be altered by hammering without breaking. Most metals and metal alloys are malleable to some degree, gold being of the highest M. Temp. may be an important factor in M.; some metals are only malleable at temp. below, and some at temp. above, their recrystallisation temp. The property is of especial importance in rolling, pressing, and forging.

Malleco, inland prov. in Chile, cap. Angol. The centre consists of a rich plain where agriculture is carried on. The chief products are wheat and cattle, and gold is mined. Area 5511 sq. m. Pop. 154,174.

Mallee, Australian name for *Eucalyptus dumosa* and *olosa*, two dwarf species of the gum-tree, which are able to live under extremely adverse conditions, and form dense thickets over tracts of country, called M. scrub. Much may be accomplished by irrigation schemes, in course of preparation, to relieve the constant threat of drought in these areas. The M. country is subject to dust-storms, which cover roads, gardens, and fences, and gather dust in drifts up to 6 ft. in depth.

Malleon, George Bruce (1825-98), Brit. soldier and author, b. at Wimbledon and educated at Winchester. He obtained a cadetship in the Bengal Infantry, and in 1842 served in the second Burmese war. His subsequent appointments were civilian. For some time he was Indian correspondent of *The Times*. His first work to attract notice was the *Red Pamphlet*, pub. at Calcutta during the mutiny (1857). Among his other works are *History of the French in India* (1868); *History of Afghanistan* (1878); *The Founders of the Indian Empire* (1882); and *The Decisive Battles of India* (1888). He also re-wrote the *History of the Indian Mutiny* (1878-80), left uncompleted by Sir John Kaye.

Mallet (originally Mallooh), David (1705-1765), Scottish poet and miscellaneous writer, educated at Clief par. school and

the univ. of Edinburgh, where he met Thomson. In 1723 appeared his ballad of *William and Margaret*, by which he is chiefly remembered, and which made him known to Pope, Young, and others. His *Excursion*, an imitation of Thomson, was pub. in 1728. At the request of the Prince of Wales, whose secretary he had become, he wrote with Thomson a masque, *Alfred* (1740), in which *Rule, Britannia* first appeared, which, although he claimed the authorship, is now generally attributed to Thomson. On the accession of George III. M. became a zealous supporter of Lord Bute, and was rewarded with a sinecure. In addition to the works above named M. wrote some indifferent dramas, including *Eurydice* (1731); *Mustapha* (1739); and *Elvira* (1763).

Mallicolo, see MALFICOLA.

Malling, East, and West, see EAST AND WEST MALLING.

Malloch, David, see MALLET.

Mallophaga, see BRU LICE.

Mallorca, Sp. name for Majorca (q.v.).

Mallow, tn. in Co. Cork, Ire., on the Blackwater R., 17 m. N.N.W. of Cork. Noted for its mineral springs, and has the remains of a castle. Pop. about 1500.

Mallow, or Malva, genus of hardy annuals and perennials. The musk M. (*M. moschata*), with its white flowers, is grown in gardens.

MALLOW

Mall, The, London thoroughfare running along the N. side of St. James's Park between the Admiralty Arch near Trafalgar Square, and the Queen Victoria memorial in front of Buckingham Palace. It is overlooked by the gardens of St. James's Palace and the adjacent houses. Parallel to it is Pall Mall, home of many of London's chief social clubs, the name of this thoroughfare as well as that of the M. being taken from the game of M. or pell-mell. This game was played in 1635 in St. James's Fields on the site of St. James's Square and Pall Mall, but was discontinued during the Commonwealth when houses were built round about. The name pell-mell is a variant of *patle-malle*, a game played in Languedoc at

least as early as the thirteenth century and believed to be the origin of croquet. Like the latter, M. or pell-mell was a ball and mallet game, with hoops.

Malmalson, chateau in dept. of Seine, France, 5 m. W. of Paris. It was built in the seventeenth century and is noted as having been the residence of the Empress Josephine after her divorce from Napoleon.

Malmédy, tn. and dist. of E. Belgium, was given to Prussia in 1814, together with the dist. of Eupen, but was returned to Belgium in 1919. In 1940 M. was again attached to Germany, but was liberated by Amer. troops in 1944. Pop. 5000.

Malmesbury, James Harris, Earl of (1716-1820), was the only son of James Harris, the author of *Hermes* and other well-known philological works. He was b. at Salisbury. In the autumn of 1767 he was, through the patronage of Lord Shelburne, appointed secretary of embassy at Madrid. The temper and firmness, as well as talent, with which Harris had managed his negotiation with regard to the Falkland Is., gave so much satisfaction to his gov. that he was the following year appointed to the post of minister at the court of Berlin. From 1777 to 1784 he was ambas. to St. Petersburg. In 1788 Pitt offered him the post of minister at The Hague, which he accepted. For services while here he was raised to the peerage. In 1794 he was employed to negotiate the marriage between the Prince of Wales and Caroline, daughter of the duke of Brunswick, and accompanied her to England. See *Diaries and Correspondence*, 1811, and *Lord Malmesbury and his Friends*, 1870, both ed. by his grandson, James Howard Harris, third earl of M. (1807-89), who succeeded in 1841, and in 1852 and 1858-59 was foreign secretary and later lord privy seal. See his *Memoirs of an Ex-Minister*, 1881.

Malmesbury: 1. Mk. tn. in Wiltshire, England, 191 m. N.N.W. of Bath, picturesquely situated on the Avon. The par. church was formerly the Saxon abbey where Athelstan was buried. In the market-place stands a beautiful Celtic cross of the time of Henry VII. The manuf. of silk and pillow-lace is carried on. Pop. of dist. (1931) 8400. 2. Municipality of Cape Prov., 35 m. N.N.E. of Cape Town, has salt-pans and sulphur springs. Pop. 2200. (See illustration, p. 708.)

Malmö, fortified tn. of Sweden, on the Sound, cap. of prov. of Malmöhus, and one of the most fertile dists. of the kingdom. It is an important railway terminus and has a citadel and port with three harbours. It has a good trade in grain and whisky, and manufs. gloves, tobacco, cotton, etc. There are also iron works and dockyards. The chief buildings are a tn. hall, hospital, and theatre, and sev. old churches. Pop. 171,200.

Malmöhus, co. of Sweden, the S. part of the Scania peninsula, is a very fertile dist. Area 1872 sq. m. Pop. 560,877.

Malmsey, sweet and luscious white wine, originally brought from Malvasia or Malvoisie in the Morea, and hence sometimes

known as Malvoisie. Vines of this variety were planted in Tenerife, Madeira, and the Canary Is., and M wine used to be made from a grape grown on the rocky ground of Madeira.

Malo, mkt tn in Venezia, Italy, 10 m. N W of Vicenza. Pop 7000.

Malo-les-Bains, seaside resort of N France, connected by tramway with Dunkirk. Pop 5700.

Malolos, pueblo of Bulacan prov. Luzon, Philippines. 17 m. N N W of Manila. The chief crop is rice. Pop 26,000.

its melting point it decomposes into acetic acid and carbon dioxide.

Malory, Sir Thomas (fl 1470), translator of *Morte d'Arthur*. Very little is known of him. Prof G. L. Kittredge held that he was Sir Thomas M. of Newbold Revell Warwickshire, who fought successively on both sides in the Wars of the Roses, sat in Parliament in 1444-45, and d. in 1471. According to Caxton he finished his work about 1470 and 'reduced' it from some 12 books. In his book he strove to make a continuous story of the Arthurian legends and showed judgment alike in

Malmsbury Abbey

MALMSBURY ABBEY

Malone, Edmund (1711-1812), Brit. critic, was educated at Trinity College, Dublin, and called to the Irish Bar in the late sixties. He came to London in 1777 and eight years later was elected to the Literary Club with the most prominent members of which Johnson, Burke, Reynolds, and Boswell he was on intimate terms. He devoted himself to the study of Shakespeare. In 1775 he pub. an *Attempt to ascertain the Order in which the Plays of Shakespeare were written* and from 1783 worked at his *Shakespeare*, which appeared in 1790. In 1800 appeared his ed. of Dryden's works with a biographical introduction. M was one of the first to express his disbelief in Chatterton's Poems supposed to have been written by T. Rowley, and in 1796 he denounced the forgeries of Samuel Ireland. See life by Sir J. Prior, 1864.

Malone, co seat of Franklin Co., New York U.S.A., on the Salmon R., 57 m. W. of Rouse Point. It is situated in the midst of a rich farming country, hops being the chief crop. It has an iron foundry, paper and flour mills. Pop 7000.

Malonic Acid, $\text{CH}_2(\text{COOH})_2$, organic acid formed by the oxidation of malic acid. It forms colourless crystals melting at 142°C , and is readily soluble in water, alcohol, and ether. When heated above

what he included and omitted. His work was finished in 1489 but was not pub. by Caxton until 1554, before the middle of the seventeenth century seven eds. had appeared. Of Caxton's black letter folio only two copies (reprinted by O. Sommer with preface by Andrew Lang) now exist. An independent MS. was found at Winchester in 1944. See studies by V. Scudder, 1921; J. Hicks, 1928; J. Vinaver, 1929; N. S. Auerer, 1933, and G. R. Stewart, 1935.

Malpighi, Marcello (1678-91), It. anatomist, b. at Cremona near Milan. He held at different periods of his life the professorship of medicine in Bologna, Pisa, and Messina. In 1691 he was summoned to Rome and appointed chief physician and chamberlain to Pope Innocent XII. He is chiefly known for his discoveries in the anatomy of the skin, kidney, and spleen, the Malpighian bodies or corpuscles of the kidney and the spleen still retain his name of their discoverer. He was also the first to examine the circulation with the microscope, and thus discovered the blood corpuscles.

Malpighiaceae, natural order of trees and shrubs occurring mostly in the S. hemisphere with glandular five parted calyx, five petals sutured at the base, and fruit a drupe, woody nut or samara.

Malplaquet, hamlet in dept. of Nord,

France, noted for the victory of Marlborough and Prince Eugene over the Fr. in 1709. It is 21 m. E. by S. of Valenciennes.

Malraux, André (b. 1895), Fr. author, b. at Paris (real name Herser). He worked with the propaganda dept. of the Third International and was editor of the *Nouvelle revue française*. In his novels he follows in the line of Dostoevsky and others who portray the egocentric social degenerate and the futility of experience. The heroic assertion of the will in face of man's lot is the theme of all M.'s novels, or the futile rebellion of the individual mind expressed in its lonely human cell facing the inane. Some of his best novels are *Les Conquérants* (1928); *La Voie royale* (1930); *La Condition humaine* (1933); trans. as *Storm in Shanghai*; and *Le Temps du Mépris* (1935). *Storm in Shanghai* is a documentary novel of great effectiveness, reflecting the suffering in the minds of Chinese revolutionaries. *Les Conquérants* is a diary rather than a novel dealing with the Chinese revolutionary troubles of the 1920's which the author witnessed. M. has a fine grasp of the objective historic situation and shows a keen sensitivity to the subjective world of his characters. He fought in the Sp. civil war and was a colonel in the Free Fr. Forces of the Interior during the Second World War, leading the Alsace-Lorraine brigade, he became minister of Information in Gen. de Gaulle's Cabinet, 1944. The first vol. of an ed. of his complete works was pub. at Geneva in 1945. See R. Bospaloff. *Chemineurs et carrefours*, 1938, and C. Mauriac, *Malraux ou le mal du héros*, 1946; also lives by G. Picon, 1945, and M. Savane, 1946.

Malstatt-Burbach, tn. in the Saarland, Germany, on the Saar, 38 m. S.S.E. of Trier, now incorporated with Saarbrücken. Before the Second World War it had large iron-works, was the centre of the coal dist., and manufactured cement, rails, and machines.

Malstrom, see **MAELSTROM**.

Malt is the name given to barley which has been germinated in a moist room at a temp. of 55-62° F., and then subjected to a higher temp. to stop further growth. The chief food store in the grain is starch, and during germination an enzyme diastase, converts the starch into maltose and dextrin, and so makes the food available to the embryo. Protein is also present, and is changed by a different enzyme. The M. is next dried and crushed, and may be used in the preparation of such alcoholic beverages as stout, porter, beer, and whisky. M. extract is prepared by steeping the M. in water and then concentrating the liquid at a low temp., or *in vacuo*, until a syrup results. This contains maltose, dextrin, diastase, and some protein. Owing to the presence of diastase M. extract effects the conversion of starch into a sugar. For this reason it is added to flour used in the preparation of some kinds of bread, but directly the loaf is heated the diastase is destroyed and its action ended. Taken by human beings M. extract aids digestion of starch, and is an addition to the diet,

for most extracts contain over 50 per cent sugar and from 3½ to 6½ per cent protein. Hott's M. extract, however, is a liquid preparation, and is an aid to digestion rather than a food. Dedicated M. extracts have the highest food value and good digestive activity. Radio M. is a preparation to which ergosterol, irradiated by ultra-violet rays to produce vitamin D, has been added.

Malta, G.C., is. and Brif. possession in the Mediterranean, 17 m. long and 9 m. broad, with an area of about 95 sq. m.; it is of carbonaceous limestone, of the tertiary aqueous formation, and occupies a very central position in the Mediterranean Sea, being distant some 54 m. from the Sicilian coast and about 200 m. from Cape Bon on the African coast. Between it and Gozo (q.v.) lies the small is. of Comino, and off this last the still smaller islet, Cominotto, rears its rocky crest, while elsewhere round the shores of M. and Gozo a few rocks stud the sea, sustaining each a few fishermen, and affording herbage for goats on their moss-grown summits. Mifla Is., 3 m. off the coast, is uninhabited and is used as a gunnery target. In physical conformation M. is comparatively low, its highest point not exceeding 817 ft. above the sea level. Much of the is. to the W. S., and S.W. of Città Vecchia is above 600 ft. in height. Madonna Church, ¼ m. S. of Dingli and 2½ m. S. of Rabat, stands on ground which reaches 775 ft. Dingli vil. is over 750 ft. above sea level. The surface is diversified by a succession of hill and dale, the land being intersected by parallel valleys, running from S.W. to N.E., the most considerable of which is the vale called Mellieha. M. shows no signs of volcanic formation, but the action of the sea among its cliffs has hollowed out grottoes and caverns in almost every direction, and some of considerable extent. M. is full of interest for archaeologists, presenting, as it does an entire and unique phase of the early culture of Europe. Stone monuments, bearing a strong resemblance to Stonehenge, are to be found at Hagar Qim and Mnajdra in the S. of the is. Stone and Bronze Age relics are to be found in the temple of Tarxien. Many of these relics have been moved to Valletta museum. In religion the Maltese are Rom. Catholics. The Maltese language is of Semitic origin, with an admixture of Arabic words. Some hold that it is derived from the Carthaginian and Phœnician tongues. There is a Maltese nobility, recognised by the Crown, consisting of about thirty families. The inhab. are good agriculturists. Mules and asses are remarkable in M. for their strength and beauty, but the horned cattle are small. Maltese goats are very fine animals. The bees produce an aromatic honey, excelled in no other locality. The vegetable products comprise all that flourish in Italy, as cummin seed, figs, aloes, oranges, and olives, with many plants of a more tropical growth. Wheat, barley, clover, and tomatoes are grown on dry land, while on the irrigated land sub-tropical vegetables are grown. The

total value of agric. produce was £1,378,009 in 1947-48. Mdina (q.v.) (or Notabile), the former cap. of the is., is a handsome old tn. lying inland; it contains the anct. palace of the grand masters of the Order of St. John, the cathedral, a college, and is still the seat of the bishopric. Its pop. is now only about 1400, but its suburb, Rabat (q.v.), had 12,500 in 1948. Its rival and successor is Valletta (q.v.). M. has a large arsenal and an important dockyard, being the headquarters of the Mediterranean fleet. M. has a univ. and lyceum, numerous elementary schools, six secondary schools, together with garrison schools and sev. private schools which receive grants-in-aid from the gov.

It is thought by some that M. was the Hyperion or Ogygia of Homer, but there is little doubt that the Phœnicians colonised the is. at a very early date, probably in the sixteenth century B.C. Before they were dispossessed by the Gks. in 736 B.C., they had developed considerable commerce. The Gks., who called the is. Melita, were driven out by the Carthaginians about 500 B.C. As early as the first Punic war it was plundered by the Romans, but did not come finally into their possession until 242 B.C. St. Paul's is., or Selmunett, in St. Paul's Bay on the N.E. coast, is the traditional site of St. Paul's shipwreck (Acts xxvii.), and the place is marked by a statue. During the fifth century A.D. it fell successively under the Vandals and Goths, whose barbarism nearly annihilated its commerce. In 533 Belisarius recovered M. to the Byzantine Empire, in nominal union with which it remained for more than three centuries; but its prosperity had departed, and its civilisation almost vanished amid constant local feuds. In 870 the Arabs destroyed the Gk. power in M., and fortified the harbour as a station for their corsairs. Count Roger of Sicily drove out the Arabs in 1090, and estab. a popular council for the government of the is., composed of nobles, clergy, and elected representatives of the people. This council, in a more or less modified form, subsisted for 700 years. Under a marriage contract M. passed to the Ger. emperor, who constituted it a marquisate, but it had ceased to be a place of trade, and was merely a garrison of more expense than value. Charles of Anjou, after overrunning Sicily, made himself master of M., which the Fr. retained even after they had been expelled from Sicily, but after a time the houses of Aragon and Castile successively held the is. Subsequently the Emperor Charles V. took possession of M., and in 1530 granted it, with Gozo and Tripoli, in perpetual sovereignty to the knights of the Order of St. John of Jerusalem, from whom the Turks had recently captured their great stronghold at Rhodes. The grand master of the knights defended the is. against the Turks in 1565, and founded Valletta. In 1571 they, with the Maltese, behaved most courageously at the battle of Lepanto, where the Turks lost 30,000 men. Though waging perpetual war with the muslim the knights continued in

possession of M. until 1798, when, overcome by Bonaparte's treachery and disorganised by internal quarrels, the order surrendered their noble fortresses to the Fr. M. became a part of the Brit. Empire in 1814.

A new constitution was given to M. in 1921, providing for a legislature consisting of a senate and a legislative assembly. The Senate comprised seventeen members, ten of whom represented the clergy, nobility, graduates, chamber of commerce, and trade union council, and the remaining seven being specially elected. The assembly was composed of thirty-two members, returned by electoral dists., the method of voting being by proportional representation. The governor had two councils, an executive council of selected ministers and a nominated council consisting of the lieutenant-governor and officers chosen from the navy, army, and air force. Provision was also made whereby the governor might refer 'reserved matters' to a joint committee of the two councils. Thus M. became, in effect, a self-governing colony, but the constitution was subsequently suspended under the following circumstances. A serious dispute between Church and State arose in 1929, the immediate cause being a disciplinary order from a religious superior, Father Carta, to a Franciscan friar, Guido Micallef, to move from M. to another Franciscan convent outside M. The Brit. minister to the Vatican informed Gasparri, cardinal secretary of state, that the Maltese Gov. had placed no obstacle in the way of the priest's departure; but he also observed that the condemnation of a Brit. subject to leave Brit. ter. at the command of a foreigner had caused popular indignation and also embarrassment to the gov., the latter having no wish to intervene in the internal disciplinary affairs of monastic orders. The case of Father Micallef was, however, only a sign of the general unsatisfactory state of affairs in the is. largely owing to the intense participation of Maltese priests in local politics, and the Brit. Gov. therefore decided that conditions justified an independent investigation by the Holy See into the whole question of the relations of the eccles. authorities in M. to the political gov. The apostolic delegate's report, however, was unfavourable, and the Brit. minister to the Vatican was informed that the head of the ministry, Lord Strickland (a Rom. Catholic), who was then about to visit Rome, was not *persona grata* with the Holy See. The Brit. Gov. expostulated with the Vatican on this slight to an executive minister of a Brit. colony, and, in these circumstances, the negotiations for a concordat came to nothing. Subsequently the political campaign of the Maltese clergy, especially in Gozo, became intensified, absolutism being refused to penitents who proposed to vote for the constitutional party. Later the constitution was suspended and all executive power was placed in the hands of the governor; but in 1931 a royal commission, under Lord Askwith (q.v.), was sent to M. to inquire into the possibility

of restoring to the Is. some form of constitutional government. The commission considered that the underlying cause of the difficult situation of 1931-32 was the language question. They recommended an extension of the use of Maltese in the law courts (it had been the official language not only of the courts but of gov. pubs.), but deprecated the substitution of Maltese for it as the official language. It also recommended the abolition of it from the curriculum of the elementary schools while advocating its retention in the secondary schools and in the univ.

liberty of conscience and the free exercise of religious worship were secured by this new constitution.

Constitutional Reform.—In 1942 and 1943 the elected members of the council of gov. represented that the time was ripe for the imperial gov. to declare its policy on future constitutional reform. The colonial secretary's reply (July 7, 1943), recognising that 'the people of Malta, together with its gallant garrison rendered services of incalculable value to the allied cause,' and that throughout those two and a half years the council con-

THE GRAND HARBOUR, MALTA

THE GRAND HARBOUR, MALTA

Letters patent were issued (1931) to effectuate these recommendations. The constitution was restored in 1932, only to be suspended again a year later. In 1936 a new constitution was promulgated providing for crown colony gov. with an executive council containing six official as against five unofficial members. At the same time provision was also made whereby Eng. and Maltese became the official languages of M., while Eng. became the language of administration and Maltese the official language of the law courts, thus finally ousting it. Crown colony gov. was, however, hardly a striking advance in M.'s constitutional progress, and it is therefore not surprising that yet another constitution was promulgated in 1949. This provided for a council of gov. of eight official members, two unofficial members nominated by the governor, and ten elected members, the governor to preside over the council, with a casting vote but no original vote. Ecclesiastics could not be members. Full

tinned to discharge its normal functions. It was announced that it was the gov.'s policy to grant M. responsible gov. as early as the war in the same sphere as in the period 1921-37. In Jan. 1946 the colonial secretary appointed a constitutional commissioner to formulate detailed proposals, after consultation with the Maltese, on the method of implementing his declaration of July 1941 regarding reform. These discussions in M. were mainly concerned with examining proposals put forward by an *ad hoc* national assembly convoked in 1945-46, for modification of the constitution of 1921, and the gov. found the commissioner's recommendations for a new diarchy generally acceptable. The National Assembly, however, desired that the constitution should be granted by Act of Parliament rather than by a prerogative instrument, 'so as to achieve certainty and stability'; but the gov. decided that, as in 1921, the constitution should be granted by letters patent, this being the all but universal practice for the colonial

empire. But it was agreed that the new constitution should be revoked only by Act of Parliament, no power being reserved in the letters patent to revoke by prerogative, thereby re-establishing the position as it was between 1921 and 1930 when an Act—the Malta (Letters Patent) Act, 1936—was necessary to restore to the Crown the power to revoke by letters patent of which it had divested itself in enacting the constitution of 1921. Under the commissioner's recommendations the safeguards contained in the constitution of 1921 for ensuring the security of M. as a fortress, were to be fully reproduced in the new constitution, and the National Assembly accepted without question the necessity for the reservation to the governor of the necessary powers. As to reservation of Bills by the governor the effect of the recommendations is that while the governor *may* reserve any Bill, he will be *required* in the new constitution to reserve classes of Bill, namely Bills discriminating against non-Maltese, Bills encroaching on a reserved matter (such as defence, naturalisation, etc.), and Bills relating to 'special matters' (e.g. official languages). This new diarchy, in which ultimate power is again retained by the imperial gov., would seem to be more likely to succeed than its predecessor for various reasons, the chief of which are: that the language question has long been settled; that the strategic importance of M. will diminish, so as to enable the imperial gov. to view with much greater equanimity the islanders' attempts to work out their own destiny; and that the Maltese wish to remain within the empire. Self-government was restored in Sept. 1947. There are eight electoral dists., each returning five members under proportional representation to the Legislative Assembly from which the Cabinet of eight ministers are selected. The new constitution embodies women's enfranchisement for the first time.

The Siege of Malta in the Second World War.—The resistance of M. to attack from June 1940 to Nov. 1942 was a unique example of a combined operation in which the R.N., Merchant Navy, Army, R.A.F., and people of M. were all indispensable and inseparable; and to bear witness to their heroism the king in 1942 conferred the George Cross upon the I. From the day after Italy's entry into the war until the winter during the siege of 1942, when siege-raising ships fought through to the I., M. fought a continuous battle against the Gers. and Itals., against superior numbers, shortage of equipment, isolation, terror, and hunger. From this long-drawn battle the I. emerged in 1943 to dominate the central Mediterranean as a striking base, a strong weapon in the armoury of the allied forces, more deadly than ever before in the long list of warfare in the Middle Sea. But M. suffered heavily from the air attacks. During its long ordeal the I. had 3343 aileris. By the end of 1942 over 14,000 tons of bombs had fallen upon the 132 sq. m. of M. and Gozo. The enemy lost 1129 aircraft in the assault, of which 236 were destroyed by anti-

aircraft fire of ships and land batteries and the rest by Brit. fighters. In the I.'s defence 563 Brit. aircraft were lost. Enemy aircraft were prepared to face almost any losses in their effort to reduce the I. to impotence. Some of the most concentrated attacks were made in Jan. 1941, when the Gers. strained every nerve to destroy the aircraft carrier *Illustrious* which had put in for repairs. The Gers. threw at least 500 aircraft into the battle for Malta, half being bombers, mainly Junkers 88 and 87 types used for dive bombing. Much of the bombing was done with the object of eliminating the Maltese aerodromes, but also in the hope of damaging the naval forces in the harbour, which had been a thorn in the Ger. side when their convoys strove to get supplies to Rommel in Libya. By early 1942, air raids having been incessant throughout the previous two years, the skyline of M. had become much changed. Church spires and bellies were missing. There was not a single building of the knights of St. John which had not been destroyed or damaged. Though by good fortune the Conventual Church of St. John escaped serious damage, there were many grievous losses, especially the total obliteration of the church of St. Mary of Damascus, dating from 1576. Serious damage was done to the churches of the Carmelites and the Augustinians. The palace of the grand masters of the Order of St. John, begun in 1574, was hit by a bomb which destroyed the oldest part and seriously damaged the marble staircase of the grand master Verdala, the prin. architectural feature of the building. The Auberge de Castille, rebuilt in 1744, suffered heavy damage but has since been largely reconstructed. The building of the knights, where Napoleon stayed during his brief sojourn in M., was also wrecked. Other churches in Valletta destroyed or damaged included those of St. Ursula, St. James, St. Barbara, St. Francis, the Jesuits' church, All Souls, and St. Paul's Anglican Cathedral. St. John's Cathedral, built by the knights, had a 1000-lb. bomb hit direct on the sacristy. St. Paulus, a fine old church in Floriana, called after the first bishop of the I., who is mentioned in the Acts, also suffered a direct hit. The military hospital of the knights, with its 520-ft. long ward—the longest un-supported hall in Europe—was badly damaged. The Royal Opera House and the Maltese Club, where distinguished visitors to the I. have enjoyed hospitality, were also destroyed. Floriana, the immediate suburb of Valletta, with its walled promenade garden, was also devastated, with much suffering to the people. A great number of private dwellings throughout the I. were destroyed. In all about 35,000 buildings were destroyed or damaged, including three-quarters of the city of Valletta and from 80 to 85 per cent of the other I. The number of civilians killed or d. of injuries was 1486. The casualties would have been heavier than they were but for the fact that a large proportion of the people slept in the rock caves. One of the

largest shelters in Valletta was an underground city built in the bowels of Mt. Xiberras. Tunnels, which were hewn out of the rocks by the knights 300 years ago, were widened and lined with numbered cubicles; street names were painted at cross-roads in the tunnels. The worst damage to monuments in M. was to Valletta and to the dockyard area with its surrounding 'three cities' of Vittoriosa, Senglea, and Cospicua. This disproportionate large heavy loss and damage was due to the concentration of the majority of the is.'s architectural monuments round the dockland area. Fortunately there was little damage by fire, as Maltese buildings, even to the floors and roofs, are all constructed of the is.'s limestone. (On the loss of monuments see *Works of Art in Malta, Losses and Survivals in the War* (I.I.M.S.O., 1946).

In 1948-49 the revenue was £5,248,212, including an imperial grant of £300,000 for commodity subsidies; expenditure was £1,969,037. A free grant was given by Britain in 1942 of £10,000,000 for war-damage reconstruction, and another £20,000,000 was promised. Pop. (including Gozo) 306,000.

Malta, Knights of, see HOSPITALIERS, KNIGHTS.

Malta Fever (Brucellosis), Undulant Fever, or Mediterranean Fever, specific febrile affection due to a group of micro-organisms discovered by Sir David Bruce, and named after him *Brucellosis*. *Brucella melitensis*, the micro-organism prevalent around the Mediterranean, is transmitted with the raw milk of goats, as shown by Sir Theodoros Zammit, M.D., C.M.G.; hence the disease was very prevalent in Malta where raw goat's milk was much in use, but it has now been much reduced and is being stamped out by having goat's milk boiled or pasteurised. The occurrence of rock fever in Gibraltar was traced to infection from the milk of goats imported from Malta. The diseases were found to be identical, and on the prohibition of Maltese goats the dis-

ease disappeared from Gibraltar. The disease has been found to be much more widely distributed than was formally supposed. It is common in N. Africa and is found also in S. Africa; it has also been reported from S.W. Texas and other countries. In 1910 Sir David Bruce described its occurrence in Ankole, on the E. shore of Lake Albert Edward. The presence of *B. melitensis* was shown to be the cause in all cases, and infection was traced to the goats of the dists. A closely related micro-organism, *B. abortus*, is the cause of contagious abortion of cattle and of abortus fever in man in Britain, U.S.A., and other countries. Undulant fever due to *B. melitensis* is characterised by an incubation period of one to three weeks, an irregular and prolonged fever sometimes occurring in waves (hence the term undulant). The temp. may keep low (much more so in abortus fever) but may rise to 105° with toxæmia and even higher to 108° in fatal cases. The course of the disease can be protracted from a few weeks to a year or more; arthritic and rheumatic pains are common complications and can leave sequelæ, but the newly discovered antibiotics aureomycin and chloromycetin have given hope of cutting short the course of the illness, and rapid cures are now in vogue.

Maltby, urb. dist. of the W. Riding of Yorkshire, on the R. Ryeon, 6 m. from Rotherham, on the E. Region railway. It is a coal-mining centre. Pop. 12,000.

Malte-Brun, Conrad, or **Malte Conrad Bruun** (1755-1826), Dan.-Fr. geographer and publicist, banished from Denmark (c. 1796) for his violent political pamphlets upholding the principles of the Fr. Revolution. With Mentelle and Herlin he collaborated in *Géographie mathématique* (1803-7). He founded the Geographical Society of Paris, and, with Eyriès, ed. the *Annals des voyages* (1808). His *Précis de la géographie universelle* (1810) was completed by Huot (1829). His poems also were much admired. See B. de Saint-Vincent, *Notice biographique*, 1897, and J. Quéraud, *La France littéraire*, 1827-64.

Maltese Dog, often, though wrongly, called Maltese terrier, the most ancient lap-dog, its type and character having been preserved for over two thousand years. The coat reaches nearly to the ground, and is straight and silky and parted from head to tail; it is pure snowy white. The eyes are dark, the nose black, the drop ears long, the back and legs short, and the feet small. The short tail is doubled into the coat on the back.

Malthus, Thomas Robert (1766-1834), Brit. political economist, was a pupil of Richard Graves and Gilbert Wakefield, and afterwards went to Jesus College, Cambridge, where he distinguished himself in classics and mathematics. He entered the Church, and in 1798 was curate at Albury in Surrey. He had already begun to write on economic subjects, and in 1798 wrote and pub. anonymously the famous *Essay on the Principle of Population as it affects the Future Improvement of Society* (1798, 1826). Charles

Darwin was led from a study of this essay to enunciate his theory of 'natural selection.' M.'s next most important work was *Principles of Political Economy with a view to their Practical Application* (1820). See C. V. Drysdale, *The Malthusian Doctrine in its Modern Aspects*, 1917; J. Bonar, *Malthus and his Work*, 1885, 1921; G. T. Griffith, *Population Problem of the Age of Malthus*, 1926; and H. Sutherland, *Laws of Life*, 1935 (anti-Malthusian).

Malton, mkt. tn. in the N. Riding of Yorkshire, England, on the Derwent, 17½ m. N.E. of York. Burnt in Stephen's reign, it was rebuilt as New M. There are remains of a twelfth-century priory and of a grammar school of Edward VI.'s time. Lime and whinstone are quarried near. Agric. implements are manufactured. There are corn mills, breweries, and foundries. Pop. 4,100.

Maltose, a di-saccharose sugar, having the molecular formula $C_{12}H_{22}O_{11}$, that is, having the same percentage composition, and molecular weight as cane-sugar and milk-sugar. It crystallises in the form of needles with one molecule of water of crystallisation. M. is produced by the action of malt on starch; the action is brought about by the presence of an enzyme diastase, and is an important item in the process by which beer is prepared from malt. As the grains of barley germinate the enzyme diastase is formed, and when the germination is stopped by heat and malt mixed with water at about 60° C., fermentation sets in which converts the starch into dextrin and M. The enzyme M. then converts the M. into glucose, which is finally converted into alcohol. See FERMENTATION; MALT.

Malus, Etienne Louis (1775-1812), fr. author and engineer. b. at Paris, was about to be made an army officer when the proscriptions of Bonaparte decided him to enlist as a common soldier. He so distinguished himself at Dunkirk in bridge construction that Lepere sent him to the École polytechnique (1793). A captain (1796), he was with the Egyptian expedition (1797), and sub-director of the Strasburg fortifications (1806-9). He made brilliant discoveries in the polarisation of light reflected from water or glass, and in 1807 wrote *Traité d'optique analytique*.

Malvaceæ, large natural order of herbs, shrubs, and trees most numerous in the tropics. They are all free from unwholesome qualities, and contain a quantity of mucilage, which is extracted from certain species by boiling and is used medicinally. The most important genus of the order is *Gossypium*, to which belong the cotton-producing plants.

Malvern, or Great Malvern, health resort and inland watering-place of Worcestershire, England, near the Severn, on the slopes of the M. Hills, 8 m. from Worcester, comprising the vlls. of M. Link, M. Wells, and Little M. The climate is bracing, and its saline, alkaline, and chalybeate springs are noted. The eleventh-century Benedictine priory has

been restored as a par. church. M. College, an important public school, was founded in 1362. Pop. 18,400.

Malvern: 1. Suburb of Melbourne (3 m. S.E.). Victoria, Australia. 2. Suburb of Adelaide, S. Australia.

Malvern Hills, hill range on the borders of Worcestershire and Herefordshire, England. They extend for 9 to 10 m. with abrupt heights, such as Worcester-shire Beacon (1395 ft., highest point) and Herefordshire Beacon (1300 ft.), an anct. Brit. fortress. Some areas of the M. H. are protected or owned by the National Trust.

Malvoisie, see MALMSEY.

Malwa ('mountainous country'), tableland of Central India, bounded S. by the Vindhya Mts. W. by the Aravalli range, N.E. by the valley of the Ganges, and E. by Bundelkhand. Among its chief states are Indore, Bhopal, Dhar, Jaora, Rajwarh, and Nimach. The chief city, Munda, is in ruins. It is noted for opium (exported from Bombay). Area 2737 sq. m. Pop. 330,000. See J. Malcolm, *Central India*, 1823; C. E. Luard, *A Bibliography of Literature dealing with the Central Indian Agency*, 1908.

Malwan, seaport, containing Raikot Fort in Ratnagiri dist., Bombay Prov., India, 50 m. from New Goa. It was once a stronghold of the Marathi pirates. Salt and iron ore are found near by. Pop. 17,000.

Maly Khingan, see KHINGAN, GREAT AND LITTLE.

Mamaroneck, residential tn. of Westchester co., New York, U.S.A., on Long Is. Sound, 20 m. N.N.E. of New York. It includes Larchmont vll. and part of Mamaroneck vll. Pop. 13,000.

Mambajao, tn. in the dist. of Misamis, Philippines, on the N.E. of Camiguin Is., off Mindanao. Pop. 18,000.

Mambusao, pueblo (tn.) of Capiz Prov., Panay Is., Philippines, on the R. Malmanang, 16 m. from Capiz. Pop. 10,000.

Mameli, Goffredo (1827-19), It. poet and patriot, b. at Genoa. He wrote the war song *Pratelli d'Italia*, and d. in defence of Rome.

Mamelukes (Arabic *memalik*, a slave), former class of slaves in Egypt, who became and long remained the dominant people of that country. Their dominion continued in Egypt for 253 years, and during that time they made many important conquests, and in 1291 drove the Franks entirely out of the E. They had their origin in the importation into Egypt of a large number of Turkish slaves from the Caucasus and neighbouring regions by the sultan of Egypt in the middle of the thirteenth century. They soon displayed insubordination, and finally, in 1251, appointed one of their own number sultan of Egypt. From this time to the Ottoman conquest in 1517, Egypt and Syria were ruled exclusively by the Mameluke dynasty. In 1811, by a stratagem, a general massacre of the M. was ordered by the pasha of Egypt, Mehmet Ali. The few survivors managed to escape to New Dongola, but were virtually exterminated in 1820. They

were famous for their courage and skill in horsemanship, and their military organisation was far in advance of their time. They were also munificent patrons of art and literature. See W. Muir, *The Memeluke or Slave Dynasty of Egypt, 1260-1517*, 1896.

Mamers, see MARS.

Mamilius, or Mamilla Gens, name of a distinguished plebeian family of Rome, who came originally from Tusculum in anc. Italy. They claimed descent from the daughter of Telegonus, reputed founder of Tusculum. The gens comprised the three families Mamianus, Turrinus, and Vitulus. Octavius M. led the Lat. against Rome after Tarquin's expulsion, and was killed at Lake Regillus (c. 496 B.C.).

Mammals, or Mammalia, classification invented by Linnaeus for those vertebrates which suckle their young. M. differ from all other vertebrates not only in nourishing the young, which are born alive, by means of mammary glands (q.v.), but in being covered with hair. Three characteristic internal features are seven vertebrae in the neck, epiphyses to the centre of the vertebrae, and a diaphragm which separates the thoracic from the abdominal cavity.

Until 1881 it was supposed that M. were consistent in being viviparous, but it was then demonstrated that primitive forms of M. still exist which lay eggs. These, comprising three species of a single order Monotremata, have been placed in a sub-class Prototheria or primitive animals. The best known of these interesting links with the reptiles is the duck-billed platypus (*Ornithorhynchus* (q.v.)), native of Australia and Tasmania. The others are the spiny ant-eaters (*Echidna*), also natives of the same continent. The female *Echidna* produces a temporary pocket for her young, which disappears when they are able to look after themselves, and in this respect exhibits some relationship to the marsupials which comprise a second of the sub-classes of M. (Metatheria). This sub-class is characterised by the possession of the marsupium, a permanent pocket in which the young are placed as soon as born. In these the period of gestation is short, and the young, helpless, are but little developed when born. They attach themselves to a teat and the milk is forced into their throats by muscular action on the mother's part. For a long time marsupials were believed not to form a placenta, but the occurrence of a peculiar form of this complex structure has been discovered in some marsupials. Except for the opossum of N. America and a few S. Amer. species, the Metatheria are now confined to Australasia, although at one time their distribution was very extensive. Indeed many of the higher M. are believed to be descended from them. They vary widely in their types and habits; some are herbivorous, some rodent, and some carnivorous.

The third sub-class of M. is the Eutheria. In all the members of this sub-class the reproductive organs are highly developed, the period of gestation is relatively long,

and the young are born in an advanced state of development. This sub-class has been variously classified, but the general modern arrangement is in nine orders, as follows: (1) Edentata; (2) Sirenia (the sea-cows); (3) Ungulata (hoofed M.); (4) Cetacea (whales); (5) Rodentia; (6) Carnivora; (7) Insectivora; (8) Chiroptera (bats); (9) Primates. In Edentata and Cetacea the teeth tend to be suppressed, but in the other orders they are important features and of great assistance in classification. Generally speaking, M. are terrestrial in habit, but the Sirenia, Cetacea, and sea Carnivora are important exceptions. The fact that they are air breathers, having no gills, or their equivalent, which would enable them to stay under water for more than a limited period, indicates that they are probably land animals which have adapted themselves for an aquatic life. The only M. with true powers of flight are the Chiroptera or bats. (Other so-called flying animals have only a broad fold of skin on each side of the body which sustains them in the air for a limited time. The bat's wings are composed of a thin flexible leathery membrane stretched between the bones of the fore- and hind-legs. All M. bear some hair at some period of their existence, even if only in the foetal stage, as in the Cetacea, where a layer of blubber under the skin displaces the hair. The Edentata, which include the pangolin, sloth, ant-eater, and armadillos, are characterised by the absence of teeth in the front of the jaw. Many of these animals are arboreal and some are burrowing. Sirenia include only two genera of living animals; a third, *Steller's Rhynchoceros*, became extinct early in the nineteenth century. To this order belong the manatees and dugongs, characterised by a long, cylindrical body, flipper-like fore-limbs, and by the absence of hind-limbs. There are no ears, and the eyes are very small. The animals feed entirely on aquatic vegetation and occur on the coasts of both Africa and America. The Ungulata include all the hoofed M., and form a large order, comprising such diverse forms as the horse, elephant, and the cow. The toes vary from one to five in number, and never bear claws, but are usually provided with hoofs. The Rodentia are the gnawing M., and include a large number of some of the smallest forms, such as mice and rats, hares, rabbits, and many S. American animals. Their incisor teeth are large and sharp, and consist usually of a pair in both jaws. They are kept sharp by the back surface, which has no enamel coat, wearing away faster than the front. They are mostly herbivorous, but some are practically omnivorous, and are serious enemies of man. The Carnivora include many of the most magnificent M. Though mainly flesh-eating the members of this order are somewhat artificially classified, for the bears are largely vegetable-feeders. Carnivora are either fissioned, the limbs being converted into appendages with separate clawed digits for terrestrial life, or pinniped, the limbs being converted into flippers for aquatic life. The fissioned

are sub divided into cats, dogs, and bears, also included are the raccoon, stoat, weasel, otter, badger, etc. The pinnipeds comprise the seals, sea lion and walrus. The Insectivora, or insect eaters are placed high in the classification of M. on account of their relationship to lemurs, but their brain exhibits a rather low organisation and they probably had a common origin with marsupials. The mole and the hedgehog are familiar examples of this order, which is unrepresented in America and Australasia. The Chiroptera or bats are specialised Insectivora, differing from other Insectivora essentially in powers of flight. They are widely distributed over the surface of the globe but abound chiefly in the tropics. They are nocturnal in habit

size of the M. G. increases from the age of puberty, and reaches its greatest size towards the end of pregnancy and during lactation. In later life the breasts are apt to become pendulous.

Mammea Americana, large tropical tree (family Guttifera). Its showy flowers are distilled by the inhabitants of tropical America to produce a medicinal tincture. A strong perfumed liquor and the huge double and bitter fruits known as mammea are eaten.

Mammertium Fertum, see *MISSINA*.

Mammillaria, large genus of succulents (family Cactaceae) with fleshy leafless stems rarely higher than 12 in. and often only a few inches and round and flattened or cylindrical or branching from

THE MAMMOTH IN ARTIST'S REPRESENTATION

and though the brain is not highly developed, the senses are all exceptionally acute. The Primates, or highest M., are divided into three sub orders, the Chiromyoides or aye ayes, the Lemuridae, or lemurs, and the Anthropoides which include all monkeys, apes, and man. See also BIOLOGY and the separate articles on individual orders and species. See Sir W. Flower and R. Lydekker, *Introduction to the Study of Mammals*, 1891, F. F. Boddard, *Mammalia* 1902, A. Thorburn, *British Mammals* 1920, G. C. Shortridge, *Mammals of South West Africa*, 1934, J. G. Boulenger, *Apes and Monkeys* 1936, and W. J. Hamilton *American Mammals*, 1940.

Mammary Gland, organ which secretes the milk with which mammals feed their young. It is thought to be a modified form of the sebaceous gland of a hair follicle. The female breast in the human being extends between the second and sixth ribs. It is composed of sev. lobules each of which has a *lactiferous duct* leading to the nipple. The nipple is surrounded by a circular patch called the areola, which is ordinarily pigmented. The pigmentation deepens to dark brown during pregnancy and lactation. The

base. Arranged in various designs over the surface are tubercles or nipples which bear spiny leaves in tufts, rosettes, or stars. The flowers spring from the axils of the upper tubercles and though small and fugitive are showy and are followed by fleshy tinted berry like fruits. A dry worn greenhouse suits most Ms.

Mammola, com and in of Reggio Italy 7 m from Gerace. Top 9500.

Mammon, or more correctly *Mamon* (representing the Aramaic *mammona*, 'wealth' or 'riches'). The derivation of the word is uncertain but it was used by the Phoenicians for 'gain' or 'profit'. In the NT M. is personified and set in opposition to God being used in the sermon on the Mount and the parable of the Unjust Steward (Matt. vi. 21, Luke xvi. 13). The 'mammon of unrighteousness' or 'unrighteous mammon' is a phrase which occurs in 1 John iii. 10. Personifying inordinate gain, medieval European writers used the name for a demon, figured in Milton's *Paradise Lost* as a fallen angel of sordid character.

Mammoth, best known of the extinct elephants (*Elephas primigenius*). Since 1799 many perfectly preserved specimens have been found, principally in the ice of

N. Siberia. It was of great size, and differed mainly from the living members of the order Proboscidea by the thick, hairy covering, and the tuks, some 8 ft. long, curved upwards, inwards towards the head, and out sideways in somewhat spiral fashion. The remains of the M. have been found in enormous number, not only in the neighbourhood of the Arctic Sea, but throughout Europe and N. America as far S. as the gulf of Mexico. Examination of many remains shows that the prin. food was young shoots of the fir and pine, and it was probably some overwhelming cataclysm which ultimately exterminated them rather than inability to find enough food.

Mammoth Cave, great cavern formed by a series of vast chambers in Edmonson co., Kentucky, U.S.A., between Nashville and Louisville, first explored in 1809. It is 6 m. from Cave city. The diameter of the whole cavern's area is 9 to 10 m., the total length (including all passages and avenues) is estimated at 150 m. In some of the grottoes there are branches of the subterranean R. Echo. M. Dome is 110 ft. long, by 200 ft. wide, by 120 ft. high. Blind fishes, crickets, crustacea, and insects have been found in the caves. Bats abound in the outer galleries. The temp. ranges from 54° to 59° F. It is famous for its stalactites, resulting from the action of water on the limestone formation, and is considered the finest cave in the world. See R. H. Ward, *Plan and Description of the Cave in Kentucky*, 1816; A. S. Puckard and F. W. Putnam, *The Mammoth Cave and its Inhabitants*, 1879; H. C. Hovey, *Celebrated American Caverns*, 1897; and J. W. Turner, *Wonders of the Great Mammoth Cave of Kentucky*, 1912.

Mammoth Hot Springs, group of thermal springs in the N. of Yellowstone National Park, Wyoming, U.S.A., about 1000 ac. in area. They are remarkable for their snow-white calcareous deposits. The waters are turquoise-blue in colour, the temps. varying from 60° to 175° F. They are unrivalled since the terraced springs of Rotomahana (New Zealand) were destroyed.

Mamore, riv. of S. America, forming part of the boundary between Bolivia and Brazil, sometimes regarded as the main headwater of the Madeira. It is formed by streams rising in the Cochabamba Mts., and is called Rio Grande in part of its course.

Mam Tor, or **The Shivering Mountain**, hill of Derbyshire, England, crowned by a Brit. camp. It commands magnificent views over Kinderhook and the uplands above Castleton and Edale; it is owned by the National Trust. Height 1700 ft.

Mamun, see AL-MAMUN.

Mamurat-ul-Aziz, **Mamuret-ul-Aziz**, or **Kharput**, a former vilayet of Asiatic Turkey, now mainly included in Kurdistan, 60 m. from Diarbekir. The collogo of Armenia is here. Cap. Mezereh.

Man, zoologically speaking, is a genus of the order Primates, or highest order of mammals. This order is usually divided into three groups, the Anthropoides, including M., apes, monkeys, and baboons,

the Lemuroidea or lemur-, and the Chiro-myloidea or aye-ayes. As far as mere physical characteristics go, M. must be considered as related to monkeys and apes; in common with those animals he possesses five fingers and five toes, armed with flat nails towards the extremities, has a similar array of teeth, which are normally preceded by milk-teeth, has a simple stomach, and lives mainly on a vegetarian diet. The young are brought forth usually one at a time and are quite helpless at the time of birth.

Towards the latter half of the nineteenth century a strenuous controversy arose as to M.'s place in the animal world, but it is now generally conceded that, as far as physical characteristics are concerned, there is no reason to suppose that M. is other than a form of development with characteristics sufficiently in common with monkeys, apes, etc., to justify his being placed in the same order of mammals. M. does not differ from those animals in possessing structures fundamentally different, but only in possessing them either in a more rudimentary form or in a more developed form. The protein metabolism of both man and apes differs from that of other mammals in that uric acid is not broken down into urea. Some of the ways in which M.'s physical organism differs from that of the rest of the Primates may now be pointed out. The lower limbs are long, and the upper limbs short in M. as compared with the apes. He maintains an erect posture, stands flat upon the soles of his feet, instead of on the outer edges, as most apes do. His backbone has a graceful sinuous curve which is entirely wanting in other members of the order. The neck is long and flexible, and the head is set normally to look ahead when the individual is in an erect posture. His skull shows a marked diversity of proportions to those of apes generally; the brain-case is large and the jaws are not massively developed. The teeth are regular; although the different forms are distinct on examination, they make an even series without any break and without any individual teeth projecting markedly beyond the rest. The body is for the most part devoid of hair, but in the beard and head hair may attain a length which is peculiar to the human genus. The thumb is long, and opposes itself easily to any of the other fingers; on the other hand, the big toe is not opposable at all, and the foot has little power of prehensile movement. Probably the most important difference between M. and other members of the same or any order is the higher physical development of the brain. Not only is the size greater in proportion to the rest of the body, but it presents a more elaborate series of folds, or convolutions. When it is understood that the physical processes corresponding to the highest mental activities are located in the cortex or rind of the brain, it is seen that the extent and number of the convolutions, by increasing the area of the cortex, must play a considerable part in determining the intellectual effectiveness of the animal.

It appears, therefore, that the physical

differences between M. and his nearest kin in the animal world are of degree rather than of kind. It is difficult to point to any one characteristic which can be looked upon as an adequate cause for M.'s superiority over other animals. The truth probably is that many causes have contributed to that superiority. Among them, in addition to mere size of brain, may be quoted the adaptability of his hands to many uses, allowing a degree of manipulation impossible to other animals, the more exquisite differentiation of sense perception than is apparent in most animals, the voice capable of many various sounds and so lending itself to the formation of a language. When differences other than physical are considered, the superiority of M. is so great as to incline some to the opinion that M. is a separate creation on the ground of his mentality alone. However great this superiority is, it does not appear that M. possesses any faculty or faculty fundamental mental process which is not possessed in some degree by some lower animal or other, save that of purely abstract intellection. Memory, the powers of abstraction, and of reasoning are demonstrably possessed by certain animals, if only in a rudimentary form. Present-day opinion strongly inclines to the theory that the processes of evolution as ordinarily understood are quite sufficient to account for the marked superiority of a single species.

Origin and Antiquity of Man.—The ultimate origin of M. is a problem bound up with that of the origin of organic life as a whole, as the conception of a sudden creation of separate and permanent species has long been abandoned by scientists. It has, however, been the aim of many anthropologists to arrive at a form of animal which may reasonably be supposed to represent the common ancestor of M. and his nearest relatives in the animal world. At various times human or semi-human remains have been discovered which bear an ape-like appearance. The generalisations made as a result of the examinations of the Neanderthal, Java, and Piltdown skulls have had to be considerably modified owing to discoveries during the twentieth century. These include a skull, *Australopithecus*, discovered in 1924 at Taung in Bechuanaland, which has aroused considerable discussion and discussion amongst anthropologists. Dr. Raymond Dart of Witwatersrand Univ. gave it the name of *Australopithecus*. The shape and proportions of the brain resemble those of primitive types of human beings, but the size and convolutions correspond to those of the apes. On this and other evidence it is regarded by some anthropologists as belonging to the same stock as the gorilla and chimpanzee, and by others as human. In either case it provides valuable evidence in support of the theory of the common origin of men and apes. Other interesting discoveries in Palestine show that Neanderthal man lived there, as in Europe. In both Europe and Palestine he was followed by Neanthropic man, but the place of origin of the latter has long

been problematic. Sir Arthur Keith suggests that the Piltdown skull may possibly be the early Pleistocene ancestor of modern European races. In S. Greenland a skull, most probably less than 1000 years old, was unearthed in 1926. It is extraordinarily similar in many respects to skulls of auct. palaeolithic man, and it has been suggested that this skull is an atavistic form. It also resembles modern skulls deformed by acromegaly, a disease due to abnormality of the endocrine system. The interest in this skull, *Homo gadarensis*, lies in the fact that a modern skull, either as a result of disease or some other cause, should so closely resemble a palaeolithic skull. *H. gadarensis* affords confirmatory evidence of the suggested line of descent of modern M.

In May 1914 there was discovered in the Olduvai Gorge M. in the Great Rift valley not far from Nairobi a site where evidence of occupation by prehistoric Acheulian M. had been found. This site was formally declared by the gov. of Kenya to be an archaeological reserve. Hitherto, however, no bones have been found which can be unhesitatingly attributed to Acheulian M., a term which in itself is misleading, as it describes not a variety of M., but a M. who made and used a certain sort of chipped stone instruments. But Africa is undoubtedly assuming more and more importance for M.'s prehistory. If men 'atavistic' i.e. became differentiated from a non-human stock) in one single area of the world, then, until a short time ago, most anthropologists would have set that area in Asia, and more especially in S.E. Asia. The balance of what evidence there is still favours an Asiatic home for the earliest men, but the balance is not so marked as it was. The most ancient forms of men are still to be found in the Far E. sites, Java and China, but every day it is becoming clearer that Africa played a great part in M.'s early hist. Fossil material (Hominoida) discovered recently at Sterkfontein and Kromdraai is believed to represent a link in the evolution of M. Prof. Le Gros Clark thinks that the skulls found here can be interpreted as slight modifications of the chimpanzee or gorilla, or as very closely related to M., coming near to what was popularly known as the 'missing link,' and in an extraordinary number of details these specimens are said to show such typically human characteristics as to rule out parallelism. Thus the face bones were typically human, the teeth, though larger, were quite human in their proportions and pattern, and some of the limb bones were quite different from those of the anthropoid apes. These creatures are described by Prof. Le Gros Clark as in fact similar to *H. sapiens*, although they had much smaller brains at this stage of their development. Dr. J. S. B. Leakey too has recently discovered in Kenya and Uganda fossil remains of primitive and now extinct forms of Hominoida, or group to which M. belongs. His discovery of the first jaw yet found of an ape of such antiquity (lower Miocene (q.v.) period) is of first-class importance if it establishes that

in the early Miocene age the apes had already begun their own divergence.

At present no remains have been discovered older than the early Pleistocene period, and the antiquity of man is provisionally suggested as about 250,000-300,000 years, but new discoveries may modify the present conclusions with regard to M.'s origin and antiquity. It may be too early to assess the full significance of the recent S. African fossil discoveries. Since 1936, and notably in 1947, sev. skulls of adults of the same fossil group, together with jaws and limb bones, have been found 40 m. W. of Johannesburg by Dr. Broom, the Transvaal palaeontologist. The common group to which all these S. African remains belong is now recognised as one sub-family, the Australopithecinae, and it is believed that they date either from the beginning of the Pleistocene age or from the later Pleistocene, which would date M.'s hist. as 1,000,000 years or more. These facts support the theory which includes the Taung skull, mentioned above, as human. But the question still remains of their place in the classification of the higher Primates. They show much closer resemblances to M. than do any of the living or fossil apes known, but this leaves open the question whether they should be grouped with the Homiidae or with the anthropoid apes. If the absolute size of the brain is the most important criterion, the Australopithecinae are to be regarded as apes of a very advanced type, showing, in the details of their anatomy, a remarkable approximation to the Homiidae and no very close relationship to the modern anthropoid apes. But if more emphasis is laid on the criteria of the skull structure, dental anatomy, and the details of the pelvis and limb bones, there is no doubt that they should be grouped with the human family or exceedingly primitive types of mankind. Further important discoveries were made in S. Africa in 1948 and 1949. At Swartkrans colony there was evidence of a large ape-man with a jaw far larger than that of any M. and yet with human teeth. His brain is 850 000 c.c. and therefore within human range. At Makapan Prof. Dart found another type, also with a large brain, and in some ways so human that it was difficult to decide whether to call it M. or not. According to Dr. Broom the S. African caves will solve the problem of M.'s origin within the next two or three years and prove that M. did not evolve from an anthropoid of the chimpanzee type but from an ape which might even have been pre-Anthropoid.

Future of Man.—It is sometimes maintained that M. has now arrived at a fairly permanent physical form, but it is difficult to reconcile the idea of a creative evolution having precisely this form as its limit. Through increasing knowledge M. is likely to take a greater and greater part in the estab. of his own environment, and may in a sense determine his own evolution. It may be said that there are two tendencies perceptible as to the manner in which a different type may be reached;

one is the tendency to differentiation of individuals and races, the other is the tendency to the movement of mankind as a whole. The first tendency can be seen in such conceptions as a chosen race, the authority of conscious superiority as in the superman, with its corollary of subject individuals or subject races, and the like. On the other hand we have the conception of solidarity implied in the idea of a common humanity with the widest possible notion of social obligations. This antithesis expressed itself in the rival ideologies of the Ger. *Herrenvolk* and the world democracies. Still more speculative than the probable results of human endeavour for M.'s uplifting are the problems of M.'s possible enemies and conquerors in the evolutionary struggle. Some writers see in the organisation and adaptability of some sections of the insect world the rudiments of a development which will surpass and conquer human development. Others see in the great diversity of animal forms below us, which have no consciousness of our existence, the possibility of a corresponding diversity of animal forms above us with which we have not yet come into contact or, consequently, conflict. Of more practical import are the efforts of bodies of men like the modern 'eugenists,' who seek to improve the race in directions which will meet with the common approval. Their efforts are as yet restricted to the prevention of the propagation of tendencies we know to be harmful to the physical well-being of mankind. Further than that our ignorance of our common destiny makes it impossible to advance. This essay deals with anthropological and biological M.; for M. considered as a spiritual being see CREATION; PHILOSOPHY; PSYCHOLOGY; RELIGION.

Man, Isle of (anc. Monapia, or Menavia; Manx Vannin, or Mannin, middle), small is. in the Irish Sea, almost equidistant (hence its name) from England and Ireland, about 16 m. from Burrow Head, Scotland; it belongs to Great Britain. Its area is about 227 sq. m. and its pop. 49,300. A cable (32 m. long) runs between Port of Ayre and St. Bees. A tiny islet known as the Calf of M., an important nature reserve, lies to the S.W. A mt. range stretches from N.E. to S.W. through the is., culminating near the centre in Snafell (c. 2030 ft.). The climate is very equable, W. and S.W. winds predominating, while fuchsias, myrtles, and other exotics flourish all the year round. Lead, copper, iron, and zinc are found, but no coal. The Laxey lead mines yield quantities of silver. The is.'s small breed of horses are noted and its tailless cats. There are herring, mackerel, and other fisheries. Granite, marble, limestone, and greenstone are quarried. The is. is a favourite holiday resort, and has steamboat services to Liverpool, Barrow, Silloth, and other ports. The chief tns. are Douglas (cap.), Castletown, Peel, and Ramsey. The inhab. are Manx (Menavia) of Celtic race. From the sixth to the ninth century they had Welsh kings. These were followed by a Scandinavian dynasty, who in turn yielded their rights to Alexander III. of Scotland (1266). In 1106 the is. was granted to the Stanleys (earls of Derby), and was purchased by the Brit. Gov. after long negotiations (1765-1829) from the dukes of Atholl, who held it from 1735. The is. forms the bishopric of Sodor and M. It has its own Lieutenant-governor, council, and House of Keys (a representative assembly of twenty-four members chosen on adult suffrage). The is. is not bound by Acts of the Imperial Parliament unless specially mentioned in them. Pop. 50,000. See J. G. Cunningham, *History of Man*, 1818; W. Harrison (ed.), *The Old Historians of the Isle of Man*, Camden, Speed, etc., 1871; A. W. Moore (ed.), *The Manx Nole Book*, 1855-87; Sir S. Walpole, *The Land of Home Rule*, 1893; A. Herbert, *The Isle of Man*, 1909; G. E. Underhill, *Isle of Man*, 1923; W. W. Gill, *Manx Scrapbook*, 1929; R. D. Farrant, *The Isle of Man*, 1937; and the publs. of the Manx Society, comprising monographs on the hist., antiquities, language, laws, etc. (1859-95).

'Man, The,' card game, see OMBRE.

Manaar, or Manar, Gulf of, arm of the Indian Ocean between Ceylon and S. India, separated from Palk Strait by the is. of Rameswaram and M., and a reef, Adam's Bridge. It is about 150 m. wide at the entrance, and has pearl fisheries. M. Is. is situated W. of N. Ceylon, at the gulf's head, and is 18 m. long by 2½ m. broad. The tn.'s pop. is about 3300.

Manabi, maritime prov. of Ecuador, S. America, between Esmeraldas and

Guayas. Sugar and cacao are produced. Puerto Viejo (c. 80 m. from Guayaquil) is its cap. on a small riv. flowing into the Pacific. Pop. 312,850.

Manacle Rocks, or Point, dangerous reef off the S.E. coast of Cornwall, England, by St. Keverne, 7 m. S. of Falmouth.

Manacles, see HANGCUFFS.

Manacor, tn. of Mallorca, Balearic Is., Spain, 30 m. E. of Palma, 10 m. from the port of Arta, where there are noted stalactite caverns. It is a bishop's see, and contains an auct. pulace. Wine, oil, fruit and cereals are produced. Pop. 13,100.

Manado, see MENADO.

Management, Office, see OFFICE MANAGER-MENT.

Managua: 1. Lake of Nicaragua, Central America, drained by the Tipitapa, S.E. into Lake Nicaragua, separated by volcanic hills from the Pacific. Lake M. or Leon has the volcano, Momotombo, on its N.W. shore. Sev. steamers ply on the lake. 2. Dept. of S.W. Nicaragua, bounded S.W. by the Pacific, N. by Lake M. Much coffee is exported. (3) Cap. of above and of Nicaragua (since 1851) connected by rail with Granada. N. of Lake M. The prin. products include sugar, coffee, cattle, and cocon. It is on the air route from Miami to Cristobal, and has a wireless station. It was selected as cap. by way of compromise between the two rival strongholds of political action, Leon and Granada. In 1931 the city was devastated by an earthquake and had to be almost entirely rebuilt. Pop. 132,200. See also under NICARAGUA; LYON.

Manakins (Pipridæ), family of Mesomyioid or songless birds of small size, occurring in forest dists. in the N. part of S. America. Like the closely allied tyrants, M. feed largely on insects, but also eat fruit and seeds.

Manamah, or Manama, tn. and the commercial cap. of the Bahrain Is., Persian Gulf. It has hospitals, school, a wireless station, and is the official residence of the ruler. Pop. 25,000.

Manaos, cap. of the state of Amazonas, Brazil, situated on the Rio Negro about 10 m. from its junction with the Amazon It. The Rio Negro is navigable for riv. boats through the narrows above M. Its chief exports are india-rubber, Brazil nuts, fish, cocon, and hides. It has a private univ. In the seventeenth century M. was important as a concentration point for slaves captured at many scattered places upstream. Later settlements of colonists appeared around M. occupied in the production, over small areas, of cacao and sugar cane. But it was the rubber plantations which brought prosperity and by the late nineteenth century the chief centres of both people and wealth were the cities of M. and Belém. Pop. 107,500.

Manapla, tn. in the prov. of Negros Occidental, is. of Negros, Philippine Is., situated in the extreme N. of the prov. Pop. 20,000.

Manaria, see MELORIA.

Manasarowar, or Tso-Mapham, lake of Tibet situated at the base of Mt. Kailas,

about 15,000 ft. above the level of the sea. In Hindu legends it is a sacred lake, and is an object of pilgrimage both for Tartars and Hindus. Area 150 sq. m.

Manassas, co. seat of Prince William co., Virginia, U.S.A., 30 m. W.S.W. of Washington, D.C. Near here was the scene of the two battles known as the battles of Bull Run, fought in 1861 and 1862 during the Civil war. Pop. 1300.

Manasseh, eldest son of Joseph, b. in Egypt. His descendants formed a tribe who received lands on both sides of the Jordan. M. was deprived of the precedence due to him by reason of priority of birth by Ephraim, on whose head their grandfather Jacob placed his right hand in blessing instead of his left, M. thus taking the second place.

Manasseh (Ben Joseph Ben Israel) (1604-1659), learned Jewish writer, b. in Lisbon; at eighteen he was rabbi at Amsterdam. Deprived of his property by the Portuguese Inquisition, he began to publish books. His knowledge of the Scriptures was so great that even eminent Christians referred to him. His greatest work, which took twenty-nine years to write, was an effort to reconcile 172 apparently contradictory biblical passages. For an abridgement of his writings see J. Basnage, *History of the Jews*, 1708.

Manatee (Manatus), marine mammal of the order Sirenia, which, though of ungainly appearance, is probably the origin of the mermaid superstition. It ranges along the W. coast of Africa and the E. coast of tropical America, and ascends the river where it browses on the aquatic vegetation. Ms. are slow and inoffensive, but for their valuable oil and their skin and flesh they are hunted and their numbers are rapidly diminishing. They are from 8 to 12 ft. long; their skin is like an elephant's, and the long body ends in a tail like a beaver's. The forepaw or flipper has small, flat nails, and its resemblance to the human hand is supposed to have given M. its name. The upper lip is cleft, and the parts diverge and clasp the food in eating.

Man-aung, see CHITUBA.

Mánbhum, dist. of Bihar Prov., India, forming the E. of Chota Nagpur. Its cap. is Purulia, and it contains the Jharia coal-field (N.). Rice, cereals, and tobacco are produced. Area about 1131 sq. m. Pop. 2,032,000.

Mancha, La, old dist. of Spain, in the S. of New Castile, now comprised in the provs. of Ciudad Real and Albacete. It is noted for mules, and for Val-de-Penas, a light red wine. Cervantes's characters, Don Quixote and Sancho Panza, have made the dist. famous.

Manche, maritime dept. of N.W. France on the Eng. Channel (La Manche), formed (1790) from the old prov. of Normandy. It consists in part of the peninsula of Cotentin, terminating N.W. in Cape la Hague. It has four arrons., St. Lô, Avranches, Cherbourg, and Coutances. The chief products are grain, flax, hemp, beetroot, and fruit (especially apples for cider), and horses are reared. In the S.W. is the bay of St. Michel, lying around

the Tombelaine and Mont St. Michel. St. Lô is the cap., and Cherbourg is on the N. coast. It was the scene of Allied landings of June 6, 1944. Area about 2475 sq. m. Pop. 435,200.

Manchester, Edward Montagu, second Earl of (1602-71), Eng. general and statesman. Created Baron Montagu of Kimbolton in 1626 he succeeded to his father's title in 1642. Both in the short and Long Parliaments he identified himself with the popular and puritan cause against the king and was accused with the 'five members' of high treason, but exonerated by a Bill passed in both houses. After the outbreak of civil war, M. raised money in London for the parliament, and in Aug. 1643 he was put in command in place of Essex. He took Lynn Regis and Lincoln, and fought at Marston Moor and Newbury (second), but owing to his general lethargy was retired in favour of Cromwell. See B. Falk, *The Way of the Montagues*, 1947.

Manchester, city, municipal co., and parl. bor. of Lancashire, England, 189 m. N.W. by N. of London. M. may be said to have grown up with the cotton industry of which it is the centre. It is a modern city covering an area of 27,255 ac. (43 sq. m.). Five rivers flow through the city, the Irwell, Mersey, Medlock, Irk, and Tib, the latter being continuously built over; and the M. Ship Canal (q.v.) connects M. to the Mersey estuary at Eastham, making the city, though 35 m. from the sea, one of the most important seaports in the country. M., being a regional cap., is the home of gov. offices and of the N. presses of at least five popular national newspapers. The total of morning daily papers is seven, of which the *M. Guardian* (q.v.), the leading Liberal daily newspaper in the country, is pre-eminent. Principal thoroughfares in the centre of the city are Market, Oxford, Cross, and Corporation Streets, Piccadilly, and Deansgate. Communications are good. With the exception of numerous parks, green belts, and open spaces, the whole area within 3 m., and along the main roads within a 10 m. radius, is continuously built-up, road and rail transport linking up the various suburbs and surrounding trs.

M. has been the seat of a bishop since 1847, James Prince Lee (d. 1869) being the first bishop. The cathedral, formerly the par. church, is not architecturally outstanding, though a good specimen of the Perpendicular, the principal part frequently restored, dating from the fifteenth century. There are one or two fine windows, but the chief distinction is the splendid carved woodwork in the choir. During the air raids of Dec. 1940 the Long Millgate corner, containing the Regimental Chapel, Ely Chapel, Lady Chapel, and Jesus Chapel, was destroyed and serious damage was done to the roof, fabric, and organ; repairs were commenced in 1946. M. is the bp. of Nonconformity and is well endow'd with churches of all denominations. There are also sev. Jewish synagogues and an unusually fine Quaker meeting house.

One of the most interesting old buildings is Chetham's Hospital and Library, built in the early fifteenth century on the site of a former baronial hall. There are sev. old halls in various parts of the city. In Market Place stands the Old Wellington Inn, last of M.'s old inns. The city possesses some of the finest public buildings in the country, the tn. hall (1877), designed by Albert Waterhouse, being an especially magnificent building, which contains in the large hall mural paintings by Ford Madox Brown and a very fine organ. To meet the needs of local gov. an extension of the tn. hall, designed by E. Vincent Harris, A.R.C.A., was opened by H.M. King George VI. in 1938. Other fine buildings are the Art Gallery, designed by Sir Charles Barry; the Royal Infirmary (1909), the Royal Exchange (1869); Ship Canal House, which houses the chamber of commerce; Midland Bank building; the Central Library, opened by King George V. in 1931; John Rylands Library; and the M. Univ. and Museum. Amongst the notable buildings which were destroyed during enemy air raids were the assize courts (1864), designed by Alfred Waterhouse, and the famous Free Trade Hall, erected from the designs of Walters, in 1856, on the site of the 'Peterloo massacre' (q.v.). Half of the huge floor of the Royal Exchange was destroyed by incendiaries during the same attack, but the remainder was usable after minor repairs. Complete reconstruction commenced in 1947.

Local Government.—Although the finds of coins and pottery and the preserved fragment of the Roman wall show that M. has been inhabited since the Roman invasion, there is very little evidence of its local gov. hist. until comparatively recent times. It is supposed to have been the home of Ina, king of Wessex (689) and is mentioned in Domesday. The first royal charter was granted in 1301, but the tn. remained under the feudal system of manorial gov. until incorporated in 1838, the manorial rights passing from the Groslys to the de la Warres, Westons, and Mosleys successively until purchased by the M. Corporation in 1816. After 1838 progress was rapid. In 1853 M. became a city; in 1893 the title of lord mayor was conferred on its chief citizen, and in 1889 cor. bor. status was granted. To-day the city is divided for local gov. purposes into 36 wards, and the city council is composed of 36 aldermen and 108 councillors. Municipal services include a very good water supply from Longdendale in Derbyshire, and from Lakes Thirlmere and Haweswater in Westmorland; electricity, gas, and markets undertakings; hospitals; airports at Ringway and Barton; libraries, art galleries and museums; parks and cemeteries; highways and transport. The latter service, inaugurated in 1901, is rapidly being converted to motor and trolley buses, which now operate over 350 routes at an average of 75 m. of tram track. M.'s rateable value is £8,401,248 (1946). In 1946 the corporation pub. *The City of Manchester Plan* by R. Nicholas, city surveyor and engineer, setting out his

proposals for replanning the city during the next fifty years. The plan, which is designed to fit into a broad regional scheme covering an area of over 1,000 sq. m., aims 'to enable every inhabitant of this city to enjoy real health of body and health of mind.' Its proposals cover demolition of slum areas and rehousing in neighbourhood units; segregation of industrial areas; improvement of communications; provision of new parks and green belts; a hospital centre based on the existing Royal Infirmary; an educational centre based on the univ.; and the rebuilding and re-using of many of the public buildings in the city centre. The proposals of the plan remain to be examined in detail by the city council and modified as may be necessary before their adoption as official policy.

Trade and Commerce.—Fruit of its hist. M. became a flourishing manufacturing centre, and in 1538 was described by Leland as 'the fairest, best builded and most populous town in all Lancashire'. About the same time Camden, who d. in 1623, said 'Where the Irk runs into the Irwell, on the left-hand bank, and scarce three miles from the Mersey, stands that ancient town called in *Antiquities* according to different copies Mancunium and Mamtunum. Perhaps, as I understand it, it has the best trade of any in these northern parts. The justian manufacture, called Manchester cottons, still continues there'. To-day M. is regarded as the centre of the Lancashire cotton trade and has earned the name of 'Cottonopolis'. But the spinning and weaving are almost entirely carried on in the many surrounding towns of Lancashire and the city is primarily the distributing centre for cotton goods to the whole world. Apart from its mercantile side, M.'s industries are varied and extensive. After cotton engineering and chemicals are the largest industries (in M. was built the empire's largest turbo-electric generator for the Battersea power station), but hats, clothing, waterproof and rubber goods, and electrical equipment are also produced in very large quantities. Owing to its situation near the Ship Canal and docks, Trafford Park, once the estate of the de Trafford, and until fifty years ago a wooded park, has become a world famous industrial estate. M. has one of the most modern dock systems in the world, the estate covering 700 ac., of which 179 ac. are water, and containing eight docks with accommodation for vessels up to 15,000 tons deadweight. The city is also the food distributing centre for one of the most densely populated areas in the world. To facilitate the handling of the vast quantities of goods for which M. is the entrepôt there are cotton, stock, coal, corn and produce, and estate exchanges, and a chamber of commerce, dating from 1794, which now has over 2500 members. Banking and insurance also form an important section of the city's business life, the M. Bankers' Clearing House handling £225,031,518 in 1946 (the area covered being a quarter of a mile radius from the clearing house).

Education and Culture.—The two oldest educational institutions in M. are the M. Grammar School, founded in 1515 by Hugh Oldham, bishop of Exeter, and Chetham's Hospital and Library, estab. by the will of Humphrey Chetham, a M. merchant and benefactor who d. in 1633. The M. Grammar School, although sev. times rebuilt, remained on its original site in Long Millgate until 1931, when the demands of twentieth-century standards necessitated the erection of new buildings in Fallowfield. For four centuries the school has endeavoured to fulfil the aim of the original statutes that 'there shall be no

such branches of learning and science as are usually taught in the English universities.' Owens College was opened in a house in Quay Street in 1851. Growth was rapid, and by 1873 the first of the present buildings, designed by Waterhouse, was in occupation. In 1880 a charter was granted for the institution of the Victoria Univ., with its seat in M. Four years later the colleges of Liverpool (q.v.) and Leeds (q.v.) were admitted and the Federal Univ. continued until 1903, when a new charter was granted and separate univs. were estab. in the three cities. To-day the univ.

THE CENTRAL LIBRARY, ST. PETER'S SQUARE, MANCHESTER

scholar or infant of what county or shire so ever he be, being manchild, be refused' Chetham's Hospital and Library still occupy the fine old building in Victoria Street which was completed about the year 1425. Inaugurated in 1656, these twin institutions have been administered on the original lines and have been maintained chiefly by the property left by their founder, the buildings being still used in almost unchanged medieval state. The hospital provides, free of cost, maintenance, clothing, and education for twenty boys, who must be legitimate children of respectable parents resident in M. and dist. The library, which was probably the first free public library in Europe, contains upwards of 100,000 vols. and valuable MSS. The univ. of M., situated in Oxford Road, owes its existence principally to John Owens, a M. merchant who d. in 1846 and who left a sum of over £96,000 for the foundation of a college in which instruction would be given 'in

contains nine faculties and the original Owens College is surrounded by additional buildings containing the Whitworth Hall, Christie Library, the M. Museum, and many depts. of learning. M. is well endowed with libraries. There is the John Rylands Library, containing the great Althorp Library (the finest private library ever brought together), and having a total of 400,000 printed books and some 12,000 MSS. (including the famous collection of MSS. found by the earls of Crawford). The Portico Library and Newsroom, founded in 1806 as a social and literary institution, was, until the passing of the Public Libraries Act of 1850, the chief circulating library in M. It contains rare first eds., and, though a private library, is now open to the general public. Finally there is the municipal library service based on the Central Library in St. Peter's Square. M. was the first in the country to take advantage of the powers granted by the Public Libraries Act of

1850; to-day the reference collections contain 389,799 vols.; the Henry Watson Music Library contains 73,236 vols., 20,814 copies of sheet music, and 216,888 part-songs and anthems, and the eighteen dist. libraries have a stock of 639,582 books. There are in M. some fifty societies interested in literature, science, and art. Of these the oldest is the M. Literary and Philosophical Society, founded in 1781, and the oldest prov. society of its kind with a continuous hist. Papers read to the society, pub. as memoirs, are sought by societies all over the world and are entered in the Royal Society's catalogue.

The city possesses no fewer than twenty-two parks, fifty-two recreation grounds, and thirty-five small open spaces with a total area of 2,209 ac. The two largest are Heaton Park, containing Heaton Hall, once the residence of the earls of Wilton, and Wythenshawe Park. Belle Vue zoological and amusement gardens are a noted addition to M.'s recreational facilities. At Heaton Park there are two golf courses. The prin. theatres are the Opera House, Hippodrome, and Palace, supported by two repertory theatres and the Intimate Theatre in the Central Library. The Hallé concerts, first estab. by Sir Charles Hallé, still continue to be given by the Hallé orchestra and have been instrumental in making M. an important musical centre.

History.—During the Civil war M. was besieged by the Royalists under Lord Strange, but the inhab. held out under the command of Col. Rosworm, a Ger. soldier of fortune. In 1689 occurred the trial of those implicated in the 'Lancashire plot,' which ended in the triumphant acquittal of the alleged Jacobites; but that there were in the dist. many warm adherents of the Stuarts was shown in the rising of 1715, when the clergy sided with the Pretender, and again in the rebellion of 1745, when M. was occupied by Prince Charles Edward, and the M. Regiment (q.v.) was raised to defend the Stuarts. In the retreat of the Stuart forces, however, the M. contingent was assigned the task of defending Carlisle, but surrendered to the duke of Cumberland, and their officers were tried for treason and executed. In 1819 M. was the scene of what was known as the Peterloo massacre, which occurred during a period of popular discontent following war and taxation which expressed itself in a demand for political reform. This discontent, instead of being regarded as symptomatic of flaws in the economic, social, and political system, was treated as if it were a crime inspired by the Fr. Revolution, a policy which culminated in the foolish conduct of the authorities in M. in the affair of Peterloo. The crowd having met at St. Peter's Fields to petition Parliament, the yeomanry were called out and many people were killed or injured. After this the M. politicians naturally took a prominent part in the reform agitation, which may be said to have its real impetus from this incident. Since that time M. has always taken an active part in politics

and has been markedly Liberal and progressive in its sympathies, especially in regard to free trade, its economic position giving rise to the name 'M. school' for the extreme *laissez-faire* school.

Among famous Mancunians may be mentioned Humphrey Chetham (q.v. and see above); John Owens (q.v. and see above); Sir Robert Peel (author of the Prime Minister); John Dalton, the great chemist who, though born in Cumberland, lived and worked for many years in M.; James Nasmyth (q.v.); Daniel Adamson; James Brindley (q.v.); Rebecca Gaskell (mother of 'Olivo of India'); Sir Richard Arkwright (q.v.); Lt.-Col. Worsley (the M.P. who, at Cromwell's order, 'took away that bauble' from the House of Commons); David Lloyd George; Richard Cobden; J. P. Joule; and the brother-grant (merchants), the originals of Dickens's Cheeryble brothers. Pop. (1931 census) 766,311; (1946, estimated) 668,660.

Manchester: 1. Tn. in Hillsborough co., New Hampshire, U.S.A., situated on the I. b. of the Merrimac R., 18 m. S.S.E. of Concord and 59 m. N.W. from Boston. The tn. is built on a plain at the height of 90 ft. above the riv., and is regularly laid out. The prin. street is wide, and is upwards of a mile in length, parallel to the riv. There are four public squares in different parts of the tn., some of which are handsomely ornamented. M. possesses twelve churches belonging to different denominations; and the educational estab. include a high school, two grammar schools, and the M. Institute of Arts and Sciences. M. has risen into importance quite recently by reason of its water power. Not far from the tn. the riv. has a fall of 54 ft. in a mile, which is taken advantage of by means of dams and canals, so that it turns many thousand spindles. There are at M. print-works, paper-mills, machine-shops, foundries, and other estab. M. received its charter in 1846. Pop. 77,700. 2. Tn. of Hartford co., Connecticut, U.S.A., 9 m. E. of Hartford. It has silk, paper, and cotton mills. Pop. 22,000.

'Manchester Guardian,' twopenny daily, estab. 1821, began as a weekly paper. One of the foremost and most polished Liberal organs of the day, it is not only the leading Liberal organ in the provs., but enjoys an international reputation second only to that of *The Times*. Long before the early eighties it had a circulation not only throughout the cotton and woollen manufacturing dists., but in nearly every mkt. in En. and vil. in the N. of England. As long ago as the early seventies its profits were estimated at £30,000 a year; it possessed a foreign service, a staff of special and ordinary correspondents, a corps of parl. reporters, and was (and still is) characterised by a generally distinguished tone which made it the equal, if not in some respects the superior, of the leading London dailies of that time. Early in its hist. its columns were notable for the anti-corn law articles of Cobden. It preserves a consistently high tone in dramatic and literary criticism and has always preserved a strictly neutral attitude in regard to religious matters. Among notable writers of the V. G. have been Andrew Lang, Richard Whiting, Laurence Housman, and L. T. Holthouse, and it owes much to the editorship of C. P. Scott, from 1872 to 1929. Noted members of its staff have been C. E. Montague, Allan Monkhouse, Samuel Langford, and Neville Cardus. See also Scott, C. P. See W. H. Mills, *The Manchester Guardian: a Century of History*, 1921; N. Cardus, *Autobiography*, 1917; and (by sev. contributors) *The Making of the Manchester Guardian*, 1947.

Manchester Regiment. The 1st Battalion was originally the 63rd Foot formed in 1756 and the 2nd was the 96th Foot raised after the Napoleonic wars. One of the chief campaigns in the hist. of the regiment was in Egypt, whence their badge of the Sphinx; other campaigns were the Amer. War of Independence the Crimean war, and the S. African war, where they were prominent at Elands Laagte and at Ladysmith. The 2nd Battalion was with the original B.L.F. in the First World War and fought at Le Cateau. Many territorial units took part in the Gallipoli campaign, 1915, 1916 in heavy fighting at Sari Bair and Achi Baba. In 1916 at the battle of the Somme city and other service battalions fought at Montauban and Guillemont. The 1st Battalion was with the Kut (g.e.) relief force and took part in the severe fighting at the Hanaiah redoubt. In 1917 various units were in the Ypres battles, notably at Passchendaele, and at Neuville Vitasse, in the battle of Arras, while in the final Ger. offensive of 1918 other units fought at Houthulst and Zonnebeke in Flanders. In the allied advance to victory their chief engagement was the battle of the Selle. In the Second World War the 2nd Battalion went to France with the 1st Corps; the 5th, 8th, and 9th (Territorial) Battalions were in France soon afterwards as part of the 42nd Div. All these units fought at Dunkirk excepting the 8th Battalion, which was sent first to Malta,

then to Palestine, and finally to the It. front. After a short tour of duty in Iceland the 9th was, in part, transferred to the Royal Artillery as the 88th Anti-Tank Regiment, while the 5th became the 111th Regiment, Royal Armoured Corps. The 1st Battalion fought in the doomed rearguard action down the Malaya Peninsula to Singapore, where the survivors were captured. The 6th Battalion was then renumbered as the 1st, and with the 7th fought at Caen, Falaise, the Seine, Nijmegen, and the Rhine. The 2nd went to India and thence to the Burma front, being among the first infantry to cross the Irrawaddy. The 9th fought, later, in Italy.

Manchester Ship Canal. This canal was opened by Queen Victoria in May 1894. Up to that time there had been large navigation between Liverpool and M. along the Rts. Mersey and Irwell, and the Bridgewater Canal was extended to Runcorn in 1722. The first plan for a direct waterway between the two cities was made in 1825 by W. Chapman, and in 1840 another was designed by H. Palmer, but it was not until 1882 that a Bill was brought before Parliament in which the design of Sir E. Leader Williams for a canal with locks was adopted. Owing to opposition the Bill did not pass until 1885, and it was not until two years later that work was begun. The length of the canal is 35 m. It begins at Eastham on the Cheshire side of the Mersey and runs to Runcorn near or through the Mersey estuary; it then goes inland to Latchford, near Warrington, where tidal action ceases, and from there to M. it is fed by the waters of the Mersey and Irwell. M. port has eight docks, the largest being 2700 ft. by 250 ft.; but a still larger is being built. A new oil dock is being built near Eastham, at a cost of £4,000,000, in connection with a new refinery at Stanlow. There are three entrance locks which keep the water level nearly to mean high-water level. The original depth of the canal was 26 ft., but it has since been made 2 ft. deep. In 1927 that section of the canal between Eastham locks and the Gowy R. was deepened to 30 ft.; as also was the approach channel to Eastham. At the narrowest part it is 120 ft. wide, so that it is possible for large vessels to pass one another. The greatest width of the locks is 65 ft., excepting the entrance lock, which is 80 ft. The canal is a splendid engineering feat. At Barton the Bridge-water Canal crosses the R. Irwell on a swing aqueduct, the first of the kind constructed in England. This aqueduct is made of steel and worked by hydraulic power. The canal is crossed by five lines of railways, carried by high-level viaducts. There are also nine swing bridges for main roads, while underneath the canal great syphons are constructed to enable the R. Gowy to continue its course uninterrupted. At intervals along the whole length of the canal there are wharves and works of all kinds, as at Runcorn and Weston Point, and at M. the docks cover an area of 170 ac. (water space), with over 6 m. of quay walls and 290 ac. of wharf space.

The immense advantage it has been to trade throughout Lancashire and the surrounding dist. has more than justified the tremendous outlay of £19,000,000, the canal being in direct communication with all the prin. railway systems and barge canals of the United Kingdom. The issued capital of the M. S. C. Company is about £19,500,000. The gross revenue (including the Bridgewater and the railways) averages nearly £2,000,000, and the net revenue about £700,000. Traffic receipts in 1944 amounted to £1,155,000, tonnage figures being over 6,000,000. The headquarters of the Canal Company are at Ship Canal House, which was opened in 1927. See B. Leitch, *History of the Manchester Ship Canal*, 1907, and A. Williams, *Romance of Modern Lingerie*, 1925.

Manchester Terrier, breed of terrier including a normal and a toy breed. It is more generally known as the black and tan terrier (*a.r.*), and the pure breed was produced through the efforts of a group of fanciers living in or about M.

Manchukuo, see MANCHURIA.

Manchuria, country in the E. of Asia, lying between China and Mongolia on the W. and S.W., and Korea and Siberia on the E. and N. M. extends between 39° 40' and 53° 50' N. lat. and 115° 20' and 135° 20' E. long. The R. Amur forms the boundary on the N. Prior to 1930 M. was divided into three provs., N. M., or Heilungkiang, Central M., or Kirin, and S. M., or Shengyang or Fengtien. Great changes took place after the Jap. invasion of M. (1930). The original provs. were reorganised into ten new administrative provs. (1935) as follows: Kirin (pop. 6,981,000), Lungkiang (2,614,000), Heiho (52,000), Sinkiang (4,500,000), Pinking (4,190,000), Chentao (97,000), Antung (3,164,000), Fengtien (9,197,000), Chinchow (3,234,000), Jehol (6,110,000). In 1937 two more provs. were created, Tunghua and Nulankiang, thus making twelve provs. in all. There were also the Mongol provs. of Hsingan, divided into four dists. (with a total pop. of 1,090,000) the Hainan special municipality (pop. 328,000), and the Harbin special municipality (760,000). The total area is estimated at 503,000 sq. m. and the pop. at 35,000,000 (excluding Kwangtung leased ter. and the S. Manchuria railway zone). The N. and E. part of the country is very mountainous, the remainder being a plain which stretches to the gulf of Liaoyuan. The mts. S. E. of Kirin rise to a height of 3000 ft. The prin. rivers of central M. are the Sungari, Mutankiang, and Ussuri; they are all navigable by native junks, and the city of Kirin on the Sungari can be reached by steamer. The Nen and its tribs. water Heilungkiang, and the Liaohe empties into the gulf of Liaoyuan. Hsingan (Changchun) is the cap. Kirin, Mukden, and Harbin are imperial cities. The chief commercial centre and port is Yingkow (Newchang), at the head of the gulf of Liaoyuan. Harbin is a most important tn.; other tns. are Liaoyuan, Tannan, Tsitsihar, Tieling, and Antung. The country is well supplied

with railways, the prin. being the S. Manchurian railway and the Chinese E. The mineral wealth, but partly explored, is great; coal and iron-mines are extensively worked and the yield of precious stones is valuable. Oil is found in the S., and gold is mined in the E. and N., silver, copper and lead are also found, but M. is first and foremost in agric. country. Its soil is extraordinarily rich. Soyabans are the chief crop, next in value are wheat, millet, and rice. Tobacco, beet, indigo, opium and flax are also grown. The raw silk obtained in the S. is woven into tussore for export. The climate is extreme, ranging from 90° F. in summer to 10° below zero in winter. The wild animals are numerous: bears, wild boars, wolves, tigers, and panthers abound. The fish are salmon and sturgeon; the sea-fisheries also are valuable. The country was originally inhabited by the Manchus, and the first appearance of these people in China dates from the beginning of the tenth century. For their relations with China see CHINA.

There is no longer a Manchurian pop., owing largely to Chinese immigration. During the Boxer outbreak (1900) the Russians occupied the country. A convention was arranged (1902) between China and Russia, and the latter agreed to evacuate the prov. Failing to keep their part of the agreement, war was declared between Russia and Japan, the result being that at the conclusion of peace (1905) Japan handed over M. to China. A definite agreement defining spheres of influence and preserving the open door was signed between Russia and Japan in 1909. Japan began an aggressive action on the ground that Jap. rights in the Manchurian railway zone had been violated. In a brief space of time Jap. troops had overrun the whole country. Mukden was occupied on Sept. 18, 1911. A series of military operations continued and on Feb. 19, 1932, the three N. J. provs. of China, i.e. Kirin, and Heilungkiang, together with Jehol, were proclaimed an independent state under the name of Manchukuo with the cap. at Changchun which was renamed Hsinking. Japan formally recognised Manchukuo, while a *modus vivendi* was struck with Russia. The League of Nations sent a commission of inquiry, under Lord Lytton, to investigate the formation of what was regarded in Europe as merely a puppet state of Japan. Under the Nine Power Treaty of 1922, of which Japan was a signatory, both Chinese sovereignty over M. and the policy of the open door for international trade were guaranteed; but these treaty obligations were held lightly by Japan in view of her investments in M. and her outlook on the economic hinterland of M. as a vital factor in her commercial interests. The Lytton Commission suggested the creation of a special regime in M. which should maintain the sovereign states of China while safeguarding Jap. rights. But the Jap. Gov., whose aggression in M. had been unanimously condemned by the League, rejected the Lytton proposals, resigned from the League, and set up the

new state of 'Manchukuo.' Soon afterwards nations of a Fascist character—Germany, Italy, and Hungary—recognised this new state. The Organic Law or Constitution of 1932 provided for a chief executive, a Privy Council, and a Cabinet. In the following year Mr. Henry Pu was made chief executive and hereditary emperor ('Huangti') of Manchukuo and he was crowned on March 1, 1934, as the Emperor Kang Teh. There was fierce fighting between Jap. and Russian forces in Sept. 1939 in the Nomonhan region over the problem of the Manchurian-Mongolian frontier, the delimitation of which was not finally settled until Aug. 1941. The whole situation in the puppet state of Manchukuo was changed in the Second World War. M. was invaded towards the closing days of the war by Russian forces, and within a fortnight the country was occupied by Soviet and Amer. troops (see under PACIFIC CAMPAIGN or FAR EASTERN FRONT IN SECOND WORLD WAR).

M. has decayed seriously from the time when, as a more or less independent political and economic unit under Chang Tso-lin and later under the puppet emperor P'u Yi, its economy was controlled by the Jap. This is due to the Russian and Communist occupations and consequent looting of machinery and factories and the civil war. The only reminders of the former Jap. economic hold on the country are the railway lines and the excellent highways they built, and the many fine buildings erected by them in the larger towns. In trade, industry, and agriculture the Jap., doubtless for their own immediate benefit, had established up-to-date research stations and experimental farms, but most of these have been wrecked or allowed to fall into neglect. Although M. was not the scene of any serious fighting in the Second World War, it suffered, in some ways, heavier damage than any other part of China. For the Russians took away part of the rolling stock and stripped the factories and industrial plants of their heavy machinery; and before the departure of the Russians and the arrival of the Chinese Nationalist forces there was still further looting and destruction of property. This spoliation by the Russians and the Chinese themselves has dealt the industry of M. a severe blow, though it does not account altogether for the great decline from the old-time prosperity. After the surrender of Japan the Chinese Gov. regained the splendidly developed rail and road systems of M., together with numerous large airfields, the hydro electric plant near Kirin, the Fushan coal-mines, and thousands of modern buildings and other valuable properties, most of this being in effect a form of reparations, for none of it had cost the Chinese Gov. a cent. If the country could have remained an independent economic unit it might have escaped the economic chaos prevailing (1947) in the rest of China; for it has a vast production of wheat and other cereals, of timber and soya-beans, in addition to its coal and iron. But all problems in M.

were overshadowed by the civil war, which began after the Jap. expulsion from China. See further under CHINA, Nanking Government loses Manchuria and North China to the Communists.

Mancini, Pasquale Stanislas (1817-88), lt. lawyer and statesman, b. near Ariano. He soon became a prominent publicist, and in 1848 participated in the Neapolitan movements, after which he retired to Turin and practised as an advocate, being appointed prof. of international law at the univ. there. In 1861 he became minister of public instruction for a short period. From 1881 to 1883 he was minister of foreign affairs. He pub. *Prelazioni di Diritto Internazionale* (1848). Mancinus, C. Hostilius, Rom. consul, 137 B.C. was defeated by the Numantines, and purchased his safety by making a peace with them. The senate refused to recognise it, and delivered him over to the enemy, who refused to accept him.

Manicumium, see MANCHESTER.

Mandaean (Manda-gnosis), E. religious sect, now very few in numbers, residing on the E. shores of the Tigris, and having a religion derived from the N.T. but tainted with Jewish and Parsic elements. They were called 'Christians of St. John' because they venerated John the Baptist, while they call themselves 'Sabba' or Baptists, and are therefore regarded by the Muslims as the Sabaeans of the Koran. Their religious books are *Sutra rabba* (Great Book), *Sutra d'Yahud* (Book of John), *Nolala* (hymn concerning baptism and the ascension of the soul after death), *Drwila* (a ritual), and *Asfar Mauidal* (an astrology). See S. A. Pallis, *Essay on Mandaean Bibliography*, 1933, and E. S. Drower, *The Mandaeans of Iraq and Iran*, 1937.

Mandalay, tn. of Upper Burma, on the Irrawaddy, above Amarapura and Ava, about 386 m. N. of Rangoon. It formed the last cap. (1860) of the kingdom of Burma. Before the Second World War the walled city was the military cantonment of the Brit. (Fort Dufferin). Before the Jap. attacks of 1942 there were many temples, pagodas, and monasteries. Silk-weaving was carried on extensively. The land is fertile and, irrigated by canals, is capable of producing two crops a year. M. is a riv. port. It has an intermediate College, an Agric. College, and research institute. Pop. (mostly Buddhists),

163 000 M dist has an area of 2120 sq m. Pop 409 000. M div has an area of 32 476 sq m, and contains the dists of M Kwankse, Myingyan and Meikilla etc.

M was savagely bombed by Jap planes on April 3 1942. The bombs destroyed two thirds of the downtown business area and killed between 2000 and 3000 people. Bombed again on April 25 the city was more or less devastated. M was evacuated by the Allies and occupied on May 1 by the Jap who found all military installations roads and bridges etc wrecked or damaged by air raids. On Jan 11 1943 M had its heaviest air raid this time by the Allies

and determine applications for renewals of licences.

Mandarin, general name under the empire for a Chinese magistrate or public official civil or military. The civil Ms chosen from the men of letters or scholars from every part of the country, were divided into nine degrees each consisting of two classes the highest of which were ministers of state councillors of the emperor and presidents of the supreme court. Each order was distinguished by the button worn on the top of the cap while the highest grade also wore a peacock feather at the back of the cap not as a sign of office or rank but as a reward for peculiar merit. The buttons

THE PAGODA OF ROYAL MERIT AND 450 PAGODAS OF THE LAW AT MANDALAY

See also under BURMA, SECOND WORLD WAR CAMPAIGNS IN. See V C S O'Connor *Mandalay* 1907 and F L Jero *Modern Burma* 1912.

Mandamus The prin application of the prerogative writ of M fr in the high court is in calling upon justices of the peace to show cause why they should not exercise their jurisdiction in a particular case and generally speaking the object of the writ is to enforce the performance of some duty or to test the legality of the performance by the inferior court of some duty of a public nature in respect of which there exists no other available and adequate legal remedy. But in theory it is a royal command which may be directed to any person, corporation or inferior court (q.v.) within the king's dominions requiring them to do something appertaining to their office and duty in accordance with right and justice. Illustrations of its application M to a mayor and corporation to counsel them to receive and count votes, to justices at Brewster Sessions to compel them to hear

of the higher officers were made of coloured coral the lower of glass and the lowest of gilt metal.

Mandarin Duck, or Chinese Pheasant (*Asiatic galea*) very small ornamental water fowl. The drakes head has a long erectile crest green purple and chestnut in colour and a curious fan or sail. The duck and drake are an extraordinarily devoted pair.

Mandarin Orange, fruit with reddish rind and dark red pulp borne by *Citrus nobilis* the Noble orange which according to Sir J Hooker is a variety of *C. aurantium*.

Mandate System system of government evolved under the treaty of Versailles after the first World War, for the expropriated Ger colonies and outlying portions of the Turkish Empire. The principle of the M S, which was embodied in the covenant of the League of Nations (q.v.) was a novel one in international law (q.v.). There is no essential difference in the M as it exists to-day under the United Nations Organisation from what it

was under the covenant (*see* COLONIAL TRUSTESHIP). It places the mandated ter. under the tutelage of the mandatory, this relationship being founded on the hypothesis that the inhab. of the mandated ter. are not sufficiently advanced to safeguard their own interests; the mandatory nation may not exploit the mandated ter. in its own interests, but exercises the mandate as a 'sacred trust of civilisation on behalf of the United Nations. Mandates were classified as A, B, and C mandates, depending on such circumstances as the stage of development of the inhab., geographical position, and economic conditions. Class A consisted of ters. that previously formed part of the Turkish Asiatic empire (Mesopotamia, Syria, and Palestine) which were sufficiently advanced to obtain a provisional recognition of independence (*see* IRAQ; PALESTINE; SYRIA). These mandates were held by Great Britain and France. Class B comprised ters. such as Ger. E. Africa, the Cameroons, and Togoland, the races of which are deemed to be at such a stage that the mandatory must (1) be responsible for the administration under conditions which would guarantee freedom of conscience and religion, subject only to the maintenance of public order and morals, the prohibition of traffic in slaves, arms, and liquor, and the prevention of the estab. of fortifications or military or naval bases, etc., for other than police purposes or the defence of the mandated ter., and (2) would secure equal opportunities for the trade of all members of the League. These B mandates were held by Great Britain, France, and Belgium (*see* CAMEROONS; TANGANYIKA TERRITORY; TOGO-LAND). In Class C were ters. such as Ger. S.W. Africa and various Pacific Is., which, by reason of remoteness, sparseness of pop., or geographical contiguity to the ter. of the mandatory, were considered best administered under the laws of the mandatory as integral parts of its own ters., 'subject to safeguards in the interests of the indigenous population.' Ger. S.W. Africa was mandated to the Union of S. Africa. After the rejection of his request to the United Nations in 1947 for incorporation of S.W. Africa as a fifth prov. of the union of S. Africa, Gen. Smuts pledged himself to give the ter. representation in the S. African Parliament while maintaining a form of mandate.) All the Ger. possessions in the Pacific S. of the equator, excepting Nauru and Samoa were mandated to Australia; Samoa to New Zealand; Nauru to Great Britain; and all Pacific possessions N. of the equator to Japan. The mandatory had to report annually on each mandated ter. to the League Council and the Permanent Mandates Commission of the League advised the League on all matters relating to the observance of the mandate. Under Chapters xi., xii., and xiii. of the charter of the United Nations (International Trusteeship System) mandates undertake to transmit regularly to the secretary-general of the United Nations, information relating to the economic, social, and educational conditions

of the ters. for which they are responsible. Approval of the M. S. has not been unanimous, it being sometimes objected that it is but disguised annexation. It is certainly true that allocation of mandates was exercised by the Allies of the First World War only in favour of allied powers, and that the control of the mandates commission was not very apparent. But it is evidence of a distinct advance in public opinion that outright annexation was and is discountenanced, and the fact that the League was the ultimate authority was some guarantee of the equitableness of a system which is perpetuated in the trusteeship system of the charter of the United Nations. In Sept. 1931 the council of the League of Nations approved the general conditions laid down by the Permanent Mandates Commission as necessary to be fulfilled before the mandate could be ended. The conditions laid down were that the mandated ter. must (a) have a settled gov. and an administration capable of maintaining its regular operation of essential gov. services; (b) be capable of maintaining its territorial integrity and political independence; (c) be able to maintain public peace throughout the whole area; (d) have at its disposal adequate financial resources to provide regularly for normal gov. requirements; and (e) possess laws and a judicial organisation which will afford equal and regular justice to all. These conditions were deemed to be fulfilled in the case of Iraq, which, accordingly, became an independent state (*see* IRAQ).

Some students of our colonial problems have suggested a solution in the extension of the M. S. to all colonies which have not attained full self-government. This, however, would involve the abandonment of complete territorial sovereignty and the better policy would seem to be an advance towards a greater degree of economic equality and social amelioration. For B mandates provide in theory for identical personal rights for nationals of all member states of the League or, as now, member-states of the United Nations, and for complete economic, commercial, and industrial equality (with some reservation for the organisation of essential public works and services and of monopolies—and the mandatory is free to organise public works on such lines as he thinks just). The A mandates contain similar provisions, inserted to meet the wishes of the League and of the U.S.A. But there are no provisions in C mandates for equality of opportunity for foreigners, though, in practice, the anomaly of the position in these mandates has to some extent been recognised. In the Brit. Cameroons practically all the plantation capital was in Ger. hands and 80 per cent of the exports went to Germany before the Second World War. In settlement there is not much serious discrimination, except in New Guinea, where Australian laws, practically excluding Jap., applied and still apply. The major consideration affecting economic equality was the pledge of the 'open door' for imports from

member states of the League. Trade statistics for mandated territories show marked differences, but on the whole the open door was well maintained except in the countries under O mandate, in which it was not prescribed. The extension of the M. S. to all non self-governing colonies is the main proposal of the advisory committee to the Labour party in Great Britain (see C. R. Buxton, *The Alternative to War*, 1936). The Brit. Gov., however, through Mr. (later Earl) Baldwin, expressed the view that the application of the M. S. to the Brit. colonial empire would not be welcomed by the inhab. of the dependencies themselves, who were proud of their status as Brit. subjects and would have resented being placed in a different category from other members of the Brit. Empire; and, again, that the authority of Parliament and of the local legislatures over these dependencies would have been prejudiced; and, finally, that so extended a scheme would have meant the abandonment of the existing machinery of a Permanent Mandates Commission composed of distinguished experts and its replacement by a kind of international colonial office. The question of extending the M. S. to other areas in the administrative sense is of less importance than the extension of its principles. Within ten years of the treaty of Versailles the M. S. had resulted in wider recognition of the principle of trusteeship, that dependencies should be administered in the interests of their inhab.; in the principle of tutelage, that the cultivation of a capacity for self-government is such an interest; of the principle of international mandate, that states are responsible to the international community for the exercise of power over backward peoples, even if that responsibility is not fully organised. The M. S. under the League embraced typical areas, and if more had been added the Permanent Mandates Commission's administrative duties might well have obscured its scientific and investigatory functions. Nevertheless the advantages of the League's supervision in the event of a future political exigency, suggesting a change in the status of a dependency, were considered in the formulation of the international trusteeship system of the United Nations Charter; for the 'trust territories,' as defined in the charter, include not only territories now held under mandate, but 'territories which may be detached from enemy states as a result of the Second World War.' But the major work of the Trusteeship Council of the United Nations, as was that of the Permanent Mandates Commission of the League, is to focus attention on the problem of native welfare and economic development, to co-ordinate investigations and experiments towards its solution, and to see that mandated areas are administered in the interests of the natives and the world according to the best learning and experience in the world, thus setting examples for the administration of backward areas everywhere.

See E. van Maanen-Helmer, *The Mandates System in relation to Africa and*

the Pacific Islands, 1929; B. Gerig, *The Open Door and the Mandates System*, 1929; Q. Wright, *Mandates under the League of Nations*, 1930; N. Bentwich, *The Mandates System*, 1930; A. M. Mande-nga, see MANDINGONGA.

Mandesur, see MANDSAUR.

Mandeville, Bernard de (1670-1733), Eng. philosopher and satirist, b. at Dordrecht, where his father was a physician. He was educated at the Erasmus School, Rotterdam, and at Leyden Univ. In 1691 he took his medical degree and came to England, but did not practise widely. His fame rests on his *Fable of the Bees*, or *Private Vices, Public Benefits*, which appeared first in 1705, and later eds. in 1714 and 1723. It was primarily written as a political satire on the state of England in 1705, when Marlborough's ministry was accused by the Tories of advocating the Fr. war for personal reasons. He also wrote *Free Thoughts on Religion, the Church, and National Happiness* (1720); *An Enquiry into the Origin of Honour* (1732); *The Planter's Charity* (1704), etc. See J. M. Robertson, *Pioneer Humanists*, 1907; F. B. Kaye, *The Writings of Bernard Mandeville*, 1921; and P. B. Anderson, *Splendor out of Scandal*, 1936.

Mandeville, Sir John, was the ostensible author of a book of travels bearing his name, written about the middle of the fourteenth century, giving an account of journeys in the E., including India and the Holy Land. It appears to have been compiled from the writings of Wm. of Boldensele, Odoric of Pordenone, and Vincent de Beauvais. The name of M. was probably fictitious. Wynken de Worde's ed. of *Sir John Mandeville's Travels* (1499) was remarkable for its illustrations, of which it contained a set 'not less wonderful than the adventures they portray.' See P. Hamelius, *Mandeville's Travels* (Early Eng. Text Society), 1919, and H. Plomer, *Wynken de Worde and his Contemporaries* (London), 1925.

Mandi, state of Himachal Pradesh in N.E. Punjab, India, on the S. slope of the Himalayas. The tn. is on the Beas, 45 m. N.W. of Simla. Timber, rice, pulse, and wheat are produced. In 1932 a hydro-electric plant was opened. Area 1200

sq. m. Pop. 232,600. See the *Mandi Slate Gazetteer*, 1908.

Mandible (Lat. *mandibulum*, the jaw), name applied in anatomy and zoology to the jawbone. In birds it signifies both upper and lower jaws, together with their horny integument, although the terms *maxilla* and *mandibula* are sometimes used to refer respectively to the upper and lower parts. In mammals the term only applies to the under jaw. In insects it applies to the anterior, upper, or outer pairs of jaws.

Mandingoes, Mandingos, Mandingans, Mande-nga, or Mandina, names of an important div. of Sudanese Negro peoples of W. Africa, especially in Senegambia, between the headwaters of the Niger and the Senegal. Among the chief tribes and dialects are the Soni-nka, the Swainiki people of Azor and the S.W. Sahara, the Malinke, and the Bamana (incorrectly called Bambara). Smaller tribes are the Kabunga, the Taronka, and the Jalunka (the suffix *nga, nke, or nka* means 'people'). They are highly intelligent, were early leather- and metal-workers, traders, and herdsmen, and are marked by a passionate love of music. The majority represent a mixture of Negro, Berber, and Arab elements. The Mandi speech is very widely diffused, and largely employed by translators. The empire of Mello (Mali) was founded by their ancestors under Musa (1311-31). They were conquered by the Songhai (Songhai) about 1500. They are zealous Muslims estimated at over 10,000,000 in number. See L. Binger, *Du Niger au golfe de Guinée*, 1892; F. Lugard, *A Tropical Dependency*, 1905; H. Johnston, *Liberia*, 1906; and L. Marc, *Le Pays Mossi*, 1909.

Mandla, dist. and tn. of the Central Provs., India. The tn. (cap.) is on the Narbada, 50 m. S.E. of Jabalpur. Area (dist.) 5115 sq. m. Pop. (dist.) 504,600; (tn.) 11,700.

Mandogari, or Mandu, deserted tn. of Dhar state, India, stretching for 8 m. along the crest of the Vindhya, 35 m. from Indore. It was the cap. of the ant. Muslim kingdom of Malwa, and has ruins of a fine mosque of Pathan architecture. See F. B. Campbell, *Gazetteer of Bombay* (part II, vol. 1.), 1896.

Mandoline, stringed musical instrument of the lute family (treble member), but with deeper convexity of back. It is of lt. origin, but is now common in most civilised lands. The two chief varieties are the Neapolitan (with four pairs of metallic strings) and the Milanese (with five pairs). It is played with a plectrum or quill of tortoiseshell, whalebone, or some pliable substance, held in the right hand. The finger-board, or neck, has many frets across. See Sir G. Grove, *Dictionary of Music*, vol. III., 3rd ed. 1927, and P. J. Bone, *The Guitar and Mandoline*, 1914.

Mandrake, or Mandragora, small genus of perennial plants of the family Solanaceae, of exceptional legendary interest. They are stemless plants, with thick tap roots and dark-green wrinkled leaves.

M. autumnalis bears pale purple flowers in Sept., and *M. officinalis*, white or blue flowers in May, followed by yellow, globose fruit. Both have been supposed to be the *M. of Genesis*, and the plants were and still are credited with many miraculous properties.

MANDRAKE

Mandrill, large W. African baboon. Its immense canine teeth, large blood-red ischial callosities, and huge, naked, gaudily striped cheeks render it one of the most hideous creatures in nature. It is insectivorous.

Mandsaur, or Mandesur, tn. of Gwalior state, Madhya-Bharat, India, on a trib. of the Chambal, 106 m. N.W. of Indore. A treaty was signed here (1818) ending the Maratha-Pindari war. There is trade in opium. Pop. 30,000.

Manduo, see MANDOUARI.

Manduria, tn. of Lecce prov., S. Italy, 22 m. S.E. of Taranto. Piny de-criber its anct. well. Olives, fruit, grain, and wine are produced. Pop. (with Ugento Montefusco), 14,000.

Mandvi: 1. Seaport of Cutch, India, on the gulf of Cutch. Pop. 25,000. 2. tn. of Bombay Prov., India, on the Tapi, 30 m. from Surat. Pop. 2000.

Manes, or Di Manes ('the good gods'), in Rom. mythology the disembodied and immortal spirits of the dead, a. applied somewhat indeminently to the powers of the lower world. They were regarded as gods, and only propitiated by offerings, especially at certain festivals (Parentalia and Feralia). Cf. LARÆ and PENATES. See Ovid, *Fasts*, II., 535, 617, 642; Cicero, *De Legibus*, II. 9, 22; G. Wissowa, *Religion und Kultus der Römer*, 1902.

Manet, Edouard (1832-83), Fr. realistic genre and portrait painter, regarded as the founder of Impressionism. He was sent on a voyage to Rio de Janeiro (1848), but persisted in taking up an artist's career, and became a pupil of Couture and Courbet. He travelled widely in Europe and devoted much time to studying the Sp. masters in the Louvre. He became head of the Ecole des Batignolles (1863). His works were severely criticised and often rejected by the Salon. They include 'Buveur d'absinthe' (c. 1860), 'Olympia' (1865), 'The Garden' (1870), 'Enfant à l'épée', 'Bon Bock' (1873), first of the *plein air* paintings, and portraits of Zola, M. A. Broust, and Rochefort (1881). See

monographs by Zola (1867), Bazire (1884), Durat (1902), von Tschudi (1902), J. Meier-Graef (1912); J. E. Blanche (Eng. trans.), 1925; A. Proust, 1929; and P. Pélard, 1945; also P. Courthion (ed.), *Manet raconte par lui-même et par ses amis*, 1945.

Manetho, Egyptian priest and historian. He lived during the reign of Ptolemy II. (Philadelphus), and was probably a native of Sebennytus in the Delta. He wrote on the hist. and theology of anc. Egypt, his greatest work being the hist. of Egypt written in Gk. Only fragments have come down to us, saved by Josephus, and the tables of dynasties of the kings divided into three books. The Christian chronographers have kept for us a great deal of his work, though many of them differ and are untrustworthy. Julius Africanus, Eusebius, and Georgius Syncellus have all handed down quotations, and references that are valuable. The fragments of M.'s work have formed the accepted foundation for the present scheme of the Egyptian dynasties with their allotted periods. See A. Wiedemann, *Aegyptische Geschichte*, 1881.

Manfred (1231-66), king of Sicily and natural son of the Emperor Frederick II., on whose death he acted as regent in Italy, during the minority of his nephew, Conradin. In 1258, on a rumour of the death of the latter, he was proclaimed king of the Two Sicilies and crowned at Palermo. He was thereupon excommunicated by the pope, but marched into the papal ter., and was acknowledged master of Tuscany. Later, however, Pope Urban IV. re-excommunicated him, and bestowed his kingdom on Charles I. of Anjou, and finally he was defeated and killed at Benevento. M.'s government was beneficial to the country; he estab. schools in all the large cities, founded Manfredonia, and built the harbour of Salerno. See K. Hampe, *Urban IV. and Manfred*, 1261-64, 1905, and W. Cohn, *Das Zeitalter der Hohenstaufen in Sizilien*, 1925.

Manfredonia, tn. of Foggia Prov., Italy, on the gulf of M., an inlet of the Adriatic, 22 m. N.E. of Foggia. It was founded by Manfred of Sicily in 1263, 2 m. E. of the anc. Sipontum. The Turks pillaged it in 1620. Figs, almonds, and carobs are exported. There are salt lagoons near. Pop. 15,000.

Mangaldan, tn. of Pangasinan Prov., Luzon, Philippine Is., near S. shore of the gulf of Lingayen. It is connected by a high road with Dagupan. Pop. 18,997.

Mangalore, or **Mangaluru**, seaport of Madras, India, cap. of S. Kanara dist. on the Malabar coast, 125 m. N.N.W. of Calicut. Coor. coffee, and pepper are exported. It has a gov. college and a Jesuit college of St. Aloysius (both connected with Madras Univ.). Weaving, printing, and shipbuilding are among its industries. It was sacked by the Portuguese three times in the sixteenth century, bravely resisted Tippu Sahib's army, 1782-83, and finally became Brit. in 1799. Pop. 81,000.

Mangan, James (Clarence) (1803-49), Irish poet, wrote for the *Nation* (founded

1842), and contributed to many Irish newspapers under various pseudonyms. *Anthologia Germanica* (1845) and *Romances and Ballads of Ireland* (1850) were among his chief works. See D. J. O'Donoghue, *Life and Writings of Mangan*, 1897, and his eds. of *Poems*, 1903, and *Prose Writings*, 1904.

Manganese, symbol Mn, atomic number 25, atomic weight 54.95, suspected to be present by Scheele (1774) in pyrolusite, and isolated by Ghan. It occurs as the dioxide (MnO_2) in pyrolusite, as the sesquioxide (Mn_2O_3) in braunite, as the tetroxide (Mn_3O_4) in hausmannite, and as the carbonate ($MnCO_3$) in association with iron carbonates in iron ores. The metal is somewhat difficult to reduce; it is prepared by mixing the oxide or the carbonate with charcoal and subjecting the mixture to a high temp. or (see GOLD-SCHMIDT METHOD) by mixing manganous oxide with powdered aluminium in a resistant crucible, and starting the reaction by means of a magnesium wire fuse. The metal is dark brown or black in colour, takes a high polish, and has a sp. gr. of 7.39, melting point $1260^\circ C$. It oxidises readily, evolves hydrogen slowly from water and rapidly from sulphuric and hydrochloric acids. It is used commercially for the production of the following alloys: manganese bronze (4-6 per cent Mn), Mn brass (with copper and zinc), Mn German silver (with copper and zinc), manganin—a very useful alloy for electrical resistances (Cu 81, Ni 12, Mn 4), Housler's alloy, a magnetic alloy (containing aluminium, Mn, and copper), spiegel iron (20-32 per cent Mn), ferro-manganese (70-80 per cent Mn), and Mn steel (as much as 12 per cent Mn). This steel is extremely hard, does not lose its temper, and is used particularly in machinery for crushing rocks. Manganese-nickel alloys for anchor bolts and boiler fire-bricks. The chief compounds are manganous oxide (MnO), a green powder obtained by igniting the higher oxides in a current of hydrogen; trimanganese tetroxide (Mn_3O_4), a reddish powder obtained by heating any oxide in the presence of air; manganese sesquioxide (Mn_2O_3), a dark brown powder obtained by heating any oxide in a mixture of nitrogen (75 per cent) and oxygen (25 per cent); manganese dioxide (MnO_2), a black solid found native as pyrolusite, and prepared as a hydroxide by shaking up the manganous hydroxide, $Mn(OH)_2$, with chlorine water. It may be used as a source of oxygen when heated alone or with sulphuric acid. Manganese trioxide (Mn_2O_3), obtained by the action of sodium carbonate on the green solution made by adding strong sulphuric acid to potassium permanganate. It is reddish-brown. Manganese hy-poxide (Mn_2O_3), a red-brown liquid made by the action of a little water on a solution of potassium permanganate in strong sulphuric acid. The manganates of the alkalis, formed by fusing manganese dioxide with the hydroxides of the alkalis; the permanganates of the alkalis, formed by treating the manganates with acids; manganous sulphide

(MnS), formed by precipitating solutions of manganese salts with ammonium sulphide; manganese sulphate ($MnSO_4$), a pink crystalline solid, formed by heating the dioxide with strong sulphuric acid; manganous chloride ($MnCl_2$), a red crystalline solid formed by passing gaseous hydrochloric acid over heated manganese carbonate. Some of the salts of manganese are used in medicine for the treatment of anaemia and chlorosis. The manganates and permanganates of sodium and potassium are used in solution as disinfecting fluids, e.g. in Condy's fluid. See also FERRO-MANGANESE.

Mangatarem, or **Mangalarén**, pueblo of Pangasinan Prov., Luzon, Philippines, on a trib. of the Agno Grande, 18 m. S. of Lingayen. Pop. 15,000.

Mange, parasitic disease of the skin caused by the presence of minute M-mites. They are of four main kinds: (1) *Sarcoptes*, which burrow through the skin; (2) *Pscorptes*; (3) *Symbiotes*; and (4) *Dermatodectes*, which are more superficial in their operations. M. affects the horse, cow, sheep, pig, dog, cat, and also man. M. in horses is compulsorily notifiable to the local authorities, as also is psoroptic M. in sheep, or sheep scab. Repeated application of greasy dressings destroys the parasites.

Mangel-wurzel, or **Mangold**, important root crop rich in cane-sugar, and derived, like sugar-beet and garden beet, from *Beta maritima*, a weed (order Chenopodiaceae) found on the Eng. S. coast. The varieties of M. are of three types—long, tankard, and globe; red, yellow, or orange in colour. Many varieties are suited to special conditions, and the gold tankard is the most nutritious. The fruit is a rough integument containing four or five seeds, and is drilled in April in rows 20 to 30 in. apart, the young plants being subsequently singled out 10 to 14 in. apart in the rows. The crop, requiring a warm, dry climate, is grown chiefly in the S. of England, thriving best in richly manured, deep clay loams. The root is very sensitive to frost, and must be lifted in Oct., before it is ripe; it is kept in clamps till Feb. before feeding to stock.

Mangin, **Charles Marie Emmanuel** (1866-1925), Fr. general, b. at Sarrebourg, Meurthe, July 6, grandson of a member of the court of cassation and counsellor of state and son of Louis-Eugène M., a divisional general. Educated at Toulon and Versailles lycées, at the college of St. Francis Xavier, Lunéville, and at St. Cyr, he began his army career as an infantry marine subaltern, and saw service in the Sudan (1893-99), Tongking (1901-1), and Morocco (1912-13). In the First World War he commanded the 5th Div.; then the 11th Army Corps, the 9th Corps, the 6th Corps (1917), and in 1918 the Tenth Army. He rendered most distinguished service in the First World War, notably in 1916 in the great counter-stroke at Verdun, the furious attack on the Meuse, N. of the famous fortress, nominally conducted under the general command of Nivelle, being actually conducted by M. The scheme of the counter-attack at the

second battle of the Marne was drawn up by Pétain in consultation with M., Fayolle, and Dégoutte; and M. and Dégoutte commanded the Franco-Amer. troops which attacked the Gers. W. of Soissons near Château Thierry on July 18. He then assailed the Gers. on the line from the Oise to the Aisne with equal success. Finally in Aug. his army broke the 'Hunding line' between the Oise, Serre, and Aisne, and reached Mézières by Nov. 8, just before the armistice. Pubs.: *La Force noire* (1910), crowned by the Academy; *Comment finit la guerre* (1921); *Commentaires et portraits* (1922); *La Plus grande France*, and *Histoire militaire et navale (in Histoire de la nation française)*, ed. G. Hanotaux. See lives by G. Hanotaux, 1925; C. Bugnet, 1934; and P. Norrau-Vanthier, 1936.

Mangnall, **Richmal** (1769-1820), Eng. schoolmistress, was probably b. in Manchester, and received her education at Crofton Hall near Wakefield, Yorkshire. She afterwards joined the staff and eventually became head of the school. She wrote *Historical and Miscellaneous Questions for the Use of Young People* (1800); *Half an Hour's Lounge, or Poems* (1805), and *Compendium of Geography*, 1815.

Mango, kidney-shaped fruit, yellow and red in colour, of the M.-tree (*Mangifera indica*), which is extensively cultivated both for the fruit and for its numerous medicinal and economic uses.

Mangosteen, brown orange-like fruit, filled with a most deliciously flavoured sweet pulp, of an evergreen tropical tree (*Garcinia mangostana*) with red unisexual flowers (family Guttiferæ).

Mangrove, or *Rhizophora*, genus of tropical trees of great value in reclaiming coast land. The seeds germinate on the parent tree, sending down roots of considerable size, and forming as the trees grow a great network which retains vegetable matter, and gradually converts swamps into solid ground. The fruit of *Rhizophora mangel* is edible. (See illustration, p. 734.)

Manhattan, co. seat of Riley co., Kansas, U.S.A., 52 m. N.W. of Topeka on the

Kansas R. It has iron foundries and flour-mills. Pop. 10,000.

Manhattan Island, situated at the mouth of the Hudson R., U.S.A. Its length is about 13 m., and its greatest width about 2½ m. It forms the commercial and financial centre and bor. of Manhattan, which is the chief business part of New York city. The rocks of which it is formed rise to a height of more than 240 ft. in the N. of the is. Peter Minuit, the first Dutch governor-general, bought it from the Indians in 1626 for the equivalent of twenty-five dollars. The building of permanent headquarters for the United Nations was started at M. on Sept. 14, 1948. See also NEW YORK CITY.

MANGROVI.

Mani, see under MANICHEISM.

Manic Depressive Psychosis, see under INSANITY (CLASSIFICATION).

Manichæism, religion professed and taught by a Persian named Mani (A.D. 216), a man of noble birth and a native of Ecbatana. He was well educated by his father, and brought up in the sect of the Mandæans. At the time of his birth two great religions, utterly opposed to one another, were the accepted creeds of the world he knew. One was Mithraism, an Iranian creed, and the other was Christianity. Mani had studied both, and also the ant. Persian Magism, and the new faith which he proclaimed combined many points from each creed. M. was a dual system of religion open to grave moral abuse, as St. Augustine, once a Manichæan, witnesses. Good and evil reigned as equal powers; the first man was a product of Satan, though containing a spark of the light of God. Mani believed he was the last of the chosen prophets, preached that Noah and Abraham and probably Zoroaster and Buddha were also prophets; he also taught a curious, shadowy, spiritual belief in Jesus Christ. The Persian king, Shapur I., was certainly influenced by his teaching; Hormizd, his successor, was tolerant and interested in this faith, but Barham I., who succeeded Hormizd, was a believer in the power of the priestly caste of Magians, who, bitterly hostile to Mani and

his creed, secured his deliverance into their hands. They crucified him, and flayed him while yet alive. The Manichæan belief existed, though modified by Christian influences, until the thirteenth century, and its moral dualism is found continually at the base of various early and medieval heresies, as the Bozonists, Albigenses, etc. See F. Cumont, *Recherches sur le manichéisme*, 1908-12; F. C. Burkitt, *The Religion of the Manichæes*, 1925; C. Widengren, *The Great Vohu Manah and the Apostle of God*, 1943; D. Obolensky, *The Bogomils*, 1948.

Manifest (from Lat. *manifestus*, plain), document, signed by the master of a vessel, and containing a list of all the packages or separate items of freight on board the vessel with their distinguishing marks, numbers, destination, description, etc. It is designed for the use and information of the custom house officers.

Manifesto, formerly a public declaration of war by a prince and explaining his motives. It was pub. within his own ter. and communicated to other states through the channels of diplomacy.

Manihiki Islands, an archipelago situated in the Pacific Ocean, N. of the Society Is. and to the W. of the Marquesas. The chief is. are Penrhyn, M., and Caroline. They were annexed by Great Britain during the nineteenth century, and are part of New Zealand for administrative purposes. Area 50 sq. m. Pop. (Polynesians) of M. 400, of Penrhyn 400; total pop. of archipelago about 1200.

Manila, cap. and prin. port of the Philippine Is., stands on the W. coast of the is. of Luzon, at the mouth of the Pasig. It was founded in 1571 by Legaspi, who inaugurated Sp. rule, and it remained Sp. until 1897, when it was captured by Amer. troops under Gen. Wesley Merritt. After the Philippines were ceded to the U.S.A. in 1899, many improvements were made both in and about the city. The old Sp. city, which was called Intramuros, remains substantially unaltered within the walls, which were restored by the Amers. after they took possession in 1898. The walls are stout and about 25 ft. high, with a circuit of 2½ m. They were begun in 1584 and completed by forced Filipino and Chinese labour. The small old city is in striking contrast to the city and suburbs outside it. There is a central square on which stand the cathedral, the chief gov. buildings, and the old Sp. gov. library. There are numerous churches and convents with hospitals and other Catholic institutions and, in all essentials, Intramuros is a Sp. tn., though the Filipinos have not been slow to adopt Amer. ways. The observatory was founded in 1865 by the Jesuits and up to the Second World War was still run by them, the official meteorological service for the Philippines being supervised there. Under Sp. rule the tn., surrounded by swamps and marshes, was malarial and unhealthy. Amer. engineers drained this land and on it were built healthy suburbs. Similarly what is now the promenade of Luneta was then beneath the sea. The Amers.

introduced a good system of electric lighting, a telephone service, and an excellent water supply, and linked the city with neighbouring towns by fine motor roads. The railway service was extended until the M. Railroad Company had, in 1941, a mileage of 712 of main-line track, and the small tramways were replaced by an Amer. street railway. But the greatest improvement was the construction of a deep and safe harbour; and the glory of M. before the Second World War was the range of new quays, unequalled in the Far E., and hardly surpassed in any seaport of the world; and M. Bay, with an area of 770 sq. m., is the finest harbour in the Far E. The quays were severely damaged in the Jap. attack in 1942, and the fact that the harbour was found in 1945 to be cluttered with sunken craft showed that during the Jap. occupation the port was used only to a limited extent. For the planning of M. the Amer. Gov. employed D. H. Burnham, the Chicago architect of the World's Fair in 1893 and later of Selfridge's store. Burnham and his associates designed avenues and parks, commercial quarters and suburbs, and the steady growth of the city justified the magnificence of their scheme. M. became one of the world's finest cities, with an excellent record in public health. The sloping lawns are a delightful feature, especially on the sides facing the modern city. The mouat was filled in in 1905. M. before 1941 was the greatest hemp market in the world and a famous port for the export of sugar, copra, tobacco, coco-nut oil, embroideries, lumber, and cordage, and for the import of foodstuffs, coal, cotton goods, and manufactured articles. The Philippine mint is at M., and the city had more than 1,000 factories, employing over 20,000 workers. There were tobacco and sugar factories, hemp-works, and mills for expressing oil. The temp. of M. rarely exceeds 100 even in the hot season, when the seat of gov. moves to Baguio. The archbishop of M. is metropolitan of the eccles. prov. of the Philippines (1941). Pop. 673,000.

The Jap. before the war were engaged in a systematic policy of infiltration, and were gradually making their way into various parts of business. The census statistics are significant; in 1925 the Jap. in M. were well under 2000 in number; by 1939 they numbered at least 50,000. The Amer. pop. was about 4000. Jap. bombers first raided M. on Dec. 7, 1941, the day on which they attacked Pearl Harbour. Jap. forces landed on Luzon on Dec. 9. There were repeated savage bombing attacks on the city throughout Dec., churches and other centres of Christian worship and culture being deliberately selected as targets. The beautiful old church of Santo Domingo, with its valuable art treasures and venerated relics was reduced to ruins. The great cathedral of the Immaculate Conception was attacked sev. times, as also with the college of San Juan Lateran, with its irreplaceable library of original MSS. Repeated attacks on successive days were made on the Santa Rosa and the Santa Catalina

convents. The San Juan de Dios hospital was also singled out for attack. In the hope of saving the city from bombing, its defender, Gen. MacArthur, declared M. an open city and its anti-aircraft guns were evacuated. Jap. troops entered M. on Jan. 2, 1942. Early in Jan. 1945 Amer. troops under Gen. MacArthur landed at Lingayan Gulf and advanced southwards towards M. Three weeks later other Amer. forces, landed on the Batangas Prov., menaced the cap. from the S. Two Amer. armies soon afterwards encircled the city and the first Amer. flying column entered it on Feb. 4. Gen. MacArthur was always in touch with the resistance movement in M. and communication with the city was maintained by numerous radio stations about the is. and by submarine throughout the period of Jap. occupation. See also PACIFIC CAMPAIGNS IN THE SECOND WORLD WAR. See J. Foreman, *The Philippine Islands*, 1906; J. B. Arnold, *The Philippines*, 1912; N. Roosevelt, *The Philippines*, 1927; H. W. Krieger, *Peoples of the Philippines*, 1942; and W. C. Forbes, *The Philippine Islands* (revised ed.), 1945.

Manila Bay, large bay on the W. of Luzon Is., Philippine Is. Its mouth is 10 m. wide, and it expands in the interior to a width of 35 m.

Manila, or Manila, Hemp, fibre obtained from *Musa textilis*, which grows and is cultivated in the Philippines, the coarser fibre being utilized for cordage and sailcloth, and the finer for handkerchiefs and scarves.

Manilius, Gaius, Rom. tribune, in 66 B.C. succeeded in having a law passed which gave to freedmen the right of voting in the same tribe as their patroni. On this being declared void by the Senate, he endeavoured to secure Pompey's assistance by proposing to confer on him supreme command in the war against Mithridates.

Manilius, Marcus or Gaius, Rom. poet. lived probably in the reign of Augustus or Tiberius. He was the author of a Lat. didactic poem about astronomy and astrology entitled *Astronomica*, a work in five books, the first two of which treat of astronomy as the foundation of astrology, the rest of the influence of constellations on human destiny.

Manilla, metal hoop or horseshoe, used by W. African tribes as currency, and still surviving in S. Nigeria. It is made of bronze, or of a mixture of tin, lead, and copper, is worth about 3d., and weighs about 3 oz. The gov. has decided to redeem it at a fixed rate, and after a stated period it will be illegal currency, save for some 200 which may be used for ceremonial purposes.

Manin, Daniel (1804-57), It. patriot, elected, during the revolution of 1848, president of the Venetian republic. From 1831 he became a recognised leader of Liberal opinion in Venice; in 1847 he was thrown into prison for a spirited public address of which he was the author. During the annexation of Lombardy to Piedmont M. laid down his authority, but on the defeat of the Sardinian forces at

Novara, March 23, 1849, he resumed it, and was the animating spirit of the entire pop. of Venice during the heroic defence of the city for four months against the besieging Austrian Army. On Aug. 24 Venice capitulated, but M., with forty of the prin. citizens, being excluded from all stipulations, quitted the city. He retired to Paris, where he d.

Maning, Frederick Edward (1812-83), by birth an Irishman, in 1833 went to New Zealand, settled at Onaki, and was made a naturalised Maori. He took part in the wars of 1845 and 1861, and in 1865 was made a judge for the purpose of settling titles of land. He wrote *Old New Zealand* (1863) and *The History of the War in the North in 1841* (1876).

Manioc, or Mandioc, also known as **Manihot**, **Mandioca**, **Cassava**, and **Yuca**—the last-named is not to be confused with yuca, a genus of the family Liliaceæ. M. is a plant with an edible root, which furnishes a starchy food now widely used throughout the tropics, but formerly known only in the Americas. It is now produced commercially as the source of tapioca. See also **CASSAVA**.

Maniple: 1. Eucharistic vestment assumed by a bishop or mitred abbot after the *Confiteor* in the mass and by a priest after the stole and before the chasuble. It is carried looped over the left wrist. At first a strip of linen it is now made of silk or other material about 3 ft. long, sometimes with a fringe and gold embroidery. It is said to symbolise penance. Disused by the churches of the Eng. communion it tends to reappear sometimes for wiping the chalice rim, which was its original purpose. 2. One of the divs. of the Rom. legion. From the fourth century B.C. onwards the 3000 heavy armed infantry formed twenty Ms. of 120 rank and file and ten of sixty, each with two officers called *centuriones* and a *virgillarius* or standard-bearer. Of each sixty soldiers twenty carried only a spear and javelin; the remaining forty had oblong shields, and probably also body armour.

Manipulative Surgery is the manual treatment, without the use of instruments, of affected joints. It thus includes massage (*q.v.*), but is more usually applied to special manipulation of the joints. It is often confused with osteopathy, which is a separate science of treatment. The medical profession as a whole still regards M. S. with suspicion, partly because it has for years been practised by people without medical qualifications. Although undoubtedly harm has been done in some cases, there are many in which good has resulted. Doctors are beginning to recognise this, and some are putting M. treatment on a scientific basis. Another hindrance to the progress of M. treatment was that certain able medical men advocated rest for affected joints. The 'rest cure,' however, often resulted in permanent stiffness.

Some affections that can be cured by skilful M. S. are adhesions of muscle and tendons to their sheaths; certain forms of dislocation; the wedging of synovial mem-

brane between two bones. A tubercular joint should never be treated by manipulation, and any affection should be carefully diagnosed, if necessary with the aid of a radiograph, before any treatment is applied. An anæsthetic is usually administered to ensure the complete relaxation of the muscles. In the treatment of adhesions the limb is grasped just above and below the joint, and, if extension be difficult, flexion is first performed, and then extension in such a way that the adhesions are separated. After the pain has subsided appropriate massage may be applied. Obviously if the operation be performed by any one without adequate knowledge considerable harm may result.

See J. B. Mennell, *Physical Treatment by Movement, Manipulation, and Massage* (5th ed.), 1945.

Manipur: 1. State of India, lying between Assam and Upper Burma. It consists of a valley surrounded by mts., the prin. products being tea, rice, cotton, opium, and tobacco. Area 8638 sq. m. Pop. 512,000. 2. Or **Imphal**, cap. of the state of M., 236 m. N.W. of Mandalay. Pop. 75,000. The state of M. and Imphal were involved in the most critical battles in Burma during the Second World War, when the Jap. vainly attempted to invade India. See under **BURMA**. **SECOND WORLD WAR CAMPAIGNS** IN.

Manis, see **PANGOLIN**.

Manisa, see **MAGNESIA AD SYPHLEUM**.

Manistee, co. seat of M. co., Michigan, U.S.A., on the Père Marquette railroad, 110 m. N.W. of Grand Rapids. Pop. 8600.

Manitoba, prov. of the dominion of Canada. Since its northward extension in 1912, to the sixtieth parallel, and N.-eastward to Hudson Bay, it has been a maritime prov.: its length is 1260 m. It has a S. frontier with N. Dakota and Minnesota (U.S.A.), to the E. lies Ontario, to the N.E. is Hudson Bay, to the N. the N.W. Tera., and to the W. Saskatchewan. It includes the whole of Lake Manitoba, Lakes Winnipeg and Winnipegosis, the Dauphin and Swan Lakes in the N.W., the Pelican and White Water Lakes in the S.W., and many smaller lakes; the total area under water in the prov. is 26,789 sq. m. The surface of the prov. is, on the whole, level, though there are some hilly tracts, such as the Turtle Hills in the S.W. and the Riding Hills further N., which are well wooded. In the E. is a continuation of the old crystalline rock formation which prevails in M., and some of the scenery is wild and rugged in character; N.W. the first prairie steppe extends through the prov., occupying one-half its area; on the W. and S.W. lies the second prairie steppe, occupying one-quarter; the boundary between the two steppes is marked by a series of elevations—Pembina Mts., Riding Mts., and Duck Mts. in the prov. itself and the Porcupine Hills on the boundary between M. and Saskatchewan. The Turtle Mts. stand in the S.W. part of M. by themselves. The surface of the first steppe is generally flat prairie, that of the second is more rolling, but on the whole there is little difference. The prin.

lakes lie within the first steppe, which has an elevation of about 800 ft. above sea level. The surface in the N.E. is very diversified, rough and broken, with frequent bogs and marsh land. All the lakes are very shallow, even Lake Winnipeg being nowhere more than 70 ft. in depth. The explanation of this is that all were at one time the centre of a glacial lake, Lake Agassiz to geologists, which covered three-quarters of M. and extended into the U.S.A. in the S., into Ontario on

into mixed farming and dairying. Newer varieties of wheat have been developed, increasing the areas where its growth is possible and moving the zone further W. and N. In 1947 the wheat acreage in M. was 2,497,000. The figure for other crops was: barley, 1,901,000; oats, 1,381,000; rye, 10,000; flax seed, 556,000; mixed grains, 13,400; other grains and pulses, 41,000; potatoes, 21,500; hay and clover, 214,600; fodder corn, 17,400. Stock-raising has become an important

National Film Board, Canada

MANITOBA: THE MINING TOWN OF FLIN FLOU

Flin Flou sprawls over one of the richest ore deposits in the world. Behind the private dwelling houses occupied by technicians, supervisors, and officials, rises one of the smelting works.

the E., and as far W. as the E. boundary of the second steppe. When the waters declined the S. central area of M. was left under deposits of clay and silt, now covered with black vegetable mould of great fertility. The prin. rvs. are the Assiniboine, rising in Saskatchewan, and the Red R., which rises in the U.S.A., and after a course of 700 m. (500 of which are in the U.S.A.) flows into Lake Winnipeg. At the junction of the two rvs. is Winnipeg.

The climate is generally healthy and dry. The trees include elm, oak, aspen, spruce, tamarack, maple, poplar, etc., and many varieties of fruit are grown. M. was formerly the great wheat prov. and Winnipeg the great market, but though the latter is still the case, the important wheat provs. are now Alberta and Saskatchewan. Wheat is still grown in M., but the impoverishment of the land by 'one-crop' farming has forced the farmers

activity, and hog raising, poultry-raising and bee-keeping are widely carried on. The livestock statistics in 1947 were: horses, 195,300; milk cows, 266,700; other cattle, 299,700; swine, 347,200; sheep, 181,000; poultry, 8,224,100.

Whilst the S. areas of M. are fertile agric. land, the N. two thirds of the prov. form part of the Laurentian Shield, the pre-Cambrian rocks of which hold promise of rich mineral deposits. In the Ruce-Beretsford Lakes dist. gold is being mined, whilst N. M. has large deposits of zinc, copper, gold, and silver. In the Snow Lake dist. large new gold deposits are being developed, as are rich nickel-copper deposits in the Lynn Lake area and new copper-zinc deposits in the Flin Flou area.

Lignite has been found in the M. portion of the Turtle Mts., and good coal in the S.E. In the N.W. are salt springs; in the Star Lake belt tungsten and molybdenum are mined; large deposits of gypsum occur

at Gypsumville, N.E. of Lake M. Cement, bricks, and limestone are also produced. The total value of minerals in 1948 was \$26,768,000.

Large quantities of high-grade fish are caught from the numerous lakes, to a value of \$5,408,000 in 1947-48. Forest reserves, including the Riding Mt. National Park, cover 3,545,000 ac. Animal pelts, in 1947, taken from the wild, were valued at about \$3,800,000, and from ranch-bred animals in 1947 \$726,589. In 1947 water-power generated totalled 2,055,000,000 kWh. In 1948 the gross value of manufactured products was \$450,000,000, produced in industrial establs. employing some 41,000 workers.

Winnipeg is the cap. and centre of trade. Other tns. include St. Boniface (21,600), the seat of a Rom. Catholic archbishop, who is metropolitan of an ecclies. prov. comprising all the Middle W.; Brandon (17,600); Portage la Prairie (7600), a wheat centre; and Selkirk, Dauphin, Transcona, Neepawa, Souris, and Minnedosa. The univ. of M., in Winnipeg, was founded in 1877, and has about 6500 regular students; the medical school is one of the best in Canada, as is the nearby M. Agric. College. There were 2091 state schools in 1946. Religious denominations number approximately: Rom. Catholic, 203,300; United Church, 194,000; Anglican, 125,100; Presbyterian, 43,000; and Baptist, 13,300. In 1947, there were some 5000 m. of railway in M., and the prov. is traversed by the two transcontinental lines, joining at Winnipeg.

M. was known as the Red R. Settlement before it entered the dominion in 1870. During the eighteenth century its only inhab. were fur trappers, but a more settled colonisation began in the nineteenth century. Until 1869 the administration of the area was in the hands of the Hudson Bay Company. It was then purchased by the new dominion; in 1870 M. prov. was set up, enlarged in 1881, and again in 1912 by the addition of part of the N.W. Terr. The prov. gov. is administered by a lieutenant-governor and a Legislative Assembly of fifty-seven members elected for five years. Proportional representation has been adopted for the ten seats in the city of Winnipeg, and the transferable vote in all other constituencies. Six members represent M. in the Senate and fifteen in the Canadian House of Commons.

The area of M. is 246,512 sq. m., comprising 219,723 of land and 26,789 of water. In 1871 the pop. was 25,228; in 1941 it was 729,744.

See G. Bryce, *Manitoba*, 1882; M. McWilliam, *Manitoba Milestones*, 1928; F. H. Kitto, *Manitoba: its Development and Opportunities*, 1931; J. F. Wright, *Geological and Mineral Deposits, S.E. Manitoba*, 1932; G. F. G. Stanley, *The Birth of Western Canada*, 1936; and Morton and Fahnestock, *Third Crossing*, 1946.

Manitoba, Lake, "fresh-water lake of Manitoba, Canada, 60 m. S.W. of Lake Winnipeg. It has an area of 1900 sq. m., with a length of 120 m. and a width of 26 m. Irregular in shape and tideless, the

lake is drained by the Little Saskatchewan R. into Lake Winnipeg.

Manitou: 1. Tn. of El Paso co., Colorado, U.S.A., 6 m. N.W. of Colorado Springs. Its position, over 6000 ft. above sea level, in the midst of beautiful scenery at the foot of Pike's Peak, makes it an important centre for summer visitors. It has also mineral springs, giving it an additional attraction. The 'Garden of the Gods' is close by. Pop. 1200. 2. Mkt. tn. on the Canadian Pacific Railway, Manitoba, Canada, 102 m. S.W. of Winnipeg. Pop. 600.

Manitou, name given by sev. Amer. Indian tribes to the presiding spirits which figure in their religious beliefs. Their number is unlimited, as individuals are each supposed to have a M. or protecting spirit. The M. is in almost all cases some animal chosen by the individual to be the object of his worship.

Manitowoc, co. seat of M. co., Wisconsin, U.S.A., on Lake Michigan, and on the Chicago and N.W. and the Wisconsin Central railroads. It has shipyards and docks; its harbour is good, and its lake trade considerable, large quantities of grain being exported. It manufs. machinery, cigars, iron goods, etc. Pop. 24,000.

Manizales, tn. in the dept. of M., Columbia, 73 m. S. of Medellin, founded in 1848. The inhab. are engaged in gold-mining. Pop. 86,000.

Mankato, co. seat of Blue Earth co., Minnesota, U.S.A., on the Minnesota R., 85 m. S.W. of St. Paul. It has stone quarries, iron foundries, and machine shops, and manufs. cigars, garments, tools, and cement. It has an important hog market and is a centre for poultry, dairy and cattle farming. Pop. 15,600.

Mankeeper, see NEWT.

Manley, Mrs. Mary de la Rivière (1663-1724), Eng. authoress, wrote sev. plays, two of which, *The Lost Lover* and *The Royal Mischief*, were produced in 1696 respectively at Drury Lane and Lincoln's Inn Fields. She led an irregular life and pub. sev. scurrilous works. She is best remembered for the *Secret Memoirs and Manners of Several Persons of Quality of both Sexes from the New Atlantis* (1709-1710), in which she slandered many well-known folk. See P. B. Anderson, *Mistress Delarivière Manley's Biography*, 1936.

Manlius, Marcus, consul 392 B.C.; took refuge in the capitol when Rome was taken by the Gauls in 390. When the Gauls endeavoured to ascend the capitol M. was roused from his sleep by the cackling of the sacred geese; collecting hastily a body of men, he succeeded in driving back the enemy, who had just reached the summit of the hill. For this heroic deed he is said to have received the surname of Capitolineus. In 385 he defonded the cause of the plebeians who were suffering severely from the harsh and cruel treatment of their patrician creditors. In the following year he was charged with high treason by the patricians, and, being condemned to death by the people, he was hurled down the Tarpeian Rock by the tribunes. The members of the Manlia

gens accordingly resolved that none of them should ever bear in future the premonition of Marcus.

Manly, tn. of Cumberland co., New S. Wales, 8 m. N.E. of Sydney. Pop. 5000.

Mann, Heinrich (b. 1871), Ger. novelist, b. at Lübeck, brother of Thomas M. (q.v.). On his father's side he descends from a long line of great merchants of the Hanseatic city of Lübeck, many of whom sat in the Senate. On his mother's side he has Lat. blood, for she was a Brazilian of Portuguese descent. His youth was spent in France and Italy. Showing no taste for business or politics, he began his career as a writer at an early age. His first novel, *Im Schlaraffenland* (Eng. trans. *Berlin, the Land of Cockayne*, 1925), was pub. in 1901. His nationalism, his merciless analysis based on sound documentation, has given him the name of the Ger. Zola, but side by side with the influence of Zola and the Maupassant has been that of D'Annunzio. M. is the acknowledged master of Wassermann and Feuchtwanger. His best work was suppressed by the censor until after the advent of the republic. His novels show us Germany as it was in its newly won vulgar prosperity from the end of the nineteenth century to the period just before the First World War. His next work was sensual and romantic and with a terribly style from which the later Expressionist writers drew much of their inspiration. His three novels on the life of the duchess of Assy, pub. in 1902-3 under the title *Die Götterinnen* (Eng. trans., *The Goddesses*, 1918; *Diana*, 1929), were in this vein. In the main, however, M. has made himself the novelist of the Ger. middle classes when he was not dealing with lit. subjects. Perhaps his greatest work is the trilogy in which he seeks to paint a vast fresco of Ger. life as it existed under Kaiser Wilhelm II. *Die Armen* (1917; Eng. trans., *The Poor* 1917) of the proletariat; *Der Untertan* (1918; Eng. trans., *The Patriot*, 1921) treats of the bourgeois; and *Der Kopf* (1925; Eng. trans., *The Chief*, 1925) of the governing class. These vols. reveal the disintegration and moral decay that even then were rotting away the pompous exterior of pre-war Ger. capitalist society. Naturally they were considered as an insult to 'Kultur' and, with the advent of the Nazis, M. was driven into exile. The whole is a scathing satire which in personalities at times outsteps the bounds of decency. His social criticism and psychological insight also found masterly expression in the novels *Professor Unrat* (1904; Eng. trans., *The Blue Angel*, 1932), which became widely known as a film; *Die Kleine Stadt* (1909; Eng. trans., *The Little Town*, 1931), which is a romantic story of a band of actors visiting an lt. tn.; and *Zwischen den Rassen* (1907). Under the Weimar republic M. became president of the writers' section of the Prussian Academy of Arts, but was expelled by the Nazis in 1933. Thereafter he lived in exile in France, where he lived in Nice until 1940, when he escaped to the U.S.A. By this time he had estab. an international position with such works as *Mutter Marie*

(1927; Eng. trans., *Mother Mary*, 1928); *Eugenie oder die Bürgerzeit* (1928; Eng. trans., *The Royal Woman*, 1930); and *Ernstes Leben* (1932; Eng. trans., *The Hill of Lies*, 1934). He also wrote two long historical novels on the life of Henry of Navarre, *Die Jugend des Königs Henri Quatre* (1935; Eng. trans., *Young Henry of Navarre*, 1937) and *Die Vollendung des Königs Henri Quatre* (1938; Eng. trans., *Henry, King of France*, 1939). These are ambitious studies of human greatness, but show a decline in artistic standards. M.'s miscellaneous writings include essays on Fr. literature and political writings against the Nazi regime. He has also written his autobiography, which is an outstanding work, *Ein Zeitalter wird besichtigt* (1945-1946).

Mann, Horace (1790-1859), Amer. educationist and statesman, b. at Franklin, Massachusetts, of poor parents, but eventually went to Brown Univ., where he graduated with high honours. He practised law with considerable success from 1823 to 1837, when he took up educational work and public affairs. Elected to the legislature of Massachusetts in 1827, and in 1836 to the state Senate, of which he became president. He was for eleven years secretary of the board of education. In 1848 he was elected to Congress, as the successor of ex-president John Quincy Adams, whose example he followed in energetic opposition to the extension of slavery. His able administration as secretary of the board of education gave him a central position in the hist. and development of education in America. His prin. works are his educational reports and *Slavery, Letters, and Speeches* (1851). See life by his wife, 1865; also C. A. Hubbard, *Horace Mann, Educator, Patriot, and Reformer*, 1910.

Mann, Sir Horace, see WALPOLE, HORACE.

Mann, Thomas (b. 1875), Ger. novelist and critic, b. at Lübeck, June 6, the younger brother of Heinrich M. (q.v.). There is a striking contrast between the two brothers. In Thomas the Lat. strain inherited from his mother is more prominent. As an artist he is largely subjective, drawing his themes from his own life and inner thought. Heinrich is more objective. He studies the causes of strength, Thomas those of weakness. Thomas is constantly preoccupied with the thought of death in the midst of life and with the position of the artist as an outcast from life. When he was fifteen years old his father d. His mother moved to Munich, where, after a brief interlude in an insurance office, during which he pub. his first story, *Gefallen*, he registered at the univ. but did not follow a set course. During a long stay with his brother Heinrich in Palestrina in N. Italy he began work on the novel which later appeared with the title *Buddenbrooks*. On his return to Munich he joined the staff of *Stapfischismus* as reader. Some of his stories were pub. in this jour. *Buddenbrooks* was pub. in 1900 (Eng. trans. 1924). It is a saga of the life of a merchant family of Lübeck, tracing

through four generations the gradual growth of decay as culture slowly saps virility. The novel at once estab. M. as one who had an individual contribution to make to literature. It was followed by *Piorenza* (1905), a dramatic dialogue, and *Tristan* (1903), a vol. of short stories including 'Tonio Kröger,' a story which exemplifies the conflict between the normal man and the artist. Of this story he wrote in the *Sketch of My Life* (Eng. trans., 1930), that in it he first 'grasped the idea of epic prose composition as a thought texture woven of different themes,' a conception which he later put to greater use in *Der Zauberberg*. He married in 1905. *Königliche Hoheit* (Eng. trans., *Royal Highness*, 1916) appeared the following year. In 1912 a visit to his wife, who was undergoing a cure at Davos, laid the foundations for the great novel *Der Zauberberg*, which was not, however, completed until some years later. In the meantime he pub. *Der Tod in Venedig* (1913; Eng. trans., *Death in Venice*, 1925) and *Das Wunderkind* (1914). His writings after the outbreak of war in 1914 were directed towards justifying the Ger. position, notably in an essay on Frederick the Great, *Friedrich der Grosse und die grosse Koalition* (1915). His 'reflections of a non-political man,' *Betrachtungen eines Unpolitischen*, of which he said 'the problem of the German nation there treated was beyond doubt my own—therein lay the national character of the book,' was pub. in 1918. Other essays were collected in two vols. and pub. in 1922—*Rede und Antwort* and *Bemerkungen*—also an essay on Goethe and Tolstoi (1923). Part of his study of a swindler, Felix Krull, belongs to this period, and was later completed and pub. in 1938 as *Bekenntnisse des Hochstaplers Felix Krull*. *Der Zauberberg* was pub. in 1923 and was immediately trans. into most European languages (Eng. trans., *The Magic Mountain*, 1927). The novel, based on life in a sanatorium, treats not only of the process of disease in sick minds and bodies, but also of the sickness of Europe. It is a vast symbolical work probing the question of culture in relation to life. In 1929 M. was awarded the Nobel prize for literature. The following year he pub. *Mario und der Zauberer* (Eng. trans., *Mario and the Magician*, 1930). The coming of the Nazi regime led to a self-imposed exile and he went to Switzerland, where from 1937 he ed. a literary jour., *Mass und Welt*. He was deprived of his Ger. citizenship and also of the degree of 'Ehrendoktor' which he held at Bonn Univ. The letter from the dean of the univ. and M.'s reply were pub. together as *Ein Briefwechsel* (1937) (Eng. trans., *An Exchange of Letters*, 1937). Meanwhile his greatest work was in course of pub., *Joseph und seine Brüder*, a long novel which appeared in four parts: *Die Geschichten Jaksabs* (1933); *Der junge Joseph* (1934); *Joseph in Ägypten* (1936); *Joseph der Ernährer* (1941) (Eng. trans., *Joseph and his Brothers*, 1934; *Young Joseph*, 1935; *Joseph in Egypt*, 1938; and *Joseph the Provider*, 1941). In this

work he attempts, in his own words, to construct 'by means of mythical psychology, a psychology of the myth,' showing how the process of life, the duality of spirit and flesh, expresses itself through myth. The novel is notable not only for its philosophic questioning of the nature of man but also for its narrative power and characterisation. Throughout this period M. constantly wrote or lectured on political themes in support of anti-Nazi movements. He stressed the indivisibility of his nature as artist and social critic, and the unity of the world of intellect. A number of his political essays and speeches have since been pub. in an Eng. trans. under the title *Order of the Day* (1942). In 1938 M. went to the U.S.A. and became an Amer. citizen. He lived for a time in Princeton, New Jersey, and in 1941 settled in California. Later works include *Lotte in Weimar* (1939; Eng. trans., *The Beloved Returns*, 1940); *Die Vertauschten Köpfe* (1940; Eng. trans., *The Transposed Heads, a Legend of India*, 1941); and a contribution to *The Ten Commandments* (1945), a collection of ten short novels by different writers, each on the theme of one of the commandments. M.'s contribution was on the first commandment and is a story of the life of Moses. In 1949 he pub. *Dr. Faustus: the Life of the German Composer Adrian Leverkühn as told by a Friend*, the Faust legend brought up to date with a background of pre-war and post-war Germany. His son Klaus and daughter Erika have gained recognition as writers. In 1919 he received an honorary doctorate of literature at Oxford Univ. and returned to Germany. See J. Cleugh, *Thomas Mann, a Study*, 1933, and J. G. Brennan, *Thomas Mann's World*, 1942; also *Thomas Mann: Stories and Episodes* (a selection, Everyman's Library), 1940.

Mann, Tom (1856-1941), Brit. working-class leader, worked from nine to fourteen on farm and in mine, served apprenticeship in engineering for seven years at Birmingham, settled in London in 1876, joined Amalgamated Society of Engineers in 1881, and became a Socialist in 1885. He was one of the leaders of the great dock strike (1889); president of the Dockers' Union, 1890-93; president, International Ship, Dock, and Riv. Workers, 1892-96. He was secretary of the Independent Labour party, 1891-96, and first secretary of the London Reform Union and of the National Democratic League; and thrice stood as parl. candidate. After residing, 1902-8, in Australia, where he continued his Socialist propaganda and was imprisoned, he visited S. Africa, and returned (1910) to England, where he became leader of the Syndicalist movement, and was imprisoned for his connection with the 'Don't Shoot' manifesto to soldiers, 1912. General secretary, Amalgamated Engineering Union, 1910-1921. Pub. his memoirs 1923.

Manna, name given to a variety of natural products. Many people suppose the M. eaten by the Israelites in the wilderness to have been *Lecanora esculenta*, an edible lichen which is removed

from rocks by wind and carried long distances. According to others it is the gummy saccharine secretion discharged by a tree, *Tamarix mannifera*, when punctured by a cochineal-like Coccus. The M. or flowering ash (*Frazinus ornus*) exudes a sweet substance containing mannite, a sugar commonly found in many forms of vegetable life.

MANNA

A, B, highly magnified.

Mannerheim, Baron Carl Gustaf Emil (b. 1867), Finnish soldier, b. at Villnäs, his family being of Swedish descent. He served in the Russo-Jap. war, 1904-5, and in the First World War, becoming leader of the Russian cavalry in 1917. After the Bolshevik revolution he returned to Finland to lead the Finnish White Army, and, aided by Ger. forces, defeated the Russo-Finnish Red troops at Tammerfors and Viiborg. Regent of Finland, Dec. 1918-July 1919, he was defeated in the Finnish presidential election by Stachberg (1919). It was at his suggestion that the M. line, the former Finnish defence system on the Karelian isthmus, was constructed. He commanded the Finns in the Russo-Finnish war of 1939 (see further under FINLAND). He has written *Across Asia from West to East* in 1906-8 (1940).

Manners, John James Robert, seventh Duke of Rutland (1818-1906), Eng. statesman, entered Parliament as a Tory in 1841, and became one of the 'Young England' party, being influenced by Disraeli. He figures in *Coningsby* as Lord Henry Sidney, and in other of his leader's novels. In 1852, and again in 1858, he was first commissioner of works, with a seat in the Cabinet, in the Derby administration; and under Disraeli (1874-80) and Salisbury (1885-86) he held the office of postmaster-general. In Salisbury's second ministry (1886-92) he was chancellor of the duchy of Lancaster. In 1888 he succeeded to the dukedom.

Mannheim, tn. of Baden, Germany, situated at the junction of the Neckar and the Rhine, 46 m. S.S.W. of Frankfurt. The tn. which, like the twin tn. of Ludwigshafen on the opposite side of the riv., is

modern, solidly built, with blocks of magnificent flats and great factories along the Rhine, was severely damaged during the Second World War. It has risen to importance through its manufs. of chemicals, iron goods, machinery, carpets, cigars, and flour, and of armament factories before the Second World War. M. is the terminus for large vessels in the Rhine traffic, and thanks to its excellent docks, which have over 30 m. of berthing, has built up a considerable reputation as a transport centre and has developed a shipbuilding industry. M. is low-lying and protected by a dyke, and the plan of its streets, including a wooded ring road, is characterised by its extreme regularity. The chief buildings of interest are the palace, public library, observatory, and national theatre. It has an airport at Ostheim, outside the city. New suburbs are Neckarstadt in the N., Schwetzingenstadt in the S.W., and Lindenhof in the S. M. began to flourish in the beginning of the seventeenth century, but suffered many vicissitudes during the Thirty Years' war. It was annexed to Baden in 1802. M. was repeatedly bombed by the R.A.F. in the Second World War between 1940 and 1944. On March 17, 1945, Gen. Eisenhower issued a warning to M. (and Frankfurt) that those cities would be destroyed from the air. The Neckar was crossed on March 28 and M. surrendered to the allies on the following day. Pop. 283,800.

Mannin, see MAN, ISLE OF

Manning, Anne (1807-79) Eng. authoress. Wrote *Mary Powell* (1850), *The Household of Sir Thomas More* (1851), and numerous other historical stories. See life by Charlotte M. Yonge in *Women Novelists of Queen Victoria's Reign*, 1897.

Manning, Henry Edward (1808-92), Eng. cardinal and theologian, b. at Totteridge, Hertfordshire, and educated at Harrow and Oxford, where he became notable as an eloquent preacher and as one of the ablest of the Tractarian party. He was rector of Woolavington-cum-Graffham, 1833, and archdeacon of Chichester, 1840. In 1851 he entered the Church of Rome, in which he attached himself to the Ultramontane party. Becoming archbishop of Westminster in 1865, he took a leading part in the debates at the Vatican Council (1870) on papal infallibility. Afterwards he pub. *Petri privilegium* (1871) and when this was attacked by Gladstone in *Papalism* M. wrote *The Vatican Decrees* (1875), in which year he was created cardinal. His other writings consist of sermons, of which he pub. sev. vols. before his secession from the Church of England, and controversial works, including *The Temporal Mission of the Holy Ghost* (1865) and *The Eternal Priesthood* (1883). M.'s later life was devoted largely to social reform. He encouraged Gen. Booth's work in this direction, founded a Rom. Catholic total abstinence association, the League of the Cross, and took a prominent part in industrial pacification, especially in the London dock strike of 1889. More

practical than Newman, he was a leading spirit in the Rom. Catholic Church in England during the nineteenth century. See lives by E. S. Purcell, 1896 and Shane Leslie, 1921.

CARDINAL MANNING

Manning, or Mannyng, Robert, or Robert of Brunne (c. 1264-1338), Eng. poet, was a native of Bourne, Lincolnshire. He wrote *Handlyng Synne*, a trans. of the *Manuel des Pechiez* of Wm. of Waddington, and *The Chronicle of England*, a new version in octosyllabic rhyme of Wace's *Brit d'Angleterre*, plus a trans. of the Fr. rhyming chronicle of Peter Langtoft. M.'s work is of great linguistic importance, and did much to further the adoption of the Midland dialect as the acknowledged literary instrument.

Manning, Thomas (1772-1840), Eng. traveller and writer, b. in Suffolk and educated at Calus College, Cambridge, where he studied Chinese. Friend of Charles Lamb, he is often mentioned in Anger's and Lucas's eds. of Lamb's letters, and in *Essays of Elia*. He went to Canton in 1806 as a medical practitioner, and visited Lhasa in Tibet (1811-12), being the first Englishman to go there. He was a master of Chinese classical literature, and in his time was regarded as the first Chinese scholar in Europe. He also wrote on mathematics. See memoir by Sir C. R. Markham, 1876.

Manningtree, mkt. tn. of Essex, England, on the R. Stour, about 8 m. from Colchester. The chief industry is malting, and there is also a trade in timber and corn. Pop. 1400.

Mannite, or Manna Sugar, $C_6H_{12}O_6$, chief constituent of manna, an exudation from the manna ash-tree, *Frazinus ornus*. M. also occurs in onions, brown seaweed, and many other plants. It is a crystalline substance, readily soluble in water and alcohol. M. is obtained from manna by

extraction with alcohol and subsequent crystallisation. It was formerly used as an aperient in Europe, and is still employed for this purpose in S. America.

Mannlicher Rifle, rifle much used for sporting and target practice, which, towards the close of last century, was adopted for military purposes by several states, particularly Austria-Hungary and Bulgaria. The Austrian type had a 'straight-pull' bolt, i.e. bolts which are not turned for locking, but one in two parts which telescope into each other. The 1895 pattern was a clip-loader, weighing 8 lb. 5½ oz., 4 ft. 2 in. long (bayonet being 9½ in.); its calibre was 8.00 mm. 0.315 in., and it was sighted from 300 to 2000 metres. The Dutch, Bulgarian, and other types had the usual turnover levers and locking lugs in place of straight-pull bolts. The commonest sporting model is of 0.256 calibre.

Mannleufel, Freiherr von, see MAN-TEUFEL.

Manoas, see CONIBO.

Manoel I. (1469-1521), surnamed 'the Happy,' king of Portugal, b. at Alcochete. He sent Vasco da Gama round the Cape of Good Hope to India (1497), Cabral on the voyage which resulted in the discovery of S. America (1500), Corte Real to Labrador (1500), and Albuquerque to the E. Indies (1505). During his reign he made many notable reforms in the field of administration and justice, and founded schools, making his court a centre of culture.

Manoel II. (1849-1932), king of Portugal, b. at Belem, near Lisbon; son of Carlos I., on whose assassination he succeeded to the throne in 1908. He was dethroned in 1910 on the estab. of the republic. He came to reside in Twickenham, England. In 1913 he married Augusta Victoria of Hohenzollern.

Man-of-War Bird, or Frigate Bird (*Tachypetes aquilus*), natatorial bird with an enormous expansion of wings and great powers of flight.

Manometer, instrument for determining the pressure of gases enclosed in a vessel. The simplest form consists of a long, straight tube, dipping into a box containing mercury. The pressure of the gas to be gauged is communicated through an opening in the box to the surface of the mercury, and the upper end of the tube is open to the atmosphere. If the pressure of the enclosed gas is greater than that of the atmosphere, the mercury is forced up the tube. A pressure of two atmospheres forces the mercury upwards to a distance of 30 in. above the level of the mercury in the box, so that this form of M. cannot be used for great pressures. Another form used for small pressures consists of a bent tube open at both ends and containing a quantity of mercury in the bend. When the pressure of the enclosed gas is communicated to one surface of the mercury, the mercury in the other limb rises or falls as the pressure is greater or less than that of the atmosphere. If, for instance, the mercury sinks ½ in. in one limb, it will rise ½ in. in the other, and the difference of level will be 1 in. The pressure of the enclosed gas will therefore be equal to one

atmosphere, plus the weight of 2h in. of mercury. For greater pressures a U-tube closed at one end is employed. The open end communicates with the enclosed gas and the closed end is furnished with a scale. If the pressure of the enclosed gas is equal to that of the atmosphere, the mercury will be at the same level in both limbs. If the pressure rises above that of the atmosphere, the mercury in the open limb sinks, and that in the closed limb rises, thus compressing the air in the closed limb. Suppose h to represent the length of the air column at atmospheric pressure, and h the length at the pressure of the gas;

then the pressure of the air column is $\frac{H}{h}$.

The difference in height of the two mercury columns is $2(h - h)$, therefore the pressure of the enclosed gas must be equal to the weight of a column of mercury

whose length is $2(H - h) \div \frac{H}{h}$ atmospheres.

Manor (Lat. *manerium*, from *maneo*, remain or dwell, the connotation being the usual residence of the owner). In Domesday Book each tract of land belonging to the king or some great feudal noble holding of the king is generally found to consist of sev. holdings called *maneria* or *Mss.*, which for the most part are coterminous with the villa, tith., or vis. A *M.* appears to have denoted such dist. of a great personage as he kept in his own hands for the abode and use of his family, and hence this dist. was also termed *demesne* (or *terra domicalis*, from Lat. *domus*, home) lands, in contradistinction to the *tenemental* lands, which the lord distributed among his tenants. In the domain there was generally a mansion or *M.-house*, which was occupied by the owner of the manerium or by his bailiff (for a number of the greater barons held numerous *Mss.*, and could not therefore personally occupy them all), together with a certain quantity of arable and meadow land in scattered strips. (See as to common field system under LAND.) Quite early in the Eng. land-holding system the great barons granted out smaller *Mss.* by way of subinfeudation, to be held of themselves, the sovereignty of such lesser lords being termed an *honour*. These inferior lords in their turn carved out of their estates yet smaller estates, and the practice would doubtless have been followed out almost to infinity but for that provision in Magna Charta, designed in the interest of the greater barons, who found that they were being deprived of their feudal profits, which enforced on lesser barons the obligation to retain sufficient land to answer their overlords' demands. Later the statute of *Quia Emptores* (q.v.) forbade subinfeudation altogether by the provision that the grantee should always hold not of the grantor but of the chief lord of the fee. All *Mss.* existing in present times were, therefore, stereotyped from the time of that statute (Edward I.). The reservation of mineral rights, exiguous quit rents from manorial freeholders, and fines on admission to copyhold estates, were the prin. remaining benefits at-

taching to a *M.* up to recent times. What privileges or anachronisms of tenure survived, however, were abolished by the Law of Property Act, 1922, which Act, *inter alia*, enfranchised all copyhold land on terms which are laid down in Part V. of the Act. See F. W. Maitland, *Domesday Book and Beyond*, 1897, and P. Vinogradoff, *Growth of the Manor*, 1908; H. S. Bennett, *Life on English Manors, 1150-1400*, 1937; and D. Jerrold, *Introduction to the History of England*, 1949.

Manrent, in Scottish hist., a kind of bondage whereby free persons became the bondmen or followers of their patrons and defenders. Hence equivalent to homage, or the attendance and personal service connoted by homage. The term is a corruption of *manred* (A.-S. *Manræden*, homage, from *mann*, vassal, and *ræd*, condition).

Manresa, tn. of Spain in the prov. of Barcelona, on the R. Cardener, 41 m. N.W. of Barcelona. The collegiate church of Santa Maria is a fine example of Sp. Gothic, and contains a fine fifteenth-century Florentine altar-frontal. *M.* is famous as the place where Ignatius of Loyola (q.v.) first felt himself inspired to found the Jesuit order, 1522. Pop. 34,000.

Manrique, Gomez (c. 1412-91), Sp. poet and soldier, b. at Amusco. He took a prominent part against the constable Alvaro de Luna in the reign of John II., went into opposition against Miguel Lucas de Tranzo in the reign of Henry IV., and declared in favour of the Infanta Isabel. As a writer he was greatly esteemed in his own day and composed didactic verses, modelled on those of Santillana, and satires as well as dramas; indeed he appears to be the earliest Sp. dramatist. Among his works are *Representación del nacimiento de Nuestro Señor*, a play on the Passion, and two *monas*, or interludes. His poems were first printed in 1835, and ed. by Antonio Paz y Melia.

Manrique, Jorge (1440-78), Sp. poet and soldier, probably b. at Paredes de Nava. He owes his reputation as a poet to *Coplas por la muerte de su padre* (1492), an elegy on the death of his father, which, with its sublime expression, ranks among the first poems of the world. A critical ed. of this work was pub. in 1912.

Mans, Le, cap. of the dept. of Sarthe, France, 112 m. S.W. of Paris. It has a cathedral, originally founded by St. Julian, which contains the tomb of Berengaria, queen of Richard Cœur de Lion. There is also the *hôtel de ville*, built in 1756 on the site of the former castle of the counts of Maine, and the prefecture (1760), which occupies the site of the monastery of La Couture, and contains the library and the communal archives. Le *M.* is the seat of a bishopric dating from the third century, and is an important railway centre. The tn. is the scene of an important motor-racing event. The chief industries are the state manuf. of tobacco, the preparation of preserved vegetables, fish, etc. In the allied advance on the W. front in 1944 the 8th Corps of Patton's Third Amer. Army was left to reduce

the Brittany ports, while the rest of the troops of that army, turning their backs on Brittany, struck S. and seized L.e M., Mayenne, and Laval; after which a spearhead struck N. from L.e M. to advance through Alençon toward Argentan. Pop. 84,000. See WESTERN FRONT 1st SECOND WORLD WAR.

Mansard, or Mansart, François (1598-1666), Fr. architect, b. at Paris. He made use of a peculiar kind of roof, which had been used 100 years before by Lesnot, but which henceforth was called the M. roof. Among his buildings, the chief are the Château de Maisons-sur-Seine, and the churches of Sainte-Marie-de-Challot, the Minimes de la Place Royale, and the Visitation de Sainte-Marie in the rue Saint-Antoine.

Mansard, or Mansart, Jules Hardouin (1648-1708), Fr. architect, nephew of François M., b. in Paris. He superintended the construction of all the prin. buildings of Louis XIV., including the palace of Versailles, the Maison de Saint-Cyr, the Grand Trianon, and the dome of the Hôtel des Invalides. He also built the Château de Clagny for Mme de Montespan.

Mansarowar, see MANASAROWAR.

Mansaurah, see MANSCRA.

Mansbridge, Albert (b. 1876), Eng. educationist, b. at Gloucester, Jan. 10, and educated at Battersea Grammar School. He was one of the pioneers of adult education (q.v.), founding the Workers' Educational Association in England in 1903 and in Australia in 1913. From 1903 to 1915 he acted as secretary of the association. During the First World War he continued his services to education on behalf of the Brit. and Australian Armies. He has been a member of various gov. committees on education, including the Consultative Committee of the Board of Education, 1906-12, and again in 1924; also a member of the royal commission on the univs. of Oxford and Cambridge, 1919-22. In 1918 he founded the World Association for Adult Education, and was the first chairman. In 1929 he relinquished his chairmanship and became president. He is also founder of the National Central Library for the Seafarers' Education Service, and the Brit. Institute of Adult Education. Books include *An Adventure in Working Class Education* (1920); *The Older Universities of England* (1923); *Margaret McMillan, Prophet and Pioneer* (1932); *Brick upon Brick: the Co-operative Permanent Building Society* (1934); *Edward Stuart Talbot and Charles Gore* (1935); *The Trodden Road* (1940); *The Kingdom of the Mind* (1944); and *Fellow Men: a Gallery of England, 1876-1946*, (1948). He was created Companion of Honour in 1931, and holds the honorary degrees of M.A. at Oxford and LL.D. at Cambridge, Manchester, and Pittsburg.

Mansie, name given in Scotland to the house of the minister of the Estab. Church and Free Church. Every first minister of a rural par. is entitled to his M.; if there is not one existing the landed proprietors in the par. are bound to build one. He is

also entitled to a stable or barn as part of his dwelling-house, and his M., when built, must be kept in repair by the heritors, but these may, after the M. is 'made sufficient,' apply to the presbytery to declare it free, when the incumbent must do the repairs. During the time occupied by rebuilding or repairs, the minister is entitled to an allowance from the heritors as M. rent. By statute the M. must be near to the church.

Mansel, Henry Longueville (1820-71), Eng. metaphysician, b. in Northamptonshire. He was educated at Merchant Taylors' School and St. John's College, Oxford, and took holy orders in 1841. He was Bampton lecturer in 1858, and prof. of eccles. hist., 1860-65. In 1868 he delivered a course of lectures upon *The Gnostic Heresies*, and in the same year was appointed to the deanery of St. Paul's. Among his works are *Phronetisierion* (1850); *Prolegomena logica* (1851); *The Limits of Demonstrative Science* (1853); and *Man's Conception of Eternity* (1854). He also contributed to the *Speaker's Commentary*, and to *Aids to Faith*, and ed. with Veltch the lectures of Sir Wm. Hamilton.

Mansfield, Peter Ernst I., Graf von (1517-1604), governor of Luxembourg, served Philip II. of Spain at St. Quentin and in the Netherlands. He went to the aid of the king of France with a body of troops when he was fighting against the Huguenots, and was present at the battle of Moncontour (1569).

Mansfield, Peter Ernst II., Graf von (1580-1626), Ger. soldier, illegitimate son of Peter Ernst, and one of the greatest generals of the Thirty Years war, first fought under the duke of Savoy against the Spaniards. Sent to help the Bohemian rebels, he took Pilsen and compelled Count Bucquoi to evacuate Bohemia, but afterwards induced the Bohemians to make Frederick, the elector palatine, their king. The latter being defeated by the imperial troops, M. for a long time held out at Pilsen and Thabor, but, yielding to superior numbers, he retreated to the Palatinate (1621). The following year he ravaged Alsace and, joining forces with Frederick, defeated both the Bavarians and the Hessians. Entering Belgium and uniting with the duke of Brunswick, he defeated the Spaniards at Fleurus and penetrated into Westphalia, pillaging so many tns. that the inhab. of the prov. offered him a considerable sum to depart. In 1625, at the head of a motley army, he re-entered Germany, but sustaining defeat at the hands of Wallenstein, he retreated to Brandenburg. Giving up the command against Austria he elected to try his fortunes in Venice, but d. at Vranovitz. See J. Massarette, *La Vie militaire et fastueuse de Pierre Ernest de Mansfeld*, 1931.

Mansfield, Katherine (1890-1923), Brit. writer, b. in Wellington, New Zealand, of the second colonial generation, her father being the colonial-born son of Arthur Beauchamp, a settler. Her father is the Stanley Burnell of her sketches. At the age of thirteen she was sent to England to be educated at Queen's College, Harlow.

Street, returning to New Zealand in 1906. Her writing was first noticed and encouraged by A. R. Orange, then the editor of the *New Age*. Her first collected volume of stories *In a German Pension* was published in 1911, being Bavarian sketches crudely written but intense. Only with the greatest difficulty did she succeed in having her work accepted, and the only time she was certain of a home for her talent was during the period when her husband J. Middleton Murry was editor of the *Ithenzum*. She disliked the provincialism of Wellington ('Philistia itself'), and in 1909 returned to England. From this point it is possible, however, to trace from her works the development of a talent that was to find its perfect material in the experiences of her early New Zealand years. The work of the ensuing eight years of experiment posthumously collected in *Something Childish* (1924), begins with a group of New Zealand stories, the remainder ranging through the continent and the various strata of English suburbia—entertaining but somewhat forced. In Dec. 1917 she contracted pleurisy, and from then till the end of her life, at Fontainebleau, she settled in many fits of heroic and weary battle against disease. Her early work consists of descriptive and highly ideal sketches. With the pub. of *Bliss* (1920), however, it was evident that her first phase of vivid telescopic journalism was over. In this and her succeeding collection *The Garden Party* (1922) she combined detailed and restless observation of objects with a slowly maturing philosophy of tolerance. She finally summed up her talent as 'very against corruption. No longer could criticism so well indicate her hatred of sentimentality of code life and her vindication of living by feeling and personality—characteristics of *Prelude* (1918), *Bliss* (1920), *The Garden Party* (1922), *The Daughters of the Lake* (1923) of all her later and more solid work. In *Prelude* she turns once more to the scene of her childhood, the book being a considerable advance on her previous work, its perfection of form being derived from a study of Tolstoy. In it the idealised New Zealand of her childhood becomes a refuge from surroundings that in sickness of mind and body had become ever more distasteful to her. Her outlook was uncompromising, for this reason her letters are as vicious as her stories and continually reveal a gift for humor and pathos which is her especial secret. Her death at the early age of thirty-three was a severe blow to literature in general and to the short story form in particular. The posthumous *Journal of Katherine Mansfield* (1924) and her *Letters* (1928, enlarged 1949) have been ed. by her husband J. Middleton Murry. See Ruth L. Mantz, *The Critical Bibliography of Katherine Mansfield* 1931 and A. Sewall, *Katherine Mansfield: A Critical Essay* 1936, also life by Ruth L. Mantz and J. Middleton Murry, 1933.

Mansfield, William Murray, Earl of (1705-93) Eng. judge, b. at Secon in Perthshire. He was educated at West

minster School and at Christ Church Oxford and having taken his degree of M.A. was called to the Bar in 1730. He was made king's counsel and solicitor general to Lord Wilmington's Gov., 1742 (entering Parliament as member for Boroughbridge) and in 1743-44 proved himself the ablest defender of the gov. in the House of Commons. In 1751 he became attorney general to the duke of Newcastle's administration which he defended against the attacks of Pitt, and in 1756 was called to the degree of serjeant at law sworn in as lord chief justice of the king's bench and created Baron M. in the co. of Nottingham. He incurred in 1767 some hatred by discountenancing some prosecutions under the penal law of 1700 which made celebration of mass by a Rom

EARL OF MANSFIELD
From the picture by Sir J. H. Keyno I

Catholic priest punishable by imprisonment for life, and still further increased his unpopularity by his conduct in the case of Wilkes in 1768, and by 17 directions to the jury in three cases of sedition libel arising out of the pub. and sale of Junius's letter to the king in 1770. In 1776 he became Earl of M. His house was sacked and burnt during the Gordon riots 1780 and he retired from office in 1794. He did much to improve mercantile law, the law of evidence and the procedure of courts, and as a parliamentarian was second only to Chatham. M. may be truly said to be the founder of the commercial law of England (Mr. Justice Buller). With his Scottish training, M. was not too favourable to the Eng. common law and he derived many of the principles of mercantile law that he laid down from the writings of foreign jurists as embodying the custom of merchants all over Europe, much in the same way as did the *præter peregrinus* in a text to Rome (see JUS GENS. *supra*). But while he obtained his legal principles from those sources, he took his facts from mercantile specialists whom he carefully directed on the law. Indeed

he reared a body of special jurymen at Guildhall, who were generally returned on all commercial cases to be tried there. On terms of the most familiar intercourse with them, he learned from them the usages of trade, and in return took pains in explaining to them the guiding principles of jurisprudence. See Lord Campbell, *Lives of the Chief Justices*, 1849-57; W. S. Holdsworth, *History of English Law*, vol. xii., 1923 ff; and Lord Birkenhead, *Fourteen English Judges*, 1926.

Mansfield: 1. Largest municipal bor. in Nottinghamshire, England, on the Mann; it is in the centre of the N. Nottinghamshire coalfield and a large industrial area. The prin. industries include coal-mining, hosiery, cotton doubling, artificial silk, woollen goods, boots and shoes, leather goods, light engineering, iron and brass foundries, radio and aircraft components, stone quarrying, moulding sand and sand lime bricks, malting, the manuf. of decorated tin boxes, and plastics. Sherwood Forest and the vale of Trent are in close proximity. Pop. 51,000. 2. City and co. seat of Richland co., Ohio, U.S.A., 60 m. S.W. of Cleveland. It is the seat of the Ohio state reformatory, and has an extensive trade with the surrounding agric. country. Its manufs. consist of stoves, threshing machines, and other iron and brass goods. Pop. 37,200.

Mansfield College, theological institution opened in 1889 in Oxford, to give instruction to students who wish to become Congregational ministers. It is a non-univ. college, and is devoted solely to the study of theology.

Mansfield Woodhouse, tn. of Nottinghamshire, 1½ m. N. of Mansfield. Two Rom. villas were discovered in the neighbourhood in 1786. Pop. (1931) 14,000.

Mansion House, oblong building in the centre of the city of London, at the end of Cheapside. It is the official residence of the lord mayor of London, and was finished about 1750. It has an interesting neo-classic Corinthian portico.

Manslaughter is the killing of another (1) on a 'sudden affray,' i.e. without premeditated design; or (2) through culpable negligence. The first class obviously closely approximates to murder. If, for example, the slayer were carrying weapons, that fact of itself might well afford evidence of a deliberate intent to seek what might, *prima facie*, look like a sudden quarrel. The second class forms the bulk of charges of M. An endless variety of negligent acts causing death may amount to M.; e.g. a labourer engaged in house demolition, without in the least taking precautions, hurls debris down on to a highway and kills a passer-by; a 'peculiar' person, not believing in the efficacy of doctors, allows his child to die of disease when it might easily have been cured. But negligence, however gross, cannot be the basis of a charge of murder, though if the jury believe the facts show design and not negligence at all, the case would be otherwise. Frequently an indictment (q.v.) for murder contains an alternative count for M. where

the prosecution are doubtful about the circumstances.

In Scots law the term M. is not used. The cardinal div. of criminal homicide is into *murder* and *culpable homicide*. The taking of another's life without intention of killing, but in circumstances which display such a complete and wicked recklessness as 'to imply a disposition depraved enough to be wholly regardless of consequences,' is *murder*. Under 'culpable homicide' are included all sorts of homicide, which are neither *casual* nor *justifiable*.

Manson, Ethel Gordon, see FENWICK.
Manson, Sir Patrick (1841-1922), the 'father of tropical medicine,' son of an Aberdeenshire laird, educated at Edinburgh Univ., emigrated to Formosa in 1865 to study tropical diseases. In 1894 he formulated the mosquito-malaria theory, which, though disputed for a time, was ultimately confirmed by experiments (see also ROSS, SIR RONALD). In 1897 he became medical officer to the Colonial Office, and in 1899 he estab. the London School of Tropical Medicine with the aid of Joseph Chamberlain, who was then colonial secretary.

Mansūra, or **Mansaurah**, cap. of the prov. of Dakhla, Lower Egypt, about 34 m. S.W. of Damietta, on the r. b. of Damietta branch of the Nile. M. dates from the crusades, and marks the spot where the crusaders were finally overcome (Mansūra means 'the victorious'). M. manufs. sail cloth, cottons, and linens. Pop. 69,060.

Mansur-al-Kamili was chief chemist at the Cairo mint in the thirteenth century. He wrote an excellent book on assaying and the purification of gold, and his chemical knowledge was far above the general contemporary level.

Manterga, Andrea (1431-1506), It. painter, b. at Vicenza or Padua. He studied in the school of Squarcione, who entered him in the guild of painters before he was eleven, but afterwards came under the influence of Bellini, whose daughter he married. His reputation was assured by his frescoes in the chapel of S. Cristoforo, in the church of S. Agostino degli Eremitani, which are still regarded as examples of his best work. In 1459 he went to Verona, and painted an altarpiece for the church of S. Zeno, and in 1460 took up his abode at Mantua at the invitation of the Marquis Ludovico Gonzaga. In Rome in 1488 he painted a series of frescoes in the chapel of the Belvedere in the Vatican, among which was the noted 'Baptism of Christ,' but all were destroyed by Pius VI. He returned to Mantua in 1490 to continue the 'Triumph of Caesar,' his masterpiece, a series of nine pictures, each 9 ft. square, painted in tempera, now in Hampton Court. Another notable picture of his later years was his 'Madonna della Vittoria' (1495), now in the Louvre. M. was also an engraver, and amongst other works engraved 'A Bacchanal Festival,' 'Marine Gods,' 'The Entombment,' and 'The Resurrection.'

Mantell, Gideon Algernon (1790-1852), Eng. geologist, b. at Lewes, Sussex. He

made a collection of fossils, which he afterwards sold to the Brit. Museum, and pub. many geological works, among which may be mentioned *The Wonders of Geology* (1839).

Mantes, tn. in the dept. Seine-et-Oise, France, 22½ m. N.W. of Versailles, on the l. b. of the Seine. Burnt in 1087 in retaliation for a witticism of the Fr. king, Philip I., by William the Conqueror, who sustained a mortal wound there, it belonged for some time to Charles the Bad, but in 1364 was secured for Charles I. by Bertrand du Guesclin. It is notable for the ruins of the church of St. Maclou. Its manufs. include musical instruments and incubators. Pop. 9000.

Manteuffel, or **Manuteufel**, Edwin Hans Karl, Freiherr von (1809-85). Prussian general and diplomatist b. at Dresden. Appointed chief of the military cabinet in 1857, and adjutant-general of the king of Prussia in 1861. In 1864 he served in the Dan. war as a lieutenant-general, after which he was made civil and military governor of Schleswig. In 1866 he invaded Holstein on the plea that the Austrians, who then held it, had broken the convention of Gastein by appealing to the Germanic Confederation. On the latter deciding against Prussia M., co-operating with Falkenstein, crossed the Elbe and invaded Hanover. Having humbled the Hanoverian army M. was placed in sole command against the united forces of S. Germany. After this he went as envoy to St. Petersburg to advance Prussian interests in Germany. In the Franco-Ger. war (1870-71) he forced Bazaine to capitulate at Metz, defeated Farre at Amiens, and forced Clenchant to retreat into Switzerland.

Manticore, mythical creature, used as an heraldic device, having the head of a man, the body of a lion, a scorpion's sting, and porcupine's quills.

Mantineia, or **Mantineia** (*Μαντινεία*), one of the most ant. cities of Arcadia, situated on the borders of Argolis, s. of Orchomenus. It was one of the most powerful tns. of Arcadia, and continued to be so down to the time of the Achaean League. It was the scene of five great battles, the first of which was fought in 418 B.C., and resulted in a defeat of the combined Argives, Mantinians, and Athenians by the Lacedaemonians. The second took place about 367 B.C., when the Spartans were defeated by the Thebans and Epaminondas was slain, the third in 295 B.C., when Demetrius Poliorcetes defeated Archidamus and the Spartans; the fourth in 242 B.C., when Aratus and the Achaeans defeated and killed Agis at the head of the Spartans; and the fifth in 207 B.C., which again resulted in the defeat of the Lacedaemonians under the tyrant Machamidas, who fell in the battle. In consequence of its treachery to the Achaeans, Aratus sold its inhab. into slavery, and changed its name to Antigonia, in honour of Antigonus Doson, grandson of Demetrius Poliorcetes and a king of Macedonia; but Hadrian restored the old name.

Mantis, genus of the family of orthop-

terous insects Mantidae. The first pair of limbs are large, powerful, and peculiarly modified, and are used to seize and maim insects for food. The praying M. (*M. religiosa*) occurs in S. Europe, and is so called from the devotional attitude of the creature as it lies in wait for its prey. Many of the species have developed colour protection to a wonderful degree, so as to be hardly distinguishable from the leaves or flowers of the plant which they frequent. Their pugnacity and deadly armament have caused them to be kept and matched against one another like gamecocks.

Mantissa, see LOGARITHMS.

Mantling, or **Lambrequin**, in heraldry, is an appendage hanging down from the helm, and passing behind the escutcheon. Originally the M. was of the prin. colour of the shield, 'doubled' (i.e. lined) with the prin. metal or fur. To-day the sovereign's M. is of gold, lined with ermine; that of peers, of crimson velvet, lined with ermine.

Man-trap. Formerly Mts. were set on land and in houses without lot or hindrance. But the Offences against the Person Act, 1861, punishes with penal servitude the act of 'setting engines calculated to destroy human life or inflict grievous bodily harm,' and specifically mentions spring-guns and Mts. among such offending devices. Homicide resulting from such traps is manslaughter. But the act expressly saves the right of any one to set a M., spring-gun, or any other 'engine' in his dwelling-house between sunset and sunrise for the purpose of protecting the house.

Mantua, or **Mantova**, tn. of Lombardy, Italy. M. stands on an is. about 5 m. in circumference, in the middle of a lagoon formed by the Mincio. It is well built, with wide streets and squares, and contains many handsome structures. The prin. buildings are the cathedral, one of the finest in Italy; the church of S. Andrea; the churches of S. Maurizio and S. Sebastiano; the house of Giulio Romano, whose works as a painter and an architect form the greatest glory of the city; the church of S. Barbara, rich in paintings; the public library of 80,000 vols., and the museum, in which is a valuable sculpture gallery; the ducal palace, an old, vast, irregular structure, partly rebuilt by Giulio Romano, which contains some good paintings. The chief industries are tanning, printing, brewing, and iron working. This famous city suffered scattered damage in the Second World War in 1945. The monumental Gothic church of S. Francis was practically destroyed; the Filippini, S. Maurizio, and S. Orsola were all more or less completely destroyed; the roof of S. Leonardo was demolished, yet the cathedral, S. Andrea, and S. Sebastiano were undamaged. The Palazzo Canossa sustained some damage to its stucco decoration, but the ducal palace was only lightly damaged. Bombing in Aug. 1944 completely destroyed the Casa della Cervetta, a house which was built about 1495 by the pharmacists Gropoli. Near M. is the bp. of Virgil. Pop. 40,600.

Manu (Sanskrit, 'man'), or **Manu Vaisvata** ('the sun-born'), the seventh of a class of fourteen demiurgic beings, each of whom presides over a period of M. He is regarded as the progenitor of the present race, and was founder and first king of Ayodhya. To him are ascribed the so-called *Laws of Manu*, as well as a work on Vedic ritual.

Manuel, kings of Portugal, see **MANOEL**.
Manuel, Don Juan (1282-1317), Sp. writer and statesman, was connected with the royal house of Castile and Leon, and on the death of Ferdinand IV. (1312) acted as regent of the kingdom during the minority of Alfonso XI. As a writer he occupied an important place in the literature of the fourteenth century. His chief work is *El Conde Lucanor* (1335), a collection of fifty tales in the oriental style, but he also wrote *Cronica de España*, as well as several treatises, including *El Libro infundido*, a treatise on education, and *Las Mancias del amor*.

Manuel, Francisco (1734-1819), Portuguese poet, b. at Lisbon. He was the writer of odes and various other kinds of poetry, but was especially famous for his lyrics. He was compelled to flee from Portugal to escape the Inquisition, and d. at Versailles.

Manuel, Nicolas (1484-1530), Swiss portrait painter, poet, and reformer, b. at Bern. He studied painting at Colmar and at Venice under Titian, and was commissioned to paint a series of pictures for the monastery of his native city. This work, the 'Dance of Death,' was in the style of Holbein, but only copies of it exist, and another excellent work, 'Solomon's Idolatry,' has also perished. In his latter years M. took an active part in public affairs, and especially distinguished himself as a promoter of the Reformation. His writings consist of various controversial treatises, *Moralities and Mysteries*, and popular songs.

Manukau, harbour and co., of New Zealand, on the W. coast of Auckland prov. dist. is the W. coast harbour for the city of Auckland. It is separated from Waitemata Harbour on the E. coast by only a mile or two. The harbour of M. is a large inlet at the head of which is the port of Onehunga, which is 8 m. by rail or tram from Auckland.

Manumission, in Rom. law, the institution whereby a slave was freed. It took its rise from the law of nations (*jus gentium*) (q.v.); for 'by the law of nature [on which the law of nations was supposed to rest] all men were born free' (*Institutes of Justinian*, Tit. V.). M. was effected in various ways: in the presence of the Church (at one of the great festivals before bishops); according to the imperial 'constitutions'; or (most usually) by *vindicta* (fictitious suit in which a friend of the slave asserted before the praetor that the slave was free by touching him with the symbolic wand of proprietorship); or by testament or any other expression of a man's last will. A slave could also gain his freedom otherwise than by M., e.g. he might be abandoned by his *dominus* (master) on account of disease or infirmity,

and a slave so treated was pronounced a freed man by an edict of Constantine. There were other methods of M. besides those mentioned in Justinian's *Institutes*, which are noticed in his Code; but they are similar to the *modos* in the *Institutes* in that all are based upon an implied wish of the master to free the slave.

Manures, or Fertilisers, those substances, organic or inorganic, by which the fertility of the soil is maintained. The great bulk of the tissues of plants is built up from natural sources, water and carbon dioxide, that are apparently inexhaustible in most parts of the world. In addition, mineral substances and nitrogen are essential to the growth of plants, and their presence in the soil in minimum proportions is necessary for the production of satisfactory crops. In a state of nature, plant food is accumulated with the decay of animal and vegetable substances, and also to some extent by the action of leguminous plants in combination with certain micro-organisms of the soil. These draw upon the atmospheric nitrogen in the air and fix it in the soil. Farmyard manure is the chief fertiliser in general use. It is composed of the excreta of animals, and straw, peat-moss, or other litter. The fertilising value of animal excreta varies considerably, not only with the species of animals, but with their age and condition. Young growing stock use up a greater proportion of those parts of the food which have manurial properties than mature animals, with the exception of milking cows. It follows, therefore, that beyond a certain point the richer the food the greater the fertilising value of the manure. Linseed cake and de-oiled cotton cake, for example, are rich in nitrogenous food, and their use makes richer M. than starchy foods, such as wheat, barley, oats, maize, and rice. If poorly nitrogenous food has to be much used on account of considerations of price, compensation to the soil is called for. The condition of farmyard manure has much bearing upon its value; the fresher it is the more slowly its constituents become available as plant food. On this account old and well-rotted dung is applied to light, porous soils, so that the crop can make use of it with the minimum of loss. In the storage of farmyard manure much loss of the liquid, which contains the most soluble and therefore the most immediately valuable fertilising elements, is avoided if an underground storage tank can be provided for its collection. It is often altogether wasted on farms, most of the solid residue having little more value than that of its mechanical effect. The most satisfactory way of storing is to pile the manure on a bed of dry earth, covering it occasionally with a thin layer of soil, and finally with a thick coating.

The possibilities of artificial M. were first revealed by Liebig, who suggested treating bones with sulphuric acid, the result being what is known as 'dissolved bones.' 'Dissolved bone compounds' usually contain, in addition, shoddy, ground leather, dried blood, fish guano, etc., and though each of these and similar

materials have fertilising value the compound may be of doubtful utility. Nitrate of soda, obtained partly from the W. coast of S. America and partly made synthetically, is one of the most concentrated forms of nitrogenous M., and being very soluble is generally used as a top-dressing. Even more concentrated is sulphate of ammonia, which, though freely soluble, is slower in action. It is a refuse product of gas works, but the vast bulk of it is now manufactured synthetically. The presence of this salt in soot gives the latter its chief manurial value. Nitrate of lime and calcium cyanamide, as well as sulphate of ammonia, are now made from atmospheric nitrogen, and their use as nitrogenous M. is increasing (see NITROGEN, fixation of). The guanos are other rich nitrogenous M. Mineral superphosphate, obtained by treating finely ground mineral phosphates with sulphuric acid, is the cheapest source of soluble phosphate. The percentage of soluble phosphates varies from about 25 to about 75 per cent. Basic slag is a phosphatic manure which is a by-product in the manuf. of steel from phosphoric pig iron. If finely ground, so that about 80 per cent will pass through a sieve of 10,000 meshes to the square inch, and if about 85 per cent of the total phosphate is soluble in a 2 per cent solution of citric acid, it is a very effective manure. Basic slag also contains lime and, like other calcareous substances, is of great value in reducing plant foods to a condition in which they are available for assimilation. The chief potash M. are (i) kainite, a mineral consisting of potassium and magnesium sulphates and containing about 12½ per cent of potash, and (ii) potassium chloride or muriate of potash. The effect of potash M. varies greatly with different soils, and experimental trial is desirable to see whether they are needed in a particular case; but usually potatoes pay for a light application before the crop is planted. See also under AGRICULTURE. See Sir E. Russell, *A Student's Book on Soils and Manures*, 1917, 1919; J. M. Remington, *The Manure Note Book*, 1916; A. D. Hall, *Soils and Fertilisers*, 1916; Commonwealth Agricultural Bureaux, *Bibliography of Soil Science, Fertilizers and General Agronomy*, 1918.

Manus, see IIAND.

Manuscripts. This term, from Lat., meaning written by hand, indicates writings of any kind, on any material, although nowadays it is mainly used to indicate medieval writings on vellum or modern writings on paper, as distinguished from printed matter. Man naturally makes use of those writing materials which are the most readily procured and the most suitable. Palm-leaves, bamboo-sticks, clay, stone, metals, ivory, bone, wood, bark, linen, wax, papyrus, leather, and other materials were used, and still are used, for writing in various parts of the world. If something durable was wanted, metal, clay, or stone or other hard materials were employed; the writings thus produced are termed inscriptions (q.v.), and will not be considered in this article.

In various parts of India and other E. countries, the leaves of palm-trees, especially the talipot palm-leaves, which are long and narrow, have been in use for centuries, the local scribes employing an iron stylus to scratch the letters, and ink is rubbed over the surface of the leaf and fills up the scratches that form the letters. MSS. written on palm-leaf have been found in various E. countries which date back many hundreds of years. In Siam the material used was an indication of the social standing of the person for whom the written document was intended; the king's letters were engraved on sheets of gold when they were sent to princes, or on paper, either black or white, when written to lesser people. Sacred works were written on *Corypha* palm-leaves, their edges being gilded or painted with vermilion, and the leaves threaded on strings and folded like a fan; these MSS. are mainly preserved in the Siamese Buddhist monasteries. The MSS. of some Indonesian peoples consist of long strips of bamboo welded by beating one to the other, then folded together, accordion-like, between wooden covers, and bound together with a string of woven rushes. Instead of bamboo strips, sometimes long strips of thin bark of trees are used. The anc. books of the Bataks (Sumatra) are written in brilliant ink on paper made of bark. The bark of trees, as writing material, is still used by many other primitive peoples in America, Africa, and Asia, and its general use in anc. Rome caused its name, *liber*, to be attached to the book, which was made from it. The Lat. word *liber* (book) passed to Fr. (*livre*), It. (*libro*), Sp. (*libro*), etc.; also the Eng. words library, librarian, etc., have derived from it. The Eng. term book and the Ger. *Buch* have a similar etymology.

Linen cloth was employed by the anc. Egyptians to receive writing, but it was also used by the Romans, many Lat. authors referring to it (*libri linei*, *volumina lineata*, etc.), as well as by the Etruscans (the 'mummy of Zaezrob'; see under ETRUSCAN LANGUAGE AND WRITING). More extensive was the anc. Rom. (and Gk.) use of wax, or rather wooden tablets coated with wax, termed in Gk. *μῦαξ*, *δελίον*, *μυριον*, *αρμακτεον*, etc., and in Lat. *cera*, *tabella*, *tabula*, or *tabulae ceratae*. These tablets were used for school exercises, accounts, literary compositions, etc. A *codex* or *codex* contained two or more wooden tablets, coated with black wax, and held together by rings; it was termed (according to the number of its tablets) *diptycha* or *duplices*, *triptycha* or *triplices*, etc., or *polyptycha*, *multiplices*.

The main vehicle, however, by which the Gk. and Rom. literatures were preserved from the earliest times down to the early Middle Ages was the papyrus roll. The oldest books known are written on rolls of papyrus, and the earliest preserved written papyrus go back to the fifth Egyptian dynasty (late twenty-eighth-early twenty-seventh centuries B.C.). The largest library in antiquity, that of Alexandria, was said to comprise 700,000 vols.

in the first century B.C. The manuf. of papyrus appears to have ceased in Egypt about the middle of the tenth century A.D.

The manuf. of papyrus had its headquarters at Alexandria, and all matters relating to its size, quality, and price were carefully regulated in Rom. times. It was made out of the pith of the stems of the papyrus plant (*Cyperus papyrus* L.), which then grew plentifully in the Nile, and it was termed *πάπυρος*, *βυβλος*, *βιβλος*. The length of the early rolls was very considerable. We are told of some that were 150 ft. long, and would contain the whole *Iliad* or *Odyssey*; some were 30 or 40 ft. long. The best quality of papyrus was about 9½ in. wide, though there was a kind of 'large paper,' *macrocolium*, as much as a cubit wide. Papyrus lingered on in Europe for ordinary documents, letters, etc., until the eleventh century. However, on account of climate papyrus has been preserved wellnigh only in upper Egypt. Very few have been found in Palestine and N. Mesopotamia; charred papyri have been discovered in Herculaneum, Italy, and in lower Egypt. Still, some 30,000 Gk. papyri, and many others couched in Aramaic, Lat., Persian, Coptic, Arabic, and Heb., are preserved in the prin. collections of Europe, U.S.A., Egypt, Palestine, etc.

In the third century A.D., while the papyrus roll was still the dominant form of book for pagan literature, most of the Christian literature was written in codices: the papyrus material was then combined with the codex form, as, for instance, in the famous Chester Beatty papyri, which are a group of papyrus codices of various books of the Bible, mostly of the third century, but at least one belonging to the first half of the second century. However, the codex did not become fashionable until perhaps the fourth century A.D. It was the growth of the Christian community which brought it into prominence; and with the codex, the material best adapted to that form, namely parchment or vellum, also came into favour. It may be said that while the papyrus roll was the book of the pagan world, the vellum codex was the book of medieval Christianity.

The invention of vellum (*vitellinum*), a material prepared from the skins of calves, sheep, and other animals, is commonly attributed to King Eumenes II. of Pergamum (197-158 B.C.), in Asia Minor, who was ambitious of forming a library, but was unable to obtain papyrus, because his rival, Ptolemy of Egypt, jealous for his own library at Alexandria, forbade papyrus to be exported. This story is told by Pliny (*Natural History*, xiii. 11) on the authority of Varro, but its historical value need not be believed. However, there is no doubt that Pergamum (hence the name *parchment*, which is the origin of our word *parchment*) was the chief centre of the vellum trade. Actually vellum was not 'invented' in the second century B.C.; it was rather an extension of, or improvement upon, the old practice. Rolls of skin were used by the Egyptians in quite early times: the first mention of

documents on skin goes back to the fourth dynasty (twenty-ninth-twenty-eighth century B.C.), although the earliest extant examples of such documents are a roll of leather of the twelfth dynasty (c. 2000-1788 B.C.), and a mathematical text of the seventeenth century B.C., now in the British Museum. It is uncertain whether the Babylonians and Assyrians employed skin as writing material (no such documents have been recovered in Mesopotamia, because her soil was unsuitable to the conservation of such perishable stuff as leather or papyrus), but Otesias reported that the Persian royal records were kept on skins of sheep or goats, and that the Avesta was said to have been written on skins of oxen. Herodotus, too, tells us that the Ionian Gks. wrote upon skins, and so did also many barbarians in his own time. The Jews probably employed skins throughout their hist. for the reception of their sacred books (a few fragments, apparently belonging to the fourth or third century B.C., have been recently discovered), as indeed they do at the present day. The Christian Church, influenced no doubt by the practice of the Jews, chose parchment upon which to write their sacred books.

However, the papyrus roll continued to be predominant, and parchment was mainly used for note-books and cheap copies until the end of the third century A.D. Then its superior advantages seem to have been suddenly realised. It was more durable than the papyrus; it provided a beautiful surface for writing; arranged in sheets or pages, it could contain in a single vol. a far greater quantity of matter than the papyrus roll. Thus it became possible to have the whole of Homer or Virgil or of the Bible in a single vol. It was possible to use it more than once, for it could be written upon, then washed out, and another text written over it, known as *palimpsest*. Two other circumstances favoured the vellum codex: (1) From Pergamum the article made its way in great quantity to Rome, and once in Rome its diffusion over the whole civilised world was assured. (2) The Christians, having chosen it as their main writing material, soon extended its use, first to the reception of their theological literature, and then to that of literature in general. It must also be borne in mind that the fourth century A.D. witnessed the victory of the vellum codex over the papyrus roll, just at the time when the Emperor Constantine accepted Christianity as the official religion of the Rom. Empire (c. A.D. 313-25), and one of his first acts was to instruct Eusebius to have fifty copies of the Gk. Bible written on vellum for his cap., Constantinople. The earliest extant great codices belong to this century: *Codex Sinaiticus* (British Museum), *Codex Vaticanus* (Vatican Library); others belong to the fifth or sixth centuries: *Codex Alexandrinus* (British Museum), *Codex Ambrosianus* (Milan), *Codex Ephraemi* (Paris), *Codex Sarravianus* (Leyden and Paris), *Codex Washington* (Washington), *Codex Argenteus* (the famous Gothic MS. preserved in Upsala),

and so forth. From the fourth century A.D. the vellum codex definitely superseded the papyrus roll, and remained the chief writing material for MSS. until the general estab. of the use of paper in the fourteenth century.

The use of paper as writing material was unknown in Europe before the eleventh century A.D., although the Chinese had known it already for about 1000 years. It was invented in China about A.D. 105. In the eighth century the Arabs learned paper-making from the Chinese, and in the ninth century they brought it to Spain and Sicily. By Europeans paper was first made in the twelfth century in Spain and Italy. The art of paper-making spread from Spain to France in 1248, from Italy to Germany and Switzerland in the fourteenth century, and perhaps also to England, where the first important paper mill was set up in Hertford by John Tate in the second half of the fifteenth century. However, in the second half of the fourteenth century paper was in fairly general use throughout Europe, and began to rival parchment as writing material for books. In the course of the fifteenth century it gradually superseded it. At that time, however, printing superseded handwriting in the manu. of books.

The Mexican pre-Columbian MSS., known as Aztec codexes, are painted in colours, on coarse cloth made from the fibre of the *Arape americana*, or on a long sheet of *amall* paper, of an average width of 6 or 7 in., but of different length. The sheet was folded up screen fashion to form the leaves, and was fastened to what may be called the binding of the codex, which was of fine, thin wood, covered with brilliant varnish: it had no 'back.'

For the writing on the MSS. see under ALPHABET; PALAEOGRAPHY; WRITING; and the single letters A, B, C, D, and so on. See also ILLUMINATION OF MANUSCRIPTS; PALIMPSEST.

Manutium, see MANCHESTER.

Manutius Aldus, or Manuzio Aldo (c. 1460-1515), It. printer and author, b. at

Sermoneta, in the papal states. He spent some time in the study of the classics, subsequently becoming tutor to the princes of Carpi, one of whom, Alberta, supplied him with the money for starting his printing press. At Venice in 1490 he produced eds. of Musaeus's *Hero and Leander*, and the Gk. Psalter. These were followed by the works of Aristotle, Aristophanes, Thucydides, Sophocles, Herodotus, Xenophon, Euripides, Demosthenes, Plato, and Pindar, as well as some eds. of Lat. authors. He is famous as having been the first to print Gk. books and to use italics on a large scale, and was the founder of the Aldine Press. See M. Ferrigni, *Aldo Manuzio*, 1925, and G. Fock, *Bibliotheca Aldina*, 1930.

Manx-cat, variety of the domestic cat (*Felis domestica*), distinguished by having no tail, or only a rudimentary one. A native of the Isle of Man, it may be of Jap. origin. It is now almost extinct.

Manx Language, see under ARYAN and INDO-EUROPEAN LANGUAGES.

Manyoh, or Manyeh, riv. bed of Russia, between the Don and the Caspian Sea. It is dry for a great part of the year.

Manzanares: 1. Tn. of Spain in the prov. of Ciudad Real, 70 m. from Toledo. It has manu. of soap, cloth, and pottery. Pop. 16,000. 2. Riv. of Spain in New Castile, with a length of about 50 m. It flows from the Pico de Peñalara past Madrid to the Jarama.

Manzanillo: 1. Tn. in Cuba on the gulf of Manzanillo in the S.E. of the is., 437 m. by rail from Havana and 112 m. from Santiago. The tn. exports sugar and molasses. Pop. 36,300. 2. Tn. of Mexico in the Colima ter. It is one of the oldest tns. along the Pacific shore. The port serves Guadalajara and Jalisco dists. The chief exports are coffee and hides. A 200 m. road via Colima to Jiquilpan was nearing completion in 1949. Pop. 7000.

Manzanita, or *Arctostaphylos manzanita*, beautiful Californian tree of the order Ericaceae, allied to the Brit. heatherberries. It varies from 20 to 60 ft. in height, and its wood resembles mahogany.

Manzoni, Alessandro (1785-1853), It. novelist, b. at Milan. In 1806, at the age of twenty-one, appeared his essay in poetry entitled *Iersi Scotti*, inspired by the death of Carlo Imbonati, an intimate family friend. In 1810 his sacred lyrics met with general admiration. Sev. tragedies, written with much spirit and originality, attracted notice not only in Italy, but also in France and Germany, and foremost among the warm admirers and favourable critics of M. stood Goethe. The work, however, by which M. attained to European fame is his historical novel, *I Promessi sposi*, a Milanese story of the seventeenth century (3 vols., Milan, 1827). M.'s ode to Napoleon (1823) is noble in thought and diction. The poet's later years were spent in strict and devout seclusion, the free tendency of his early opinions having been succeeded by a stringent conformity to the doctrines of Rome. An ed. of M.'s works in 5 vols. was pub. by Tommaseo in Florence (1828-29).

Maoris, or **Mau** (New Zealand word signifying *native* or *indigenous*) the name given to themselves by the inhab. of New Zealand. The M. in common with the natives generally of Polynesia, belong to the Malay race or family of mankind though calling themselves indigenous, the M. have a tradition that their ancestors migrated to the present seat of the nation from the Is. of Hawaiki about 100 years ago. This Is. has been identified with Hawaii and Savaii in the Pacific Ocean. On their arrival in New Zealand the M. found inhab. on the E. coast of the N. Is. of similar racial origins to themselves known to the M. as *Morioris*, 'inferior people' this race was driven to the S. Is. and to the Chatham Is. through absorption by the dominant M. the *Morioris* finally became extinct in 1835. Of them but nothing definite is known and even their origin remains a mystery. Coming from tropical lands the M. mainly confined themselves to the warmer N. Is. and when discovered by Europeans were in a high state of neolithic civilisation, with marked superiority in the arts of wood carving and military engineering. Their prin. social unit was the family group and from combinations of the numerous groups were formed sub tribes and tribes. With highly developed social and ritualistic customs they were communistic within the sub tribes in their system of land tenure as well as in their methods of cultivation. Inter tribal warfare was common and indeed the Maori has never been united as a nation tribes fighting against tribes to the death. As individuals they show exceptional courage and intelligence.

The skin of the M. is in general of an olive brown colour but there are some in whom the shade is much lighter, while in others it is darker. In stature they almost equal Englishmen and have a powerful muscular development. They have well shaped intellectual heads, and their features, when not tattooed might almost be taken for Europeans. Few of them have beards or whiskers. The women are of lesser stature than the men in proportion and are in other respects inferior to them. Cannibalism was universally prevalent among the M. before their conversion to Christianity. The last instance of it occurred in the year 1843. Infanticide which also prevailed largely among them in their days of heathenism has now long been abolished and the same is the case with slavery and polygamy. The most curious of Maori customs now almost extinct owing to the influence of Christianity is the practice of tattooing or Maori moko. To day no Maori man lives who bears more than a few scrolls of moko and that only on the face (tattoo on the body was called 'whakapahe'). It is rarely seen except upon the old men but the tattooing of the lips and chin of married women is still a common practice. There was considerable art displayed in the practice, the native artist showing originality and taste in his remarkable arabesques in moko pattern. In the later development of moko, these

winding arabesques were not designed merely to ornament a surface of flesh but in parts followed the conformation of the individual countenance. The whole countenance was much disfigured by the practice although it was considered by the M. as highly ornamental and further more it served the purpose of marking the clan or tribe to which the tattooed person belonged and indeed the M. regarded the unmarked face as common and plebeian and originally only the free men were tattooed, but never a slave. As compared with tattooing in the still milder

L N 1

climates of the South Sea I. which leaves the skin smooth the moko of the M. is really a chiselling of the flesh actually done with chisels made of shark's teeth, bird's bone or shells and stone the whole process of chiselling and colouring being very painful. During the process of moko the patient was taped and therefore might not be touched nor could even touch his own face, and if he touched anything it had to be destroyed, as it could never be used again for a common purpose. It was tapu that made the difference between chiefs and others for there was little or no outward distinction and in their mutual intercourse there was unreserved freedom among the M.

Maori society had three grades, each one having sev. degrees of position or influence. The first class was that of the 'Rangatira,'

or chieftain; the second, the 'Waro,' or commoner; the third, the 'Hononga,' or slave. The 'Ariki,' or priest, was generally found in the person of the chief. The M. believed that the 'atua,' or departed spirit of a chief, cared most for the living members of his own family; hence the families of the chiefs were more tapu than others. A common man, if brave or wise, could rise to the dignity of a chief. The M. are associated in our minds with warfare, yet it is said that few members of the race have a knowledge of the correct use of their weapons of war. The Maori did not use a heavy weapon, his best defence being agility and quickness of perception, to which indeed he was trained from early childhood. In the art of parrying a blow the Maori fighting man was an adept, and the shield was not much in use. The chief weapons were the taiaha, mere, and kōkoi. The taiaha was a weapon carried by persons of distinction, and even to-day a chief will hold one when making a public speech, although he may not know the use of it as a weapon. It is a weapon of about 5 or 6 ft. in length, with an elongated carved head, and it terminates in a spear-head. The kōkoi, a 6- to 8-ft.-long spear, pointed at both ends, was the weapon most commonly used; the longer kind was called huata, and the shorter the tao, these latter being used in hand-to-hand fighting or in duels.

Of the great number of Maori legends, those relating to the hero Maui are most widely known. This hero was skilled in magic; it was Maui who snared the sun, and in his preparations for the feat he invented a rope made from flax. It was Maui who fished up the is. of New Zealand with a hook made of the enchanted jawbone of an ancestress, and this jawbone in Maori belief now forms the curve in the S. extremity of Hawke's Bay. The numerous adventures of Maui have naturally given rise to a set of proverbs, and reference to these in speeches or ordinary conversation lends a subtlety to the language of the learned which eludes those not acquainted with Maori mythology. Another hero of Maori myth is Ngatoro, whose name is associated with Mt. Tongariro, the volcano in the middle of N. I. Ngatoro climbed this mt., first enjoining on his brothers not to touch food during his absence; they disobeyed, with the result that Ngatoro, in his wrath, felt faint, and calling on the gods to send fire to him, the mt. became a volcano, so that the hero was revived by the heat and descended to the plains below. The route by which the fire came became, in the Maori belief, the famous thermal dist. around Rotorua and Taupo. Such legends are very similar to Samoan myths, which equally show much poetry in the explanation of natural phenomena. The primal being of Maori myth was Io, the supreme god, who in some manner caused the earth and sky to exist, and these are personified in Rangī, the Sky Parent, and Papa, the Earth Mother. Fairies figure prominently in Maori legends. The M. are true believers

in fairies even to-day. In former days many were the stories told of monsters known as 'tanīwhas' who lived in sea caves or in swamps, stories which probably had their foundation in the schools of seals and porpoises seen off the coast.

Dancing has always been a favourite recreation of the M., with whom, as in their other arts, there is a well-defined constructive scheme so that the progression of movements adequately expresses the passions or the development of a dramatic idea. Of the latter type the 'poi' dance or famous canoe dance, which is perhaps the favourite among the M., exhibits considerable interpretative skill. Maori carving is a most characteristic, if dying, art, which distinguishes the race from other Polynesians. Dist., tribes, and even families specialised in some particular form of art expression, and were jealous to preserve their secrets. Carved figures, interiors of houses, such as carved pillars, and, above all, the embellishments of the war canoes, afford some of the most striking examples of Maori carving.

The language of the M., like the Polynesian languages generally, belongs to the Malay family. Seven tolerably distinct dialects are spoken among them. The language being rich and sonorous is well adapted for poetical expression. More than five-sixths of the M. are now converted to Christianity. Since the native wars, which lasted from 1843 to 1869, the M. have enjoyed complete peace, but they steadily declined in numbers from about 100,000 to 40,000 in 1901. During the last forty years, however, they have increased, and their number may now be put at about 98,000. Much may depend on the creation of a native land settlement scheme, for there is very little land held by 'customary' tenure—i.e. land which has never been the subject of a Crown grant, and is held by natives under the customs and usages of the Maori people, as recognised and guaranteed by the treaty of Waitangi. Nor, again, is there any large area of 'native freehold' land. There is, however, a very prevalent opinion that the Maori can have no future as a distinct race, for even though the downward trend in pop. has long been arrested, there is a continuous infusion of Maori blood in the New Zealand pop. Two Maori members may be appointed to the Legislative Council by the governor-general (since 1927). There are four Maori members in the House of Representatives, elected for three years, and every adult Maori living in any of the four Maori electoral dists. is entitled to vote (Act of Dec. 11, 1937). Maori children may attend public schools, but there are also native vil. schools provided for their primary education. There are also a few mission schools remaining from the pre-Maori war system estab. with the help of gov. subsidies. For post-primary education the Maori child may go free to any available secondary school, but in remote areas he will go to a denominational Maori secondary school. There are now some twelve secondary schools for M. besides primary schools.

Mao Tse-tung (b. 1893), Chinese Communist political leader, b. in Hunan. He took part in Sun Yat-sen's revolution of 1911 and joined the Communist party on its foundation in 1921. In 1931 he became chairman of the council of people's commissars in the areas of S. China given over to Soviet principles. In 1935 he led the 'long march' to Shen-si and brought about the alliance between the Communists and the Kuomintang in 1936, which was only ended at the close of the Second World War in 1945 when civil war again broke out. (see under CHINA, History). Since then he has been the accepted political leader of the Communists in their successful campaigns against the nationalist forces of the Kuomintang. His so-called 'New Democracy', the bible of the Chinese Communists, is best described as 'communism through capitalism,' a shrewd and, in the long run, extremely dangerous and misleading economic policy, which, in his own words, means that 'private capitalism must be developed and the initiative of millions of Chinese encouraged because an era of capitalism and industrialism is the essential first stage towards a Communist China.' M. and his adherents are, in fact, resolved to follow the speediest road to the Chinese Communist state. In an article written to commemorate the twenty-eighth anniversary (July 1949) of the founding of the Chinese Communist party, M. reaffirmed Communist China's alignment with the Soviet bloc of powers and restated his now familiar thesis that there is for China no 'middle way.' China (he said), now formed part of the 'anti-imperialist front' led by Russia, and could look for friendly help only from that direction. Yet he admitted that if China is to become an industrialised nation and economically independent, this could only be achieved by trading with the imperialist powers. According to M., the Chinese Communist party has two guiding principles. First, it intended to unify

four categories: workers, farmers, small capitalists or bourgeois, and liberal capitalists, or owners of industries vital to the nation's welfare. It would ruthlessly suppress the activities of all reactionaries, including imperialist forces, landowners, and bureaucratic capitalists. All democratic rights, including the freedom of speech, of assembly, or of pub., and of association, would be conferred on the first four categories but denied to the others. Secondly, the Chinese Communist party aimed at strengthening the united international front with the Soviet Union, with all people's democracies and proletarian classes, and with the masses of all nations throughout the world.

Map, or Mapes, Walter (fl. 1200), medieval author and wit, probably a native of Herefordshire. He studied under Girard la Pucelle at Paris, and on his return to England was made clerk of the royal household, being frequently employed as a justice itinerant. He was with Henry II. at Limoges in 1173, and in Anjou in 1183, and in 1179 was sent to the Lateran Council at Rome. In 1176 he received the prebend of Mapesbury at St. Paul's, becoming before 1186 chancellor of Lincoln, and in 1197 he was made archdeacon of Oxford. He wrote *De nunciis curialibus*, a collection of legends and anecdotes from his native country. This book gives some information of the Templars and Hospitallers, and also contains a sketch of the Eng. court and kings from the reign of William I. to his own time. Besides this, it gives an account of M.'s life. He probably was also author of some of the satirical Golluthic verse, as well as of a large part of *Lancelot* and specimens of his wit are preserved by Giraldus Cambrensis.

Maple, or Acer, genus of deciduous trees of the order Sapindaceae, with opposite, stalked, palmately veined leaves of great decorative value, and racemes of green flowers followed by two-winged samaras. The common or small-leaved M. (*A. campestre*) has the racemes erect, and is the only Brit. species, but the greater M., or sycamore (*A. pseudo-platanus*) with pendulous racemes is now perfectly naturalised. Of the numerous N. Amer. species, the sugar M. (*A. saccharinum*) is one of the most valuable. M. wood has many uses. The M. leaf is the national emblem of Canada.

Map Reading. Whereas formerly a map indicated more or less inaccurately a number of places and their supposed relative positions, a modern map, carefully selected and studied, can be a mine of compressed authentic information. The maps generally referred to in this article will be those of the official Brit. Ordnance Survey, on which all privately pub. maps (e.g. Bartholomew's) are based.

In 'reading' a map the first thing to do is to study carefully the conventional signs employed. These vary somewhat according to the scale and the date of pub. Ordnance Survey maps being now subjected to a process of continuous revision and improvement, those of latest date will, in general, be the most accurate.

and informative.* These maps show both natural physical features and man-made constructions; the special character of the ground surfaces; areas, distances, levels, and boundaries; also archaeological, historical, and prehistoric features. Formerly printed on the margin of the map sheet, these conventional signs can now be obtained on a separate card containing information on both sides, with scales along the edges in ft., yds., m., and km., and a protractor for measuring or setting out angles. The most generally useful map for all purposes is the inch-to-a-mile (coloured).

Roads are readily distinguishable according to their categories, from good main roads down to narrow bad unfenced roads, footpaths, and bridle paths. Railways, whether single or double tracks, with embankments, cuttings, tunnels, viaducts, stations, level crossings, bridges (over or under), mineral lines, and tramways, are also shown.

Waterways comprise rivers, lakes, tarns, reservoirs, all coloured blue, streams and tribs, in meandering blue lines, canals with straight banks, ditches generally in fine blue straight lines. Boundaries of various kinds include co., bor., par., etc., shown by various combinations of black dots and dashes. Electric transmission

lines are represented by fine black lines with pylons spaced conventionally.

Many conventional signs (more numerous on the large-scale plans) indicate the character of the ground surface, e.g. slopes, broken slopes, cliffs, mud-banks, flat rock, boulders, shingle, sand, sand-pits, gravel-pits, pasture, orchards, etc.; also abbreviations or signs for artificial objects like letter-box, police call-box, well, trough, post office, youth hostel, windmill, lighthouse, church, etc. Sites of antiquities have a conventional sign, with distinctive lettering to indicate either prehistoric, Roman, or medieval remains.

Contour lines, usually drawn in brown or red ink, are an invaluable modern invention and display relief without obscuring physical features. Widely spaced contour lines indicate gentle slopes, generally devoted to agriculture, and closely packed lines steep or precipitous slopes. Aerial photographs may reveal features not otherwise discernible. See J. W. Cameron, *Map Reading*, 1920; T. Pickles, *Map Reading*, 1937; G. T. McCaw, *The Basis of Map-making*, 1938; F. F. Crossley, *Map Reading*, 1943; B. Lockey, *The Interpretation of Ordnance Survey Maps—Geographical Pictures* (4th ed.), 1946.
